When all the checking is satisfactorily completed, the supply column lorries move away on their road back to railhead, and the units' representatives, under the issuers' instructions, proceed to make their dumps—the correct amount of supplies due to each according to the issuers' slips, which the chief clerk has made out and handed to them—so much bacon, so much butter (twice a week), so much jam, so much bread and meat. The loaders hustle around, while the quartermaster-sergeants stand about with note-books and pencils, and an ever-watchful eye upon the issuers, whom they persist in regarding as their natural enemies. The S.O., who has to keep his eye upon the issuers' clerks and quartermaster-sergeants and loaders, walks about amongst the dumps, signing *chits* for fuel (usually drawn from a small depot near divisional headquarters, though the S.O. is responsible for the quantity drawn, hence the *chits*), urging haste on every one, choosing out a ham, perhaps, for brigade headquarters mess—one must 'do' the General decently—seeing that Colonel Thingummy gets the marmalade he has been demanding for the past fortnight, and attending to all sorts of special 'wants,' from brandy for the Buffs' medical officer to 'anti-frostbite' for the Rifle Brigade.

Soon arrive the supply-wagons from camp, with the A.S.C. transport subaltern at their head. On each wagon is painted a mystic device. To the uninitiated—for example, a possible spy—this means nothing. To those who know, it indicates the battalion or other unit to which the supply-wagon is allotted. So the wagons draw up adjacent to their own particular dumps, which are accordingly forthwith loaded on to them by their loaders, and they move away either to the appointed rendezvous with the first line transport (when the brigade is in what might be called 'temporarily permanent' trenches), or, probably, back to camp to await orders when a battle is in progress or expected.

During this time the S.O. has probably had one or two visitors. There is, for instance, the S.S.O. (Senior Supply Officer), who calls at each refilling point in the divisional area (more or less). 'Any complaints?' he asks, and dashes off again in his 'Sunbeam.' Possibly the C.O., accompanied by the adjutant, turns up, relieves the S.O. of a cigarette, tells him a funny story, and rides on; though meanwhile his clear old eye has been noting many little things it didn't appear to note, about which he tells the adjutant as they ride away.

Refilling over, and the convoy on its way safely, the S.O. gets back to camp, has a belated breakfast, posts up his supply accounts, reads through the indents for supplies required the

day after to-morrow with his chief clerk, and attends to any correspondence. He also sees his requisitioning officer and gives him instructions as to the quantity of vegetables, hay, straw, &c. required for the morrow. If the R.O. has not made arrangements to have these commodities ready at refilling point, he goes off in the car to do so.

After that there is nothing very pressing until the daily meeting with the senior supply officer at two o'clock, when the day's accounts are checked—a dull affair, usually over in half-an-hour.

Outside the S.S.O.'s billet the car is waiting, for the S.O. is going to 'see his units;' that is to say, he is going to call upon one or two of the commanding officers of the battalions in his brigade, and perhaps a company of R.E. on the way. He goes up by way of brigade headquarters, usually about four miles from the brigade company of the divisional train. The S.O. takes the car as far as he can in daylight, to certain cross-roads about two miles behind the front-line trenches in the salients. He leaves it there, under cover of some trees or a shell-scarred house, in the charge of the driver, and proceeds to walk across that forbidding and desolate shell-pocked mile or two which lies immediately behind the line. He notes with interest the new shell-holes made since yesterday on or near the path, listens to the weird flight of an occasional Hun shell overhead, hears the low groaning of a close one, and sees it throw up a ton of earth two hundred yards or so away to the left. Then suddenly across the fields sounds the warning note of a whistle. Overhead is the buzzing sound of aircraft, and the *pop-pop-pop-pop* of the British 'Archibalds;' around a black speck in the sky appear little, white, fleecy clouds which slowly enlarge and disperse like thick puffs of smoke from a man's pipe. The S.O. gets under cover of some trees until the whistle sounds again, and tells him that he and all others may safely show themselves. And so, with a feeling of relief, he arrives at the brigade headquarters, and reports to the staff-captain, who, if he is the right sort of S.O., is his very good friend.

Now it is hardly necessary in these days to describe a brigade staff-captain. He is, of course, a 'Tin Hat,' wears red tabs on his jacket, and is regarded by every newly arrived sub. with feelings of intense reverence, mingled with awe. In spite of this, however, a brigade staff-captain on active service is quite the most get-at-able person set in authority. He is a sort of adjutant-quartermaster and general factotum to the brigade in one. He is the brigadier's mouthpiece in matters of supplies, and he can always (nearly always) tell you where his battalions are going to bivouac on a march—a thing that takes not a little ingenuity to discover on occasions. So a supply officer must always

keep in close touch with him. He knows all about 'movements,' details of which he sends you in a long official envelope marked 'Secret' in red ink, and all serious complaints and suggestions about rations—especially the rum ration!—go through him.

'Hallo!' he says to our S.O.; 'glad to see you. Come in and have some tea.' So the S.O. does, and meets the brigadier, and the brigade major, and the signalling officer, and perhaps a visitor from divisional headquarters gathered round a table in the least damaged room of the farmhouse among the batteries. A cup of tea, and then to business. The Warwicks are complaining of a short ration of tea two days ago. 'Yes, I know about that,' says S.O. 'Somebody had to go short because the stuff didn't come up, but I made it up to them this morning.' 'That's all right, but you might call in and see the colonel; he wants to make some suggestions, I think.' S.O. makes a note of it. Then the Staffords' doctor wants some brandy, and the Northants' colonel would also like to see the S.O.

'Signals' is going down to the trenches after tea, so S.O. and he, long since good friends, start off down the shell-scarred path to the little gap in the bank on the side of the road which leads under cover to the reserve dug-outs.

By this time it is quite dark. The path is strewn all the way with holes and unevennesses made by small shells and the traffic of many troops. Much rain has made it muddy enough and slippery enough under any circumstances. But these holes are filled with dirty water, sometimes knee-deep. Signals and S.O. stagger painfully on, now arm-in-arm to prevent slipping. Both carry electric torches, but they dare not use them. However, they know the path well, and after twenty minutes' slipping and sliding, walking and trotting, they make the reserve trenches where the Warwicks' colonel is to be found.

Reserve trenches are rather like a small village—a troglodyte village such as that at Kinver. They are carefully built into a high bank, the solid earth supported by wooden beams forming the back and a part of the roof. The other walls are composed of sand-bags boarded up, and that part of the roof not formed by the inletting into the bank is heavily covered with the ubiquitous sand-bag, corrugated iron, and thick turf. Inside everything is cosy enough. There is a table in the centre of the room, where the adjutant is seated with some papers. There are two or three chairs, and a couple of biscuit-boxes, which form a sort of cupboard; a coke-burning stove pervades the room with a comforting, if somewhat odorous, heat.

Every Englishman will carry his sense of the fitness of hospitality to the ends of the earth—to the trenches and beyond. The colonel welcomes S.O. and Signals, insists on their occupying his best chairs near the fire, produces

whisky and siphons, hands his cigarette-case, and having made every one thoroughly comfortable and at home, begins to discuss with S.O. the ever-interesting subject of 'supplies.' 'Change of diet for the men' is the colonel's scheme, and S.O. takes a few notes. Larger variety of vegetables wanted; a little more work for the requisitioning officer. 'They used to send us up tinned salmon last year,' said the colonel. 'Can't they do it now?' S.O. explained that the tinned salmon was a present to the troops from British Columbia; but he will see if anything can be done through the senior supply officer.

More talk of a similar character, and drinks finished, S.O. and Signals salute and retire, *en route* for the next officer on the calling list. They are told the Northants' colonel is in the fire-trench with his battalion, so along the deep communication-trench they go toward the bit of line the Northants are holding. The trench is nearly half a mile in length, and it takes them a good fifteen minutes to traverse it, so covered with mud and water is the surface. At the end of it they find a sentry. 'The colonel's just gone up to inspect the defences at the Bluff, sir,' he says. 'If you wait here, he'll be back shortly.' S.O. and Signals find a subaltern acquaintance, and chat to him. Things are very quiet this evening. The artillery action of the afternoon has subsided, and only an occasional sniper's shot is heard, and now and again the rattle of a machine-gun somewhere down the line.

Presently the colonel returns, and they walk back with him to the second-line trenches, discussing between their slips the possibility of getting a better supply of charcoal, a matter of considerable difficulty now that the charcoal country of the Somme district is partly in German hands. S.O. propounds a scheme of his for collecting charcoal from large bakers in some of the French towns, which may bring in a little more; and so, business done, Signals and S.O. retrace their steps, and get back to brigade headquarters about seven-thirty p.m., where S.O. finds his car waiting for him, grim and lightless, under cover of trees. No car or transport is allowed on that road in daytime, but at nights slowly and carefully they come in the darkness.

Half-an-hour's run takes him back to camp near P., a belated dinner, a chat with the R.O., his own dug-out, and sleep that comes readily enough at nine-thirty, what time in England the night clubs have not yet begun to fill.

So far this has been an endeavour to picture roughly the work of a supply officer at one of those times—so numerous indeed—when despatches say: 'On the western front, apart from artillery duels at some points of the line, there is nothing to report.' But during a march, and, worse still, a retreat or an attack, the difficulties are innumerable, and to a man naturally inclined to feel the responsibilities of his position acutely, the ever-present anxiety is a continual source of trial. He has to deal with units constantly changing their positions almost from hour to hour; he has to find out where they are and where supplies are wanted; sometimes he can't get a map, even in unknown districts, and has to find places in his car, return, and guide the supply convoy to them on horseback. There is a transport officer in charge of the convoy; but it is the S.O. who is responsible that supplies get to the spot to which they have been ordered to be sent.

At times when every staff-officer is nerved to the utmost by great anxieties; when all is rush and hurry, and information is difficult to come by; when an hour's delay behind may mean untold hardships in the firing-line, then it needs all the resources of a cool head, the power of quick decision, tireless energy, sometimes considerable personal gallantry, to see that battalions and batteries, field companies and ambulances, get their daily ration at the proper time. Above all else, the S.O. must never be out of touch with the staff-captain of his brigade. Where supplies are concerned, these two must always work together. Divisional orders have a way of being altered, quite necessarily, at the last moment in emergencies. But if staff-captain and S.O. understand one another, and know what each is going to do, all sorts of difficulties vanish. But anxiety is ever the lot of the S.O. On him rests largely, at times on him alone, the responsibility for the 'feeding of the five thousand,' or the four or six thousand, as the case may be. It is no light burden.

CORPORAL MARGUERITE.

CHAPTER III.

MOST of the houses in Armand were shaken to their foundations almost as soon as it was daylight the next morning. The inmates of the 'Coq d'Or' were suddenly awakened. Sounds of men hastily getting up came from the little rooms, and, a few minutes after the first heavy

detonations had shaken Grandpère François's inn, doors were opened, and the colonel and his officers made their appearance, buttoning tunics or girding on sword-belts as they came hurrying along the passages and descended the stairs.

In a few minutes the whole village was in

confusion, officers shouting orders, men aroused hastily from heavy sleep forming up in the street in the rapidly increasing light of dawn.

Among the German officers there was evident concern and distrust. The colonel and Lieutenant Hofmeyer, his face still scarred by Marguerite's nails, stood in the early morning light just outside the inn door talking earnestly. The steel of their sword-scabbards and the gold braid on the colonel's uniform gleamed dully.

'There is not a doubt, sir,' exclaimed Hofmeyer. 'She was stopped while returning to the village. It was at three this morning.'

The older man looked sharply at the speaker, and said heavily, 'It is no offence, lieutenant, for her to have been outside the village. Unless,' he added, 'I had issued orders last night that none of the inhabitants were to leave it.'

'No, sir,' the lieutenant admitted reluctantly; 'but in war, if I may be allowed to say so, one cannot take risks.'

'Agreed!' interrupted the colonel.

'And one must make an example. It may cause the villagers to be cautious regarding the information they give when we have gone.'

At this moment a shrill scream cut the still morning air; and a moment later the mother of Marguerite, pushed roughly by two infantrymen, came round the corner of the inn, accompanied by a corporal.

'Your name?' asked the colonel sternly, as Madame Baudet was brought in front of him.

'Jeanne Baudet,' came the unflinching reply.

'You have been seen returning before dawn to the village, Jeanne Baudet,' said the colonel. 'You are suspected of giving information to an enemy advance patrol. Have you anything to say?'

'I have nothing to say,' was the reply, after a moment's hesitation.

'You admit that the charge is true?' pursued the colonel.

'I admit nothing and I deny nothing when questioned by the enemies of France,' came the answer.

'She is like all these peasants—recalcitrant,' exclaimed the lieutenant.

The colonel said nothing, and stood thinking for a moment. Then he said, addressing Jeanne Baudet in a hard voice, 'You know what happens to spies and informers?'

'I know what happens.'

There was another pause.

'I have no alternative in the interests of my men, and of the German army. You will be shot.'

The words fell with stupefying effect upon Jeanne Baudet's ears. But out of the confusion of mind that momentarily resulted upon the sentence emerged the thought, 'Then it is true what they say of these Bosches; they shoot even women as well as men.'

The colonel said something to the lieutenant, and then turned on his heel.

'Place her against the wall,' said Hofmeyer harshly; adding, when this had been done, 'Call up four more men, corporal.'

Three minutes sufficed to do this. The six men, at about fifteen paces, stood with their rifles raised.

A volley rang out, echoed sharply against the walls of the houses on the opposite side of the little Grande Place, and the thin wreaths of acrid smoke drifted slowly away in the air.

Jeanne Baudet had fallen without a cry, and lay against the wall still and piteous.

Marguerite, in the tiny attic room into which she had locked herself the night before, had awakened early. She had sat near the window, afraid to venture downstairs, and whilst doing so had heard the voices of the colonel and the lieutenant, though she could not catch all they were saying. Then the shots rang out, and, with that strange form of telepathy of which many have experience, she had seemed to visualise the whole tragedy, and become cognisant of what had happened. She craned out of her narrow window, but could see nothing down below by reason of the jutting eaves. Then frantically she tried to unfasten the door; but in her mental anguish she forgot where she had put the key.

It was not till half-an-hour later that she was released by Grandpère François himself, red-eyed and shaken. Together they stood at the window watching the departure of the enemy—the enemy that she cursed in her heart with a deep, undying, and hundredfold hatred. Her face was pale and drawn, and her eyes had a terrified look in them, as though some horror had frozen itself upon the retina.

When the last of the Germans had disappeared round the corner of the street across the Grande Place, she turned away, and, with her grandfather, stumbled half-blindly down the creaking stairs, and entered the room where her mother lay so still, with dark marks staining the fabric of her bodice on the breast.

The days that immediately followed at Armand were stirring ones. The village was lucky to escape destruction in the first days of the German retreat; but it was not, as time proved, to be spared the horrors of war.

Many French and British wounded came into it, and ambulance-carts with their sorrowful burden were drawn up in the little cobble-paved square which rejoiced in the grandiloquent name of the Grande Place. These wounded soldiers of France and Britain were tenderly ministered to by the women of Armand, Marguerite among the rest. But all the while she was helping to bandage, or to hold while others did the work, or to give food and drink, an idea was coming to birth in her mind, born of the awful hatred

of the German invader which burned in her heart and soul—a hatred which nothing would ever blot out, something that she herself felt would never die.

At noon on the seventh day after the Germans had come and gone, one of the wounded quartered at the 'Coq d'Or,' a mere boy of nineteen, a corporal in the 40th Regiment of the Line, died in Marguerite's arms. For two days she had tended him untiringly, soothing his pain, and often vainly attempting to calm him in his delirium.

When all was over came the opportunity of carrying out the plan which had grown in her mind. She crept away to her own little room under the roof, up a narrow, twisting staircase which seemed to lead nowhere till one came to the door of the attic itself.

When she had crossed the room—which she was destined never to enter again—she knelt for a moment or two at the foot of the crucifix which hung upon the roughly plastered wall, praying for the soul of him who lay still and peaceful in the room below. Then she rose and went to the little dressing-table, a gift from Grandpère François, with a tiny swing mirror on it, and peered at herself in the glass.

Tears sprang to her eyes. How could she do the thing that she was about to do? But at last, with an effort, she undid her hair and let it fall, a cascade of gold, down over her shoulders to her waist, and then, slowly and deliberately, with her teeth set, she seized a pair of scissors and ruthlessly sheared off her tresses, which fell in thick coils on to the uncarpeted floor.

Then, when it had all gone, and her hair was almost as short as that of a boy, she covered her face with her hands, not daring to see herself in the glass. But in a moment or two she regained her composure, and glanced furtively at the strange and almost boyish-looking face which stared back at her from the surface of the tiny mirror.

She realised suddenly that she had done a terrible thing—that she had taken an untraceable step in the course of action which she had mapped out for herself. But the fire of a great determination, fed by the suffering and horror which she had passed through, steeled her heart, and with tearless eyes she turned to the little bed where lay the regimentals of the young corporal whose soul had so recently winged its way to its eternal home.

With fingers that no longer trembled, she commenced to undress, letting her garments fall one by one as though she were performing some sacrificial act on the altar of her country and her honour. Then, just as slowly and deliberately, she re-dressed herself in the unwonted clothes. Corporal Duplessis was small and slight, almost of girlish figure indeed, and

so his clothes fitted Marguerite almost as though they had been made for her.

When she had buckled the belt round her waist, and had, just as an experiment, rammed his *képi* on to her fair head, she crossed to the little mirror to see how she looked. A smile flickered for a moment on her face as she saw the reflection of a pretty boy with a smooth face, which had, however, strong features and sad eyes gazing back at her.

'*Bien !*' she said to herself; 'I make not so ill a little corporal, when all is said and done.' And then she recrossed the room to the bed, picked up her fallen garments one by one, folded them, and placed them in their proper drawers, or from habit hung them in the cupboard; and then she sat down to think. 'It is hard to leave Grandpère François,' she said to herself, 'without a good-bye, and M. le Curé, and Gabrielle, and Jeanne. But it must be done.'

It was quite dusk when she crept downstairs. Corporal Duplessis' boots were thick-soled, and they seemed to her to make a terrible clatter on the bare boards of the staircase. But at last she reached the ground floor, passed through the kitchen, which was deserted for the moment, and went out into the little back courtyard, which gave access to the fields, across which lay the road to Rheims.

As she was crossing the courtyard she ran almost into the arms of one of the Sisters, who glanced at her hastily, and then, with a laugh, and 'It was lucky, corporal, that I was not carrying the soup,' passed on.

Marguerite had little idea of what she would do when she got away from Armand. Vaguely at the back of her mind there was the idea that she would join some regiment, and that she would take part in the fighting.

As she walked bravely on across the fields in the hope of striking the road to Rheims, around which she knew the battle was now raging, she tried to feel that she was comfortable in the clothes she wore. Often, before she was quite grown-up, she had run races across the fields with her boy acquaintances, and when she had been beaten she had excused her defeat by reason of the petticoats which hampered her free movements, and had said laughingly, 'Ah! you would not beat me,' Jean or Georges or Raoul (as the case might be), 'if I wore the breeches and you wore the petticoats.' And now at memories of these occasions she smiled, and wondered how it was that the clothes she had professed to covet were so horribly embarrassing. But that feeling would surely go, and when she had a rifle across her shoulder she would march along with the best of them, singing as the good soldiers did, happy in the service of *la Patrie*, and in the thought that at last the time would come when France should be revenged on the nation that many years before had so cruelly humiliated her.

Late at night she saw the bivouac fires of the army corps which was operating in the neighbourhood of Armand flickering on the countryside. An hour later she had entered the lines, had been challenged, had failed to give the password, and then, at her own request, had been taken before the commanding officer. He sat in the little parlour of a cottage, a stern-faced man with a heavy white moustache, in company with several other officers, with plans spread out in front of them on the table, and several candles as the sole illumination of the little room.

When the white-moustached officer, in whose eyes, though of a hard blue in colour, there lurked an unexpected tenderness, had listened to her story, he said brusquely but not unsympathetically, 'It is impossible, mademoiselle; we cannot accept you.'

And then Marguerite went forward and fell on her knees beside the speaker. 'Oh, M. le Général!' she exclaimed, 'surely you will not deny to a woman of France the right to fight for

her country if she will, and to avenge her cruel wrongs?' And then, with bent head, Marguerite told the whole sad story, though her voice broke here and there with sobs, and the General would have spared her.

When she had finished, she rose and said, 'After that, M. le Général, can you refuse?'

The officers all regarded her, not curiously as at first, but with looks of admiration, and the youngest of all those present said, '*Mon Dieu!* what a girl, *mon Général!* If France has such as she it is well for her indeed.'

And then, after a whispered consultation with one of the other officers, the man they called General said to the younger man, 'Captain Roger, we know nothing of this, of course; but have Corporal Marguerite attached to the 99th. She may be useful for ambulance work.' As she left the room the General murmured under his white moustache, '*Le bon Dieu* keep the girl, for she has courage as well as beauty. France can do with women of her kind.'

(Continued on page 395.)

IN THE ELECTRICAL DEPARTMENT OF A GREAT HOSPITAL.

ELECTRICITY is being more and more employed in the treatment of disease of many kinds, and for the after-treatment of those wounded in the great war or injured by the accidents of daily life. It is true that in many ways we whose daily work it is to employ this great force know little more about it than the Greek philosopher who discovered the fact that by rubbing a piece of amber he had produced what we now call electricity. What it is exactly who can say any more definitely than we can answer the question, 'What is heat?' It is a source of energy, giving us heat, light, motive-power. We know how to produce it, how to control and use it; but what *exactly* it is is very difficult for the wisest to put in language understood of the multitude.

A well-equipped electrical department is a necessity in every hospital of any size in these days, for electricity is a recognised remedy for many things that afflict the human race. Rheumatism, sciatica, paralysis of various kinds, ailments of nerves, wounds, trench frostbite, and so on, not to mention functional diseases, all gain great benefit from electrical treatment; whilst the electrical department is also, as a rule, responsible for X-ray treatment (as distinguished from radiography, which is the making of shadow pictures by means of X-rays, or screen examinations for the location of foreign bodies or fractures), as well as for treatment with Finzen light and the various other forms of ultra-violet rays now employed in electrical therapeutics.

One electrical room with which I have inti-

mate acquaintance is a picturesque spot. Round its walls are switchboards with complicated, mysterious levers, each with its glowing incandescent electric lamp. In one corner, lying on a luxurious couch, is a soldier, who grasps a thick, highly polished bar of plated metal. Above him stands a nurse waving two metal wands, from which vivid stars of brilliant violet light crackle and spit, their connecting wires (attached to a kind of cage of coiled wire) glowing with the same lambent flickers of violet light. This is the high-frequency 'brush' treatment. In another recess a girl is being treated for functional loss of voice, electrodes being applied to her throat. After much patient work on the part of the Sister in charge, lo! a miracle is worked, and she speaks, at first in a strange, hoarse voice, which, however, improves as the treatment is continued.

Next door a small youth perched upon a chair is being treated with X-rays for ringworm. Beyond him are various recesses which can be screened off. In one a soldier sits with each foot immersed in an earthenware footbath filled with warm water, through which passes an electric current which will restore circulation to his feet, frostbitten in the sodden trenches. Chilblains, broken and otherwise, benefit greatly by this treatment. In the next recess is another soldier sitting in what might be a stall in a choir, but instead of resting on carved arms his forearms are each immersed in a deep earthenware trough full of the warm electrically charged water.

In the centre of the big, lofty room is a large table, round which sits a party of more soldiers waiting their turn for treatment. They are amusing themselves with card-tricks, and with earnest endeavours at solving Sister's large collection of puzzles of the wire and various other varieties. Some of them are gathered round a big white porcelain bath, in which sits a very small boy who is having an electric bath to cure him of paralysis left by measles. The soldiers are sailing toys on the water for his edification, which, judging by his howls when he is lifted out and wrapped in a warm towel, is great.

At another machine a medical officer is testing muscular reactions in the arm of a soldier which has been shattered with shrapnel. He puts the tiny electrode on the nerve-points, noting the response given to the electric current. One man being tested in this way was seized with a violent fit of coughing whenever a certain nerve-point in his forearm was touched with the electrode—why, neither he nor any one else quite knew.

In a side-room is the lair of the 'slave of the lamp'—that is, the nurse who gives the Finsen light treatment. In this case she is using the more portable form of Finsen lamp, called the Finsen-Reyn. By means of a carbon arc lamp an intense light is produced, which, passed through a water-cooled rock-crystal lens, is focused to a fine ray. Her patient lies on a couch, and she directs this ray on to the patch of lupus on his cheek, using a water-cooled compressor to expel the blood from the part treated. It is a tedious treatment, for only about an inch in diameter can be done at once, and each area takes an hour. Other forms of light are being tried with electrodes made of tungsten or wolframite instead of carbon, which give a light very rich in the ultra-violet rays. Treatment with this new

form of light promises well, and does not take so long as the original Finsen lamp. It is called the Simpson lamp, after its inventor. In this side-room there is also a mercury vapour lamp, a pretty little silver-plated affair of (dare I say it?) Teutonic origin installed before the war. An electric current is passed through a horse-shoe-shaped tube of mercury, and an intense, ghastly violet light results, which is passed through a quartz crystal lens and played upon the patient, who has to be most carefully masked and his eyes covered, for twelve seconds of this light playing on his eyes would destroy the optic nerve, and blind him incurably. The operator wears lead-glass spectacles to safeguard her own sight. This ghastly light (which makes the skin appear greenish-yellow and the lips bluish-purple) is used for various skin diseases, and in some cases of baldness will make the hair grow. In yet another room is radiant heat. You put your rheumatic arm or leg or whole body into a metal cylinder filled with glowing incandescent lamps. It is an efficacious treatment, but makes one feel limp afterwards, a sensation which a little turn with the high-frequency brush does much to counteract.

Such is a brief description of electricity as used in the treatment of disease and injury. Its application requires the greatest care and years of training, for there are dangers that only the skilled operator knows and guards against. Consequently the advertising quacks should be avoided, and only properly trained electrical operators under a qualified medical man who has studied electricity as a specialist should ever be resorted to to administer this sort of treatment, which, when properly and carefully given, is of incalculable value, and has saved many from becoming nervous wrecks or incurable cripples.

A NIGHT ON THE LANG MUIR.

By HENRY HILTON BROWN, F.E.S.

I SUPPOSE that when one in advancing years looks back upon the lengthening strip of life's journey lying behind him, it is natural that his eye should be arrested by any event which stands out clearly in the distance. In the prospect of the desert a rock becomes a precipice, and a little hill assumes the proportions of a mountain. This must be my excuse, if excuse is needed, for seeing interest in what may seem to another a very slight episode. There are few men who have not had in their youth a similar adventure, and my tale will revive many fading memories.

At the Academy which I attended in the early 'seventies there was a great zeal for natural science. It will readily be surmised

that natural science was not one of the subjects taught in school; had it been so, there might have been diligence, but there would have been no zeal. The enthusiasm was due to the efforts of a master who had been able to infuse into our sluggish natures some portion of his own earnestness. Most of the older boys were affected by it. No doubt the phase through which they passed was beneficial, although it was transient. It reminded one of the profuse blossom which appears upon a young apple-tree, and which passes away, leaving one small apple set. Of many boys who then devoted much time to the study of nature, hardly one retained his enthusiasm beyond his schooldays.

Three boys—whom I shall call Tom, Dick, and

Harry—and myself took up the study of butterflies and moths. Tom was the moving spirit, and it was he who suggested our enterprise—namely, that we should try ‘sugar’ in a plantation on the edge of the Lang Muir. It is unnecessary to bore the reader with technical details, seeing that the episode which I am going to describe had but little connection with entomology. For our purpose, it is sufficient to explain that ‘sugaring’ is the attracting of moths at night by means of a sweet liquid painted upon the trunks of trees.

The Lang Muir is a tableland well known under another name to mariners who sail the Moray Firth. The summit lies about seven miles from the coast, and maintains an altitude of from eight hundred to a thousand feet. It is a rough tract, extending four miles by three, and is for the greater part covered with long and tough heather, broken by peat-mosses, quaking bogs, and march ditches full of water. It is a desolate spot by day, and by night is one to be avoided.

The northern slope, leading from the lowland to this tableland, is not so inhospitable. The industry of generations of crofters, if it has not made the land blossom as the rose, has carried cultivation of a kind to the very edge of the heather. Holding their crofts at a nominal rent (often a shilling an acre), father and son, mother and daughter, have toiled early and late, year in, year out, to produce this result. Few of those who have made political capital out of the struggles of Scottish crofters have any real idea of the strife which they wage with the soil and the elements. Endless work and constant pinching earn the income of a labourer. Sometimes even that narrow income is not attained. On these very crofts at the Lang Muir the harvest is often in October; and if snow falls heavily during that month the reaping may be postponed till Christmas, when the grain will barely serve for bedding cattle.

Yet they might have found compensations for their lot had toil and anxiety left them the capacity of perceiving them. The view from the hill is of great beauty, hardly surpassed in Scotland. The eye surveys a wide extent of low ground, from the bracken-clad valleys at the foot of the ridge, over farms and villages, fields and woods, to the blue Firth. From such a height the sea shows a high horizon. Part of the arc is sharply defined against the sky where the North Sea opens out, and part is lined by purple or gray peaks where the hills of Ross and Sutherland rise in successive ranges, the home of red-deer. If I could transfer to this page a clear picture of that prospect, many a kindly Scot toiling in the plains of Manitoba, roasting in the Deccan, or wandering over the South African veldt would be refreshed as if his heated forehead had been fanned by a fresh breeze from the beloved but far-distant home-

land. But few of the crofters, while they are in the homeland, think much about the view. On this same ridge, farther west, there is a farmhouse so set that it commands an outlook which men might come from London to see. In the north and west walls which face this lovely scene *there is not a single window*. The only apertures of that sort are in the other walls, and look forth upon the yard, with all its untidiness and filth. I doubt, therefore, whether many crofters consider that their lot is alleviated by being cast amidst delightful scenery.

Upon the hillside, partly for shelter and partly to utilise poor soil, strips of fir-trees have been sandwiched between little fields of oats, bear, and rough grass. Across the grass parks, red with ‘sourrocks,’ but fragrant with a close growth of white clover, numbers of small butterflies flit on sunny days—rusty browns, pale blues, or bright coppers. It was one of these strips, adjoining such a grass field on one side and the heather on the other, which was the proposed scene of our saccharine experiment. It was called Muirend Belt, and the farm of Muirend, tenanted by Harry’s father, was to be our base of operations.

We decided to make the experiment on a Friday, so as to take advantage of the Saturday holiday. Perhaps we were ill-advised in neglecting the old superstition as to works undertaken on a Friday; but if we were, the *dies nefastus* had its revenge.

An unfortunate hitch occurred at the outset. We had hoped to set off at four o’clock, but fate ruled otherwise. Tom was a bit of a humorist, and had devised an ingenious method of ringing the bell, while sitting at his desk, by a long string attached to the bell-rope. Between three and four the senior Latin class was translating Horace. Dick was in deep water, and was floundering sadly under repeated interjections from the master: ‘*Perge, Ricarde; perge quam celerrime.*’ Tom came to his relief, and created a diversion by causing the bell to give three solemn tolls. The master hurriedly made for the door, hoping to catch the delinquent in the act, and Dick meanwhile hastily coached his lines. But Tom, like many another inventor, was proud of his invention, and wished to show its capacities by ringing the bell while the master was actually looking at it. He made the attempt, was detected, and sentenced to an imposition of a hundred lines of Virgil. We united our forces to help him; but our best industry did not enable us to start until nearly five o’clock. This loss of almost an hour was the initial cause of all our future trouble. Our programme was a simple one: first, to ascend the Lang Muir and paint the trees; then to descend to Muirend for tea; and, lastly, after eleven o’clock, to reascend and collect our spoils. The postponing of this programme by an hour had serious consequences.

Muirend lay at the foot of the hill, and was a

farm of fair size for that district. The tenant, as I have said, was Harry's father. As boys, we knew little of him, except that he was a man with a loud voice and a hard hand, who disapproved of our climbing upon the stacks, and emphatically discouraged our attempts (usually futile) to ride on the backs of the sheep. A dozen years later I knew him better. He was a shrewd, keen man, a good farmer, plain and blunt in his manner, and employing a style of speech racy of the soil. A crop of stories grew up around him, of which one may be recorded here. The digression may be pardoned on the same ground as the misfortune of the foster-mother of Midshipman Easy—namely, that 'it is a little one.'

The laird, with whom he was a favourite, built a nice dwelling-house on the farm, of which 'Muirend' was very proud. He was a most hospitable man, and frequently invited friends to stay with him. On one occasion he had invited a cousin, and, as usual, proceeded to show him the house. Opening the door of a well-furnished bedroom, he said, 'This is faur my gran' freens 'll sleep.' After the cousin had sufficiently admired the elegance of the room, he opened the door of a more modest apartment, remarking bluntly, 'This is faur ye're to sleep.' He thus neatly indicated to his friend the exact position which he occupied in his regard.

Our ascent to the Lang Muir must have created a record. Discarding the ordinary 'peat-road,' we ran a straight course for Muirend Belt, crossing fields and fences, scrambling over dry-stone dikes without any regard for displaced copestones, tearing through fir-plantations, and forcing a path through close masses of furze or whin. Family parties of rabbits bolted at our approach, racing for their burrows, and affording a pleasurable excitement to Jock the farm-dog, who accompanied us. If Jock had been in charge of the sheep he would have ignored the rabbits; but being at present off duty, he felt at liberty *desipere in loco*. When we had surmounted the slope and entered upon the moorland, we came upon a heap of boulders among the heather. These were stones which had been removed from the neighbouring field when it was being brought under cultivation; but, after the manner of boys, we pretended that they marked the last resting-place of a northern rover, and called the heap 'Sweyno's Cairn.' We were to become better acquainted with it before the night was out.

Painting our sweet mixture upon the trunks of firs did not occupy us long, and we sped downhill to tea at the farm. I have already spoken of the hospitality of 'Muirend,' and he maintained his character on this occasion. To describe the meal would demand the pen of him who recorded the *Noctes Ambrosianæ*. It would have served as a light refection between dinner and supper in the Blue Parlour or at Buchanan

Lodge, but anywhere else it would have been regarded as provision for a whole day.

The unfortunate delay in starting caused us to be nearly three-quarters of an hour late in visiting our 'sugar.' We took with us a bull's-eye lantern, chip-boxes, and a butterfly-net. This last article was not intended for the pursuit of specimens on the wing. The need for a net arises from the circumstance that many of the moths which visit 'sugar' become inebriated, and when the light is turned upon them fall down into the long grass, where it is hard to find them in the dark. The net is placed beneath the 'sugar' before the light is shown, and when the moths fall they drop into captivity. It took us some time to go round the trees, and by the time we had reached the last another day had fairly begun.

It was Tom who filled up the cup of our misfortunes. No sooner had we finished our round than, partly elated by a rare specimen which had fallen to his share, and partly to relieve his pent-up energy, he snatched off Dick's cap and darted away with it over the moor. Of course, we all followed, and for about five minutes there was a running up and down, here and there, the cap being thrown from one to another, until Harry, who was the last holder, tripped over a stone and fell headlong among the heather, with Dick close behind him.

Then happened that which made the night memorable to us, and might even have made it fatal. After we had laughed sufficiently at Tom's predicament, and Dick had retrieved his cap, we looked round, and discovered that while we had been 'playing the fool,' as the Latin master would have said, a dense white easterly 'haar' had crept over the ridge of the Lang Muir and imprisoned us within walls of ice-cold cotton-wool. We could not see twenty feet around us.

At first there did not seem to be any cause for alarm. We knew that it was not safe to be in a fog on the Lang Muir at the dead of night, but we had no doubt we could get out of it with ease. We could not be more than a few hundred yards from the descending slope of the hill, and once we entered on that descent we should be all right. We have good authority for the statement that 'a haggis can charge down a hill.' The only question that caused difficulty was the direction in which the descent lay. We had lost all idea of our position in the course of our chase. If we struck out in the proper line, we should reach the edge in a few minutes; but if we took any other line, we should be involved in the pathless moor. Even if we were lucky enough to pass safely through the moor—three or four miles—and reach the other side, we should be in a series of densely wooded and steep slopes, interrupted by precipitous ravines, in which we were quite likely to break a limb, if not our necks.

But could we hope to cross the moor in darkness and mist? The heather was broken up with quaking bogs and 'mosses' large enough and deep enough to swallow the whole of us and leave no sign. These places are dangerous even in daylight. I was told by a shepherd on one occasion that he had been on the Knock o' Braemoray looking for strayed sheep. He was familiar with the hill, although it did not form part of his own grazings. He was coming down through long heather, and was getting tired of wading over it with high steps. He welcomed the appearance of a patch of green at the foot of a rock. Without thinking what he was doing he jumped off the rock, and in a moment was bogged up to the waist. As no help was near, it was lucky for him that he got a grip of the rock and so pulled himself out, as otherwise he would probably have been engulfed in the horrible pit. We had all heard similar tales, and had no wish to put ourselves in the way of such gruesome adventures.

Two courses were open to us. We might remain where we were until the mist lifted, or we might start off in the hope that our luck would lead us to a wire fence or a burn, either of which would have served as a guide. The first was the safer; but the 'haar' was horribly cold, and we had no overcoats, so that if we stood still we ran a fair chance of being chilled to death. As for the other course, there were then no fences on the moor; and the few streams which drained it to the north ran down ravines so steep and difficult that even if we had been lucky enough to reach them we could not have risked the descent.

We must do something, however, and that quickly. Our first plan was to walk in a straight line for three hundred paces. If our line was right, we were sure that by that time we should reach the edge of the slope. If we had not done so after the number of steps arranged, we should know that we had taken a wrong line. We would then turn right-about and walk straight back to the stone over which Harry fell, and thence proceed on a new line.

But after we had counted three hundred and fifty paces, we were still plunging through heather, and clearly off our line. We wheeled about and marched right back. We counted three hundred and fifty, four hundred, four hundred and fifty paces, but saw no stone. The lantern showed nothing but heather on all sides. It is easy to see what we had done. To walk three hundred yards through mist in a perfectly direct line is a difficult feat. We had failed to perform it, and therefore we had lost our direction. Suddenly Harry, who carried the lantern, gave a yell. We closed up beside him, and gazed upon a surface of black water, extending beyond the rays of the lantern to an unknown distance. The mist had drawn closer, and was falling in a small, chilly rain, and

we had not the most remote idea where we were.

At this instant a piercing scream rang over the moor. It filled us with fear, for we did not know what creature had emitted it, or, indeed, whether it might not have proceeded from Something too horrible to mention. We had never heard such a sound before. It was like the shriek of a sea-bird, but no sea-bird would be on the Lang Muir after midnight. And yet, if we had had our wits about us, the cry might have given us the clue we wanted. I have now no doubt that it was the less familiar call-note of the tawny owl. We had often heard the well-known hoot of the owl, and, of course, knew that this was quite different. But when two owls are hunting, especially in the early morning, they use a peculiar call, apparently for signalling purposes, of a quality similar to that which gave us such a fright. No doubt the owl was in the Muirend Belt, and if we had followed the sound we should have been led clear of the moor.

But we did not know this, and instead of moving toward the point whence the shriek came, we were struck with panic and inclined to bolt in the opposite direction. Happily, we resisted this impulse, which would have led to our separation, and probably would have ended in one of us coming to grief.

Tom, who was the original cause of our trouble—first, by delaying our start, and thus keeping us on the hill until the mist came up; and, secondly, by leading the foolish dash into the moor—now devised a plan for our escape. He had in his pocket part of a ball of twine which he had used in constructing the unlucky bell-ringing apparatus. He carefully tied one end of the ball to a bunch of heather. Gradually we grasped his idea. It was simply the old device of the worsted clue, so familiar in nursery tales, only in place of its running in front of us, we had to walk out with it. We could not now mistake our return journey.

At the first attempt we reached the extreme length of the string, about four hundred yards, without any incident except the alarm we caused to an old cock-grouse comfortably asleep among the long heather. He shot off with excited splutterings and a noise which in these modern days we should describe as like that of an aeroplane. We retreated along the string to the edge of the black pool to endeavour by another cast to regain our bearings.

A second essay was more unfortunate. We had not gone twenty paces when the light in our lantern went out. We had not intended the light to last longer than the period of our inspection of the tree-trunks, and the oil was now exhausted. The failure of the lantern was a serious matter, both because the want of light hampered our movements, and also because it increased the 'eeriness' of our situation. No one can realise the comfort of a light unless he

has experienced the deprivation of it under such circumstances as we were then enduring. The cheery beam sustained our sinking courage, and when its friendly glow ceased we felt that our last hope was gone. This feeling was intensified in a few minutes, when Harry, who was still leading, plunged up to the knees in water. We were evidently far astray, and we hastily beat a retreat to our starting-point.

There is a saying that there is luck in odd numbers, and our third attempt vindicated popular wisdom. We ploughed our way through deep heather almost to the end of our tether, and then found ourselves stumbling over a mass of boulders. By feeling the size and shape of some of the principal blocks we satisfied ourselves that this was the heap which we had named 'Sweyno's Cairn,' and we were thankful that we had taken sufficient notice of it to enable us to recognise it in the dark and to use it as a landmark. The cairn, in fact, saved the situation, because it was now apparent that the length of our string would not have permitted us to reach the edge of the hill, and we might have trudged on the whole night seeking in vain for a way of escape. Having reached the cairn, our danger was at an end. There was no difficulty in finding the descent, although there might still be much trouble in tracing the road to the farm.

But we were to sustain another fright, and, as an imaginary danger is often more alarming than a real one, I am not sure that this was not the worst scare we got. While we were discussing the best course to follow in our endeavour to attain Muirend, we became aware by the sound of rapid footfalls that some animal was rushing toward us. What could it be? The same idea struck us simultaneously, and was voiced by Dick: 'Is't a wolf?' Now it is easy, sitting at the fireside or reading this narrative in broad daylight, to laugh at the absurdity of this suggestion; but it must be remembered that we were soaking with the fog and the wet heather, chilled to the bone, and a good deal unnerved by our night's adventure. Moreover, we had heard much about the ferocity of wolves in general, and of the Scottish wolves in particular. We knew that it was not so very long since these animals had been hunted in the north of Scotland, and old men told weird tales of stray wolves which yet lurked in the recesses of the Forest of Darnaway, which lay about twelve miles to the west. What were twelve miles to a wolf? It seemed not at all unlikely that one of these Darnaway wolves on the prowl had scented us, and was now about to make his supper off an unfortunate moth-hunter. In those days boys were brought up on a course of Mayne Reid and Fenimore Cooper, and it did not take much to set them thinking about wild beasts. But whether our fancy was excusable or not, it is certain that, in the expressive words of the Patriarch, 'fear came

upon us, and trembling.' Our suspense was not protracted. The footfalls drew nearer and nearer; the body of a large animal loomed dimly through the mist and darkness, and in the next moment flung itself upon Harry. It was Jock!

It appeared that when the mist fell at the farm, which it did about half-an-hour after it had enveloped us, there was great anxiety for our safety. Unluckily, we had not said where we were going to 'sugar' (we did not wish them to know, fearing 'Muirend' might object), and so no one knew where to search for us. The shepherd remembered that Jock had gone with us in the afternoon, and when he explained to the dog that we were to be looked for like lost sheep, the sagacious old fellow, without hesitation, set off for Muirend Belt.

Such is the plain tale of our night on the Lang Muir. It was not a complete night, but I can certify that it was long enough for us. Being in the district last summer, the whole story came vividly back to me, and it seemed to have sufficient interest to justify my writing it down. As I said at the beginning, to some it will seem to be a very slight episode; but to others it will recall incidents of their own youth, and in so doing will restore for an hour memories of the old days and the old vigour. Sometimes an occurrence is more interesting for what it recalls than for what actually happened, and it is a commonplace that we read with deeper feeling the account of some adventure which resembles an experience of our own, than the account of something which is quite outside the bounds of our personal remembrance. The incident was a simple one, not rising beyond the mildest comedy; and yet there was a moment, as we looked on the black water receding into the unknown, and saw the ghostly mist creeping round us, and heard the mysterious Thing crying in the darkness, when it approached perilously near to tragedy.

BON-ACCORD.

GRANITE city of the North,
Gray and cold,
Thine a race of roving folk,
Free and bold,
Following around the world
Each his bent,
Till they meet by happy chance,
Well content.
When at last they bid good-bye,
Loath to part;
None shall suffer loneliness
In his heart.
Vanished forebears gather round,
Unseen near,
Gallant soldier, reverend priest,
Poet-seer.
They who handed on the torch,
Joy afford.
Motto ours for Life or Death—
'Bon-accord.'

Chambers's Journal

SEVENTH SERIES

THE VICEROYALTY OF INDIA.

By W. V. ROBERTS.

LORD CHELMSFORD'S acceptance of the Viceroyalty of India in succession to Lord Hardinge of Penshurst will doubtless confirm the faith of those who believe that, in this particular appointment, there is a preference for peers over forty and under fifty years of age. Lord Chelmsford is forty-eight. Peers who have accepted the office when in the forties certainly make a notable list. They include the Earl of Mayo, the Earl of Lytton, the Earl of Northbrook, the Marquis of Lansdowne, and the Earl of Elgin, who all entered upon the viceroyalty at ages ranging from forty-three to forty-six. But then a strong list might be made out of peers who have become Viceroy of India when between fifty and fifty-five years of age. Here one has to record the names of Lord Lawrence, the Marquis of Ripon, the Earl of Minto, and Lord Hardinge, the Viceroy who has just retired.

What is true is that a peer at fifty-five or more has very little chance of becoming Viceroy. There was an exception in the case of the Marquis of Dufferin, who did not obtain the office till he was fifty-eight; but the marquis was the most distinguished diplomatist of his time, and with the known readiness of such a peer to accept the appointment no Government would hold back. It is recorded, however, that Lord Dufferin complained in a letter to Sir William Gregory that all the people who surrounded him at Calcutta were younger than himself, and that he had no companion or playfellow. Consequently he relinquished the office before the expiration of his term, so that the experiment of nominating to the viceroyalty a man who has passed the age of fifty-five is certainly not encouraging.

Mr Gladstone, during his last premiership, wished to appoint Sir Henry Norman when that eminent soldier and administrator had reached the age of fifty-seven. At that time Mr Gladstone was an octogenarian, and one of his colleagues credited him with the declaration that he thought 'that young fellow Norman to be just the man for the post.' But Sir Henry Norman did not take the office, so that what might have been the experience of so elderly a Viceroy one can only conjecture. By way of contrast it may be worth noting that since the accession of the late Queen Victoria the position of

Prime Minister, which may be deemed to be more important and onerous even than that of Viceroy, has been obtained by only two men before they were fifty—Sir Robert Peel and Lord Rosebery, who each became Premier at forty-six; and that the most usual age at which a man becomes First Minister of the Crown is when he is in his sixth decade.

On the other hand, everybody knows that Lord Curzon, the youngest Viceroy of India appointed since the abolition of the Company, had a very distinguished term. As Mr George Nathaniel Curzon, Under-Secretary of State for Foreign Affairs, he was only thirty-nine when the office was offered to him. But he had as a youth been fired with an ambition to become Viceroy of India. From childhood he must have known that Government House, Calcutta, was a replica of his ancestral home, Kedleston Hall, near Derby, and that fact probably had much to do with shaping his desire. The building of Kedleston Hall was the work of the brothers Adam, who wrought so great an architectural change in the district between the Thames and the Strand in London about a hundred and forty years ago, a circumstance commemorated to this day in the name of one of the streets—Adam Street, Adelphi. Kedleston Hall became, indeed, rather a show-place, and among those who admired it was Lord Wellesley. Now Lord Wellesley, as everybody knows, was one of the great rulers of India under the old régime, and it was he who, when Government House, Calcutta, was to be erected, decided that in style it should be an exact copy of the Hall at Kedleston.

There is another point of interest. When Wellesley was Viceroy he urgently desired advancement in the peerage, and Lord Rosebery, in his *Life of Pitt*, tells us how incensed he was because that statesman offered him only an Irish marquissate. Wellesley, he says, declared that the impression produced in India would be fatally detrimental to his Government, and that the slur inflicted by this 'Irish,' 'pinchbeck' reward affected both his health and his spirits. Well, the curious sequel is that on his appointment as Viceroy Lord Curzon was a commoner. But, as eldest son, he was the heir of Lord Scarsdale, a peer of the United Kingdom, and in view of

that fact the title was conferred upon him of Lord Curzon of Kedleston in the peerage of Ireland, and he thus went to India holding only the Irish title which Lord Wellesley had about a century before so much contemned. Was there any 'slur' in that, as Lord Wellesley probably would have maintained? On the contrary, at an Eton send-off dinner to Lord Curzon the Earl of Rosebery humorously spoke of the young Viceroy as 'reviving the dormant glory of the Irish peerage.' Doubtless Lord Rosebery then had the Wellesley incident in mind; but in the humour there was truth, for Lord Curzon showed in India that there was nothing 'detrimental' in an Irish peerage. As an Irish representative peer he afterwards sat in the House of Lords. Then an earldom of the United Kingdom was conferred upon him; he entered the Cabinet as Lord Privy Seal; and, on the death of his father, the Barony of Scarsdale was merged in his earldom.

Lord Palmerston, it may also be recalled, was an Irish peer, and he it was who, while Prime Minister, conceived and carried through the Act, in 1858, by which the old East India Company was abolished, the present system of government under the crown created, and the line of Viceroys spoken of in this article established. Under that system the Viceroy has usually been a titled personage, and that was why, to provide a title for him while heir to a British peerage, an Irish peerage was conferred on Mr Curzon. It is true that in the case of Sir John Lawrence the peerage was not conferred till the close of the viceroyalty; but the rule that a Viceroy should have a title in the peerage has held good since. Similarly, it may be noted, the Governors-General of the Dominions are peers, though the Governors of separate states may be commoners. Thus, when the Union of South Africa was formed after the war, Mr Herbert Gladstone, on becoming its first Governor-General, was made a peer, and Mr Sidney Buxton, who succeeded him, was made a peer as Lord Buxton.

The office of Viceroy or Governor-General of India is now unique in the British Empire, and indeed in the world. It is true that there are Governors-General of the Dominion of Canada, the Commonwealth of Australia, and the Union of South Africa; but in Canada, Australia, and South Africa there are elected Parliaments, with Upper and Lower Chambers, and Executive Governments for the administration of affairs. In India the system of government is far removed from that. When the supremacy of the Presidency of Bengal was established in 1783, the phrase 'the Governor-General in Council' was authorised, and the term still applies in the government of India. The Viceroy as Governor-General rules through a council of official and non-official members, a small mixed body of British and Indian notables, subject only to the Secretary of State for India.

The responsibility for decisions thus taken is often great. As an illustration one may recall that in 1874, when the late Lord Salisbury became Secretary of State for India for the second time in his career, a great Indian famine was known to be impending. To meet it, Sir George Campbell, the Lieutenant-Governor of Bengal, urged that so long as the scarcity in Bengal lasted the exportation of grain from India should be absolutely prohibited, and that rice, instead of being exported to Europe, should be sent to the famine-stricken districts. The Viceroy, however, then Lord Northbrook, took a different view. He regarded Sir George Campbell's plan as a dangerous interference with trade, likely permanently to cripple the grain trade of India. He therefore recommended that the export trade should continue as before, and that the Government should import rice into Bengal. Between these conflicting opinions the Secretary of State for India had to decide, and Lord Salisbury, although the other view was for the moment more popular, resolved to support the recommendation of Lord Northbrook; and the result, we are told by Mr H. D. Traill, in narrating the incident, 'was crowned with complete success. The dreaded visitation passed off without even so much as causing any increase in the death-rate of Bengal.'

When Lord Chelmsford, who has now undertaken the Viceroyalty of India, relinquished the Governorship of New South Wales in 1913, it was said of him by an Australian critic that he possessed two great qualifications—first, ready understanding and sympathy; secondly, capacity and judgment. These were among the qualities that carried Lord Northbrook through the famine period, and they will be invaluable to Lord Chelmsford in whatever crises he may have to face.

Fortunately the services of Viceroys when their periods of office have expired are seldom lost to the State. Lord Dufferin, after being Viceroy of India, returned to diplomacy, and served as ambassador, first at Rome, and then at Paris. Other ex-Viceroys have, on returning home, served in various Cabinets. Thus, Lord Northbrook, after being Viceroy from 1872 to 1876, was First Lord of the Admiralty from 1880 to 1885; Lord Ripon was successively First Lord of the Admiralty and Secretary of State for the Colonies; Lord Elgin also has been Secretary of State for the Colonies; Lord Lansdowne has been Secretary for War and for Foreign Affairs, and is now in the Cabinet without portfolio; and Lord Curzon is in the Cabinet as Lord Privy Seal.

At least one Viceroy has given his life in the service of India. That was Lord Mayo, who, during a visit in 1872 to the convict settlement at Port Blair, in the Andamans, was assassinated. More recently, while Lord Hardinge was making a state entry into Delhi in December 1912, a

bomb was thrown, and he was severely wounded. For a time he suffered greatly; but, happily, he recovered, and in gratitude for his recovery Lady Hardinge established a Children's Day in India.

But mention of the incident reminds one of the great change inaugurated during Lord Hardinge's viceroyalty—the removal of the seat of Government from Calcutta to Delhi, an ancient capital city. The announcement of the removal was one of the surprises of the Durbar, at which the accession of the present King-Emperor was pro-

claimed. It was almost universally welcomed. And there can be no finer testimony to the wise and beneficent rule which has been maintained by Viceroy after Viceroy than the fact that, while the appointment of the first Viceroy in the present line marked the close of the great Mutiny, to-day, in the hour of trial, no part of the Empire has shown a greater loyalty to the crown, or proved that loyalty by more splendid and heroic efforts to maintain unimpaired the good of the commonweal.

PINCHER MARTIN, O.D.

CHAPTER V.—THE OFFICERS.

I.

THE *Belligerent's* captain, John Horatio Spencer, D.S.O., was a fine type of the modern British naval officer, and a thorough seaman, who had risen in his profession through sheer merit and force of character. He had been lucky, it is true, for as a young lieutenant he had seen much active service in West Africa, had been severely wounded, was mentioned in despatches for 'great gallantry and resource,' and had received the Distinguished Service Order. In 1900, again, as the senior lieutenant of a second-class cruiser on the Cape of Good Hope station, he was landed with the naval guns for the relief of Ladysmith. He again did excellent service, was promoted to commander in 1901, to captain seven years later, and 1914 found him commanding a first-class battleship at the comparatively early age of forty-three.

In appearance he was a big, thick-set man, nearly six feet tall, and broad in proportion. He had a red, clean-shaven face, a pair of penetrating blue eyes which seemed to read one's innermost thoughts, and dark hair slightly shot with gray over the temples.

Every ship he had ever commanded, from a destroyer upwards, had been a happy one. His officers loved him as a friend and admired him as a superior, and 'Our John,' as they affectionately called him, spent far more time in their company than he did in the fastnesses of his own cabin. He hated the solitude of life in his own apartments in the after-end of the ship, and, when he had no guests of his own, frequently had meals in the wardroom as an honorary member, and played bridge and spun yarns in the smoking-room. He had the happy knack of being friendly with every one with whom he came in contact, and invariably treated his officers as equals when he was off duty.

On deck, of course, it was a different matter, for there he was very much their commanding officer, and they his subordinates; and, as Tickle, the junior watch-keeper, once put it, 'the owner *

was the whitest and the straightest man on God's earth; but Heaven help you if you make a fool of yourself on deck!'

Captain Spencer did bite sometimes, and bite hard; but the culprit generally deserved all he got, and bore no grudge whatsoever. More often than not he would be discovered the same evening in the smoking-room having a sherry-and-bitters with 'the old man,' just to show there was no ill-feeling on either side.

On the mess-deck the captain was revered in rather a different way, for the men, while admiring him, regarded him with a certain amount of awe. Some of the younger and more timid ordinary seamen and boys, indeed, looked upon him as a sort of awful deity, an ogre almost, who sat in his cabin all day long inventing new schemes for their eternal damnation. They were frightened of him, and, on the rare occasions when they did catch sight of his four gold stripes on deck, felt rather inclined to run away and hide their faces. It was foolish of them, for a kinder-hearted man than the skipper it would be impossible to imagine.

But the men saw comparatively little of him, and had few opportunities of discovering his true character. He appeared on deck for 'divisions' every morning; walked round on Sundays criticising their clothes, the length of their hair, and the cleanliness of the ship; was always on the bridge at sea; and punished them when they misbehaved themselves. They realised he was just, and justice is what the bluejacket most admires; but they were not aware that he took a deep interest in them and their affairs, and that he knew everything that went on on board. Neither did they perceive that he frequently went to a great deal of trouble to stretch points in their favour in the way of leave and other privileges.

'Our John' hated advertisement in any form; and this, perhaps, was why the men never really understood his true kindness of heart. For instance, when he subscribed five pounds towards a fund for the benefit of the widow of one of

* The commanding officer of a man-of-war is frequently referred to as 'the owner,' or 'the old man.'

his men who had died, or two pounds towards the ship's concert party, he gave the money anonymously. When he granted the men an extra forty-eight hours' leave on his own responsibility, and because he considered they had earned it by their good behaviour, he never told them so.

So, from the lower-deck point of view, Captain Spencer was justly admired and greatly feared; but there was not a man on board who had not the fullest confidence in him and his judgment, or who would not cheerfully have followed him to the very gates of hell if he had asked them to. Neither was there a more efficient or a happier ship than the *Belligerent*. Her officers and men knew it, and gloried in the fact.

But no small credit for this excellent state of affairs was due to the commander and other officers. The former, the Honourable Algernon D'Arcy Travers, was the direct antithesis of the captain in appearance. He was tall and very thin, but was a pleasant messmate with a very pronounced sense of humour, and on occasions behaved with all the boisterous bonhomie of a junior sub-lieutenant. His excessive leanness did not worry him in the least, though he did once say that he wished his 'hinge' were a little better padded and the wardroom chairs rather softer. It was a matter of some import to his wife, though, for that lady sent him bottles of malt extract to thicken the flesh on his bones. This nutritive compound, however, was generally handed over to his bluejacket messenger, who liked the sweet taste of it; and that youth, already chubby and well-favoured, was gradually assuming the proportions of a young elephant. The commander found that being thin was an advantage in some ways; and on riotous guest nights, when he made as much noise as anybody present, it certainly permitted him to scramble through the square opening in the back of one of the wardroom chairs without much difficulty.

It was a feat few of his messmates could perform. The engineer-commander, George Piston, a well-covered officer, had tried it on one occasion, and had stuck half-way through. His messmates, headed by the commander himself, cheered him on with howls of merriment; but the victim himself was laughing so much that he seemed to have swelled. He could not budge one way or the other, and there was every prospect of his having to go through life with a chair securely fastened round his portly middle. They took off his garments one by one; but it was no use. They used vaseline and oil as lubricants, and endeavoured to tuck the folds of flesh through the narrow opening, but without avail.

'For heaven's sake send for a saw!' spluttered the gasping officer, relapsing uncomfortably on the sofa and beginning to feel rather alarmed. 'I

can hardly breathe. Give me a whisky-and-soda, some one, or I shall burst!'

The saw arrived in due course, and the chair was removed with some damage to itself. The gallant officer never attempted the feat again.

The commander, an ex-torpedo specialist, was a good officer at his work, and the *Belligerent* always looked as clean and as smart as a new pin. Her organisation, too, was as perfect as it could be. The ship's company were very fond of 'the Bloke,' as they called him; and when men did misbehave themselves he generally made the punishment fit the crime. When two ordinary seamen, Barter and Hitchcock, began to give trouble, for instance, he hit upon rather an original method of dealing with them. He provided them each with an ordinary singlestick and a face-mask, but no body-pads, and then promised them one penny each for each visible wale inflicted on the anatomy of the other. The instigator imagined that he would have to shell out a shilling at the most; but after a bout lasting for a fierce fifteen minutes, examination in the bathroom at the hands of a ship's corporal showed that Barter had earned one shilling and eightpence, and Hitchcock two and a penny. They were never obstreperous again, and the ship's company, instead of offering them sympathy, laughed immoderately.

The commander, like other naval officers, had his bad moments, and sometimes the watch-keepers found it advisable to steer clear of him before breakfast. But even if an explosion did occur no bones were ever broken, for they all knew he said a great deal more than he meant. After breakfast and a pipe he was amiability itself, provided nothing went wrong.

Chase, the senior lieutenant-commander and gunnery officer, has already been described; and the next in seniority was Vernon Hatherley, the lieutenant-commander (T.). He was something of an exquisite. He took a great pride in his personal appearance, was reported to wear silk slumber-wear, and kept a store of cosmetics and unguents in his cabin for the anointing of his face and hair. His messmates knew this, and, headed by No. 1, sometimes shampooed him with whisky-and-soda after dinner. But Torps, as they called him, was an excellent fellow, and took the ragging all in good part. Moreover, he generally succeeded in getting his own back by discovering something wrong with the electric lights in his tormentors' cabins at times when they most wanted to use them. He was an x-chaser, in that he had done remarkably well in all his different examinations; but besides being an expert theorist, he was an officer who knew the practical side of his business from A to Z.

The navigator, Christopher Colomb, had just married a young and pretty wife, and did not spend more time on board than he could possibly help. As a consequence, his messmates saw com-

paratively little of him, unless the *Belligerent* was cruising, and Mrs Colomb could not follow her husband. The captain occasionally succeeded in getting him to play golf in the afternoons; but Colomb preferred his wife's society to that of any one else. When he was on board in the evenings he shut himself in his cabin, and spent the time writing a learned treatise on *Magnetic Influences at Sea*. The book is still being written.

Peter Wooten, the next senior non-specialist officer of the military branch, was doing a two-year spell in a battleship, after having been in command of destroyers and gunboats for the past six years. He hated the drudgery of big-ship life, where he acted as the commander's understudy on the upper deck, had charge of the midshipmen and their instruction, arranged the ordinary seamen's training classes, worked the derrick for hoisting in and out boats, and generally acted as a sort of 'odd job' man. The life was fairly comfortable, it is true; but he much preferred the joys of commanding his own small ship to being a comparative nobody in a vessel the size of the *Belligerent*. He was a burly, deep-chested man, with fair, curly hair, tanned face, and a pair of clear, humorous blue eyes. He was fresh from China, where he had commanded a tiny river gunboat up the Yang-tse-kiang; and there, miles up the great river, far away from any admiral, and completely 'on his own,' he had made history in a small way. He was a great character, and his stories of the Chinese revolution, when he could be induced to tell them, were sometimes amusing and always interesting. (He was the commanding officer of Martin's destroyer when that ordinary seaman joined the 'black navy' soon after the outbreak of the present war, so perhaps we may be pardoned for allowing him to spin one of his yarns. It has the advantage of being true.)

'It was quite a pretty little show,' he said one evening in the smoking-room after dinner, when somebody had egged him on to talk after a second glass of port. 'Have any of you fellows ever heard of a place called Kiang-fu, up the Yang-tse? You might know it, No. 1; you're an old China bird.'

Chase shook his head. 'Sorry I don't, Peter. But let's have the yarn, all the same.'

Wooten lit his pipe. 'Kiang-fu,' he started, 'is one of their walled towns on the banks of the river. It's a beastly place, full of stinks and bugs and abominations generally; and the only white people there are the consul and his wife, a couple of missionaries, and two merchants. Well, one morning my old *Kingfisher* was lying about twenty miles downstream, and a Chinaman from the consulate at Kiang-fu arrived in a sampan with a note from the consul to say that five thousand rebels had arrived before the place, and that there was going to be some scrapping.

There were about a thousand Imperial troops inside the town, Johnson the consul said, and he was in a bit of a funk as to what would happen when the rebels took the place. They'd have butchered every one, of course, Europeans included. My orders were to protect British interests, but not to fight, so I upped killick* and steamed for Kiang-fu for all I was worth. We got about six and an onion† out of the old bus, I remember, and got there about noon.' He paused and sucked thoughtfully at his pipe.

'And what happened then?' queried some one.

'I found the bally battle in full swing,' Wooten went on. 'Guy Fawkes Day wasn't in it, and both sides were blazing away for all they were worth, and making a hell of a row. However, they weren't doing much damage to each other. I anchored my hooker about a couple of hundred yards from the shore, where we could get a decent view of what went on, manned my two six-pounders and the Maxim, and hoisted an ensign and a large white flag—wardroom tablecloth it was—in a boat, and then went ashore to see Johnson. Things were pretty lively, and shells were bursting and bullets were whistling all over the place. The rebel attack was to come off that night, and as there could be only one end to it, I took Johnson and his missus, the two missionaries, the two shopkeepers, and Heaven alone knows how many Christian Chinese off to my ship. The upper deck was fairly packed with 'em. Then we sat down to watch the sport. One of the shopkeepers, I may say, was a Scotsman, and the other a Yank, and they wanted me to order the rebs. to shove off out of it and leave Kiang-fu alone. They had a lot of valuable stuff in their godowns‡ waiting to be shipped down the river, and said the whole lot of it 'u'd be looted if the city fell.

'I cursed them for a couple of tizzy-snatchers,' he resumed, grinning at the recollection; 'told 'em they ought to be jolly thankful to have got off with their lives; and asked 'em how the dooce I could dictate to five thousand ruddy cut-throats with Mauser rifles and Lord knows how many field guns—decent guns, too; none of your clap-trap rubbish. I had exactly thirty men all told, a broken-winded eighty-ton gunboat, two six-pounders, and one Maxim. Pretty tall order, wasn't it? However, I was still yapping to 'em on deck when I heard a sort of *phut*, and a bally bullet buried itself in the deck about a foot off my leg. It came from the direction of the rebel trenches, about five hundred yards off, and some silly blighter had evidently eased off a rifle at us for the fun of the thing. I heard one or two more bullets come whistling overhead—damned bad shooting they made—so sent all the refugees

* Weighed anchor.

† A fraction of a knot.

‡ A 'godown' is a warehouse.

over the lee side of the deck out of harm's way. Then I trained my guns on the rebels, and hoisted all the ensigns I had. They knocked off firing then, so I got into the boat with the consul, the wardrobe tablecloth, and the largest ensign I could find, and pulled ashore.' He paused.

'Had you any weapons with you?' somebody asked.

'Lord, no!' said Wooten. 'Doesn't do to let a Chinaman see you're frightened of him. I took a walking-stick, and Johnson had a white umbrella. I was in a dooce of a funk, though, and when we landed we found a whole bally company of soldiers waiting to receive us.'

'What! a guard of honour?' asked Chase.

'Don't you believe it. They had fixed bayonets and loaded rifles, and I felt rather nervous as to what was going to happen. You see, there wasn't another British ship within a hundred miles of us. However, I landed with the consul, and a Chinese officer with a drawn sword came forward to receive us. He wasn't a bad fellow, and talked quite decent English, with an American accent. I asked him what the dooce they meant by having the troops there as if they wanted to scupper us, and told him who the consul was, and that I was the C.O. of the man-of-war, and that, on behalf of his Britannic Majesty, we wished to see his General. He said the old bloke was having his afternoon caulk, and that they daren't wake him. I said he'd better roust the old josser out, and be damned smart about it. He hummed and hawed a bit over that, and then said that if we'd come along with him he'd take us to the headquarters, and see if we could have an interview. I wasn't going to kow-tow to any bally Chinaman, though, so I told him that if he didn't take steps to have the General brought to us in less than half-an-hour I'd raise hell's delight. It's no use being anything but dictatorial with Chinamen,' he went on to explain; 'and if you can bluff 'em into believing that you've got the whip-hand they generally knuckle under. We had some more talkee-talkie, and then he did go off with his men, and jolly glad I was to see the last of 'em. Twenty minutes later the General arrived. He was rather a fine-looking old boy, with no pigtail, and was dressed up in khaki and a sword. He had a couple of A.D.C.'s with him. He couldn't talk English, so I asked him through the consul what he meant by allowing his troops to fire on my ship, and said that I should have to report it, and so on. He said they hadn't done it. I said they had, and that if he came on board I'd jolly soon prove it. Well, after a lot of jawbation we got him into the boat, with the A.D.C.'s, took him off to the ship, and showed him the bullet-mark in the deck. He got in a bit of a funk then, so Johnson and I drew up a document in Chinese and English, in which he said he was sorry for what had occurred,

and so on. It went on to say that he agreed to abandon the siege of Kiang-fu, as British interests were at stake, so we'd more or less cornered him. He signed like a lamb, wily old devil; but then we remembered that no document is valid in China unless it's stamped with the official seal of the man who signed it. We asked him where the seal was, but he hadn't got it on him. Johnson asked him where it was, and he said he'd got it in his old headquarters, about ten miles downstream. He volunteered to go and fetch it, but we weren't having any. The upshot of the whole affair was that we sent one of the A.D.C.'s ashore to order the siege to be stopped, and the rebels to retire, and took the General and the other A.D.C. down the river. Then we sent the A.D.C. ashore to get the seal, and had the document properly stamped. That's all, I think.'

'But did the rebels retire?' asked the commander.

Wooten nodded. 'Yes,' he said. 'They left the place like lambs, and the Imperialist colonel inside nearly fell on my neck and wept. The two shopkeepers gave me a box of a hundred cigars between them! Damned nasty cigars, too!'

His listeners laughed.

'And what happened to you?' asked Chase.

'Oh,' smiled Wooten, 'I sent the document to the admiral, with a covering letter, and jolly nearly got badly scrubbed for exceeding my duty and abducting the General. However, it was all right in the end, and I believe the old man was secretly rather pleased with what I'd done.'

'So he jolly well ought to have been,' remarked one of the watch-keepers.

'Myes, but he was a man who didn't say much. However, a month later a British colonel and a couple of other officers came down from Peking to confer with me about putting Kiang-fu in a state of defence in case the rebels came again, for by that time the powers that be had come to the conclusion that if they did capture it, it wouldn't do us any good. The colonel and I went ashore together, he with his two officers, and I with a sheet of paper and a pencil.

"'You'd better loophole that wall," he started off, pointing at a solid stone affair about three feet thick. "This house had better be demolished, and you'll have to dig a trench along here, with decent sand-bag head-cover. I should think a hundred and fifty rifles will be enough to man it, provided you have a couple of Maxims at each corner. Over there we'll have an emplacement for a field-gun, and there another trench."

'He went on like that the whole of one grilling forenoon, and by the time he'd finished I totted up my figures, and found he'd used the best part of a thousand men.

"That's all right, sir," said I; "and when may I expect the regiment?"

"Regiment!" he said, rather surprised. "What regiment d'you mean?"

"The regiment for doing all this work and garrisoning the place, sir," said I innocently. "You've been talking about knocking down houses, erecting barricades, and digging trenches right and left. I've only got thirty men."

"The deuce you have!" he said thoughtfully. "We'd better"—

"Go and have lunch, sir," I chipped in.

"Excellent idea," said he, mopping his face.

'So off we went, had a top-hole *tiffin*, and that was the last we ever heard of it. Kiang-fu never was put in a state of defence so far as I

know. However, the rebels never came there again, so every one was quite happy. I tell you,' Wooten concluded with a grin, 'one occasionally has some pretty rummy times up the Yang-tse.'

One had, apparently, and Peter Wooten was an officer of great initiative and resource, who had served his country well, and had upheld the dignity of her flag on more than one occasion. Chinese generals, mandarins, and other Celestial potentates were nothing to him. He bullied or bluffed them all into doing what he wanted, and they used to walk in terror of 'the red-faced devil with the loud voice,' as they called him. No wonder, then, that Peter felt himself tied by the leg in a battleship, where, to use his own expression, he was a 'mere dog's body.'

THE GERMANS IN CHILE.

A SOUTH AMERICAN FORECAST.

By OSWALD H. EVANS, F.G.S.

A FEW months before the war-cloud darkened over Europe there lay at anchor for some days on the wide, sparkling bay of Valparaiso three great war-vessels of the Kaiser's navy—two heavy battleships, the *Prinz Albrecht* and the *Kaiser*, and the four-funnelled cruiser *Strassburg*—all smoking like foundries, and ever and anon making the hills echo with the roar of saluting cannon. A salute with heavy guns is a serious affair in Valparaiso Bay on a still morning. Long after the gun thunder has ceased and the smoke has driven far across the wave-tops in white cumulus clouds, the uproar continues, tossed back and forth from mountain to mountain, to die at last in a muffled pulsation, flung perhaps from the far-off Andean snows.

Three powerful units of a navy younger than a middle-aged man, a war-machine pure and simple, with no more magic in its history and associations than a steam-hammer. Efficient enough they certainly were, for within their steel hulls were crowded all that cold-blooded science could compass of power; beautiful too they were, in some half-grotesque German fashion, as though Albert Dürer had had a hand in their designing.

A few hundred yards away from them lay two or three cruisers of the Chilean fleet; old vessels all of them, more than half-obsolete beside their giant guests, but beautifully kept, and bearing names that recall the glories of a hundred years of eventful national history. The contrast was interesting.

Crowds of visitors went over the German vessels, and returned full of admiration, though the locked gun-turrets and jealously hooded gun-breeches were much commented upon as revealing

a characteristic of the Teutonic mind that widely contrasted with the relatively great freedom allowed to visitors on board our *New Zealand*, which had called at the port a few months previously, when boy scouts poked their inquiring staves everywhere, and were hauled out from the innermost recesses of the vessel.

This visit of the German battleships was the first of many trying experiences that British people in Valparaiso have had to pass through lately. It was a great day for the innumerable German residents, and they never wearied of pointing out the perfections of these Dreadnoughts to any British acquaintance who could be induced to lend an ear. For this reason, and perhaps from some premonition of the future, few of our countrymen went on board. From the *Paseos*, however, those open spaces above the lower town commanding an extensive view over the sea, which form a pleasant feature of the place, it was easy, with good glasses, to watch the hive-like activity of their decks, and to see the sudden crystallisation of groups of hurrying little figures into rigidly ordered lines, or a squad coming forward man by man to twirl, one after another, on a horizontal bar.

On shore the German liberty men thronged the streets. Sedate youths, lacking the jolly, rolling gait of our Jack-tars, they gazed soberly into shop windows and flirted mildly with the Chilean damsels. Some were glorious in full dress, with innumerable silver buttons; others were clothed in garments recalling the sailor suits of our childhood. All wore their caps at the precise angle laid down, it is to be presumed, in the regulations, the long ribbons hanging down behind like Chinese pigtails. Their deportment on shore was such that the

patrolling pickets found nothing whatever to reprove, and the visit of the foreign ships passed off without the slightest incident.

Valparaiso is not what it was. Once upon a time, many, many years ago, a British officer shot a policeman in the theatre, and the indignant populace trundled a field-piece down to the beach with the intention of opening fire on his vessel. And not so very many years since the crew of an American man-of-war fell into controversy with the longshore men, with a result so serious that for many a long year strained relations existed with the States. The place is still, I believe, useful to novelists whose heroes engage in knife-combats, and whose rascals come to horrid ends in 'the rude and bloody wharf-side drinking-shops of Chili,' as Stevenson unkindly called them. But those days are over, or nearly so.

It is interesting nowadays to recall one's impressions of those German sailors. As they trooped up to the German church on Sunday, clean washed and shining-faced, the elder men with little chin-tuft whiskers like the Dutchmen who came up the river in Mr Pepys's day, they looked a set of healthy, open-faced boys and sober, decent men, and one's heart warmed toward them. The officers were not, perhaps, so *simpatico*, as the Chilians say. The German officer has always gone against the grain with Englishmen, but even now it is somehow difficult to make those faces fit in with the facts. My own idea was that the great Freemasonry of the Sea had evolved a type of German radically different from that of the army. Which may be considered as a warning against hasty generalisation.

Whilst these ships were in, Chile was honoured by a visit from Prince Henry of Prussia, the Mailed Fist personified. In the light of subsequent events, the main object of his South American tour appears to have been the stimulation of German sentiment and commercial enterprise, more especially in the Argentine, southern Brazil, and Chile. The Chilians, ever renowned for hospitality, gave him a hearty welcome; but when, with that graceful tact for which his countrymen are so renowned, he exhorted the children of the German school never to forget that they were Germans in spite of their misfortune in being born in a foreign land, and bade them take care never to depart from German customs and the German tongue, their minds were 'clouded with a doubt.' It was felt, when the speech had been translated into plain Spanish, and its import appreciated, that children born to Chilian citizenship owe duties to their motherland as well as to that of their parents overseas. This will be the more readily understood when it is remembered that Chilian-born children, of whatever race, are supposed in due course to serve their term in the army.

His Serene Highness did not come to this

rather out-of-the-way corner of the globe merely to admire Chilian scenery or to remind school children that they were still under the Kaiser's yoke; nor did the three big ships turn up so opportunely only to meet him. Beyond the main object, the glorification of the Fatherland, they proposed to advertise German-built war-ships. I am told that the vessels had little plates affixed to their masts bearing the famous inscription, 'Made in Germany;' and I know that since their visit an idea gained ground among Chilians that our big battle cruisers were not found to be satisfactory sea-boats.

The more important countries of South America, no wiser than their European elders, are caught in the wicked net of militarism. Acting on the principle that the smaller nations require the biggest armaments in order to defend themselves against the greater, they outvie one another in the projection of super-Dreadnoughts. All have coast-lines long enough and vulnerable enough to make the problem of their defence one of national anxiety, so that the advocates of heavy naval and military expenditure are at no loss for plausible arguments in support of their views. Each state has neighbours with old scores to pay off, and inherits a legacy of suspicion—the worm that dieth not. Each views with alarm and jealousy any sign of increasing armaments in another, and so the vicious circle is complete in the New World as in the Old.

Such, at least, was the situation until recently. The spectacle of old Europe converting itself into a man-made hell, however, has had some effect as a valuable object-lesson; and, in the presence of this awful but logical effect of increasing armaments, the South American peoples have come into closer touch with one another than formerly. One has to live in a country of the southern continent to appreciate the triviality of the intercourse between the neighbouring states in normal times. I believe I am right in saying that twenty-five years or more had elapsed since a Peruvian flag had been seen on a merchant vessel in Valparaiso Bay. Now, however, there is some indication of the growth of a common consciousness, of a feeling that the union, in sentiment if not in hard political fact, of the sister republics would evolve a Latin-American entity of weight in the councils of the world. That noble dream of a united South America, a physical impossibility in the days of its originator, the warrior statesman Bolivar, is perhaps nearer realisation than ever before. This aspiration—for it is as yet little more—deserves the sympathy of the Old World, and especially of the allied nations. The sentiment of the free peoples is utterly opposed to the ideals of German militarism. It is, I know, customary to look upon South America as the native land of revolution and political intrigue; and yet, to the hardy optimist, the very disorders

that have been so plentiful during the past century may be regarded as symptomatic of a fervent desire for individual freedom and development. Germany has, in the past, supplied the Chilean army with instructors, Krupp guns, and a thousand details of equipment, among the rest a uniform, which, however suitable for men of a tall, blonde race, sits oddly on the sturdy little brown men, with their strange diversity of facial type, ranging from that of the pale, aristocratic Spaniard of *sangre azul* to that of the pure Indian, whose expression can only be described as pertaining to the Stone Age.

Hitherto the supply of naval equipment has mainly been in British hands; at the time of the outbreak of war the two big warships, the *Cochrane* and the *Latorre*, were in construction in England, together with a group of large destroyers. These vessels, under new names, are now incorporated with the British fleet, and the Chileans are wondering if, after all, it is good policy in these days of submarines to put all their eggs into one or two baskets. Signs were not lacking that the Germans, powerfully backed up by their Government, were about to make a great effort to capture a part, if not the whole, of the great business of naval construction for the smaller foreign Powers.

For the time being the supply of war material from Europe has fallen off, and the imperative need of economy will limit the expenditure in this direction for a long while. Perhaps, too, when the war is over, the world, grown wiser as well as sadder, will find worthier objects to occupy its energies than the sale of firearms to children.

Here in Chile, where the war affects every one seriously, if indirectly, the problem of the future already presses. For little Chile, as for the rest of the world, a simple return to the *status quo ante* will be impossible. It may be that there are still months and perhaps years of travail to pass through before liberty and security and freedom of thought are assured for peoples great and small alike; but already in Chile and in South America at large certain facts stand out that are of peculiar interest to Englishmen.

The main fact is this. Whilst the turmoil of the war is fixing all our attention on Europe and Asia, a great body of Germans, practically cut off from the Fatherland, are doing all in their power to consolidate their position and extend their influence throughout the great southern continent. Before me is a map of the world, with German possessions before the war marked out in inky black. As such they have been, or are being, dealt with. But we know that many vast and desirable regions where the German flag floats only over consulates might, on the same principle, be tinted with a wash of dark gray. The Teuton is ubiquitous; but here and there members of the race are present in such numbers as to stamp their social and political character-

istics on towns and wide areas of country. I draw my examples mainly from Chile, but parts of southern Brazil and Argentina would afford even clearer instances.

Time was, and that not so long ago, when the British were easily predominant among the many foreign colonists of this country. The British, using the term to cover the Scotch, Irish, and Welsh, as well as the English, have made themselves for good and evil a part of the past and present history of Chile since Francis Drake and his numerous imitators played the pirate from Cape Horn to Panamá. These times passed none too soon; but the old type of adventurer persisted to lend his potent aid in the struggle for national independence. In his troubled wake came the merchant, who in early times was little more than a *contrabandista*, but who now, under the republic, traded and prospered exceedingly. In Chile, as elsewhere, British trade was built up by the energy and initiative of private individuals acting without the least support from their Government. Settling down for good and all in the country, the merchants founded families. Their descendants have grown up to love Chile without losing their heritage in the old mother overseas, a fact which the summons of war has abundantly made evident.

I believe it is safe to say that the British have gained the respect and even the affection of the Chilean people as a whole. I believe, further, that the influence of our countrymen in Chile has been a good one. May we never, as individuals or as a nation, give these old friends cause to think otherwise of us! But of late years our supremacy, both numerical and commercial, has been very seriously menaced throughout South America by other European nations in the aggregate, and by the Germans in particular. That the overcrowded or oppressed of the earth should pour into countries full of potential riches is to be expected; but how it comes about that the Germans have made their foothold so firm is a question that still lacks complete explanation. The State aid and constant pressure that fortify German undertakings do not wholly account for it, nor is it thinkable that British energy has suffered decay. The secret perhaps lies in the difference of temperament, and in the contrasting organisation of the two colonies. The Germans in South America are welded into a self-conscious whole by unity of aim and iron discipline, a statement which cannot be made of the British. The beaver-like industry of the youthful German is proverbial, whilst the young Englishman, though a harder worker here than at home, likes to get his fair share of football. The Germans are deliberately attacking a position which the British are only now realising that it will take all their energies successfully to defend.

We all know now, only too well, that the Germans possess that uncanny solidarity which seems to imply a fixed and innate idea of sub-

ordination and concerted action under superior orders, and the 'close formation' is carried into commercial life. A German acquaintance—the word 'friend' has to be dropped nowadays, even on neutral ground—once told me that the feeling of restraint among his younger countrymen becomes at times almost unendurable. There can be no doubt, however, as to the working of the system from the point of view of material success, whatever havoc it makes of individual minds and souls.

Excellent German schools, the cheapness and efficiency of which attract the children of the native population and of other nationalities, including, formerly, our own; admirable German hospitals; powerful banks and business concerns, numbering among their employes hundreds of Chilians—these things do not make for the advancement of British interests, though I do not wish it to be implied that we cannot match them in all these respects.

The war has directly weakened the British colony in Chile. The flower of the British and Chilian-born British youth has long ago departed singing toward the red glare on the far horizon, and already numbers of them have fallen for Britain, leaving sad hearts in many a household. The majority of the German lads remain perforce, however unwillingly, and by remaining serve their country better, perhaps, than they know. Here in Valparaiso the German tongue is heard on every side, and the German countenance is mirrored in every window. In the early days of the war it was almost impossible for British people to keep free from 'enemy trading.' The precisian, for instance, had difficulty in getting bread, since the bakers are nearly all German or Austrian. In this town he had to eschew tramcars and electric light, and forgo Valdivia beer. Little music can yet be bought save at 'enemy' shops, and a host of people would have to abandon their houses to avoid paying rent to German landlords or to avoid German neighbours on either side and 'across the way.' In endeavouring to carry on 'business as usual,' a merchant soon found that he could not, all at once, disentangle German interests from the complex fabric of modern commercial life.

The Germanisation which I have very imperfectly sketched is greatly accentuated in many towns and districts of southern Chile, and its possible development in the future is a matter which merits the consideration of all who have interests in the country.

If it falls out, as we all trust and believe, that the end of the war sees a Germany chastised with scorpions, her false gods overthrown, bereft of her oversea possessions, we shall have to face—no matter what *modus vivendi* we arrive at with our present enemy—the gigantic effort of the most scientifically organised people on earth to win back in commerce what they have lost in

war. It is in the countries where a neutral flag covers and protects German enterprise that the silent struggle will rage none the less fiercely that it may never come again to the arbitrament of the cannon.

The increasing number of remarkably fertile German and Austrian immigrants possessed of that strong tendency to racial cohesion which so largely augments their power will in no great time present itself as a serious problem to the South American republics. One may predict with some confidence a great influx of Germans and Austrians into South America after the war, since the line of least resistance will lie in this direction. Nowhere else in the world do such vast areas of potentially valuable land support so inadequate a population. From the German point of view, the prospect of their 'entering into the land to possess it' will turn on the numbers of the race poured in and born in the country. Without an unthinkable effort, Germany and her Austrian dependency could send forth from their teeming millions a throng capable of outnumbering the native Chilians, for example, within a generation. This once accomplished, unless the Governments, or, rather, the people, are very wide awake, control will gradually but inevitably pass, through methods open or concealed, into the hands of the masterful, utterly unscrupulous majority. When that state of affairs comes about, merchants of other nationalities may as well put up their shutters.

Danger to native South American interests arising from armed aggression or from attempts at internal revolution may presumably be ruled out, or else the present restraining war will have failed of effecting its main purpose. None the less, we have recently read of a threatened danger of German insurrection in southern Brazil, and the pathetic complaints of native Brazilians illegally excluded from areas occupied by German 'colonies.' Nay, more, we have read of German complaints that Brazilians have ventured to occupy land within these sacred areas, a thing almost incredible.

The unceasing German propaganda takes many forms, and it is often difficult to distinguish the cloven hoof in the flood of articles and Press comments ostensibly coming from native sources. Every opportunity is taken to complicate the relations existing between the Allies and the South American republics, and to render it difficult to settle disputed questions amicably. Most dangerous of all is the naturalised German, who uses his disguise to appear more ardent for the honour of his adopted nationality than any genuine Latin-American patriot.

In this connection I must briefly refer to the case of the *Dresden*. Thanks to the traditional good understanding between Chile and Great Britain, the destruction of that warship in Chilian waters was not followed by the strained relations

which the German residents did all in their power to bring about, but was arranged with full and due satisfaction to Chilean honour. Our guns certainly had knocked the lobster-pots about on Juan Fernandez, and the Germans made what capital they could of our technical breach of neutrality. Inflammatory leaflets, purporting to be written by Chileans, were circulated, and a fragment of shell picked up in the island was exhibited in a German shop window under a provocative label. The attempted agitation fell flat. The incident is closed, the damage done compensated, and the British note, which so promptly answered the admirable statement of the Chilean Minister in London, gave general satisfaction. At the same time, it is to be desired that, so far as the stern necessities of warfare permit, the proud and sensitive Latin-American character should be most considerately dealt with, lest the impression gain ground that, in her dealings with small States, Great Britain considers that 'the jingling of the guinea helps the hurt that honour feels.'

The *Dresden's* crew, now interned in Quiri-

quina Island, and recently afflicted, we are told, by an outbreak of trichinosis—probably due to an incautious attempt to acclimatise a national dainty—what will become of them? Three hundred 'stirring brisk lads,' as Defoe would call them, highly trained and disciplined, are indeed a fine gift to the German colony. I doubt if many of them will go home after the war to an exhausted and temporarily disorganised country, when good opportunities lie to hand in this fresher field.

To look ahead through the smoke-clouds to the new conditions which peace will impose on a world filled with bitter memories and unsatiated passion affords no pleasant prospect. Enough may be gathered from this bundle of personal impressions to make it clear that our South American markets will demand a great share of our attention if we intend to retain them; and it is to be remembered that this great half of the New World bids fair to become, in time, the seat of intense human activity, in which our traditions require that Britain should take her due share.

CORPORAL MARGUERITE.

CHAPTER IV.

'SOMEWHERE in France,' by which phrase the papers are by a rigid censorship forced to hide localities, a fierce engagement was taking place. It was at a point near where the stretch of flat country southward of Ypres held by the British lines merged into those of their French brothers-in-arms. Occasionally, indeed, in the stress of battle, and in the inevitable confusion which sometimes occurs, French and British fought together side by side in a single trench.

A heavy cannonade had been maintained from the German artillery upon the two small villages which lay some four or five miles in the rear of the Franco-British fighting-line, just within the border of west Flanders.

Earlier in the day Corporal Marguerite had been engaged in Red Cross work, for the ambulances with the wounded and the stretcher-bearers came to these two villages behind the lines in a steadily flowing stream which kept every surgeon and nurse busy. But though Corporal Marguerite, as she had become affectionately called, ministered to the wounded men with tenderness and a skill born from intuition rather than experience, she was not content. In her heart there still burned the flame of hatred of the Germans who had not only devastated the fair land of France, of which she was a daughter, but had also slain her mother and devastated her own soul.

So, in the late afternoon, when there came an ominous rumour that the pressure on the trench immediately in front of the village in which she

was stationed was becoming increasingly severe and dangerous, she crept away to the outskirts, determined to do her part in the defence of France. As she swung along over the field no one she met stopped her—her uniform was a sufficient pass; and if any one, on seeing her, thought about the matter, he came to the conclusion that she was returning to the firing-line.

As she crashed through a low, broken hedge she stumbled, and almost fell on top of a young private of one of the French regiments, who lay mortally wounded where he had managed to crawl and prop himself up against the hedge. He was too near insensibility to realise that Marguerite was not a comrade in arms; and when he saw her bending over him he said, 'Here, comrade, take my rifle, and go and shoot some of those cursed Bosches.'

Marguerite knelt down and placed her arm beneath his shoulders, drew the stopper from his water-bottle, and held the latter to his lips. But he made no effort to drink. He was past the need of assuaging the terrible thirst which had seemed to consume him but a short while before; and even as the girl paused to consider what else she could do, his head fell back upon her arm, and she knew that he was beyond her aid.

Amid the screech of shells, which tore through the air to plunge among the ambulances and the cottages hastily turned into hospitals in the village whence she had come, and with the

occasional sharp, wasp-like song of a rifle-bullet spinning through the air, Corporal Marguerite, with tears in her eyes, knelt beside the dead soldier of France, laid him tenderly down, and crossed his hands upon his breast. Then swiftly she unfastened his bandolier, which was heavy with cartridges, seized his rifle, and set off across the fields to the firing-line.

At last she came quite close, and the waspish buzz of the rifle-bullets and of the machine-guns became as incessant as that of a swarm of bees. She lay almost flat on the ground, and crawled towards the trench. At last she was in it, standing side by side with smoke-grimed, earth-bespattered men, who, either behind machine-guns or with their rifles resting upon the top of the trench parapet, were pouring a murderous fire towards the German trenches a few hundred yards away.

Amid the din of battle, with the terror of sudden death hovering over the trench in which the soldiers of France and those of Britain stood side by side steady as a rock, Corporal Marguerite's presence passed almost unnoticed. Once or twice the men on either side of her would exclaim with a careless oath, 'Got him that time!' or 'Steady!' or 'Damn you! don't crowd me up so.' But no one paid any real attention to her, and she continued to slip in the clips of cartridges and fire steadily, as she saw the others doing.

Towards the late afternoon there came a lull in the firing. 'A calm before the storm,' a young Englishman who was placed next to her observed; adding, as she did not reply, 'I expect that means the Huns will be coming out of their holes before long.' And then, as she still said nothing, but only smiled at the speaker, he exclaimed, while he looked her up and down, 'Well, I'm blest if you aren't the prettiest *piou-piou* that I've seen since I landed!'

Although Corporal Marguerite could understand scarcely a word of what the young fellow, who was trying to rub some dust out of his eyes, said, she understood enough from the look of admiration and astonishment which crossed his eyes to cause her to blush.

'Well, I'm blowed!' went on Private Atherton, who, before he had come soldiering to France, had been not only the apple of his mother's eye and the idol of his sisters, but also a partner with his father in an old-established firm of solicitors in Lincoln's Inn Fields. And then, as Corporal Marguerite blushed still more deeply, he muttered beneath his breath, 'Hang it all, I believe the corporal is a girl!'

Before he could say more, or question her, or even draw the attention of his company officer to her, there was a wild shout from the end of the trench. 'They're coming!' ran the cry down the line, and over the blue-and-white sand-bags of the German trench a swarm of gray-green coated men could be seen clambering,

whilst for a few moments on the British trench was concentrated a perfect hail of shrapnel and shell-fire from the German batteries in the rear.

In the few terrible minutes, whilst the earth in the trench seemed positively to shake and even rock, Private Atherton had no time for thought or speculation concerning the girl who stood beside him; but at the back of his mind remained the fixed idea that by some sport of chance the slim young French corporal who had been firing so coolly beside him for the last hour or more was a girl, and that when the rush came he must somehow or other manage to protect her.

Amid the rattle of the machine-guns in the Franco-British trench, and the sharp, spiteful, continuous crack of rifles, it was impossible to hear the human voice at the distance of a foot or two, but the instructions of the company commanders were passed from man to man: 'Wait till the enemy is within eighty yards, and then empty your magazines into them, and prepare to receive them with the bayonet.'

Across the open space between the two trenches, which was littered with wire entanglements, the German hordes came on, only to meet, when they were within eighty or ninety yards of the Franco-British trench, so withering a fire that the whole mass of men seemed to tremble, stagger, and fall. But others came on, and some few reached the object of their attack.

In the corner where Corporal Marguerite stood, close to Atherton, with her bayonet fixed and a terrible desire to kill in her heart, a handful of Germans who, by one of the chances of war which are so extraordinary and inexplicable, seemed to have escaped almost unscathed while their companions were mown down on either side of them, came rushing on.

As Atherton saw that they would reach the trench, he turned to the girl and said, 'You'd better get out of this, corporal; or, if you won't, then get behind me. The devils will be upon us in a second.'

Then, almost before the girl realised it, the Germans were clambering over the sand-bags, and some were thrusting down fiercely with bayonets, while others whose magazines were not empty were firing rapidly and with deadly effect.

Atherton spun round with a nasty jab in his shoulder only just in time to see and ward off a fierce downward cut from an officer who, almost astride the topmost sand-bags of the trench, was about to slip down where Corporal Marguerite stood. But for the speedy intervention of Atherton's rifle, the girl would undoubtedly have been run through the shoulder or the breast.

Those who have gone through a battle sometimes tell how, in the supreme moment of the fight, an incident or a face in the *mêlée* and in

the fierce struggle stands out isolated, as it were, and remains impressed upon the mind. And so it was with Corporal Marguerite, for she recognised in a flash the officer who had cut down at her as her captor at Armand. For a moment she trembled and felt as though the sight of that face would deprive her of all power of initiative. All the horror of the night and dawn at Armand, and the death of her mother, came rushing back upon her. But, as Hofmeyer felt one of the sand-bags slipping beneath his feet, and attempted to spring clear, the girl almost mechanically and without any recognised volition upon her own part pointed her rifle upwards, and with a cry the German stumbled and pitched forward on to the bayonet.

Borne backwards by the shock of the falling body, Marguerite lay buried beneath the weight of her enemy and the sand-bag that had slipped down with him. Then, as she realised the horror of her position, with her dead enemy pressing down upon her and almost crushing the breath out of her body, she lost consciousness.

The counter-attack upon the enemy who assailed the trench had been successful. A British Highland regiment had entirely cleared the Germans out of the Franco-British trench they had momentarily occupied, and had, by one of those irresistible charges for which the regiment had become famous, captured the enemy trench and made some two hundred metres advance.

Atherton, shouting himself hoarse, almost mad to be avenged upon the Germans, was one of the first to reach the enemy trench and help to drive out the few Germans found in it. Then, when the firing had died down, and it was realised that, for that day at any rate, the conflict in that particular salient was finished, he suddenly remembered the girl whose comrade he had been throughout the afternoon.

In addition to his wound, Atherton had been a good deal knocked about in the rough and tumble of that onward rush. He had done one or two things, too, that marked him out for mention in a day of gallant deeds. And now, as he was sitting on a sand-bag in the captured trench, binding up his knee, which had been scragged by wire entanglements, and tying a handkerchief round his head where a bullet had furrowed its way, only lightly skinning him, a surgeon came along and ordered him to the rear.

'I'm all right, sir,' said Atherton; but the patch of blood on his khaki near the shoulder gave the lie to the statement.

'You do as I tell you,' said the surgeon. 'You are fit to walk, but you need attention. Go to the base as quickly as you can.'

Reluctantly Atherton clambered out of the trench. Still a few bullets were spitting across the open space between the old Franco-British

trench and the one lately captured from the Germans. As he was crossing it, wondering vaguely whether his luck would be to be shot down by a stray bullet, his mind began to work normally again, and suddenly he remembered the little corporal whom he had last seen crushed backwards by the German lieutenant who had tried to cut her down. He must find her. That idea formulated itself with absolute clearness in his mind. He realised that in the brief time during which he had noticed her standing beside him in the trench she had made a definite impression.

At last he crossed the intervening space between the two trenches in safety, although he did it falteringly from weakness and the pain of his wounds. He stumbled over the sand-bags, and slipped down into the trench. To his mind, confused by the recent din of battle and all the attendant horrors of the past two hours, the place seemed full of dead and wounded. He could not pass along it without treading on some one, and the first step he took fell upon the chest of a German infantryman, who lay with a bayonet-thrust through his lungs. The body yielded sickeningly beneath his weight. Notwithstanding the horrors he had been through, he experienced a sudden repulsion from the idea of thus trampling underfoot even a dead enemy.

At last he reached the corner of the trench in which he had been standing with Corporal Marguerite. She still lay partially underneath the body of the German lieutenant, Hofmeyer. As Atherton stooped down and attempted to drag the body off her, he found that she was quite unconscious, although she had managed to extricate her head and one shoulder from the stifling pressure of the dead man.

In his weakened state it was all Atherton could do to drag the dead off the still living; but when he had done so, the girl, though still unconscious, seemed to relax her limbs and stretch herself with relief.

Atherton dashed the blood and sweat from his eyes and peered down at her. His heart beat more quickly at the thought, 'Is she, after all, dead?' With his mind still confused, his brain half-asphyxiated, as it were, by the terrible cannonading and the fatigue and loss of blood that he had sustained, he was unable to decide in his own mind whether there was any life in the slim body of the girl that lay before him.

He knelt down, unbuttoned her jacket, and placed his ear near her heart. He thought that he could detect a slight, almost intermittent beat, and he cried out with joy at the discovery. Then he became suddenly conscious that the skin of her neck and bosom looked almost lividly white, and that her breast was heaving gently. Laboriously he rose from his knees, and tried to pick her up. In her unconscious condition Corporal Marguerite was no light weight. But

at last he managed it, getting her across his back much as a fireman would do in fighting his way with an inert body from a burning building.

He found a spot where the dead lay so thick that he could clamber up over them, swaying under the weight of his burden, and get out of the trench; and then, half-blinded with the mingled blood and sweat which trickled from his forehead, he stumbled onward across the fire-scorched field, every now and then blundering into shallow cavities torn by shells, in the direction in which he believed the temporary field hospital lay.

The distance seemed interminable. He struggled on, panting and half-unconscious, his mind obsessed by the one idea that he must reach the hospital, not so much for his own need as for that of the girl he bore.

Suddenly he was conscious of a sharp pain in the fleshy part of his thigh, just as though a large red-hot needle had been driven into it. The thought 'I'm hit again!' passed through his mind, and he gave an involuntary sob. Now he would never reach succour, and perhaps the two of them would fall there and lie until death came. Perhaps, indeed, he thought, the bullet had passed through the girl's body before it entered his own.

A few more steps and he stumbled heavily. A dark curtain seemed suddenly drawn down over his eyes. There was a roaring in his ears like the sound of the sea. Then all was blank.

CHAPTER V.

IN one of the rooms, now a hospital ward, in a great Paris hotel in the Place Vendôme, Norman Atherton lay in bed No. 16, trying somewhat futilely to pick up the threads of memory which had been snapped and seemed now so easily to evade him. He knew nothing of what had happened from the time that he fell within half a mile of one of the field hospitals beneath the girl he was trying to carry into safety; nothing of the night spent in the open beneath a couple of blankets, his wounds temporarily dressed; nothing of the journey to Paris, and the transference from the motor-ambulance to the ward of the great hotel. All that time was a blank. And, as he lay worrying at the tangle of memory, he could recall nothing save the sweet, boyish face of Corporal Marguerite, the close-cropped golden hair, and the blue eyes which he had peered down at as she stood beside him in the trench just as the enemy attack developed.

Of course, he had been forbidden to think. Sister Anastasie had become as nearly cross as her nature would allow her to be only that morning, when he had begun questioning her

eagerly but somewhat incoherently concerning past events. 'You must not think! You must not talk!' she said quite sharply. 'All you have to do, my friend, is to get well again quickly, so that you may go back to fight the enemies of France, as every good soldier wishes to do.'

But it is indeed difficult to calm the mind of an invalid which is not at rest. And at last, in the latter part of the afternoon, Sister Anastasie realised that to satisfy her patient, in some particulars at least, would be the best thing to do in the end. So she told him what she knew: how he had been found side by side with a young corporal, who proved to be a girl, and had been taken to the field hospital, then to the base, and lastly to Paris, where he now found himself. Nearly a fortnight had elapsed, Atherton discovered, since he had been picked up on that nameless battlefield 'somewhere in France.'

'One does not easily, my friend,' said Sister Anastasie, 'get over the effects of wounds like yours, and especially concussion of the brain, from which you have been suffering.'

'And what became of the girl?' asked Atherton eagerly.

'Ah!' said Sister Anastasie, who scented with the unerring instinct of a woman a romance in which she would willingly play a part, 'she, the Little Corporal, as they call her, was but slightly wounded. She is in Paris. They aren't going to let her fight any more.' And then she lifted her shoulders, and said, '*Ma foi!* certainly not. Fighting is not, after all, good work for women; and women are wanted badly in the hospitals. Ah! the hospitals,' she went on, 'are very, very full—full of the brave sons of France, full of you English who have fought so well, like what you call *les bouletogues*, beside us. And so Mademoiselle Marguerite, the Little Corporal, will fight no more, my friend; only fight wounds and death. That certainly is woman's work; not the handling of a rifle.'

'But where is she?' said Atherton. 'I must see her, Sister.' But the Sister shook her head. And then Atherton played a trump card with some of the coolness for which he had been noted. 'If you don't let me see her, Sister,' he went on, 'I simply won't get well. I *shan't* get well, Sister!'

Sister Anastasie smiled. What persistent, strong-willed fellows *les braves Anglais* were, to be sure! And so she promised him that she would see what Dr Mercier said when he came into the ward.

'But you mustn't expect to see Mademoiselle Marguerite,' said Sister Anastasie, in a rather severe tone which her kindly eyes belied. 'And now you must have your afternoon sleep, or when Dr Mercier comes it will not only be "No visitors" for you, but black looks for me also!' And the Sister, having smoothed his

pillow and straightened the bedclothes, which he had disarranged in his twistings and turnings, crept away, and passed—a white-coifed, white-clad figure—down the ward to other duties.

It had been a morning of rain, little showers which had served to lay the dust, and now Paris lay beautiful in the sunshine. It was a quieter city than in former times. The traffic through the Place Vendôme, except at certain hours, was much less; but otherwise, from the sunny balcony where Norman Atherton, now convalescent, lay in a wicker *chaise longue*, Paris seemed much as he had known it in former times, when he had been there on a visit of pleasure or business. But though his gaze followed the track of ambulances, taxis, and other vehicles across the sunlit Place, every now and again his eyes turned, as though expecting some one, to the French windows which opened on to the balcony.

At last, just as a neighbouring clock was striking three, some one stepped out from the window. It was not easy to recognise the trim figure of Corporal Marguerite in the more flowing garb of a hospital Sister. The golden hair, now growing again, was of course hidden beneath the white head-dress with its spotless, stiffened wings. Her face had received an added beauty since the time when she was the acknowledged belle of Armand. For one thing, just now the pallor which illness and suffering had wrought was dissipated by a slight flush; and, for another, as was only natural, the garb which many think makes even a plain woman attractive made Sister Marguerite more than beautiful.

'Ah!' said Atherton, 'you have come, Sister.'

And, though there was a light in her eyes and a smile upon her lips, she answered in quite a matter-of-fact way, 'Of course, it is I. Cannot you believe it, my friend?' Then she came and sat on the end of the *chaise longue*, and for just a little time they talked of things of the moment—the progress of the war, the terrible toll of wounded which flowed unceasingly into the beautiful city. And then Marguerite, after a long pause, said slowly, 'It has never been possible for me, my friend, to thank you for what you did—for saving my life.'

Atherton flushed. Her hand was very near his, and he took it. 'Please don't say any more,' he exclaimed. 'It was nothing. The only pity was that I got knocked over and I didn't save you after all. It was the stretcher-bearers did that;' and he laughed a little bitterly.

'But no,' said the girl, 'it was you who did it.' And suddenly she burst into tears.

A man is always at a disadvantage in dealing with a situation like this. The most carefully chosen words seem but platitudes, and hardly ever bring comfort to the woman. Atherton was no exception to the rule. He was distressed,

and at the same time felt himself helpless. Why on earth should the girl cry? flashed through his mind. It was all over now, and why could she not be sensible and listen to what he had made up his mind to say to her? And then, as she did not withdraw her hand, he suddenly did instinctively the only thing that could have comforted her—he drew her down towards him and said slowly, 'Don't cry, Marguerite; you mustn't cry. I want to say something to you, and I must say it, for you know in half-an-hour the Sister will be here, if not sooner.' When the girl was calm Atherton went on, 'You know the day we met first, and you stood firing in the trench?'

Marguerite nodded her head, and a blush stole into her face.

'Well,' continued Atherton, 'you looked just what that American chap who's in the bed next to mine would call the "dinkiest" Little Corporal that ever I set eyes on! But you're not going to be a corporal any more, Sister Anastasie tells me. You're going to nurse the sick and wounded. Perhaps before the war is over I shall be wounded again, and you'll have to nurse me.'

The girl shivered.

'But,' he went on, 'I want to settle something before I go back to the trenches. I want you, Little Corporal'—and his voice became very persuasive and tender—'I want you to cement our national *entente cordiale* by marrying me. I'm a bit of a crock just now,' and then with a laugh he added, 'but I shall be a devilish fine fellow when I'm mended up, and perhaps I shall be lucky and not get broken again. What do you say?'

Marguerite was silent for a moment or two, and then she said, 'To-day I cannot think, my friend, of our own affairs. After the war—who knows?'

'But I cannot wait for my answer until after the war, Little Corporal,' urged Atherton, drawing her close to him. 'I must have it now.' Then he added, after a pause, during which she seemed to nestle closer to him, 'If you do not say "Yes" I shall be unhappy, and you know that it's not good for a wounded man to be unhappy, don't you?' And then he looked at her, and he felt that all he needed to make him happier than he had ever contemplated was for the little figure who now clung to him with tears in her eyes to say 'Yes' to his question.

'I am not good enough,' murmured Marguerite humbly, as the tears fell down her rounded cheeks.

'You are a thousand times too good,' said Atherton, kissing her.

And then Marguerite shook her head and whispered ever so softly, '*Non, un mille fois non, cœur de mon cœur*. But let the answer be as you wish.'

THE END.

AN INTERESTING MOTOR-TRANSPORT ENTERPRISE.

MANY of the electric tramway companies in Canada and the United States have recently been called upon to face serious competition on the part of motor-cars. It is stated that there is not a city upon the western coast of America where the tramway systems have not been hard hit. Owing to the success of the scheme it is developing rapidly, and it is quite possible that, in a modified form, it may make its appearance in the Old World. The vehicles are not licensed, and indeed are not necessarily constructed for public service, any car being suitable for the purpose. Street traffic always reaches its maximum in the morning and evening, when the workers are proceeding to and from their tasks. At these times the trams are always severely taxed. In order to ease the situation an enterprising individual conceived the idea of utilising a number of motor vehicles of all descriptions to compete for this 'rush' business. Traffic is sought upon the streets through which the tramways run. As soon as the motor-car has its full complement it is driven with all speed direct to its destination, and, in order to make good time, it cuts through back-streets and by-ways, where there is no congestion of traffic. At night the additional advantage is offered that when the weather is wet the passengers are set down successively at their own homes. This filching of the traffic at the termini of the tramways has proved highly successful. Not only is it possible for a person to pass from his home to his office in about half the time necessary by tramcar, but the fare is reasonable. Five cents (two-pence halfpenny) is the charge for any distance, and as the colloquial name for this coin is a 'jitney,' this form of traffic has become known as 'jitney competition.' The enterprise is proving remunerative, because it is carried on only during the 'rush' hours, when the vehicles are sure to be filled. The success of the scheme has produced a strange condition of affairs. While special vehicles have been built for the service, it is the small four or five seater private car which is the most remunerative. Many private car owners are in this way turning their vehicles to profitable account twice a day. They travel to and fro throughout the city in the manner of a taxi-cab during the 'rush' hours, and throughout the rest of the day remain at home for use by the owner's family. Many women who own motor-cars and who have no family ties appear with their vehicles during the morning and evening rushes to participate in this lucrative harvest. Not only has the competition hit the tramways hard, but it is driving the taxi-cabs off the streets. For journeys between certain points and the railway stations

the fare by 'jitney-car' is about a quarter of that demanded by the taxi-cabs; while, if one desires an outing during the morning or afternoon, arrangements can be made with one of the 'jitney-car' owners at a cost at least 50 per cent. below the usual rates. The majority of the vehicles are driven by their owners, and small syndicates are springing up to facilitate the purchase of vehicles by their respective members. At the moment the suffering municipal undertakings are striving to devise ways and means to eliminate or at least to regulate this competition. It has been suggested that the vehicles should be controlled in the manner of British omnibuses, should be compelled to keep to certain routes, should not be permitted to deviate from the streets laid down, should not compete for business in places through which a tramcar runs, and should be at work during certain fixed hours in the morning and evening respectively (even if resting during the day), irrespective of weather and the health of the driver. But it is generally regarded as a hopeless proposal, because the vehicles are privately owned, and if legal measures were brought into force it would be an easy matter to defeat them. Wiser counsels maintain that the tramways must tolerate the change in fashion which is taking place, as the 'jitney' is but a logical development of these high-pressure days, and is a change comparable to that which the electric tramways themselves brought about when they superseded horse-drawn trams, buses, and cabs.

EVENING.

THE red-gold glory of departing day
Lies like a sea of splendour in the west;
And Nature to her children all doth say
A soft good-night, and hushes them to rest.

The Earth her form in pearl-gray mist enshrouds,
While silence hovers in the glimmering light;
Across the sky sail little fleecy clouds,
Kissed by the rosy lips of coming night.

I stand quite still, and, by the deepening hush,
I know the supreme moment draweth near
When, from the whispering shade of yonder bush,
The nightingale pours forth his music clear.

He sings; and floods of broken melody,
Like showers of angel's tears falling from heaven,
Pour from his swelling throat. In ecstasy
The stars look down at all the joy thus given.

He sings of all the good that ever was,
Of all the joys that have been, and will be;
Tears spring unbidden to my eyes because
I long to have you listening here with me.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

LIFE is made more bearable now by its incongruities. Swamped by reckonings in millions and billions, overwhelmed by a feeling of helplessness through the loss of order in the world, men and women have lost sense of the relative values of persons, things, and events. It is not their fault. When reason has been abandoned to the point of wilful and meaningless destruction of what is good in the world, when the object of the day seems almost negative, when life is less stable than before, and the existence not alone of individuals but of nations is in jeopardy, where can there be coherent comparison of values, how is any ordered system to be regulated, since all order and system must be based on life, continuity, and reason? It is instantly demonstrable that nothing matters to us now but the war; that, as it means life and the future well-being and bearableness of the world, the war is everything, and nothing else is anything. Some, no doubt, would urge that, this being a time to assert the superiority of the spirit, and art being long as life is short, such things of the spirit as art and music and literature—which will make life worth living again when the wars are done, and will help man on once more as he tries to grope his way back to beauty—are greater than war, and have eternal powers of endurance. Governments, however, have no spiritual value or capacity. They make proclamations which are intended to impress the people, and they declaim upon right and justice; but Governments are, after all, worldly things. They are committees of expediency. Their moral standard, as we have found over and over again in recent times, is below that of the upright individual who sets himself an ideal, and strives after it, while the committee of expediency considers the material interests of the nation and its sense of responsibility for the moment. This is inevitable. The individual has his ideals for private contemplation and speculation; in his daily life he demands such facts as food and comfort. So the committee of expediency must be material, and none the less because the like committees of opposing States are more material still. The individual may not achieve it, but somehow he strives toward his ideal; at the least he sets it steadily

before him. It is something abstract, a principle, a fixed feature of his code of ethics. With the State it is not the same. The State is little concerned with such abstracts, save in times of peace, when the painting of village pumps is a matter for grave consideration and for orations at Westminster. For the rest, expediency and the worldly law of material interests must often prevail. The law of necessity is applied constantly. Because of it rulers deviate from undertakings, and according to that merely worldly law they are justified. They do not permit the application of the law of necessity by the individual, but it is the first law for their own conduct, because the preservation of the State in the most material sense is their supreme responsibility. To preserve the State the uttermost limits in measures of expediency are touched. Do you remember the withering, worldly truth that Isidore Lechat shouts at his son Xavier in M. Octave Mirbeau's satirical comedy, *Les Affaires sont les Affaires*, which is surely less comedy than tragedy: '*D'honneur . . . d'honneur. . . Au diable l'honneur! Où il y a de l'argent . . . il n'y a pas d'honneur*'?

* * *

The State, therefore, feels it must hold to business, and reserve the cultivation of fine ideals to times and circumstances when other affairs have no pressing urgency. It is because of this variance that the incongruities arise—this variance between the individual, who seeks anxiously now for a path of happiness of his own discovery, sometimes by secret and devious methods, and the State, that now dominates and exercises an ever-increasing pressure upon him, and seems to condemn him at every act and movement for selfishness and incompleteness of sacrifice. The State is not wrong to be so material, nor the individual to permit a certain development of himself. The two forces are the complement of each other, and may produce a tolerably good working arrangement. They are as two parties in a country's life, and the State, with its programme of self-preservation, is now in full power, as only when the enemy is at the gate; while the individual, free and assertive in peace, even wilful and arrogant in his liberty, relapses to the feeblest of all minorities.

He is only a number, a subject, a unit, a little piece of a vast and menaced whole. The individual sometimes seems to draw farther and farther back from the State and its great weapon of warfare, to feel even a detachment from it. Here one refers not to any class of individuals, and certainly not to any one who might be considered as in the least unpatriotic, but to all. Thus you discover that in the working of this principle and in the tendency of the individual to assert himself and his freedom despite the present stupendous enterprise, we have the interesting circumstance that while the State, with a vehemence never known before, preaches to the people the need for sacrifice, for economy, and for utter detachment from all individualism, its leaders in their individual selves may find it difficult to set the best example. Here, then, at the top are the most obvious incongruities.

* * *

They spread through every stratum of our life. Human nature rebels against the war as we know it now. It is necessary; it must, indeed, be carried through with all our might and determination and force, for we are right, and we must cleanse the world; but individuals in the twentieth century cannot live and be absorbed in war and nothing but war for seven or thirty or a hundred years, as in the times when wars were fought on horseback, and there were tented plains, knights in glittering armour, warm chivalry; when war was the greatest and best of sports, those not taking part in it going on with their daily work and play almost undisturbed. As the war continues you must necessarily find, after a certain height of sacrifice and intensity of feeling have been reached, that there is a fast-increasing tendency to the assertion of a greater measure of individualism; not in the way of selfishness or anything approaching to it, but in the endeavour to pursue separate interests with a closer concentration than at the beginning of the conflict, in the attempt in some measure to live the two lives—that of the unit of the State and that of the individual with ideals and desires. An artist does not see that it is good that art should be wholly abandoned. If there are things that are greater than art, there may be things that are greater than war. The State seems to suggest that the only literature having its commendation is that of its own composition, as displayed on the hoardings, in the form of advice to the people about their private ways and their public duties; that in art it most approves the pictures drawn in its own publicity departments, and pasted on the walls; and that in music it considers nothing appropriate to the time save a brass band and the 'Tipperary' tune. Here individuals detach themselves, and so come the incongruities. It is a difficult and doubtful point whether there is a human instinct for war. Some things suggest

it, and others oppose it. When we think of man come up by evolution from matter, from the earth, fighting all the time for the survival of the fittest, and thus reaching his present fine capacity, war as an instinct is indicated; but when man spiritually is considered it is not. But there is no doubt whatever that there is an intensely strong instinct for the exercise of human powers and faculties in a peaceful and non-war way; and it is this instinct at work insistently that leads to the incongruities, the bewildering contrasts and contradictions. It is not selfishness. It is nature, and not the worst of nature.

* * *

The minds of people everywhere are awaking to such considerations at this moment, when Nature herself presents the most confusing incongruity of them all—the sun of early summer shining on an earth that leaps to production once again, the fields and trees exulting in the new glory of their green, the flowers in all their delicacy and beauty come again to ridicule and scorn the grossness of the human kind—and the world at war. The world must be ashamed; when the madness of war has passed again, its remorse must be long and bitter. The human race yearns for the exercise of the ways and sympathies of the paths of peace; it snatches at every opportunity of gaining such satisfaction. So some of the incongruities seem barely to touch upon the senses now. No long time has passed since the theatre was looked upon by a part of the community as a palace of the devil; this morning, in the very heart of London, in Westminster, I find on the notice-board attached to an important parish church, side by side with the particulars of confirmation services, an arresting printed announcement headed, 'Gaiety Theatre,' with the intimation following that there were to be more performances, for the sake of a war charity, of *Under the Red Robe*. On a recent Sunday morning, as I was passing from Whitehall, I saw a bearded man nonchalantly perched on the saddle of an old-fashioned high bicycle riding past the Abbey, with the little wheel running behind as if—so it seemed to one's excited fancy—it were in a state of desperate stress to keep in close attendance on the master-wheel. It is thirty years or more since the high bicycle was superseded; yet here was an individual, in the full and arrogant exercise of his independence, producing such a relic from his private storehouse, and vaunting a bit of old Victorianism in the noblest thoroughfare of London on a Sunday morning in the second spring of war. Here was individualism. But so much is the public spirit attuned to the good of a little freedom that there was less staring and wondering than there would have been in the last days of peace. You may do a very strange thing in London now, and it

is not set against you for eccentricity, but is reckoned for good sense and strength in the way of giving a little freedom to individualism. Surely, in spite of all that can be said by their partisans, there is some incongruity in the advertised gambling on horse-racing at the present time, and in the football matches that were attended by hundreds of thousands of people every Saturday all last winter. (Years ago, in these pages, the writer, before any one else, earnestly advocated a tax on football matches, gave the reasons why, and indicated the results; now such a tax becomes a fact.) If these are to be admitted as fair expressions of individuality in war-time, it becomes the more difficult to condemn such incongruities as those contained in the numerous advertisements in important London newspapers of lessons in the game of bridge that are to be had in the West End, of bridge clubs where people may play in the afternoon, of whist drives where humbler folk may compete for petty prizes, and of dancing classes where the newest dances are taught. They say that even now there is almost a boom in dancing; that the newest and most fantastic American twists and turns have been studied not merely by flighty women, but by many others. When such things are utterly condemned, you must in reason consider them as inevitable features of the psychology of a nation ground down by war at its worst. They may not be so many foolish whims, but rather a subconscious strike for liberty by the individual.

* * *

A man of celebrity dies, and there appear in the papers long accounts of the circumstances and achievements of his life. There may be a column or more, and the bulk of the people may have little more than heard of this man. One life only has gone, and it gets a column, but some hundreds of lives are accounted for in a single one of the casualty columns alongside. Is this an incongruity? Where is the proportion between the one life that ebbed away in a stately mansion and the hundreds that bled off on the battlefield? But it is not an incongruity; for we, the mass of the people, have come to realise and act upon the principle that the lives of peace and the lives of war are things not capable of being compared. They are in separate worlds; they do not come into the same thoughts. A thousand may be killed; but the one still matters. The thousand are for the State and the one is for the individual. Here lately has been another noticeable expression of seeming incongruity. Just upon the outbreak of war an explorer set out for the South Pole. It had been reached before, by a Norwegian and by our own great Captain Robert Scott; but this time it was to be done in a new way. The explorer has not returned to time, and forthwith for a day or two his predicament is given the full

publicity of the war itself. Plans of Europe give way to maps of the frozen South; there are columns and more columns about the circumstances and the possibilities, and interviews with everybody having anything to say about the prospects of the missing explorer who would reach his base and find no ship there. Schemes are instantly considered for sending out a relief ship to him. All the world seems anxious. This for a day or two seems to become the most important matter of the time. The east front and the west front move into the middle distance. Hundreds of lives have been sacrificed on the battlefields, ships have been ruthlessly sunk, and in the air there has been as much heroism in a day or two as would have sufficed for the glory of a war complete in bygone ages; yet, save by those immediately concerned, it is all thrown into the background, and full attention is cast towards the dangers and the difficulties, the hardships and discomforts, of those engaged in this affair of the Farthest South. So the war is not to be considered in relation to the life of peace; the subjects are boxed in different compartments of the mind.

* * *

We work at this war, and shall continue to do so, as never at anything else. The utmost force of spirit and body that we can lay to this task shall be applied. But in many respects it is beyond our proper realisation. Does it make us callous? Have you not sometimes shuddered as you reflected how cheap heroism has become in your mind, and in that of all? Every day there is heroism in France and Belgium such as the world has never known before; but it is mostly unreported, and even when it gets into print there is little notice for it. There is so much of it; it is one great confused mass, mixed up with trenches and machinery, gases, and all the blackest compounds of the devil. It is a record of the most amazing heroism under supreme difficulties and discouragements, the like of which the world has never known before, and will probably never know again, for mankind will shrink from any further experiment with such conditions. Knowing there was to be no special glory, no open recognition; that it was to be pure raw sacrifice unadorned, to be accompanied not by the thrills and excitements of old-time fighting, but by all the ugliest adjuncts of most modern war, and that the chances of coming through unscathed were smaller than ever before, our men have gone to their death in thousands. Never was such sacrifice, never such transcendent heroism. But the mind cannot grasp it; it is too much, too overwhelming, such an enormous mass that it is passed silently by. Never was heroism as great as it is to-day; and, because there are such mountains of it, it hardly seems to count, and at the finish of the war there will be few incidents to be

remembered. Can you, reader, tell now the story of only six great incidents of the first six months of the war, the most fateful months of all, when such incidents were to be reckoned by

the tens of thousands? You cannot, and the point is proved. The heroes of to-day, greatest of all, have the rewards of their own sacrifice, and nothing more.

PINCHER MARTIN, O.D.

CHAPTER V.—*continued.*

THE watch-keeping lieutenants were George English, Aubrey Plantagenet Fitz-Johnson (usually known in the wardroom as 'the Dook'), Henry Archer Boyle, and Tobias Tickle.

English was a mild, inoffensive little man, whose chief ambition in life was to retire from the navy while he was still young, marry a wife, live in a small whitewashed cottage miles away from any sea, rear pigs and chickens, and collect butterflies. For all his lack of ambition, however, he was a good and zealous officer. He never made a bad mistake; but never, on the other hand, did anything very brilliant. He was a conscientious plodder.

'The Dook' was a tall, dashing, immaculate person, with sleek and shiny hair. He had a wonderful taste in dress, and how many different suits of plain clothes he possessed nobody but himself and his servant knew. How much he owed his tailor and his haberdasher nobody but those long-suffering tradesmen themselves were aware of, for Fitz-Johnson cast all his bills into the fire immediately on their receipt. His garments were always fashionable and well cut; his ties, collars, shirts, and socks of the newest and most exclusive pattern. His uniform frock-coat fitted his *svelte* figure like a glove; his trousers were always perfectly creased; and on Sundays he always appeared at 'divisions' with a brand-new pair of kid gloves—he never wore the same pair twice. The men called him Algy. He looked it. He was essentially a lady-killer. His cabin was full of autographed photographs of feminine admirers and mementoes in the shape of faded dance-programmes and little knots and bows of ribbon. His bedspread, a wonderful creation in blue silk, embroidered with his crest and monogram, had been worked by one set of fair fingers; his door and scuttle curtains, of chintz, by some one else; and a little bag for his hairbrushes by a third lady. When the mail arrived his letter-rack in the wardroom was crammed with bills, and letters in feminine handwriting. He kept up a voluminous correspondence, but was wise enough never to have more than one ardent admirer in any one place. He was a regular 'devyl with the girls,' there was no doubt about that; and if the ship arrived at some new place, and the wardroom took it into its head it would like to give a tea-fight, 'the Dook' was immediately sent ashore to prospect. How he did it nobody quite

knew; but at the end of twenty-four hours he would be on friendly terms not only with all the young and pretty girls in the place, but also with their mothers, aunts, and female cousins. He was always on the verge of being engaged to be married, but never quite pulled it off. His host of unpaid bills, and the fact that he had little or no money besides his pay, probably frightened him. But, at any rate, he was a valuable acquisition as a messmate, for he sang well, and could play almost any musical instrument under the sun.

His chief failing was that he was never less than a quarter of an hour late for his watch. 'I'm deuced sorry, old chap,' was his usual excuse to the officer he had to relieve. 'The fella didn't call me properly.'

'Oh, to hell with you and your rotten excuses!' would growl the irritated watch-keeper who had been kept up. 'You're about the frozen limit! The corporal of the watch was hammering on your cabin door for at least a quarter of an hour!'

'It really wasn't my fault, though,' Fitz-Johnson would protest mildly. 'Please don't get shirty, old chap.'

It was impossible to be really angry with him; but he continued to relieve late until the other watch-keepers hit upon a scheme of keeping him up for an extra half-hour at the end of his own watch. That cured him eventually.

Boyle, the next in seniority, was a young, enthusiastic, and very energetic officer, who wished one day to become a gunnery officer. He had charge of the after-turret, with its pair of twelve-inch guns, and spent much of his time in a suit of oily overalls scrambling about in the depths of the hydraulic machinery. He was of an inventive turn of mind too, and even at the comparatively early age of twenty-four had already designed a self-stabilising seaplane, a non-capsizable boat, a patent razor-strop, and an adjustable chair. This last, which he used in his cabin, was really most ingenious. It had hidden springs all over it, and you pushed a button and it did the rest. You could use it for anything, from an operating-table to a trousers-press; and it was often brought into the wardroom after dinner on guest-nights for its various uses to be demonstrated. It worked beautifully, until one night the *padre*, who was reclining gracefully at full length, pressed the wrong button in a sudden fit of exuberance. The chair

promptly bucked like a kicking mule. The front shot up and the back fell down, and the reverend occupant hurtled adroitly backwards straight into the arms of an astonished marine servant with a tray full of whiskies and sodas. He came to the ground with a crash, with the marine and the liquid on top of him, and everybody laughed.

The servant, drenched through, retired grumbling to change his garments; and the Rev. Stephen Holiman scrambled to his feet, surveyed the mess of broken glass and liquor on the deck, and then felt his pulped collar and examined his clothes.

'Boyle, you silly ass!' he expostulated, justifiably annoyed, and trying to mop himself dry with a handkerchief, 'why the d-dickens couldn't you tell me the thing was going to pitch me over backwards like that?'

'I'm awfully sorry, *padre*,' spluttered the inventor, weak with laughing. 'You must have pressed the wrong button; but even then I've never known it do that before. Perhaps it wants oiling.'

'Take the rotten thing away and drown it!' retorted the *padre*, as angry as he ever got. 'It oughtn't to be allowed on board. It's ruined my clothes!' But the *padre* was a sportsman with a sense of humour, and after a little more grumbling, during which he got no sympathy from his messmates, cheered up and went off to change. Ever afterwards, when the chair appeared, he endeavoured to make it play the same trick on some unsuspecting guest. But it never would.

Tobias Tickle, commonly known as 'Toby,' was the officer of Martin's division, whom we have already met. He had married very young, and had a rich and pretty wife, who was as popular as himself; but this did not prevent Toby from being a very riotous member of society on occasions. He was loved by his men; for, while very strict, he took a great interest in them and their affairs. He knew the surname and Christian name of every bluejacket in his division; knew whether they were married, engaged to be married, courting, or single; and always gave them good advice when they asked for it. They often did. On more than one occasion he or his wife had helped them in other ways.

Once, when Mrs Buttings, the wife of an able seaman, had been ailing, and had had to undergo a rather serious operation, Mrs Toby heard of it through her husband. She promptly visited the patient, found her living in a miserable little dwelling in a back street in Landport, with four children between the ages of six months and five years, and nobody to look after her except the neighbours. This would not do for Mrs Tickle. She promptly engaged a trained nurse, sent the children off to a farmhouse in the country, visited the invalid daily, saw that she had a proper diet,

and provided her with many sovereigns' worth of coal and luxuries.

Buttings himself, when he went ashore and saw the transformation in his usually rather slovenly home, was furious. Like most blue-jackets, he hated the idea of charity in any form, and went straight off to see Tickle.

'Look 'ere, sir,' he said. 'With orl my doo respects to you, it ain't playin' the game!'

'Not playing the game!' answered the lieutenant, quite at a loss to understand what the man was driving at. 'What d' you mean?'

'Well, sir, it's like this 'ere. I goes 'ome an' finds my 'ouse rigged up like a bloomin' 'orspittle, an' the missus lyin' in bed with flowers, an' beef-tea, an' port wine, an' sich like. I finds another 'oman there a-lookin' arter 'er—dressed up like a 'orspittle nurse, she wus—an' w'en I arks 'er wot she done with the kids, she sez as 'ow they bin sent to the country. W'en I wants to know 'oo's done it, she sez Mrs Tickle. It ain't fair on a man, sir, doin' a thing like that, an' habductin' of 'is kids. S'welp me, it ain't!' Buttings paused for breath.

'I'm sorry you think that, Buttings,' said Tickle gently. 'Your wife has been very ill, and what she wants is good food and proper treatment. She's getting that now. The children, too, are out in the country having an excellent time. After all, my wife didn't do it without asking Mrs Buttings.'

'Yessir. That's all wery well; but I pays the rent o' the bally 'ouse.'

'Of course I understand that. But surely you don't grudge your wife a little comfort after she's been so ill?'

'No, sir, o' course not,' said the seaman, scratching his head. 'But 'oo's goin' to pay for orl this 'ere? Port wine an' chicken jelly ain't got for nothin'.'

Tickle felt half-inclined to tell him outright that he, or, rather, his wife, was prepared to pay for everything; but if he had, the able seaman would at once have been in open rebellion. The nurse alone came to two guineas a week, and the food and little luxuries for the invalid to as much again. 'Well, Buttings,' he said, pretending to consider, 'suppose it costs about seven-and-six a week. That's about it, I should imagine.'

Buttings seemed rather relieved. 'Seven an' a tanner,' he said, more happily. 'I kin manage that, sir. I ain't got much money to splosh abart, o' course,' he hastened to explain; 'but I don't like ter think as 'ow I ain't payin' for what my old 'oman's gettin'.'

And so, for the time being, the matter ended, and both parties were satisfied.

Mrs Buttings recovered in due course, and became her old buxom self, and then it was that she enlightened her husband as to what the Tickle had really done. Buttings was speechless with rage.

But Christmas came soon afterwards, and on the morning itself, as Tickle was having his bath, there came a knock at his cabin door. 'Hallo, what is it?' he asked, springing up and wrapping a towel round himself.

'It's Buttings, sir,' said the seaman, pulling aside the curtain. 'I've got this 'ere for you, sir, from my missus an' meself; an' this, sir, is for your lady. We both wishes you an' your lady a 'Appy Christmas, sir.' There was a suspicious huskiness in his voice; and, after pushing two small parcels into the astonished officer's hands, he fled before Tickle could say so much as 'Thank you.'

One package contained a highly ornamental silver cigarette-case, and the other a small gold brooch of impossible design. Accompanying each gift was a flamboyant card with a chaste design of clasped hands, wreaths and sprigs of

forget-me-nots, and true-lovers' knots. Below were the words: 'In friendship we are united.' Inside, in very laborious handwriting, came the inscription: 'With great gratitude from Able Seaman and Mrs Reuben Buttings.'

'Well, I'm damned!' muttered the lieutenant, gazing at the presents, deeply touched. The little gifts, which had cost Buttings and his wife many of their hard-earned shillings, were their way of showing that they had not forgotten.

Mrs Toby was so overcome when she received her brooch that she nearly wept with emotion. 'Dear, dear people!' she murmured gently; 'I love them!'

And still some folk have the effrontery to say that there is no bond of sympathy between the officers and men of the Royal Navy.

(Continued on page 423.)

FROM SOMEWHERE IN FRANCE.

MY DEAR . . .—There has been such an orgy of grumbling this year both at home and abroad, and we're all so full of our own imperfections, that it was quite a joy to see a show that seemed to be running really well, to be saving waste, and to be full of energy and go. The other day we were taken to see one of the great army workshops out here in France which make and mend—darn and stitch, I was going to say—for the army at the front. It was in a famous French town not unknown to English history in the past, and often in our minds to-day.

When war broke out, and our Government saw itself compelled by dire necessity to raise and train great armies, and send them to northern France, it leased a big site—a timber-yard—in this French town, and paid the owner a handsome rent for the use of his ground and buildings. They say he is a discontented man to-day, for if he still had the timber and the yard how much more he could get!

The beginnings were small, but to-day it would take you many hours to visit and really see the many activities that are centred there. We began on boots! They were particularly interesting, because boots are a subject always near the heart of an infantry officer. It is wonderful how quickly a private soldier will 'do in' a pair of the stoutest ammunition boots, wonderful how soon he finds a chance to 'treat' the toes before a good hot stove, and more wonderful still how long he will suffer a half-amputated sole before he can be induced to face the shoemaker's shop!

Flanders mud and *pavé* roads are hard on leather! And here in the repair-shops we found a shed stacked to the roof with old boots, most seemingly past repair, never two of a pair together, but nearly every one destined to be

remade, mated, soaked in oil, and sent out again; and, better still, welcomed by the troops to whom they are issued, for the remade boot won't need 'breaking in,' and how well we all know that painful process necessary with the new article! And here in the shops we saw workers from London, from the Midlands, Kettering and Northampton; skilled men working as I believe they never worked before. We've heard tales of workers who were slackers at home; never did work seem more strenuous than it did at this 'base' workshop. There was no fake about that. We were with no official party, with no 'important visitors.'

Then from boots to 'smoke helmets,' and here it was woman labour—girls from the countryside and neighbouring villages sewing, folding, packing, all leading up to the mysterious chemical baths which the helmets suffer before they go out in their special bags all stamped and numbered, to be carried over the shoulder and *never* left behind, lest haply the poison gas should catch our men unprotected. And the work goes on by shifts night and day, and the lady in charge told us proudly how the thousands of the output had run up and up.

After a visit to the dipping-rooms, where the odour of the 'preventives' did not invite one to linger, we went on to the 'arms hospital.' Hospital indeed! From an injured field-gun to the tap-screw of a water-cart, they were all there being mended; rifles old pattern, new pattern; limber wheels, limber couplings (often invalids, but now better devised than in early days), pumps, sprayers, machine-guns, Lewis guns—all the appliances of war, damaged and battered, often red with rust, often seeming past repair, but all destined to be put to some use. In this part, too, was a wonderful machine-shop, and

we were asked to admire the very latest thing in universal lathes. 'Yankee?' said somebody. 'No; Coventry, England. And the best at that.' This from the mechanic who was operating it, who was prepared to discuss the relative merits of the whole race of machine-tools, for had he not come from the Great Western Works at Swindon, and his next-door neighbour from Crewe! There were other subjects to discuss: the earnings of the gentry who had stayed at home and volunteered for nothing, for instance! But *that* is quite another story, and you know all about *that* at home.

Talking of grumbles reminds me of a subject of conversation among our men. We hear it on route marches, in billets, everywhere. That is the unexpected inequalities of service. It did not occur to them when they enlisted in those early enthusiastic days (not that it would have made a shade of difference) that the fellow-workmen who stayed behind were going to come into princely earnings largely through their absence. And now, when they read of the necessity of mobilising all able-bodied labour for war, warlike stores, or necessary trades, it seems a bit hard that those who are labouring farthest from danger should pick all the plums, and those who—well, didn't just rush to enlist should now pose as the champions of labour. Maybe there'll be some adjusting to be done when the lads come home at last!

But I've wandered away from the workshops. And there were many departments I haven't the

space to describe—from the rag depository to the furnaces for melting down spent ammunition-cases. In days of peace I've visited, as an interested (and no doubt tiresome) stranger, many a workshop—at home in Scotland, in England, in France too, and in America, where we all know they do things twice as quick and twice as well as anywhere else in the world! But I've never seen shops more strenuous or workers more obviously meaning business. And that day's visit cheered us up quite a lot!

By the by, we really found a Flemish town at last that pleased the eye. It clusters round the top of a steep hill, and is full of seventeenth century buildings, and girded about with picturesque gates. Incidentally the Bosches are reputed to have shelled it from Heaven alone knows how many miles away; but, like all our 'background,' it remains quite calm. And I was taken to a château, too, really worthy of the name, for we have casually called many a twopenny-halfpenny villa a 'château' since we came to visit Flanders! This one is real, though—early fifteenth century, with many patches since, but towers and gables and moat unmistakable and pleasant to look at. And in the courtyard are iron staples where a British regiment of hussars picketed their horses when they came with the army of occupation in 1815; and here we are back again in this cockpit of Europe. Will the generation of A.D. 2000 come back to war in Flanders? If they do, I hope they get the business over before they have a month of storms like March 1916!

THE JUDGE'S WATCH.

CHAPTER I.

JUDGE SELWYN was trying to soothe the feelings of the pursuer, and it must be admitted the latter had grounds for being ruffled. The case was a peculiar one. Strictly speaking, it arose out of another case.

The pursuer and the defendant, personally unacquainted, had found themselves fellow-travellers in an otherwise empty railway carriage. Defendant had fallen asleep, and on waking had found himself minus his watch. Whereupon he had accused his companion of stealing it, and at their destination had had his indignant fellow-traveller arrested. On his return home he had been confronted by his watch reposing on the dressing-table! Dumbfounded and dismayed, he had started, hot of foot, to retrieve the mistake he had made, but too late to prevent the accused spending a night in the police-office. In retaliation, the outraged man had brought an action against his accuser for defamation of character and unlawful detention.

The case had provoked a considerable amount

of interest, and a number of counsel were present in court, as well as the general public.

Judge Selwyn, still pouring oil on the troubled waters, wound up facetiously, even faintly jocose. The mistake was, after all, a natural enough one. The court might be amused to learn—here he slipped his hand within the folds of his gown—that he had committed the identical mistake that very morning—started from home without his watch! In these days of cerebral activity certain actions became subconscious, such as winding one's watch or putting it in one's pocket.

The court smiled, as the world does when a great man elects to unbend so far as to class himself with frail fellow-mortals.

On that day, as it happened, the Judge was in high good humour. A lady had stopped him that morning to compliment him on his youthful appearance; and if there was one thing the Judge prided himself upon, it was on defying the years. And one catch-phrase he regarded

with a positive detestation, 'Too old at forty!' A second fact which contributed to his genial humour was that there were one or two guests expected to dinner that evening at The Laurels, promising young barristers for the most part. The Judge made a sort of cult of giving such 'a leg up.' It tickled his vanity to know himself the mighty ladder by which those youthful aspirants climbed. Sir Daniel and Lady Yates had been included in the party—the latter to lend moral support to Belinda, the Judge's daughter; Sir Daniel to act as a breakwater between the Judge and his younger guests, to render presumption or familiarity on the part of the young barristers impossible.

Incidentally the Judge noticed there were several of the evening's prospective guests in court. There was also an uninvited guest—a young barrister—a certain Desmond Dawkins. The young man had no interest for the old one further than that he had dared to lift presumptuous eyes to his only daughter. The sublime audacity of the thing! He was a handsome young ass; but looks with the Judge didn't count, he having none of his own. He vowed, also incidentally, he'd put his foot down on Dawkins, though Belinda, obstinate young monkey, most certainly encouraged him.

That afternoon the learned Judge took his way home on foot. As a rule he motored. When he went on foot he was liable to many halts. There is no more widely popular virtue than success. *'Men will praise thee when thou doest well to thyself.'* And success exuded from the Judge at every pore. The consequence was he got held up at the distance of every hundred yards or so. But he enjoyed it. He swelled himself out and strutted. And what man had a better right? Had he not created himself from the outset?

Eventually he inserted his latchkey in his own door. His abode was a blaze of vermilion paint and white enamel, of electric light and glowing fires and luxurious velvet carpets—all silent tributes to his genius!

There came to meet him at this juncture his only child, beautiful as Jephtha's daughter. She alone, perhaps, could pierce the crust of his self-complacent vanity. 'Holloa, dad!' she said, and brushed his cheek with her lips, and linked her hand in his arm. She too believed him to be the last word in embodied wisdom.

'Well, sweetheart?' he greeted her.

'Cyril Smart has fallen off!' she announced abruptly.

'Humph! And at the last moment—too late even for a fill-in!'

'I've got a stop-gap!' she answered. 'Desmond Dawkins!'

The Judge frowned. 'You should have got some one with brains!' he responded, hiding his annoyance. 'The rest are all "brainy." He'll be like a fish out of water.'

'Then he'll keep me company. Otherwise I'd have been out in the cold.'

The bewildered father, whose life-business it was to read his fellow-mortals' inmost thoughts, found himself vaguely groping after the workings of his daughter's mind as he followed her into the drawing-room.

She made his tea, gave him a cup, and handed him a muffin.

After which the Judge rose. Not even to Bridgeman would he relegate the solemn responsibility of decanting the port.

'By the way, dad,' Belinda addressed him as he neared the door, 'such an odd thing! No fewer than three messengers have called this afternoon for your watch! I fancy it's the confusion of war-time, but it seems a "footling" thing for Swayne & Gull to have done.'

But her hearer had crumpled up and collapsed in the nearest chair like a pricked balloon. His face had gone ghastly. One eye squinted ferociously, as it did when he was mightily moved, and his pendulous, clean-shaven lips twitched. 'My watch!' he gasped. 'What do you say, Bel?'

'What it is to have a suspicious legal mind!' she playfully rallied him. 'I know how you value your watch, dad. But, believe me, there's no harm done. I only meant it was stupid of Swayne & Gull to send so often. I dare say I'd never have known had Bridgeman been at home; but he wasn't, and Annette answered the bell.'

'And they all said they had come from Swayne & Gull?' stuttered the Judge, and covered his shaking lips with his hand.

'Dad dear!' Belinda reasoned with him, vaguely uneasy, 'from whom else could they have come? Annette asked them if they were from Swayne & Gull, and each one said he was. No harm can have come to your watch. Three messengers means over-zeal, not carelessness, take my word.' She jumped up as she finished, a dismayed eye on the ormolu clock ticking on the chimneypiece. 'We haven't too much time to dress!' she ejaculated, and left the room.

The Judge collected himself with an effort. He looked unaccountably white and shaken. 'Gave myself away that time,' he muttered to himself, 'by Jove, with a vengeance! The wonder is there weren't half-a-score of messengers instead of three! Tempting Providence! Court-ing robbery! That's about it,' he ruminated. 'And not a chance of recovering my watch without advertising myself a fool!' He moved heavily to the dining-room.

The immaculate Bridgeman was there awaiting instructions. Bridgeman had apparently accepted the fable of Swayne & Gull. His master daren't deceive him.

He superintended the solemn rite of decanting, after which he dragged himself heavily upstairs. His eyes travelled to his watch-stand,

empty, on a table by the bed. The watch itself was valuable—a presentation—and possessed a curious 'engine-turned' plate inside, unique in its way. Apart from its intrinsic worth, it had associations. But it was lost irrevocably, and he dared make neither moan nor effort to recover it. His sense of justice was outraged. The soul of the man was sore vexed within him. But he was helpless. Already he had advertised himself a fool. Let him not emphasise the fact of his folly. An infant could have foretold the consequences of that rash remark of his let drop in court. Good heavens! where had his wits been? He wondered drearily, as he tied his white tie before the mirror, whether perhaps his brain had lost its keen edge.

While the Judge was indulging in these dismal reflections, in the drawing-room his daughter, a bewildering apparition in ivory satin, with a flame-coloured bow at her waist, was in intimate confab with the 'stop-gap,' Desmond Dawkins, who had arrived early.

'Your father didn't kick up a shindy when you told him you'd invited me, Linda?'

She smiled bewitchingly up at him. 'He accepted you with philosophy.'

'Made the best of a bad bargain!' the young man whimsically paraphrased. 'I wish to heaven he'd accept me with philosophy as a son-in-law!' he sighed, his fingers closing over hers as they rested on the chimneypiece.

'Perhaps he will—some day! It's no good rushing dad.'

'If only I could tackle him to-night!' breathed the lover.

'Desmond!' she protested, shocked. 'It's as much as your life's worth. Dad's like a motor-car. He has moods. To-night isn't his best. Something's put him out.'

'I say, Linda,' complained the young man, 'I've got the confoundedly unpleasant feeling, when with your father, that he doesn't think much of me!'

'He doesn't think much of many people,' she consoled him.

'Except himself,' reflected her lover bitterly. 'Look here, Linda,' he proceeded, a certain edge on his tone, 'it's a funny thing how a man like your father—all brains, you know, and contemptuous of men with less than himself' (here his companion winced)—'can make the most glaring *faux pas* upon occasion, simply give himself away, blurt out a thing a kid might be trusted not to blab.'

'That doesn't sound to me like dad!'

'He gave us a specimen of it to-day in court, though,' pursued the young man with secret gusto. And he rehearsed the incident of the watch. 'Positively an invitation to the riff-raff of the city,' he wound up. 'The marvel is your house wasn't besieged.'

But his hearer had sunk on a chair. Her gray eyes stared stupefied; her breath came in

gasps. Every drop of blood had left her cheeks. 'The house *has* been besieged!' she breathed in an awed whisper. 'Bridgeman was out! The first man said he came from Swayne & Gull, or, rather, Annette asked him if he did, and he admitted it. So did the second, ditto the third.' She gazed affrightedly at her companion, who gazed back at her.

He spoke at last. 'You've told the Judge?'

She nodded.

'How did he take it?'

'Badly! Now I think of it—very badly!'

'Raised a hullabaloo, did he? No wonder!'

She smiled faintly at the word as describing her pompous parent. 'He looked as if he might have liked to.'

'Stopped short of giving himself away a second time,' reflected the young man. 'Realised he'd better save his face.'

'Look here, Linda.' He spoke again after a meditative pause. 'Tell you what, my dear girl, I'm rather afraid they mean to have your father "on toast" to-night.'

'Do speak English, Desmond!' Her nerves were on edge.

'Well, these fellows coming to-night, you know—they heard the Judge give himself away in court. You bet they'll want to "pull his leg" for it. And he won't like it.'

Belinda paled. 'But will they dare?'

'You see, he's so precious hoity-toity and patronising, your respected parent—if you'll excuse my saying so—and human nature simply pines to get its knife into that sort.'

The girl bit her lip in meditative gloom.

'I'm wondering whether perhaps I couldn't checkmate them,' mused the young man aloud.

She clasped her hands and stood up, her attitude one of passionate pleading. A rescuer! A saviour of her father from this unthinkable mortification! 'I'd give you anything in the world if you would, Desmond!'

'A kiss, for instance?'

For answer she put her two hands on his shoulders, stood on tiptoe, and touched her lips to his delicately. It was like the brush of a bird's wing.

He whispered, 'Trust me, sweetheart.'

CHAPTER II.

THE lovers had barely time to shoot apart on the entrance of the Judge. The guests succeeded in rapid rotation. When they were all present, Dawkins discovered he had left his handkerchief in his coat-pocket, and repaired to the cloak-room to recover it. The light was bad, and he tried three strange and unfamiliar coats before he lighted on his own. Eventually he discovered the missing article had been up his sleeve all the time. But, in spite of this, he tiptoed up to his host's bedroom before his second advent to the drawing-room. Altogether

his movements were mysterious, but luck favoured him, in so far as he met no one in his peregrinations. He managed to slip into the drawing-room unobserved, taking cover behind Bridgeman's stentorian 'Dinner is served!'

Not one of the guests but noticed that the host was not in his usual form. A depression seemed to weigh upon his spirits, from which he roused himself with a palpable effort.

Belinda, queening it at the head of the table, cast more than one anxious, furtive glance in the direction of her father's frowning brows. Her eyes then turned to her lover. The atmosphere was heavy with impending doom. A humiliation, a mortification of some description, was awaiting her parent! Desmond had promised to checkmate his tormentors; but, while her heart confided in her lover, her judgment hardly approved her faith. Her father wore a nervous, harassed look unfamiliar to her.

Sir Daniel Yates, on her right, commented on it. 'Judge not looking himself,' he observed. 'Been overdoing things of late. He and I aren't so young as we once were. Don't be offended, my dear young lady; but, as a case in point, your father hardly displayed his usual acumen in court to-day. By the way, he hasn't had his watch thieved this afternoon? Well, now, I'm afraid he deserved it,' as Belinda shook her head. (Her swift perception told her that through the table's talk Sir Daniel's words had caught her father's ear.) 'Pure good-nature,' pursued her partner. 'Soothing the ruffled feelings of a man who had spent the night undeservedly in a police cell, having been wrongly accused of robbing another man of his watch.' And he rehearsed the story for Belinda's benefit. 'A man of your father's shrewdness to give himself away like that!' he ended with a laugh. 'Well, well, the public is more dense or less dishonest than we give it credit for!'

But the guests near by had caught the gist of Sir Daniel's remarks, and looked conspiratorial, or so thought Belinda. Then—she never quite knew how it happened—the word 'watch' ran down the table. It seemed to her it was Kenneth M'Clure who set the wretched ball agoing. A wave of understanding seemed to ripple over the guests like a breeze across a cornfield. Belinda was sure that only Sir Daniel and Lady Yates were excluded from the conspiracy.

'A curiosity!' Vaguely the phrases penetrated to her. 'Unique of its kind!' She glanced at her father. He was like an animal being tortured.

Then M'Clure, with a fiendish inspiration, put the question: 'Got it on you now, Judge? Pass it round, won't you?' There was malice in the suggestion. M'Clure had always been jealous of his professional brother.

Again, Lady Yates: 'May I see this curiosity, Judge?'

Upon this the traditional silence in which a pin might be heard to fall. The entire table, to

Belinda's tortured senses, seemed to hang upon her father's lips.

'I never wear my watch in the evening!' At last the words were wrung from the Judge.

'Doesn't mean to gratify our curiosity!' M'Clure addressed Lady Yates, with assumed lightness.

'Do send for it!' urged the unconscious lady. 'My curiosity is immensely piqued.'

The servants had withdrawn.

The guests, one and all, seemed to focus their attention on their host. To Belinda's quivering senses it was conspiratorial the way in which all other topics were by common consent abandoned. To her agonised eyes her father *writhe*d. A sickly smile quivered at the corners of his lips. Like a creature that can find no cover, he temporised. He glanced round and murmured 'Bridgeman!' perfectly aware that no Bridgeman was within hail.

To Belinda's sharpened perceptions the conspiracy grew and swelled. Glances of mutual understanding flashed between the guests. They meant, as Desmond had graphically put it, to have the Judge 'on toast.'

Then, of a sudden, something unexpected happened. Desmond Dawkins leaned forward and addressed his host. 'Shall I ring the bell, sir?'

The Judge met his eye, squinting ferociously, as was his wont when powerfully moved, and the glance, to his daughter's eyes, was murderous. It gave tardy place to a conventional smile. The infatuated young man chose to take this for assent, and before he could be stopped had rung the bell.

Bridgeman answered; to whom said his master in accents of constraint, 'Bring my watch, Bridgeman!'

In that moment of torturing suspense Belinda accorded her parent a passionate admiration.

As the door closed on the butler a pregnant silence fell on the company. No one tried to speak except the unconscious Yateses, and no one replied to them when they did. The entire table, Belinda now perceived, was in a cabal against her father. They were all legal. They didn't love the Judge. It is never disagreeable to mete out punishment to our enemies, especially to our enemies in high places. It has a salutary quality about it rather seductive to the meters-out.

Belinda, feeling numb and paralysed, crushed a grape between her fingers as she listened for Bridgeman's return. What would her father do when he announced there was no watch? Feign astonishment? If he did, he'd only give himself further away! The guests would poke fun at him, or worse! However subtly veiled, they'd manage to insinuate they considered him a fool. Hadn't he proved himself the veriest simpleton in giving the public a lead to the catastrophe? Hadn't he practically invited the criminal world

to the theft? It might even leak out that there had been *three* attempts to get at the watch.

These reflections flashed lightning-quick through Belinda's mind while she waited. A cynical anticipation of enjoyment played about the lips of most of the guests. Her father looked like a criminal awaiting execution. Her eyes sought Desmond's, furious, withering. He *was* an owl! What had possessed him officiously to offer himself as her father's executioner, so to speak? Then she was suddenly arrested by an odd expression on his face.

Simultaneously the door opened. Enter the immaculate and unconscious Bridgeman, and laid the watch with precision by his master's plate!

The faces of the guests were a study! The jaws of half of them dropped. They exchanged mutual glances of consternation. Only Lady Yates and Sir Daniel preserved an expression of interest and innocence.

The Judge himself looked as if the watch had descended from heaven with manna-like directness. About Desmond Dawkins's lips there played an expression of quiet triumph. Belinda looked as she felt, dazed and dumbfounded.

Lady Yates interrupted the concentrated gaze of the Judge upon the familiar face of his time-keeper by lifting it. 'Very much like other watches—on the face of it,' she observed, scrutinising the disc with tortoise-shell *pince-nez*. 'So this is what is called "engine-turned"?' she proceeded, prising open the case, and regarding the inside.

Suddenly Belinda, realising that somehow a crisis had been tidied over, recollected her duty, caught her guest's eye, and swept her from the room.

When the ladies had gone, a profound silence settled on the company. The watch lay on the table, but those who had professed the keenest curiosity seemed to have lost interest in it. The company—with the exception of Sir Daniel and Dawkins—exchanged a sort of wireless telegraphy. It was evident that some piece of machinery had gone wrong, and it seemed to be held that a young barrister, a certain Sidney Cust, was mainly responsible.

During dessert the Judge's spirits seemed to rise in inverse ratio to the descent of gloom upon the company. Mr Cust broke away from the procession filing to the drawing-room, and made a mysterious *détour* by the cloak-room and his overcoat, whose pocket, judging from the invectives which flowed from his lips, he found most mystifyingly empty.

A traitor in the camp! But who? The others were as disconcerted as he. And they were all 'in it' except Sir Daniel and Dawkins. No good, the plotters had decided, to take Dawkins into their confidence, it being unlikely that a young man so patently 'gone' on Belinda would see the humour of 'pulling his

future father-in-law's leg,' no matter how beneficial the process might be to that gentleman's soul.

The guests were at their wits' end. In due course they departed, still at that perplexing mental extremity. Dawkins alone availed himself of the Judge's restored equanimity to linger. His host seemed to have forgotten him, for, having let drop the information 'that he would be back presently,' he repaired to the library, whither he summoned the butler.

The immediate advantage of his departure which Dawkins took was to take his hostess in his arms.

'Mind!' that young person admonished him; 'you're crushing my chiffon!'

But, instead of regarding the warning, he approached his face to hers till their lips met.

'Really, Desmond!' she remonstrated.

'Really, Linda!' he mimicked tenderly.

'What would dad say if he knew?'

'That a man who'd got him out of such an infernal hole as I had deserved anything he could name—to the half of his kingdom!'

'What *do* you mean, Desmond?'

'What I say,' responded that young man calmly. 'Those fellows had come meaning to give your father the worst "roasting" he'd ever had in his life! Saw their chance the instant the Judge gave them their cue in court. Sent and got the watch for the first time of asking. Your humble servant, perceiving likewise how the land lay, likewise sent—too late! A common or garden thief—the wonder is there weren't half-a-dozen of them—came in an easy third, likewise, providentially too late. As it happened, I got wind of the conspiracy by the merest off-chance. The programme they had sketched was on this wise. Knowing the Judge's habit was never to wear his watch in the evening, they arranged they would work the conversation at dinner round to it. Your father would then be asked to send for his watch. He would show blank dismay on finding it gone. Wounded *amour propre* would succeed to this when he realised that he, and none but he, was to blame for its defection. He, who prided himself on his astuteness, had walked into a pitfall the veriest tyro would have avoided!'

'Yes!' struck in Belinda, breathless. 'And how did you checkmate them?'

'I slipped out of the room before dinner, and explored their overcoats. I discovered the watch in Cust's. At the dramatic moment, when Bridgeman should be at the end of his resources, it was to be presented to the Judge, and so complete the tableau and his humiliation! I transferred it from the plotter's pocket to its accustomed watch-stand in your father's room.'

The young man paused, out of breath.

'Desmond,' exclaimed the girl admiringly, 'I had no idea you were so clever!'

'Geniuses are not generally appreciated till after death!' admitted Dawkins modestly.

'It's the sort of thing dad would have simply loathed, to be caught so patently tripping,' she reflected aloud; 'to be made a laughing-stock of! I wonder,' she proceeded, 'whether he has solved the mystery by this time. When he's enlightened he'll feel he can never sufficiently repay you!'

'He need have no delicacy on that score! It'll be the easiest thing in the world!' said Dawkins.

'You mean he'll be able to get you promotion? Well, of course, he has weight in legal circles.'

'That sort of promotion wouldn't content me.'

'Dear me! I'm making all sorts of discoveries about you. First, how cute you are, then how ambitious! Dad mayn't have anything to offer you worthy of your august consideration!' She was slightly ironical, because slightly nettled.

'Oh, yes, he has!'

'What, pray?' The adorable lift of her chin, the challenge in her gray eyes, was irresistible. 'What?' she reiterated.

'Can't you guess?'

THE MONTH: SCIENCE AND ARTS.

HYDRO-ELECTRIC DEVELOPMENTS IN CANADA.

ONE outcome of the war which is likely to prove of far-reaching economic effect to the Empire in general is the greater attention which is being devoted to the utilisation of water-power for the generation of electricity in connection with industry. As is well known, the Dominion of Canada is probably more lavishly endowed with possible water-power than any other country in the world. What can be achieved by harnessing this abundant energy for industrial purposes has been revealed at Niagara, and further developments are in prospect. A short time ago a contract was made for the construction of a huge barrage across the St Maurice River, two hundred and forty miles above its confluence with the St Lawrence. This barrage will be two thousand feet in length by eighty feet in height at its highest part, and will cost about three hundred thousand pounds to construct. It is stated that the reservoir which will thus be formed will exceed that produced on the river Nile by the huge barrage at Aswan. In this manner a flow adequate to drive the turbines which are to be laid down for the generation of the current will be obtained for three hundred days during the year. It is also intended to construct another barrage across the foot of Lake St Francis, an expansion of the St Lawrence River about thirty miles below Montreal. This work, which will control a part of the waterway, will cost about twenty thousand pounds, and its object is to secure greater regulation of the water-flow than is at present possible. As things are, the amount of water varies considerably, being much less during winter than in spring, when the snow and ice melt. By means of the reservoir which will be formed it will be possible to obtain a sufficient storage to equalise the supply, to the advantage of all the hydro-electric plants between Lake St Francis and Quebec. Serious attention is also being devoted to the fixation by electricity of atmospheric nitrogen and the production from the air of

synthetic ammonia, which is already being done in Germany. It is suggested that the enormous volume of water-power in Upper Quebec, formerly known as Ungava, should be used for this purpose. This power is at present running to waste, as the extreme coldness of the country prevents its agricultural and economic development. Some of the Ungava waterways are of considerable dimensions, and abound with big falls. Thus the Great Whale River, which flows almost due west about latitude fifty-five degrees to empty itself into Hudson Bay, has numerous falls ranging from sixty-five to three hundred and fifteen feet in height, two of the highest being within twenty miles of its estuary. At present this waterway is too remote from the settled portion of the province to be profitably harnessed for industrial purposes, although the settlement of the province along the Hudson Bay coast is quite likely to take place upon the completion of the Hudson Bay Railway and the opening of Hudson Bay to navigation. At the moment, however, the utilisation of the water-power available upon the Hamilton River, which flows eastward through Ungava to empty into the Atlantic, south of latitude fifty-five degrees, is attracting the greatest measure of attention. This stream has a waterfall three hundred and two feet in height, while the fall of the river itself through a distance of twelve miles is no less than four hundred and sixty feet. It is estimated that this total fall of seven hundred and sixty-two feet would furnish some three hundred thousand horsepower. It is proposed to erect, probably near Rigolet, plant which would serve a considerable portion of Labrador, and in addition to producing fertiliser from the atmosphere, no doubt other branches of manufacture connected with electrical development would be carried on, particularly as abundant reserves of limestone are to be found within easy reach of the proposed station. The fact that the authorities are keenly alive to the hydro-electric possibilities of northern Quebec is shown by the comprehensive manner in which they are surveying the available resources.

SABULITE, A SAFE MINING EXPLOSIVE.

Elaborate tests have been carried out at the Anaconda copper-mines in Montana with the Belgian explosive known as sabulite. It has been adopted for use in Australian and New Zealand mining operations with satisfactory results; but the Anaconda Copper-Mining Company's experiments were its first application in the States. This explosive is stated to be safer and more powerful than 45 per cent. dynamite, and to be almost free from noxious fumes. It is a simple mechanical mixture of nitrate of ammonia, trinitrotoluene, and calcium silicide, the last-named being a recently discovered product of the electric furnace. It is used as a substitute for the powdered aluminium which enters into the composition of certain ammonium nitrate explosive agents, and is not only cheaper than powdered aluminium, but has the great advantage of being stable under normal atmospheric conditions. An important feature of sabulite is that it will not explode unless a detonating-cap is used. At the American tests the cartridges were burned, bored with a white-hot iron, subjected to blows from a sledge-hammer upon an anvil, and fired at with a rifle. In every instance the contents failed to explode. But when the cartridges were fitted with a detonating-cap, and were used against hard granite, the blasting effect was most impressive, and compared favourably with that produced by dynamite. Unlike the latter agent, sabulite is frost-resisting, and does not deteriorate with age if it is kept dry. Apart from its safety in handling, it is advantageous in mining operations, because few injurious products of explosion are given off, so that work may be resumed upon a shattered rock-face immediately after the blast. In tests which were carried out in Australia in a closed experimental gallery, it was found that the atmosphere immediately after the explosion was contaminated by carbon dioxide to the extent of only .26 per cent., while there were no traces whatever of nitrous fumes or carbon monoxide.

WATER-MASSAGE FOR THE WOUNDED.

One of the latest and most ingenious appliances for the rapid restoration of wounded soldiers is the 'whirling' or 'whirlpool' bath. In reality this is a form of massage by water preparatory to manual massage. The bath is prepared in two forms, one for the legs and the other for the arms. The vessels are fitted with taps controlling the admission of hot and cold water, as well as an array of nozzles for the distribution of the water. The bath is filled with water at about eighty-six degrees Fahrenheit, and the limb is immersed for a time so as to accustom the patient to this temperature. The taps are then turned on, and the setting of the nozzles is so arranged that the water is induced to race round and round the injured limb, the water meantime being gradually in-

creased in temperature. The whirling action is somewhat remarkable in its effect, for whereas the skin could scarcely tolerate the water when still, it is readily able to bear far higher temperatures when the water is whirling. The skin assumes a healthy natural glow, testifying to the reaction which is taking place. The treatment lasts for about twenty minutes, and immediately upon withdrawal of the limb manual massage is practised. One result of the water treatment is that the patient is able to stand the manual massage without the slightest pain, although possibly before immersion in the bath he could not bear the injury to be touched. When the wound is above the thigh, instead of a bath being used, the patient is subjected to treatment from a hose, which is equally effective. The cures which have been wrought by water-massage have proved remarkable; it has triumphed when all other treatment has failed. It has been introduced into this country as an experiment; but doubtless the achievements recorded in France, where it is being used upon an extensive scale, will be repeated, when its more widespread application may be accepted as certain. In Paris, where the Grand Palais has been converted into a huge hospital, some two thousand five hundred wounded soldiers, the greater proportion of whom have been discharged from other establishments as incurable, are constantly under treatment.

FERTILISERS FROM BANANA-STALKS.

One result of the war has been the complete cessation of our supply of potash for fertilising purposes, for the whole of it came from Germany, where, it may be remembered, it constituted a powerful monopoly. Yet this chemical is indispensable for nourishing the soil. Under these circumstances it is incumbent upon us fully to avail ourselves of every source of supply, no matter how unlikely or unimportant it may at first sight appear. One such possible source was described recently by Mr R. H. Ellis before a Leeds meeting of the Yorkshire section of the Society of Chemical Industry, and the discovery was the direct outcome of a chance observation. Mr Edward E. Lawson inadvertently left some banana-stalks lying upon the polished seat of his office chair. Upon his return he was somewhat surprised to find that all the French polish had been removed at the places where the stalks had been in contact with the wood, pointing to the presence of some strong alkaline reagent. He communicated his observations to Mr Ellis, who thereupon investigated the economic possibilities of the discarded stalks, although his main line of examination was the suitability of the tough fibre for paper-making. While engaged in this work he noticed that the juice of the stalk, when it came in contact with the human skin, set up a decided irritation. Accordingly he probed the mystery more deeply, ultimately to discover that the stalk contained a high percentage of potash, and

practically no soda. This analysis was subsequently confirmed by Dr A. J. Hanley, of the Agricultural Department of Leeds University. As a matter of fact, it was ascertained that the dried matter of the stalk contained as large a percentage of potash as the German kainite. The investigations showed that a ton of the useless stalks would yield one hundred and eighty-eight pounds of dried matter containing 13·7 per cent. of potash, or fifty-four pounds of ash containing 47·5 per cent. of potash—that is, over twenty-five and a half pounds. The yield may not appear to be very great per ton; but, when the huge consumption of bananas is borne in mind, it should represent in the aggregate a considerable amount. For instance, it is computed that in Leeds alone the stalks of at least four thousand bunches of bananas are burned as useless every week. These weigh sixteen thousand pounds, and contain one thousand three hundred and forty pounds of dried matter as rich in potash as kainite. Probably other cities could point to a weekly consumption proportionately great. At present these stalks are regarded as refuse, and are disposed of in dust destructors; but if the whole available yield were scientifically treated, so as to secure the maximum yield of potash, an appreciable contribution would be made to our fertilising agents. It is quite possible that other vegetable matter, similarly destroyed, is proportionately rich in this essential, and it is suggested that all vegetable refuse should be collected separately and treated by itself. The collection of the banana-stalks should offer no insuperable difficulty. The markets, municipal and otherwise, where the fruit is sold should collect the stalks, or arrange with the purchasers for their return after the fruit has been detached. Similar arrangements are carried out in Germany in regard to other refuse of proved economic value, and what is feasible in that country is surely possible in these islands. Unfortunately we do not seem to realise that the most apparently useless material may have a distinct economic and commercial value when submitted to the prescribed scientific treatment. It is the recognition of this that has enabled the Germans to build up large and flourishing industries out of sawdust, to produce gas from blast-furnaces, and in other ways to turn to profitable use 'waste' substances which we, in our prodigality, consider fit only for summary destruction by fire.

A NOVEL SELF-PROPELLED INVALID-CHAIR.

A chair which should make a wide appeal, not only for the use of invalids at health-resorts, but also for wounded soldiers at convalescent homes, has made its appearance. It resembles the familiar four-wheeled Bath-chair; but at the front, under a small bonnet, is placed an electric motor developing about one-quarter horse-power, this power being transmitted through simple

vertical gearing to the front wheels. Beside the occupant is a small single-lever controller, the movement of which gives one of four speeds as desired; while, if moved to a fifth position, it applies a powerful band-brake capable of stopping the vehicle upon a steep hill. Near the controller is a small interlocked switch by means of which four speeds in the reverse direction may be obtained, together with the powerful braking effect. Steering is carried out in the usual manner by a tiller. The motor is fed from a battery weighing about sixty pounds placed beneath the seat, and this is of sufficient capacity to enable the chair to cover, upon a single charge, approximately twenty miles along a level road. Speeds up to about five miles an hour are possible. The chair weighs about two hundred and eighty pounds, of which the motor, the gearing, and the battery represent one hundred and forty pounds. It was submitted to one of the hospitals in the metropolitan area now devoted to military service, and the simplicity, ease, and perfection of its control aroused considerable interest. Nowadays, owing to the facility with which batteries can be charged at a small cost, this invalid-chair should meet with a successful future. The accumulator can be recharged during the night when the chair is not in use; and it enables the invalid to move about as he pleases, without physical effort or the need of an attendant.

THE URGENCY OF REAFFORESTATION.

Military activity has made considerable inroads upon our supplies of home-grown timber, and many valuable stretches of forest have been heavily depleted. But reafforestation should be carried out upon a scale at least equal to deforestation. Planting of young trees should be commenced without delay. Unfortunately, however, the nurseries which normally supply all our needs in this direction are not in a position to meet the situation. Shortage of labour is responsible for a diminution in the maintenance of the stocks of young trees, while the demand for greater quantities of home-grown food-stuffs is taxing the resources of the agriculturist to the utmost. The President of the Board of Agriculture, realising the gravity of the situation, is urging that one and all should participate in the cultivation of trees. Any contribution to the work, no matter how slender, will be of value. Certain trees, such as the larch, the common spruce, the sitka spruce, the Scottish pine, the Douglas fir, the silver fir, the Corsican pine, and the beech, are recommended as being in the most urgent demand. The Royal English Arboricultural Society is attacking the problem earnestly, and it is a task in which many can extend assistance. Possibly, after the war, we may follow the practice of extensive tree-planting which is in vogue in some other parts of the world, one day in the year

being set aside for a festival of this character. Another field of activity in which the amateur gardener can assist is the cultivation of herbs for pharmaceutical purposes, a dearth in the supply of which is threatened in the near future unless timely steps are taken. In order to stimulate public interest and to secure co-operation in this direction, Mr E. M. Holmes, of the Pharmaceutical Society, has delivered a lecture upon the growth, culture, and preparation of medicinal and domestic herbs before the Royal Horticultural Society, which deals with every phase of the problem. It is not generally known, but this branch of agriculture can be made highly lucrative, more especially as the demand is in excess of the supply.

A NOVEL LIGHT-DIMINISHING SCREEN.

The drastic lighting regulations which have been enforced for the defence of the community against aerial attacks have rendered the tasks of those responsible for public lighting extremely difficult. A certain proportion of lamps must be kept alight, especially at busy cross-roads and junctions. The general method of meeting the situation is to treat the light-shade with a red or blue opaque colouring medium, but the results are far from satisfactory. The manager of one of the electric lighting enterprises serving outlying London has devised an ingenious shade, the primary object of which is to cut off all the upward rays from the lamp, and at the same time to avoid the brilliantly lighted patch upon the ground immediately beneath the lamp which is produced when a reflector is used. The shade consists of a screen of circular laths or vanes, somewhat after the style of the venetian blind, and set at a similar angle one above the other. By this means the rays of light are deflected downwards, and yet may be seen from a considerable distance on the street-level. By frosting the incandescent electric lamp bulb, or running the lamp under its full power, a soft, reduced light is obtained. Although primarily designed for use with electric lamps, there is no reason why this screen should not prove equally applicable to inverted gas-lighting.

MUNITION-MAKING MALADIES.

The high pressure under which the production of munitions has had to be performed has produced what may be described as distinctive maladies. These are particularly noticeable in connection with the manufacture of high explosives. Thus, in handling trinitrotoluol, after a prolonged period one becomes drowsy, suffers from frontal headache, loss of appetite, and may even become afflicted with a distinctive eczema. Unless the operative takes a welcome rest in time, jaundice may supervene, with decided danger to life. In a few instances death has been directly traced even to the handling of

T.N.T. Tetryl throws off a slight dust, which, unless timely precautions are taken, leads to troublesome eczema. Another medium inimical to health is the varnish with which the wings and bodies of aeroplanes are treated. Tetrachlorethane enters largely into the preparation of this varnish, and this throws off a noxious vapour which produces drowsiness and loss of appetite, and, if work is persisted in, ultimately jaundice, liver complications, and coma. In this case, fortunately, an alternative varnish has been discovered which is free from the evil constituents; but it has not come into general use for the simple reason that there are insufficient supplies of the necessary ingredients to meet demands. Men and women who are engaged in any of these branches of munition-making should be healthy, and temperate, as well as regular, in their habits. It is also essential that adequate meals should be taken at regular intervals. An impoverished, ill-nourished, and weakened frame is readily acted upon by the dangerous fumes and dust. The danger is the more pronounced among women, who are not disposed to devote such careful attention to their meals and nourishing food-stuffs as men are. Neglect in this direction is certain to be attended with evil results, and that within a very short time. Milk and cocoa are recommended as suitable foods, while the necessity of plenty of sleep and rest is imperative.

TUNGSTEN.

One reflex influence which the war is having on commerce and industry is the better exploitation by ourselves of the resources of our Empire for many of the raw or manufactured products for which we have been beholden to Germany. Amongst these are tungsten for steel-making, monazite for the preparation of gas-mantles, synthetic indigo, and beet sugar. Tungsten, the metallic chemical element found in the mineral wolfram, is essential for hardening steel, and is used as an alloy of high-speed steel for machine-tools. Tungsten steels with self-hardening properties are also used for heavy guns and armour-plating. Tungsten ores occur in association with tin ores in Cornwall, mostly in small veins in hard rock. Experts say that the industry only requires organisation. From a statement in the *Times* it appears that a small district in Burma is capable of supplying more than half the world's annual requirements of tungsten. Deposits containing wolfram are found all down the coastal districts at the extreme of South Burma, but especially in the district of Tavoy. Before the war the output of ore went to Germany. Sir Harcourt Butler, the new Lieutenant-Governor of Burma, has now taken steps to get all the wolfram wanted by the British Government. Owing to lack of carrying-power, we are likewise threatened with a shortage of paper pulp. It appears that the bamboo areas in

Burma, with an economic range of river transport, could produce annually twelve million tons of pulp.

CONVERTIBLE BED FOR THE DISABLED.

What promises to be a useful invention is that made by a Midlothian lady of a piece of furniture convertible at will into a bed, a couch, or a Bath-chair for the use of persons disabled either by wounds or disease. Its construction is such that patients can be raised or lowered in bed, have their positions varied from the horizontal to the vertical or to any intermediate angle, be moved from room to room, carried upstairs or downstairs, or wheeled about outside, all without requiring the patient to be removed from his bed or dressed for going out. There are subsidiary devices for enabling the bed to be used as a trolley, so that a patient may be anaesthetised in his bed in a ward, wheeled to the operating theatre and back, and allowed to regain consciousness; for setting the bed at an angle for the benefit of patients who require to lie in an inclined position; for holding breakfast-trays, reading-boards, or work-boards in front of the patient; for enabling the patient to wheel himself about; and for giving him increased ease and comfort in other directions. The framework and machinery for doing all this is ingenious but simple. The conversion movements are operated by hand, and can be effected by one person and from either side of the bed; or electricity or other motor-power may be applied.

A NEW HEALING-LAMP.

The treatment of various skin diseases, such as lupus, by electric light has been in operation for several years with marked success. As is well known, dependence for therapeutic purposes is placed upon the ultra-violet rays, and the Finsen-Reyn lamp has proved the best means of utilising them. Recently, however, a new lamp has made its appearance, and is at present being tested in St Bartholomew's Hospital, London. This lamp is the invention of Mr Simpson, who for some time past has been engaged in making experiments with certain rare earths. During these researches he discovered, upon striking the electric arc between certain ores, that the light thus obtained was exceptionally rich in the essential ultra-violet rays. Accordingly he was prompted to ascertain the therapeutic properties of the light, and found it richer in these than the Finsen light generally employed. The lamp he devised as a result of his discovery is now being subjected to practical application, and the results so far achieved are stated to be satisfactory in every respect.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE FARM IN THE SAND-DUNES.

ACROSS the sandy lea
I drove the cattle home;
I turned my back upon the sea,
Where, redd'ning o'er the foam,
As loath as lovers are to go
The summer sun at last dipped low.

Slow-footed Kuni stopped,
A hurried mouthful snatched;
Brown Tessa paused awhile and cropped
Where the lean soil was patched
With softer grass of fresher green,
As though the pixies there had been.

I saw our lone farm stand,
Rough-hewn of granite gray,
Upon a rock amid the sand
That, on a windy day,
In many a spiral whirls, and falls
Like sea-spray on our lichened walls.

'Twas built, as I've heard tell,
A thousand years ago
Upon the flat rock, where a well
Sent forth, as now, a flow
Of sweet spring water o'er a plain
That bore a crop of golden grain.

A thousand years passed by,
And gone the corn-lands, gone
The flowers that bloomed amid the rye
And barley. On and on
The hungry sands have swept apace,
And gulfed their fragile life and grace.

A thousand years, and, lo!
The sands are at our door.
And near and nearer, soft and slow,
The sea creeps evermore.
Around our barns the conies breed,
From out our hands the seamews feed.

Another hundred years,
And buried all will lie
From all men's sight, and lost to tears
Or any memory.
'Twill seem an idle tale, I know,
That once we lived here long ago.

So musing, o'er the lea
I drove the cattle home,
Where spreading corn-lands used to be
Beneath the sky's blue dome;
And all the while it somehow seemed
To me as if I strangely dreamed.

MARY TREVORIAN.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

A SPRIG OF APPLERINGIE.

By JOSEPH LAING WAUGH, Author of *Betty Grier*, *Robbie Doo*, *Thornhill and its Worthies*, &c.

CHAPTER I.

IF any one had told me when I set out on my morning walk down town that in the busy thoroughfare of Princes Street I should meet Robert Broadfute and his wife from Glenhead I should have received the news without surprise. Indeed, for the past few days so much in thought and spirit had I been 'mong my old parishioners, and so near to them, so part-and-parcel of them, did I feel, that I think I should have been disappointed had the probability of my meeting in Edinburgh any representatives of my old charge in Shinnel Glen seemed remote.

Somehow a great deal had happened of late to remind me of the red sandstone manse in the bield of Birkhill Woods; the bare, featureless kirk on the braeface, surrounded by graves of many a slumbering generation of stalwart shepherds; the quiet glen adown which murmured the Water o' Shinnel; and the cottages here, the farmhouses there, whose doors were ever open to me at a time when the gates ajar and the smile of welcome meant more than words can convey. A week-end spent with a college chum in the Vale of Manor had turned up a bygone page of my life-history, and brought back to me all the langsyne recollections which a city's din had sought to stifle. Never before had I crossed the Tweed near Cademuir; I was a stranger to Manor; but somehow the glen was kenspeckle, and the glorious country which lay before me was not new. Its replica in feature and natural beauty lay north and south in the Birkhill uplands—the same gray-green, sheep-dotted hills, sloping gently and gradually towards thyme-scented knowes; a wandering, rippling stream, singing to its saughs in the meadows as Shinnel had often sung to me; the lay of the lark in the lift and the lintie in the thorn; the peace, the repose, the Sabbath-like stillness. Ah me, how vividly it all came back! And I returned to town refreshed, rejuvenated, with the glow of the caller air on my brow, the clean 'feel' smell of wind-tedded fleece and sweet meadow grass in my nostrils, and the heart prompting, strong within me, to take for the coming Sunday's text, 'I will lift up mine eyes unto the hills, from whence cometh my help.'

Then an old landscape photograph, which I

turned over in my desk when rummaging for sermon paper, made a final appeal. The print was brown and dim with age, but the eye of loving, lingering memory made clear every feature—the snug farmhouse of Glenhead, half-surrounded by silver birks, nestling in the lirk between high Powstane and rugged Torscaur; the long stretch of sheltered glen, showing here and there glimpses of a meandering burn on the banks of which, as a humble disciple of dear old Izaak, I had spent many a glorious hour. Here the meadow where, after doffing the black coat and ministerial collar, I had forked hay till my bones ached, and earned Glenhead's everlasting commendation; there the winding sheep-track athwart Powscour, with the sharp turn at the Bennan Boulder. It is marked on the photograph by the prick of a pin-point, and it is a memorable spot to me; for, as it is a turn in the sheep-track, so was it the turn in the tide of my spiritual affairs.

How well I remember that summer afternoon! I was standing there in the first blush of manhood and in the first month of my ministry, full of the joy of life and the pride of my new position. I felt qualified in every way to perform my duties, and confident in my powers to meet unaided all my difficulties. In my own strength and under my own auspices I would do this and undo that. At my feet, in the glimmering haze, lay my upland charge. Southward among the trees I saw the red gables of the old manse which was now my home, and a little to the east the gray roof of the auld kirk from whose pulpit I should weekly give my rural flock the benefit of much college lore. And the stipend—my word, it *was* considerable! I rubbed my hands together, and with a sigh of gratification and contentment I sat down on the boulder. For a time I looked vaguely into middle space, unimpressed and indifferent, seeing nothing of God's care and love either in the smiling heavens above or in the placid, fruitful strath stretching below. Then, somehow, slowly the eye of my understanding began to open, and the perfection and beauty of His handiwork were revealed; the glory and sacredness of my surroundings came to me; the majesty of the everlasting hills made me cower

my head, and I felt my brow undeserving of the sunshine glow. From the solitude of the glen a still, small voice spoke to me, and as I listened I became conscious of my littleness and unworthiness. All my vauntings and vainglory left me; and, stripped of all conceit and self-confidence, and humbled in His sight, I slipped down to my knees behind the boulder and called aloud, 'God be merciful to me, a sinner.' It was there, just where the pin-prick shows, that after much wrestling on that July afternoon, there came to me the full knowledge of the love of God and the peace which passeth all understanding.

That was twelve years ago; yet how vividly had the faded photograph brought all these memories back to me! I took it out from the docket in my desk, fixed it in a frame, and placed it on my study mantelpiece. Then I looked up the 121st Psalm, read it carefully, and straightway began my sermon.

The breath of early summer was in the air as I passed along the Middle Meadow Walk on my way to Princes Street. The trees were in bud, the birds in song; the joy of life and living was evidenced all around me; and my text, simmering in my mind, impelled me to look eastward to where on Arthur's Seat the tender grass in virgin green was marching and blending with the blue-red scaurs of Samson's Ribs. I knew, too, that the May dew was lying on every blade which had not yet made obeisance to May morning sun, and my thoughts went wandering back to those early mornings when, after 'brushing with hasty steps the dews away,' I had lured the manse breakfast from the quiet Shinnel pools beside the howms of Dalmakerran.

On reaching Princes Street I found even there something to remind me of the old glen. Pausing for a minute at the window of my favourite fishing-tackle maker, I saw displayed, as if by design, a cast of flies which I judged a certain lure for Shinnel in May—a top 'March Brown,' then a 'Butcher,' and last a 'Greenwell Glory.' A steel-centre trout-rod, with only the plate-glass between me and the handle, was provokingly tempting, as were also a hook-book with innumerable receptacles, an aluminium reel which, when I closed my eyes, I almost heard 'going out,' and other requisites dear to every angler's heart. The appeal was strong and insistent, but I pulled myself together and overcame. My library shelves required McConachie's *Lap of the Lammermoors* and Grant's *Rambles in Arcadia* more than I needed a new steel-centre rod or an aluminium reel, and it was when emerging half-an-hour later from my bookseller's, with these pastoral gems parcelled and tucked under my arm, that I came face to face with Robert Broadfute and his wife from Glenhead.

'Lovenanty, Maister Crosbie, is it really you?' the two exclaimed in unison and in pleased surprise; and as Glenhead seized one of my hands,

and his goodwife the other, I felt myself in the seventh heaven. We stood silent just for a minute, the while my eye wandered from the buirdly farmer with the tackety boots and the rough homespuns to the dear old mother in Israel beside him, with the scoop bonnet and the faded Paisley shawl.

Oh, how pleased I was to meet them! We shook hands twice, maybe three times; and as the delightful lilt of the Doric fell on my ears, and I felt 'touched' by that atmosphere which clean-living, clean-thinking people from a clean countryside carry about with them, the years of my sojourn in town one by one passed from my ken, and I heard once more the clang of the auld kirk bell stealing along the Shinnel howms in the hush of a Sabbath morning.

In a general way I am a slow thinker; in emergencies I sometimes cannot think at all; but for once I was equal to the occasion.

A chat such as we all wanted was impossible on the busy, crowded pavement, so I suggested an adjournment to an adjoining café for a cup of tea. As a refresher, tea was not, I well knew, much to Glenhead's liking; but Mrs Broadfute was with us, and I was glad my old friend in the homespuns took in the situation at a glance. All he said, and that resignedly, was, 'So be it, Maister Crosbie. It's the only coorse open in the circumstances.'

What a glorious half-hour we had living old times and fighting old battles over again! Mrs Broadfute, in her anxiety to give me all the family news, forgot about her tea till it was stone-cold; and Glenhead dumped his hazel staff on the oak parquered floor by way of emphasis as he proceeded with a thrilling account of the late spring snowstorm when 'hay was at its dearest, and haun'-feedin' a perfect ruination.' All the doings and deeds of the parish were told with gusto, the misdeeds mentioned in a whisper, and dismissed with a nod of the head and the usual 'Imphm! ay, ay!'

Few in the parish were forgotten. Even my successor was not omitted; but—tell it not in Gath, publish it not in the streets of Askelon—Glenhead reckons him 'a costive preacher, a conscientious veesitor, a cauld cloot at a waddin', a bucker-up at a funeral; but as a curler he's no worth a—dash.' He hesitated on the last word, and it struck me that had he been airing his views to his neighbour Ha'scaur he would have used one which does not end with 'h.'

'Now, Glenhead,' I said, after we had exhausted all our local topics, 'is this a one-day trip, and can you come out to the manse and take pot-luck with me, or can you remain overnight?'

'Man, Maister Crosbie, I'm sorry we can dae neither.' He looked to his wife for confirmation. She nodded to him, then shook her head and flecked bun-crumbs from the lap of her gown. 'Ye see, I'm here the day on a dooble errant,'

he continued. 'I'm killin', as it were, twae birds wi' ae stane, and I ha'ena ower muckle time for the job. I've ca'd my wee black mear oot to the gress for guid. Man, man, but she's been a fell yin, anxious and willin'; but it cam' to be that I hadna the he'rt to work her ony langer. Ay! I bred her, and she's ta'en me up hill and doon brae for the feck o' five-and-twenty years, and I'm mair in her debt than she's in mine. So she's a pensioner noo—imphm! I maun fill her place, though, and I'm here to attend a horse sale this efternoon at three o'clock. Then, man, I'm on my gait to another ploy, oot o' my line in a wey, but I've ta'en it on haun', and I maun see it through. Ye'll mind, I daur say, o' yon wee white hoose on your left-haun' side as ye gang into the Toon o' Scaur frae the Shinnel side—The Knowe they ca' it? Weel, the wife's gran'faither and her faither had it on a ninety-nine years' lease. They were a' born there, and sae much o' hame was it that they never thocht or coonted on it gaun frae them. Three years last Martinmas the lease was up, but the wife's sister, Mrs Beck, Andra Beck's weeda—ye mind o' Andra, dootless; thowless sowl he was, but a weel-meanin' man—and, as I say, Mrs Beck was juist alloood to sit still as a yearly tenant at some nine pun' ten shillin' a year. Noo, aboot six months bygane or thereby, the factor telt her she wad ha'e to flit, and he backed it up wi' a letter to this effect: the new proprietor was gaun to pu' it doon and build what he ca'd a modern edifice wi' modern conveniences, and she bude to gang. I've plenty o' trachles o' my ain, and as a rule I'm no in the wey o' takin' on ither fouk's; but she's the wife's sister. She was, as I've said, born in the hoose. She's never kenned ony ither hame, for Andra, puir sowl, couldna gi'e her a new yin when they mairret, so they juist steyed on wi' the auld fouk, and someway her helplessness touched me. She's aulder than the wife here, and juist gey feckless. Of coorse, Maister Crosbie, we could eásy enech put her up, and will if the warst comes to the warst; but, man, it's the leavin' the auld hame. Puir body, she's ta'en to her bed ower the heid o't, and she telt me yesterday that she wad rather lie on the cauld doorstep o' The Knowe than in the veesitor's bedroom o' the Manse o' Shinnel.

'I've been argybargyin' back an' forrit wi' the factor, Weelum Frizzel the joiner, ca'in' an' writin'; but he telt me it's nae use and a' to nae purpose, an' a' that was left to dae was to see the proprietor himsel'. I understaun' he's a lawyer aboot George Street somewhere—I've the name and address a' richt here in my pocket-book, and I'm thinkin' yince I get sterted on him I'll work the oracle. I'm no easy put doon in a collieshangie argument, Maister Crosbie, and wi' a lawyer—even a toon's yin—I think I'll be able to haud my ain and mair, Maister Crosbie—*ay, and mair.*'

He took a long breath, struck his chest with his open hand, gave a croose cough, and looked knowingly towards me. Then he glanced at his wife.

'Mary here wanted to come wi' me,' he continued, 'dootless to back me up in her wey o't; an' though I consider womenfouk are juist in the road when it comes to a push o' this kind, I didna think it worth while to say her nay. Ye ken, Maister Crosbie, I haud that a woman's place is her ain fireside. Mary rules there her lane. She's what yin wad ca' absolute, Maister Crosbie—absolute's the word. I tak' nocht to dae wi' hoose affairs, as she hersel' will admit, an' yince I've steekit the door and got my twae feet on the lobby bass, I'm, as it were, under orders. But ootby—weel, I've aye been able to swing the tattie. Dod, Maister Crosbie, yin has to be able to dae that. Ay, and ye've to swing it wi' a birr too, for ootby-workers are no slow to tak' advantage o' ony dilly-dallyin'. Noo, there's ony ae tattie-swinger at Glenhead, an' that's me.

'This I've ta'en on haun' wi' aboot The Knowe is a man's job, as I've said—a real tattie-swingin' job, Maister Crosbie; no for a woman body to be mixed up wi'—no, no. When she insisted on comin' wi' me, I asked her if it was to see the shop windas, or the Castle, or Holyrood, and sic like; but she said "No;" a' she wanted was to see the new laird o' The Knowe. Mebbe it's juist as weel, though, that she should be wi' me, for when she sees hoo I'll work my wey roon this big lawyer's lug she'll grip my arm a bit tichter as we walk away frae his door. But this is no an interestin' crack to you, Maister Crosbie. I doot I'm deavin' ye.'

I assured him that I wasn't deaved; on the contrary, that I was very much interested indeed, and sincerely trusted he would be successful in advocating the cause of the widow. Then, after hastily reviewing all he had told me, I asked him if he felt quite sure of his ground, and if he had a line of argument thought out. 'You know, Glenhead,' I said, 'it would never do at all to go before this man with an indefinite, ramstam sort of pleading. So far as I can make out, you have no case at all. The present proprietor of The Knowe can do as he chooses with his own property. You don't question the legality or fairness of the transference, do you?'

'No, I've nae fault to find wi' that, Maister Crosbie.'

'Well, you're probably pitting yourself against a hard-headed man of business who knows his own mind and what his rights are, and who won't thank you for interfering in what is his own concern. Of coorse, if you can work on his feelings—excite his sympathy for Mrs Beck in her illness, and her love for the old home, and appeal to his sentiment'—

'Appeal to his sentiment! Humph! I'll appeal to his common-sense, Maister Crosbie, that's what I'll dae. Oh, you lippen to me noo.

A tattie-swinger for a job o' this kind! As for my line o' argument, as ye ca' it, that a' depends. We're no a' made in the same mould, and we've a' to be tackled in different ways. Whenever I clap my e'e on him I'll ken what to say, and hoo to say it. Man, Maister Crosbie, it's an eddication to ferm a place like Glenheid. It's baith hill an' arable, an' ye've to scrape a leevin' oot amang woolbrokers, soo-dealers, horse-coupers, and dairymen. Every yin's fechtin' against ye. Oh, ye've to keep your een skinned, I can tell ye, and ye've to golly here and wheedle there juist as the case needs it, ye understaun', and aye wi' an eye on the main chance. Noo, in this particular ploy I may be up against a cute man, or mebbe a dour man, which will be waur, and it may be that I ha'ena what yin wad ca' a case; but, Maister Crosbie, I've ser'ed a graun' apprenticeship, an' when it comes to a wee bit gi'e an' a big bit tak' I wad like to see the Embro' lawyer that'll ca' croose ower me.'

'Yes, yes, Glenhead, I admit your persuasive powers with a horse-couper and all that, but this man is a lawyer, and'—

'Weel, there's no muckle difference, only I dinna ken this yin, and in the circumstances I'll juist ca' canny at first till I find my wey, and then I'll grope cautiously alang. I may tell ye, though, Maister Crosbie, there's ae thing I'll no dae, and that's tell him o' my relationship wi' Mrs Beck; that wad gi'e pairt o' the show away. I'll no let that oot unless I canna help it. As for the rest o't, I'll juist talk ower things in a freendly—eh, in a cracky—yes, and a freendly wey, ye see, Maister Crosbie.'

'Yes, of course I see, Glenhead,' I said; though I didn't see at all. 'May I ask what is the name of this lawyer-laird of The Knowe?'

'Oh, it's Carstairs—Gavin Carstairs, W.S., o' Carstairs & Cranstoun. I'm telt he's a gey soople haud-by-the-heid kind o' a—— Lovenanty, Maister Crosbie, is there ocht wrang?'

I had started forward in my seat when I heard the name Gavin Carstairs, and in my agitation I had let my glasses drop to the floor.

'Oh, there's nothing wrong; you've surprised me, that's all. I happen to know Mr Carstairs. As a matter of fact, he's a member of my congregation;' and I vigorously polished my pincez to gain time for thought.

Much passed quickly in my mind, and Glenhead was watching me narrowly; but I felt my face was no index to my thoughts.

'If he's a member o' your congregation, then he'll—he'll be a freen' o' yours, Maister Crosbie?' Glenhead slowly and thoughtfully said. 'And I'm vexed if I've said ocht to his discredit. Mind you, I dinna ken the man frae Adam. I'm gaun by country report an' judgin' him by hard-he'rted treatment o' Mrs Beck, the wife's sister. That's a', Maister Crosbie—imphm!'

'Oh, that's all right, Glenhead,' I said reassuringly. 'I'm not thinking of that at all.

Knowing Mr Carstairs as I do, I am just wondering how best I can act in your interests.'

Then it dawned upon me that my recent recurring memories of Shinnel had been called up for a purpose, that there was a providence in our meeting in Princes Street, and all at once I accepted the rôle of the humble instrument.

'Glenhead,' I said, 'this is none of my business, and so far as I can see, apart from solicitous motives on Mrs Beck's account, it is none of yours either; but I am willing to give you any little service in my power, if'—

'Thank 'e, thank 'e, Maister Crosbie. As I said before, it's a tattie-swinger's job, is this; but a freen' at coort's worth havin', and I'll be real gled.'

'Well, that's settled, then. Now, Glenhead, I may tell you that this Mr Carstairs is reckoned one of the ablest lawyers in Edinburgh. He may be a hard man; I have never found him to be so, and I talk of people as I find them. He is an honourable man, but of fixed determination, and if he has decided to take possession of and rebuild The Knowe, then The Knowe will be rebuilt.'

'Phew! ay, ay, imphm! Then ye think it's nae use me'—

'I think nothing, Glenhead. Carry out your arrangement, and I'll come with you and pave the way for your reception. By the way, does he know you are calling to-day? Have you made an appointment with him?'

'No, no, he doesna ken I'm comin'. I'm juist lookin' in, as it were, on the bygaun.'

'But he's a busy man, and won't see you, I'm afraid, unless a meeting has been arranged beforehand.'

'If he's in, shairly he'll ha'e the decency to see me! I've aye an open door at Glenheid for a', gentle an' semple, an' what I alloo to ithers I expect ithers to alloo to me.'

Mrs Broadfute had been slowly sipping her second cup of tea during our conversation, listening intently and saying nothing. She put the empty cup on the table, and with a look of disappointment on her sweet old face she turned to me and smiled.

'I see, Maister Crosbie, hoo the land lies; but it wad be an awfu' peety if, efter comin' sae far, we werena to see Maister Carstairs. Could it no be arranged even though we had to stay in the toon a' nicht?'

'Mrs Broadfute, are you very, very anxious to see this man?'

'Well, yes, for Betty's sake. Somewey, I think if we could juist get a word wi' 'im she might get bidin' on at The Knowe till'—

She didn't finish the sentence, but I interpreted aright the silence which followed. I lifted my hat and parcel.

'Come away, then,' I said, 'and we'll see what can be done.'

THE 'PILGRIMAGE RAILWAY.'

By A. HILLIARD ATTERIDGE.

UNTIL comparatively recent years the country east of the Jordan was very little known to European travellers. Every year for centuries western Palestine had been visited by pilgrims and tourists; but their journey usually ended at the shores of the Dead Sea and the Jordan Valley, and until very lately few crossed the deep ravine which the river follows, for the highlands beyond it—the uplands of Gilead and the mountains of Moab—were regarded as a dangerous and inhospitable land, where there were few sights to attract the traveller from the West. It was not until the Palestine Exploration Fund carried out its survey of Palestine that the region was accurately mapped. But during all this period, when it was practically unknown to Europe, it was one of the familiar highways of the Mohammedan world. All over the East there are caravan tracks, most of them trade routes; but some derive their importance from the fact that they lead to Mecca, the centre of the Mohammedan world, the place to which it is the duty of every pious Moslem to make a pilgrimage at least once in his life. These roads to Mecca are known as the 'ways of the pilgrimage' (Darb-el-Hajj). One of the most important of them starts from Damascus, and runs southward for a thousand miles to Mecca. The northern part of this pilgrim way lies along the outer margin of the hills beyond the Jordan, following the eastern edge of the well-watered country, where it slopes towards the desert of western Asia. The southern part of the road runs east of the Gulf of Akaba and by the desert-land of Midian, along the eastern side of the Red Sea, through the Hedjaz to Medina and Mecca.

Damascus is one of the oldest cities in the world. All through its long history it has been one of the meeting-places of East and West, and a centre of many important trade routes converging from all parts of western Asia. During the thousand years that it has been a Mohammedan city it has thus been a convenient gathering-place for the annual pilgrimage to Mecca. The setting out of the pilgrimage used to be a remarkable sight. The city itself could not find room for the pilgrims, and they camped round it for miles. All the races of central and western Asia were represented—Turks and Circassians, Afghans and Turcomans, Kurds and Arabs. Thousands of men and camels were finally marshalled for the long march by the pilgrims' way—a journey of nearly three months.

In recent years the pilgrimage has become less picturesque and more expeditious, for the greater part of the journey is performed by a railway which starts from Damascus and extends as far as Medina. Only the last part of the

pilgrimage, that from Medina to Mecca, is now made on foot or on camel-back. The construction of this railway was a very remarkable enterprise. I think one may safely say that every other railway in the world is a commercial undertaking or a military line. The Damascus-Medina Railway was made for religious purposes. It has no shareholders, and the capital for its construction was found entirely by money subscribed by pious Moslems, or provided by the Turkish Government, in order to facilitate the pilgrimage.

The line is officially known as the Hedjaz Railway, but is sometimes called the 'Hajj Railway'—that is, the 'Pilgrimage Line.' The work of constructing it was begun in 1901. I have seen it stated that the construction was proposed under German influence at Constantinople, and the work carried out by German engineers. But I doubt if this is true. Indeed, I suspect that this theory of its origin is an afterthought, prompted by the fact that the line has lately proved useful for the movement of Turkish troops from Damascus to the eastern edge of the Sinai desert, in connection with the German projects for an invasion of Egypt. I believe that, as a matter of fact, the only foreign engineers employed in the construction of the railway were Italians. Military labour was largely used, detachments of the Damascus army corps being employed in making the cuttings and embankments, and generally preparing the road-bed for the track. This made the work very economical, as the soldiers were given only a small addition to their ordinary pay. It is very likely that this economic method of construction was suggested by the fact that, a few years before, Lord Kitchener had used the same method in the laying of the Soudan Railway. Indeed, it is not improbable that the successful construction of the Sirdar's railway across the deserts of the Upper Nile suggested the making of the Hedjaz line.

The funds for the work were provided by subscriptions throughout the Turkish Empire and most parts of the Mohammedan world beyond its frontiers. They were very largely the contributions of poor people, and money was even collected by the children in the schools. The Turkish Government assisted the work by requiring every official in its Civil Service, and every officer and soldier in the army, to contribute one-tenth of one month's pay, but this was the only forced contribution. The Sultan, at the outset, gave as his personal offering an amount equivalent to about fifty thousand pounds sterling, and subsequently made several smaller offerings. With the large sums thus collected, the cheapness of ordinary labour in the East, and the help of the large working-parties provided by the Damascus

army, the building of the railway line was carried through at a relatively small cost; and, wonderful to say, it is asserted that it was the only public work ever executed by the Turkish Empire in which there was no leakage of money into the pockets of officials and no question of baksheesh. It is said that contributions came from every part of the world, even from Mohammedan emigrants as far off as America, Australia, and the islands of the Eastern Archipelago. In all, it is estimated that about three millions of money was raised by these various means.

The work was begun at the Damascus end of the line in the summer of 1901. It did not make rapid progress, but it was carried through steadily year after year, and by the end of 1906 four hundred and fifty-two miles of railway had been laid. The line had then reached Tebouk, in the Hedjaz, to the east of the northern end of the Red Sea. As each section of the line was completed, traffic was carried to the railhead, and the journey of the pilgrims was thus shortened year after year. Extra rapid progress was made in 1907; two hundred and seventeen miles of railway were laid, and the line reached Bir-Jehid, six hundred and sixty-nine miles from Damascus. Beyond this point a considerable part of the road-bed was prepared over the remaining section of one hundred and fifty-six miles to Medina, one of the cities of the pilgrimage, for it contains the tomb of Mohammed.

Great efforts were made to complete the line to this place by 31st August 1908, the anniversary of the Sultan's accession. The programme was successfully carried out, and on that day the line was opened to Medina, eight hundred and twenty-five miles from Damascus. It was estimated that in another two years it would reach Mecca, two hundred and seventy-seven miles farther south; but Medina is still the terminus, for the troubles of the Turkish Empire prevented the original programme from being completed.

The railway is a single line, with sidings and passing-places for trains at the stations and at a few points between them. The gauge is three feet five and a quarter inches, to correspond with that of the railway from Beyrout to Damascus, over which the locomotives and rolling stock had to be brought.

Before the war a train left Damascus at seven-thirty A.M. every Monday, Wednesday, and Saturday, making the journey to Medina in a little over two days and nights, and arriving there at three P.M. on the Wednesday, Friday, and Monday. The return trains started from Medina on the Tuesday, Thursday, and Saturday mornings. Tickets for the through journey to Medina were issued only to Mohammedans, the country of the pilgrimage being closed to all but the Faithful. But tourists from Christian lands were allowed to use the railway as far as the station of Ma'an, a village on the line in the country east of the Sinai desert. Ma'an is described by Palgrave,

the well-known Eastern traveller, who from this point commenced his adventurous journey across Arabia in 1861. The line was useful to tourists, not only to this stage, but also to the junction at Deraa, east of Nazareth, whence a branch-line goes off to Haifa, near Mount Carmel, on the shores of the Mediterranean. This branch-line crosses the Jordan south of the Lake of Gennesaret, and traverses the country of Galilee. Ma'an was the starting-point for tourists who wished to visit the rock-built city of Petra. Before the Hedjaz Railway was opened this was a place seldom visited, as it could be reached only by a desert caravan journey. But as soon as the new railway reached Ma'an, Petra became comparatively easy of access, and before the war Messrs Cook used to organise a personally conducted excursion to the famous ruins once a week during the tourist season. Ma'an has become during the war a point of strategic importance. It is the nearest station to the tracks that lead across the Sinai desert to the Suez Canal, and is thus one of the Turkish bases of operations against Egypt. It is even said that German engineers have constructed a branch-line running from Ma'an westward into the desert.

The northern section of the Hedjaz Railway between Damascus and the junction at Deraa runs through a fairly well-watered country—the eastern margin of the wooded uplands of the Gilead of the Bible. South of Deraa, the line, still following the old pilgrim route, passes through a half-desert country. There is some cultivation where it follows for a few miles the upper valley of the river Zerka—the Jabbok of the Bible. Here the Turkish Government has, since the opening of the line, planted a colony of Circassian immigrants. The railway station at Amman keeps in a slightly altered form the old name of the country, Ammon, conquered by King David's captain, Joab, a district whose stronghold was the wild mountain plateau that rises around the upper gorge of the Jabbok. Half a mile from Amman station are the ruins of what was once the capital of the country, the city of Rabbath-Ammon; though the ruins of to-day are not those of the old Ammonite capital, but of a later Roman city built upon its site, as an outpost towards the desert.

South of Amman the desert character of the country becomes more pronounced, and water is very scanty. Ma'an is the next point of importance, and some fifty miles south of it there is a remarkable piece of engineering by which the line is carried across some very difficult country. Here all farther progress seems to be barred by a great inland hollow, some thirty miles across, and bounded on its northern side by an escarpment of almost cliff-like steepness. The place is known to the Arabs as the *Batn-el-Ghurl* ('the Hollow of the Genii'). The railway descends its steep northern side by a series of bold zig-zags close to the pass by which the old pilgrimage road reaches the plain below in the same way.

The line issues from the hollow on its southern side by a narrow sandy ravine. The next station is Tebouk, an oasis in the desert, with a village and about half a square mile of date-palms. Beyond Tebouk the line works its way for a while through a narrow stony valley, and then the country begins to open out and loses something of its desert character as the railway enters the Hedjaz province. Here it is in the land of the pilgrimage, which is barred to Europeans.

It will be gathered from this description that the line runs through a country on which there can never be a considerable industrial traffic. It exists only for the purposes of the pilgrimage, and a very moderate amount of traffic supplies all the needs of the pilgrims. For the moment it has become a military line of some local importance; but the pilgrim traffic is still kept up, though for the time being it is closed to Western tourists.

PINCHER MARTIN, O.D.

A REALISTIC STORY OF THE INNER LIFE OF THE ROYAL NAVY.

By TAFFRAIL, Author of *The Bad Hat*, *The Decoy*, *An Eye for an Eye*, &c.

CHAPTER VI.—'THE 'ORRIBLE DEN.'

L

FROM the quarterdeck one climbed down a steep ladder, walked aft along the maindeck past the wardroom, descended another ladder, and finally emerged into a large flat lit by electricity. To starboard was a bulkhead with rifles in racks, their blued barrels gleaming dully in the glare of the electric bulbs. Behind the rifle-racks came some of the officers' cabins, through the open doorways of which one was vouchsafed an occasional fleeting glimpse of sea and sky framed in the circular opening of a scuttle in the ship's side.

The small habitations seemed to reflect the personalities and tastes of their several occupants. Some were gay with pictures, photographs, brightly coloured bedspreads and curtains, and had easy-chairs, well-filled bookcases, and a glittering array of silver-backed brushes, photograph-frames, and ornaments on the chests of drawers serving as toilet-tables. In others there was little or no attempt at decoration, and they were furnished with almost Spartan simplicity, with nothing but what the Admiralty allowed. This consisted of a bunk with drawers underneath, a solid mahogany chest of drawers, a book-shelf, a folding washstand, a minute writing-table, a straight-backed cane-bottomed chair, a small strip of carpet, ugly maroon-coloured scuttle and door curtains, and, by way of decoration, the inevitable shallow circular tin bath suspended from the roof.

Amidships in the flat, in ordered rows, came the midshipmen's sea-chests. They were painted white, with black lids, and bore their owners' names on small brass plates. Each was exactly three feet six inches long, one foot eight and a half inches broad, and three feet seven and three-quarter inches high, neither more nor less. Admiralty regulations are explicit and precise, even on the subject of midshipmen's sea-chests. In these receptacles the snotties*

kept, or were supposed to keep, all their worldly belongings, and woe betide them if the first lieutenant discovered their clothes or boots lying about when he went his rounds twice a day! The garments were promptly impounded and placed in the scan-bag, which was opened only once a week. Moreover, one inch of soap—which went toward cleaning the ship—had to be paid for each article claimed.

On the opposite side of the flat were more rifle-racks and two curtained doorways. One of these gave access to a pantry, the other to what the commander called 'the 'Orrible Den,' otherwise the gunroom. It was the habitat of the junior officers, and provided accommodation for two sub-lieutenants, an assistant-paymaster, ten midshipmen, and Mr Hubert Green, the assistant-clerk.

Imagine an apartment about thirty feet long by twenty feet wide, with plenty of head-room. It ran fore and aft, and on the ship's side opposite to the door were four circular scuttles. They were about six feet above the waterline, and could be left open in harbour or in the calmest weather at sea. If it was blowing at all hard, however, they had to be kept tight shut to prevent the entry of the water. On these occasions the atmosphere, well impregnated with the smell of food from the pantry, could be cut with a knife. The sub-lieutenant, complaining bitterly of the 'fug' or 'frowst,' sometimes ordered a junior midshipman to carry out what was known as 'scuttle drill.' This meant that the unfortunate youth had to open the port gingerly to let in the air, but that he must bang it to again whenever a sea came rushing past. If he allowed water or spray to enter he was chastised. He generally was, but not really hard. Underneath the scuttles, and along the after bulkhead, were narrow cushioned settees serving as seats. Then came two long tables, with, outside them again, padded forms. Altogether there was seating accommodation for about twenty-four people at meals.

* 'Snotty' is the naval slang term for midshipman.

On the inner bulkhead near the door was a stove, and beyond this again a small piano. This instrument had been quite a good one once upon a time, but, owing to an accumulation of foreign matter in its interior, caused no doubt by a youthful officers' steward, who found it a convenient receptacle for dirty cotton-waste, polishing-paste, bathbrick, and emery-paper, was long past its palmy days. However, it still made a noise, and was useful for sing-songs.

On the foremost bulkhead was a small hatch with a sliding door communicating with the pantry, and underneath it a mahogany sideboard. The appointments were completed by three wicker arm-chairs, provided by the occupants themselves, a sofa, a rack for the midshipmen's dirks, a mahogany letter-rack and notice-board, and rows of small lockers, just under the ceiling, round two sides over the settees. In these the snotties kept their small personal belongings, books, and pots of jam or potted meat. But we have forgotten the beer-barrel. It occupied a conspicuous position near the sideboard.

Pictures and prints hung on the white enamelled walls, rugs were scattered about the floor, and the two long tables were covered with crimson cloths of the usual Admiralty pattern, and were adorned with palms in pots and vases of flowers. So, taking it all round, 'the 'Orrible Den' was not quite so bad as it was painted. In fact, it was quite a cheerful apartment.

Sub-Lieutenant Archibald Bertram Cook—commonly known as Alphabetical Cook—was the senior member of the mess and *ex officio* president. He was a lusty, riotous, red-faced fellow of twenty-two, and ruled the midshipmen with a rod of iron. The other sub was Roger More, six months junior to him. Wilfrid Shilling, the A.P.,* was a tall, anæmic-looking officer, with an incipient beard and rather long hair. He wore glasses, and was deeply in love with a young lady at Weymouth. He went by the name of Blinkers.

Next came the senior midshipmen, Antony Charles Trevelyan, Roderick MacDonald, William Augustus Trevor, and Henry Taut. They varied in age between eighteen and a half and nineteen and a half; and the first, on account of his rather blue chin and heavy growth of hair, went by the elegant name of Whiskers. MacDonald, who was short and had rather a barrel-like appearance, was nicknamed Shorty or Tubby; while Trevor, a small youth, sometimes answered to Winkle. Taut, the midshipman of Martin's division, was the Long Slab. He was tall and very thin, rather like a lighthouse.

Then came the six junior snotties, whose names do not really matter. They were all under eighteen, and had only just joined the ship from the training-cruiser. They were, in consequence, very small beer indeed—mere ex-

crescences on the face of the earth. Collectively they were referred to as the Warts, Crabs, or Dogs' Bodies, and had to do what everybody else chose to tell them.

The Wart of all the Warts was Mr Hubert Green, the assistant-clerk. He was a small, freckle-faced youth, with a squeaky voice and ginger hair, and had only just come to sea. He was only seventeen and a half, the baby of the gunroom, and on account of his youth and general ignorance of the navy and naval affairs, spent his life having his leg pulled by the midshipmen.

Both the subs and the A.P. had cabins of their own. The midshipmen 'lived in chests,' as the saying is; slept in hammocks in the gunroom flat; and performed their ablutions in a small tiled bathroom farther forward. Publicity was a thing they had no qualms about whatsoever, and between seven o'clock and seven-forty-five in the morning, when they were dressing or parading about with or without towels, waiting for their turns to wash, the flat was no fit place for the general public.

Except on Sundays, when they lay in till seven o'clock, the snotties turned out at six-fifteen, and from six-forty till seven were on deck at physical drill. At seven, therefore, came the rush for baths, the usual exaggerated tin saucers, of which there were only six. The bandsmen servants procured their respective masters' hot water beforehand; but it was always a case of first come first served, and nobody hesitated to use anybody else's belongings if he were big and strong enough to do so with impunity. Such things as hot water, sponges, soap, and nail-brushes were regarded as common property unless their owners chose to retain them by force. Towels and tooth-brushes alone were sacred to the individual.

The subs and the senior midshipmen bathed first, and woe betide any Crab who was discovered in the bathroom when they arrived! He was promptly hurled out. Then came the junior snotties, and lastly the assistant-clerk, who, poor wight, usually had to be content with cold water. But they were all quite happy, and made a great deal of noise.

Pay of one shilling and ninepence *per diem*, plus a compulsory allowance of fifty pounds a year from one's people, which was what the midshipmen received, is not great affluence, even in the navy, where living is comparatively cheap. It amounts in all to six pounds fifteen shillings and tenpence per month of thirty days.

Mr Tubbs, the long-suffering gunroom-messman, and a bit of a villain, undertook to provide breakfast, luncheon, and dinner for the sum of thirty shillings a month a head from each member; but in addition to this he also took the tenpence *per diem* allowed to each officer by the Government in lieu of rations. Afternoon tea, cake, bread-and-butter, tins of biscuits,

* Assistant-paymaster.

potted meat, jam, fruit, and other extraneous edibles were charged for as extras, in which category also came such things as soap, bootlaces, drawing-paper, pens, ink, pencils, &c. The sum of ten shillings *per mensem* was supposed, by Admiralty regulation, to suffice for the midshipmen's needs in the way of extras; but the most of them, with the connivance of the messman, ran what they called 'extra-extra bills.' It was on the profit made on these that Mr Tubbs was able to make two ends meet at all, for one and tenpence a day is not much wherewith to satisfy the food capacity of a young and lusty lad with a healthy appetite.

Snotties over eighteen were allowed to expend fifteen shillings a month on wine, and those under this age five shillings less; but nobody under twenty was permitted to touch spirits. The mess fund—for newspapers, breakages, washing, and other small incidental expenses—came to a nominal five shillings a month, but generally exceeded it; servant's wages were ten shillings; personal washing, say, ten shillings; and tobacco—if the officer was over eighteen, and allowed to smoke—to about seven shillings and sixpence or half-a-sovereign. The monthly balance-sheet, omitting all extravagances, therefore, worked out somewhat as follows:

RECEIPTS.

1s. 9d. a day for 30 days . . .	£2 12 6
One-twelfth of £50 . . .	4 3 4
Total . . .	<u>£6 15 10</u>

DEBITS.

30 days' messing at 1s. a day . . .	£1 10 0
Mess Fund . . .	0 5 0
Wine . . .	0 15 0
Tobacco . . .	0 7 6
Extras . . .	0 10 0
Servant . . .	0 10 0
Washing . . .	0 10 0
Total . . .	<u>£4 7 6</u>

This, omitting the 'extra-extra,' left a nominal credit balance of two pounds eight shillings and fourpence wherewith to last out the month. Only one or two of the snotties received anything extra in the way of allowances from their people, though their outfitters' bills for all necessities in the way of clothing were usually met by their parents. But even this did not improve matters to any great extent, and not one of the young officers was ever known to have much in the way of money unless parents or relations behaved handsomely on birthdays or at Christmas. Even then the gift dwindled rapidly, for if one of them did receive a windfall of an odd pound or two, he took care that his messmates shared his good fortune. The clothes they had, too, were in a perpetual state of being lost; and if one of them was asked out to dine in another ship, everybody contributed something towards his attire. One provided a shirt, and others handkerchief, collar, tie, and evening shoes; but

in spite of it all they somehow always managed to look smart and well-dressed.

This state of chronic hardupness is hereditary in midshipmen. History relates that a youth once came home from China and landed at Portsmouth with no soles to his boots, a hole in the crown of his straw hat—it had been eaten by cock-roaches—the seat of his trousers darned by himself with sailmaker's twine, and no tails to any of his shirts. With the ready resource of the sailor, he had removed these for use as pocket-handkerchiefs.

The Royal Navy is essentially a poor man's service, and comparatively few of its officers have anything considerable in the way of means over and beyond their pay. It is sometimes difficult to keep out of debt, for they are expected to go everywhere and do everything, while uniform is expensive, and the cost of living is always increasing. It seems to be part of a midshipman's job to be poor, and one would as soon expect to find a dustman with a gold-mounted shaving-set as a snotty with more than half-a-crown in his pocket on the 28th of the month.

The snotties of the *Belligerent* were no exception to the general rule. They were quite irrepressible, and were as happy and cheerful as they could be, though sometimes they did complain bitterly that they were half-starved. On occasions, to the accompaniment of spoons beaten on the table, they chanted a mournful dirge anent the iniquities of the messman. It was long and rather ribald, but the last two lines of the chorus ran:

We're starving! we're starving!

And the messman's name is Mr Tubbs!

They weren't really so famished as they pretended to be, but Tubbs certainly was an old rogue. One celebrated morning, when the senior sub-lieutenant was absent, he peered through the pantry hatch at breakfast-time.

'Now, gennelmen,' he said, 'wot we 'ave for breakfast is 'ot sardines an' 'am. Sardines is a bit orf, the 'am is tainted, an' fruit is extra. Wot'll you 'ave?'

The ship was half-way across the Bay of Biscay at the time, and had been at sea for several days, so perhaps there was some slight excuse for the inadequacies of the morning meal. But Tubbs had tried this game before; and, headed by Roger More, the junior sub-lieutenant, the members of the mess rose *en bloc* and hastily armed themselves with dirks.

The messman, scenting trouble, promptly fled from the pantry with his satellites after him, while the hungry officers rushed in, broke open various cupboards, and helped themselves liberally to Tubbs's private store of tinned kippers and haddock. He complained bitterly, but got no redress.

Another time the members of the mess were sitting round the table waiting impatiently for lunch. Noon was the proper time for the meal;

but at twelve-ten nothing had appeared on the table except the vegetables. The hungry officers commenced to bang on the table with eating implements, and started the inevitable dirge, and in the middle of it Tubbs's face appeared framed in the pantry hatch.

'I'm sorry, gennelmen,' he said when he could make himself heard in the uproar. 'The boy's fallen down the 'atch with the joint, an' it ain't fit to be seen. I've some very nice corned beef'——

A chorus of groans drowned his utterance. 'Let's see the joint,' some one demanded.

'It's bin thrown overboard, sir,' the messman explained glibly, disappearing from view.

Several of the junior midshipmen and the assistant-clerk were despatched to visit the scene of the alleged accident, and to report on what traces they found. There were none. There never had been any joint.

'Tubbs!' they yelled in unison when the spies came back.

The messman's head appeared, and the minute it bobbed up into sight it was greeted with a volley of vegetables. On the whole the shooting was good, and Tubbs made an excellent Aunt

Sally. Potatoes baked in their jackets spattered and burst all round the pantry hatch like a *rafale* of shrapnel-shell, while some, passing through, exploded on impact with the messman's head. The *pièce de résistance* was a cauliflower. It struck the ledge and detonated like a high-explosive projectile, and the messman received its disintegrated stickiness full in the face. He slammed the hatch up with a bang, and rushed into the mess with his face, beard, and hair dripping with vegetable products; while the culprits, wildly excited, shrieked with laughter. The bombardment would have continued, but the available ammunition was expended.

Tubbs was furious. 'I'll 'ave the law on yer!' he shouted wildly, waving his fists. 'I'll report yer to the commander, and 'ave yer court-martialled, see if I don't! It's disgraceful, that's wot it is, an' wot the navy's comin' to I don't know! Calls yerselves gennelmen, do yer?'

He went on for quite a long time; but nothing further ever came of it. He knew well enough that he had brought it on himself; but thereafter he became rather more particular over the matter of providing meals.

(Continued on page 435.)

THE RABBIT.

By H. A. STRONG.

THE rabbit is not indigenous to Great Britain, but was originally a native of Spain. The Romans acclimatised it from the Iberian Peninsula; it was unknown to the Greeks on the east of the Mediterranean Sea. Like the esparto grass and the cork-tree, it had its home in Spain, and its history is bound up with that of the Iberian race, with whom it probably passed into western Europe by way of Africa. The Romans knew this animal by the name of *cuniculus*, our coney; it seems probable that this word is itself of Iberian origin, and it is said by Baskish scholars to be represented by the Baskish word *unchi* at the present day. The Romans as early as the times of Cicero and Cæsar gave the appellation of *cuniculum* to an underground passage or a mine, and it was disputed among them whether the animal took its name from the mine or the mine from the animal. Modern scholars assume the latter alternative, an agreement with the express statement of Martial that 'the rabbit showed to its enemies the way to make undisturbed passages.'

The first mention of the rabbit in literature (for it must be remembered that the coney of the Scriptures was the jerboa) is found in the Romanised Greek Polybius, a writer who flourished about one hundred and fifty years before the Christian era. He spells the word *kuniklos*. 'In Corsica,' he says, 'there are no wild animals except foxes, rabbits, and wild sheep'

(*mouflons*). Athenæus uses the same word, as does Posidonius of Apamea in the first half of the first century before our era. Catullus speaks of Iberia as 'rabbit haunted'; Varro, Strabo, and Pliny the Elder describe the animal and its habits; and Varro tells us of the various methods employed for catching it.

The Iberians seem to have valued their native rabbits highly; we find that they had transported them to the Balearic Islands, as well as to Corsica. The Romans regarded young unweaned rabbits as a peculiar delicacy; they called these by the name of *laurices*, a word possibly of Baskish origin.

But the enormous rate at which rabbits multiply—as we have seen, unfortunately, in Australia—caused them to be looked upon as a plague, just as they are regarded in Australia at the present day. They spoilt whole agricultural districts with their workings, loosened the roots of the trees, and even undermined human habitations. The inhabitants of the Balearic Isles actually sent deputies to Rome with a request that a new dwelling-place might be allotted them, as the rabbits had fairly eaten them out. Pliny tells us that these same islanders sent a petition to the Emperor Augustus that he would send a detachment of soldiers to their aid against the rodent. The rabbit plague was felt along the seacoast as far as Marseilles.

It is interesting to learn that the Iberians, to

meet this unwelcome invasion, had discovered the services which might be rendered them by the kind of weasel indigenous to the north of Africa, known to us as the ferret (*viverra*). Numbers of these useful animals have been turned out in the rabbit-haunted parts of Australia to attempt to keep down the noxious animals, as they are there regarded. Herodotus expressly tells us that in his time ferrets were found in North Africa under the silphium shrubs. We know that the Romans used, instead of the domestic tabby—which was as yet unknown to them—some kind of tamed weasel, which may possibly have been this very *viverra*, though they commonly called it *mustela* or mouse-catcher. The Romans kept rabbits and hares in *leporaria* for the table. In one of the banquets described by Athenæus a speaker describes how, on a voyage from Pozzuoli to Naples, he had touched at a small island (Nisida), and found it occupied by few inhabitants, but by numerous rabbits; and to-day it holds good that there are few of these animals in Italy itself, but that many of the islands on the Italian coast can boast too many of them. The Romans regarded them as characteristic of the Iberian Peninsula, much as we regard the kangaroo as the totem of Australia. Gold and silver coins of the Emperor Hadrian are stamped with the legend 'Hispania,' under a recumbent female figure holding an olive-branch, and resting her elbow on Cape Calpe; on the obverse is stamped the outline of a rabbit.

These little animals must have spread over Europe through Roman influence at a very early date; for we find Gregory of Tours at the end of the sixth century A.D. stating that during the days of Lent young rabbits were a favourite dish (the *laurices* already described). A contemporary of Dante's, Crescentius, speaks of rabbits as abounding in Provence and Lombardy. They have now spread to the islands of the eastern as well as the western Mediterranean, and scored them with their burrows, though they are not found in Turkey. It is common in Scotland and in Ireland to hear the rabbit spoken of as a late introduction from England, but Mr Ritchie of Edinburgh has pointed out that this is a mistake. He affirms in *Notes and Queries* that the rabbit was mentioned as at Aberdeen in 1424, that it abounded in Orkney in the sixteenth century, and in Ireland is mentioned as early as the fifth century.

Our word 'rabbit' is supposed to be a diminutive form connected with the word *rabo*, the Spanish word for 'a tail.' The French word *lapin* is believed to be a shortened form for *clapin*, 'a skulker in holes.' The German *Kaninchen* is, of course, from *cuniculus*, as is the English word coney. The Russians call the rabbit *krolík*, or 'little king.'

The devastation caused by rabbits in Australia and in New Zealand may well make acclima-

tisers pause before proceeding to introduce new animals into new countries without due thought. The countless millions of these rodents whose ravages man is now endeavouring to counteract are the descendants of a few rabbits imported into Victoria some fifty years ago by a squatter for his own sport. They have now spread over a great part of the country, and laid upon Australia a heavy debt incurred in different attempts to exterminate them. In some places, like the stony ranges of western Victoria, they abound in such numbers that sometimes of an evening I have seen them in thousands; nor is there any hope of eradicating them from such strongholds. They have spread up into south Queensland in spite of the efforts made to fence them out; but I doubt whether they will thrive in the tropical north. Efforts have been made to exterminate them by digging them out and stopping the holes, by poison, and by the introduction into rabbit-infested districts of natural enemies of the rodents, such as weasels, foxes, and cats. From these, chickens and lambs have suffered, and many wish that foxes especially had never been introduced. Some landed proprietors offered a reward for each rabbit killed on their property. The proof was to be the tail of the animal; but it was shortly after observed that numerous tailless bunnies were running on the estate. The trappers had caught them and let them go again that they might breed as before! They are mostly caught nowadays by trappers.

The rabbit is as rarely eaten in Australia as in Ireland; but factories for preserving rabbits have been established on the island continent, and the rabbits so preserved fetch a good price in the English market. I saw lately a crate of rabbits which had been preserved in the cold chamber. They were larger than English rabbits, and were sold at a shilling each. In some parts of Victoria I have seen rabbits of different colours—black, white, and brindled. I do not know whether these are to be regarded as freaks, or whether the colouring depends on the soil.

The question has often been discussed as to whether the rabbit and the hare ever interbreed. Frank Buckland expressed his entire disbelief in the genuineness of any such alleged case, and I think most gamekeepers agree with him. The so-called Belgian hare is simply a well-developed rabbit, and has often been introduced into English warrens with the view of improving the breed.

It should be added that the plan of poisoning rabbits has been found in New Zealand to have had the effect of destroying some of the native birds, such as the pretty weka-weka hen, well known to bushmen, and of interest to naturalists from its peculiar habits. It is the most inquisitive creature alive, and fortunately for itself one of the most agile and restless of birds; otherwise it would fall an easy prey to all sorts of enemies,

thanks to its feminine failing. Mr Wakefield, in his interesting work on the fauna of New Zealand, remarks that 'it must always know what is going on, and will even enter boldly the tent of the encamped traveller, and steal his goods and chattels as he lies in his blanket. It is very common, when a coach stops to change horses in the unpeopled wilds, to see three or four of these queer birds emerge from the surrounding herbage, and bravely and minutely investigate the proceedings, walking almost under the horses' heels, and surveying the passengers as if they were old friends, yet ready at the first hostile attack to make themselves scarce as if by magic.' These birds are quite peculiar to New Zealand,

none like them being found in any other part of the world. It would be a pity for this interesting creature to become extinct; for the curious kakapo, or owl-parrot—which used to eat fruit, but since the advent of the whites has become a flesh-eating fowl—and the wingless kiwi are destined soon to disappear.

In Australia the last and most generally adopted method of getting rid of the rabbits is simply to fill up their holes with earth, and to continue this process until the bunnies are all suffocated. It may be imagined that this is an expensive process; but it has, so my Australian correspondents say, the advantage of being effectual.

IF THE CENSOR ONLY KNEW.

By ÆSCULAPIUS.

I.

STAFF-SURGEON MICHAEL O'BRIEN had a weakness for books with showy covers. In fact, he invariably judged a book by the cover. He was also inclined to impulsiveness. One morning he was making his rounds in the sick quarters of H.M.S. *Alcibiades*. He suddenly halted. A gurgling sound issued from his capacious throat. The sick-berth steward was alarmed. 'Are you ill, sir?' he asked with some concern.

No, the staff-surgeon was not ill. It was intended as a gurgle of delight. The dull-gray monotony of his daily existence had been transformed into something with colour in it. His diagnostic eye had spotted a book on the table. Glaring red letters beckoned to him. They were written at a rakish angle. They trailed across a yellow background. They made up the words of the title *Jaccuse*.

He pounced upon the volume. 'In the king's name,' he demanded, 'whose book is this?'

'It's Wireless Operator Morgan's, sir,' the sick-berth steward replied.

'Oh, you mean the bloke with belladonna in his eyes?'

'That's right, sir. He wants to go to hospital.'

'Well, you can tell him *ex cathedra*—mind you don't say "catheter"—that he isn't going. There's nothing wrong with his eyes. What's more to the point,' the staff-surgeon continued, 'he'll not be able to read for a week, so I'll borrow his book. You may also intimate to him that if he isn't careful I'll stop his rum.'

'That ought to shake him up a bit, sir,' the steward said with a grin.

II.

The staff-surgeon walked aft with his prize tucked under his arm. Carefully avoiding the snares of the wardroom, he made straight for his

cabin. He was determined to commune at once with *Jaccuse*.

Alas! man proposes, God disposes, especially in the navy.

The staff-surgeon was still gazing in rapture at the outrageous cover when the first lieutenant thrust his tousled head into the former's cabin.

'Will you come shooting with me, doc.?''

'Will a duck swim? Have you gone balmy? Here we are in the midst of the greatest war in history, and yet you ask'—

'Oh, dry up about the greatest war in history! I'm fed up on war. But, honest Injun, haven't you heard? Something has gone wrong below. It'll take two or three days to fix it.'

'Hosanna!' murmured the staff-surgeon.

'I have the captain's permission,' continued the first lieutenant, 'to take you with me on a couple of days' leave. Are you coming?'

'Yes, certainly, I should say so, with the greatest of pleasure,' replied the staff-surgeon, expressing his exhilaration of spirits in a crescendo of redundancies. 'When do we start?'

'A boat leaves for the beach at seven bells.'

'Right-o. I'll be ready.'

The staff-surgeon's servant appeared at this opportune moment. He bore the insignia of his office, a highly burnished copper kettle.

The staff-surgeon said, 'I shall need my hunting gear in a few minutes, Barlow. After that I'll not trouble you for two lovely days.'

'Very good, sir,' the marine rejoined.

The staff-surgeon accordingly went shooting, and forgot all about *Jaccuse*.

III.

The first lieutenant and Staff-Surgeon O'Brien were in the wardroom. Their messmates were smacking their lips in anticipation of a delightful bag of game which the lucky sportsmen had brought back with them.

A sick-berth attendant came up to the surgeon, and said, 'A prisoner for examination, sir.'

Staff-Surgeon O'Brien went forward immediately to the sick-quarters. Wireless Operator Morgan, half-stripped, was awaiting medical examination. The staff-surgeon had a sort of sneaking sympathy for offenders. He was a bit 'ag'in the Government' himself. That's where his Irish blood came in. It was, therefore, with a kindly look that he regarded Morgan. The dark-complexioned wireless operator stood shaking before him.

'Well, my lad,' the surgeon inquired heartily, 'what have you been up to?'

Morgan was silent. The master-at-arms answered glibly for him. 'He broke his leave, sir. He was discovered at the railway station taking a train for parts out of bounds, sir. The captain has given him ten days' cells, sir.'

Whether it be the fear of coming into close contact with an officer, or whether it be the stethoscope, a service man's heart beats rapidly when he is being medically examined.

Morgan was no exception to the rule. In fact, his heart beat so fast that Staff-Surgeon O'Brien exclaimed, 'I don't know how fast you can work your wireless key. What I do know is that you'd be working it mighty quickly if you kept up with your heart-beat at the present moment.'

The staff-surgeon studied the face before him. If ever a pair of eyes reflected fear, the dark-brown ones before him did. 'Buck-up, my lad,' he advised him. 'You're as nervous as a kitten. Ten days' cells never killed any man.'

There being nothing organically wrong with him, however, he reluctantly affixed his signature to the 'Medically Fit' declaration of the warrant.

'By the way, Morgan,' he said in his cheery way, 'I had forgotten all about your book. I'll return it to you in a few days.'

'There's no hurry now, sir,' the prisoner faltered. 'I wouldn't be allowed to read it, in any case,' he said in a choking kind of voice. Then, in a half-querulous, half-defiant way, he made a curious remark. 'I don't believe a German wrote the book. England caused the war,' Wireless Operator Morgan declared.

'Don't you give no more of your cheek, Morgan, or it'll be the yardarm for you,' the master-at-arms said to him menacingly, as he marched his prisoner away.

IV.

Staff-surgeon O'Brien lingered in his cabin, waiting for the tea-hour. Sixteen months of nearly continuous sea-life had accustomed him to the vagaries of sky and sea. Each alternately danced attendance on his line of vision through the porthole. Occasionally a big green wave hit his scuttle with a crash, obliterating everything, and then receded noisily. Somehow or other the pleasant interlude on shore had put

him in a reflective mood. Here he was racing through the water in a cruiser, going whither he did not know. What was more, he did not care. A super-Dreadnought appeared for a moment in all her stupendousness. What did it all mean? With a sigh his eyes wandered round and took in the different knick-knacks of a naval officer's cabin, until they fell on the gaudy cover of *J'accuse*. 'The very thing that may prove illuminating,' he murmured.

He seated himself luxuriously in his arm-chair, lit his pipe, and adjusted the electric heater at his feet. After reading a few chapters he began turning over the pages at random in a disgruntled sort of way.

'I don't agree with Morgan's sentiments. I shouldn't wonder, though, if he's right about the author not being a German,' the staff-surgeon mused.

A double-sheet of note-paper slipped out of the book and landed astride the rounded grating of his heater. Being in a lazy mood, he let it stay where it was till a curious phenomenon roused him from his sybaritical attitude, yet held him spell-bound for a few seconds. The sheet of note-paper had fallen from between the pages of *J'accuse* as white as the driven snow. Now it was being rapidly covered with writing before his very eyes. The scorching of the edges warned him that it was time to snatch it from its present position. He picked the thing up hastily. His sense of responsibility as a censor of letters in H.M.S. *Alcibiades* was thoroughly roused. There was dirty work going on somewhere. It was his duty to find out where. All letters written on board his Majesty's ships in a time of war are censored. No matter whether the scribe be an admiral or a seaman, his letters are submitted to the rigid scrutiny of the censor before being sent to the General Post-Office, London.

The heat of Staff-Surgeon O'Brien's radiator had rendered visible the following interesting communication:

'The ships of our squadron go out on the stunt mentioned a week from to-day (Tuesday) . . . speed probably . . . knots. After accompanying squadron to *point-d'appui* in latitude . . . , longitude . . . , we leave them and proceed to . . . for a refit. They are becoming very vigilant since last affair. I propose to try to get sent back immediately to depot hospital on account of imaginary eye-trouble.' ('I didn't do six months' eye-work in Vienna for nothing,' muttered O'Brien.) 'If cannot arrange this, will break leave before ship sails, and go . . . It's too risky staying on board. In any case, will meet you at usual rendezvous. Please have railway passes ready in case we may have to slip over to France in khaki. I have run out of special invisible fluid. I pinched some silver nitrate in dispensary, and am obliged to trust to it. *Au revoir*.'

The handwriting was quite small and regular, and each line was about an inch apart.

'The blighter adds insult to injury. He makes use of the medical department to execute his nefarious schemes,' exclaimed the staff-surgeon, in a towering rage. 'So that's the way he evades the censor. I suppose he writes such visible tosh as "Hope this will find you well, as it leaves me in the pink," with ink between his invisible treachery. The swine! I'll soon fix him.'

He was about to report the affair to the captain, when there was a deafening detonation; the ship trembled violently, and listed to port. At the same time the guns roared. Hoarse shouts were heard, and the tramping of many feet on deck. O'Brien paused long enough to slip on his inflatable waistcoat before going on deck. As he leapt up the gangway the bugler sounded the call to 'Collision Stations.'

Staff-Surgeon O'Brien attempted to make his way forward to the sick quarters.

The quartermaster, saluting him, said, 'Sorry,

sir. All the watertight doors are closed. We can't clear a passage for you yet.'

The gunnery-lieutenant came up to him and said excitedly, 'We've been torpedoed, doc. It's only a moderate explosion. The damage is pretty well confined to one bulkhead. We shall be able to limp back to port under our own steam. We've got the cursed submarine, too. She's one of their latest. Every shot told, and she sank in a few minutes, with no Huns to tell the tale.'

'Have we any casualties?' the staff-surgeon inquired.

'Only one killed. Curiously enough, the only prisoner we've had for months has been blown to smithereens.'

'Serves him damn well right, too,' the staff-surgeon said.

'You bloodthirsty Sawbones! What has the poor wireless operator done to you?'

'You'll hear later, my lad. Meanwhile I'm going to try to get in touch with my sick people,' the staff-surgeon said, as he left the gunnery-lieutenant.

OUR SCHOOLS AND THE TRENCHES.

By Sir JAMES YOXALL, M.P.

AT a spot where the opposing fronts lie unusually near each other, the Germans pushed above their parapet a board on which they had chalked the words

GOTT MIT UNS.

Presently a British board replied,

SO 'VE WE GOT MITTENS.

That was a natural rejoicing on a freezing day, and there was no irreverence implied in it. Nor was there any special piety meant in the other inscription, I am sure.

At night the Germans chanted Luther's *chorale*, by order, and the British sat whistling 'Here we are, here we are, here we are again!' or some other lyrical absurdity, of their own free cheery will. I applaud them for the difference, though 'Surely it is a very sad difference' some superficial observer is sure to think; and then, 'Our men cannot have been so well taught as theirs?' But that is the English paradox coming out again; for though the current idea about education in England is that anything can be taught to anybody by a mere course of lessons at school, yet a co-equal English idea is that education of any kind is next to no use in practical life.

Education is not coaching or drill; they can coach the typical German into anything, but can educate him into nothing. The 'sad difference' is essential, happily; it is the contrast inherent between a dull flockishness drilled and a lively individuality developed. No course of lessons could ever make Germans British-minded, and

no system of schooling could ever make British people German-like, thank Heaven! Both are patriotic, both are brave; but—the pious inscription and the *chorale* notwithstanding—the Germans are not the superiors either in reverence or any other form of good taste, and in effect their general training has been inferior to ours.

A trench is a kind of school itself, no doubt; a place of education in living, fighting, and—dying. But it is also a testing-station, a place of trial and assay, a stern touchstone of what previous training has educaed. I will be no excessive claimant for British schools, however; I know how much a teacher has to depend on the inherent quality of the human material placed in his care, and I feel that to compare the effect of German schools on German human material with the effect of British schools upon British human material would be a futile examination of unlikes. Yet let us consider a little what the 'wonderful German education,' and the pseudo-*Psychologie* which is its basis, have done for German soldiers in essentials.

In Bavaria I have visited excellent schools of all grades; to my own knowledge, the schools built in Munich during the last twenty years have been models in bricks and mortar, equipment, baths, maps, diagrams, and so on. Yet not even the Prussians can have behaved more brutally than the Bavarians during this war. What son of the smallest Highland school, or the poorest place of teaching on some fat English plain, would assault age, infancy, and womanhood in war or peace as the sons of those pretentious

school-shells at Munich have done? Or rejoice, at home, over hospital ships torpedoed and babies Zeppelined? *Gott mit uns* and the *chorale* are thus either automatic or blasphemous, and I think the former; there was no observant traveller in urban Germany before the war who did not perceive that little trace of true religious feeling was left. Even the forms of it less resembled sincerity than a rigid, goose-step drilling, which was no training for the heart or outlet for the soul.

Patriotism and loyalty have not been 'taught' in most British schools; in Germany they were school-subjects, coached in by systematic drill, as was nearly everything else. Battle-pictures of French defeats in 1870-71, and portraits of the Kaiser, the local minor monarch, Bismarck, and Moltke, hang in every German school; while the only battle-picture I remember seeing in a British school is the pathetic 'Roll Call,' which shows the misery, not the pomp and circumstance, of war. German teachers proudly exhibited maps of German colonies, absurdly distorted in scale; in English schools, except in the Navy League map which I suggested twenty years ago, the British red on the chart of the world has been given small special notice. Yet who will say that Hans has been schooled into being patriotic and Tommy has not?

By the use of reading-books even small German children were drilled in arrogance and international hatred or contempt, though no British reading-book has ever shown a trace of anything of the kind; result, fair-play and chivalrous pity in our trenches, foul-play and craven fear of capture in the others. Teachers here successfully resisted the ousting of Swedish and other systems of physical training in schools by Red-Book military drill; yonder quite little school children were coached for the army, just as adolescents were barracked in the army itself, and adults were drilled in everything, all through a drab and envious existence which no spark of individualistic joy or humour relieved. Yet millions of British volunteers have picked up army drill and skill with receptive quickness, and did not do it solemnly, priggishly, or despairingly to the point of suicide (as is often the German way), but merrily, though also duteously, and with patriotic fervour as well as fun.

Our schools have done much to draw out natural qualities of leadership, and to prepare recruits for becoming non-commissioned officers; this also applies to the higher grades, of course. 'Our officers are splendid!' the rank-and-file write home, but also 'The men are gentlemen' their officers say. I heard the same opinion from French Senators in Paris recently. Universities, colleges, and schools of various kinds here have supplied at least twenty-five thousand teachers to be officers or men since August 1914; and when it is remembered how small a class of the

nation teachers are, how many of them are women, and how many of the men are over military age, this contribution may be considered unusually large.

Religious teaching in schools has had its great and hallowing part in the preparation for the trenches. Hans does not seem to have profited thus, but Sandy has learned well from his dominie and the Shorter Catechism, and Tommy from the Bible-lessons in English schools. What drill in ethics or didactic moralisings could parallel the inspiring effect of the hymn, the prayer, and the simple Biblical discourse upon young hearts? And our men at the front show reverence for religion through all. From Gallipoli a French soldier wrote to a Swiss newspaper thus: 'I watched British soldiers at worship. While they sang their slow, grave psalms, Turkish shells were falling all around, and some burst alongside; but not a man in khaki turned his head, and when the explosion was over you heard again the singing mount to the skies.' The tendency of schools here is to deprecate fuss or any excited expression of feeling; perhaps too much so, for maybe enthusiasm is sometimes repressed. 'See Tommy watching a football match! Not a muscle quivers; you would think him bored,' this French observer wrote. But he added, 'Let a particularly good kick be given, however, and what a yell bursts from the apparently impassive Briton! It is a shout of hope, encouragement, or triumph, that suddenly unseals to you the passionate excitement which was hidden all the time.'

It was a commonly heard reproach that English schools made too much of games, and perhaps there was ground for that; but at least school cricket has trained the men for bombing, that feature of the offensive in these days. Ours are the quickest, hardest, and straightest throwers of hand-grenades, we learn; and also that football has prepared them for the team-play of attack. The public school tradition of keen but fair play, broadening down, has affected humbler places of study, and many a son of these had learned, as the lad in Sir Henry Newbolt's poem did at Clifton College—

To set the Cause above renown,
To love the game beyond the prize;
To honour, while you strike him down,
The foe that comes with fearless eyes.

Much of the reason why 'our officers are splendid' and 'the men are gentlemen' is that pluck was applauded, foul-play was repressed, and natural good-breeding was developed at school. As for the Prussians, the opinion of the late Premier of Luxemburg was that 'they are the worst of pigs'; they are *cochons enragés*, say the French—a kind of drilled wild boar. But what French soldiers say about their British comrades is almost the highest possible testimonial to the influence of British schools.

THE ENGLISH HERB INDUSTRY.

By MARY HOLDSWORTH.

IN order to meet the demand for medicinal herbs, the shortage of which is assuming serious proportions, there is an imperative need for the people of this country to take up their cultivation.

Time was when we grew all the medicinal herbs we needed for our own use. In the Middle Ages they were grown in the kitchen-gardens of the monastic orders and of the great country houses. In those days the mistress of the house not only knew the simples of the field and garden, but gathered and brewed them for the use of her household. But nowadays it is only the few who have knowledge of the lore of the fields and woods; and the herb industry has almost, though not quite, been taken out of our hands.

In pre-war days most of our supplies were obtained from central Europe (Germany, Austria, and the Balkans). Owing to the British blockade, these supplies have been cut off, and we are faced with a dearth of the herbs. So serious has been the rise in prices that certain drugs that could formerly be obtained for one shilling and sixpence halfpenny now fetch twenty-five shillings. Hospitals and private persons are feeling the heavy strain laid upon them by this enormous increase in price. Belladonna, to take one instance, has increased 600 per cent. in price.

Now there is no reason why we should not cultivate these medicinal herbs again, both for our urgent need and also to keep the supply in our own hands for the future. Spring is the time to begin planting. Wanted urgently are belladonna, henbane, dill, chamomile, valerian, dandelion, aconite, feverfew, foxglove, opium poppy, blessed thistle, common barberry, broom-tips, and others. Many of these much-needed plants are found in a wild state, and only require collecting—e.g. foxglove, colt's-foot, autumn crocus, male fern, &c. Many others will find a ready market if well grown and prepared. In drying herbs, an even and good colour is of great advantage; the better the colour the more saleable the drug. Therefore it is a good plan to pick and dry in small quantities. Roots, of course, require washing and drying.

It should be borne in mind that, while the price of some of the more important drugs has increased enormously, there is only a limited market for certain others, and it would be no difficult matter to overload the market with them. Thus a certain amount of co-operation is necessary to regulate the supply. Intending growers should seriously consider this point before embarking on the scheme to any great extent. A good plan is to arrange beforehand with wholesale drug-dealers, who will advise as to what is most likely to be in demand at any given time.

While, of course, it is possible for the supply of a drug to exceed the demand, it must be borne in mind that the quantity of dried herbs required is very great; they are needed in hundredweights and tons.

As it is probable that many people who could grow the herbs would find a difficulty in drying and preparing them, it may be remarked that there are several establishments in London and elsewhere which undertake the drying and preparing of medicinal roots and herbs; and that if fresh plants are forwarded to them by passenger train, carefully packed in wooden boxes in the same way as flowers are marketed, they could be dried at the drying-sheds.

The Board of Agriculture has issued a very instructive leaflet (No. 288) on the cultivation of medicinal herbs, which can be obtained post free. The Herb-Growing Association, 7 Queen Anne's Chambers, Westminster, London, S.W., has also been formed for helping forward this movement, and is prepared to give advice on the growth, preparation, and sale of medicinal herbs. Those desirous of taking up this work, which is of immediate and national importance, can become members of this association on payment of a small fee, which entitles them to receive all the help and advice they require. The association has issued a valuable leaflet, price sevenpence halfpenny, post free; and has established a drying-shed at Byfleet, where herbs may be sent to be dried. The association will sell as well as dry the herbs, a commission being charged for the work done. Members are requested to inform the association what they intend to grow or collect. This should be done as soon as possible, so that it can be known where anything can be procured if required at short notice.

REST.

At last the healing touch of eve descends;

The day was long, the sun's red splendours smote
The grassy pastures; and, as peace transcends

The pomp of war, our lips send forth a note
Of grateful praise for that red-barr'd west,

And the soft twirling of the burnt-up spray.

Athwart the brow cool breezes, on the breast

The healing touch of evening. O'er the brae

A mist is wrapped. The foxglove's bells, astir,

Greet the late bee; the roses throw a spell

Of scented sweetness, and from haunts of fir

Come resinous perfumes that cling and dwell.

Grayness enwraps the lonely tree that stands

Midway in yonder pastures, where, 'tis said,

The fairies tune their pipes at eve. The lands

Greet the deep dew. Far, winging overhead

A rook seeks some plantation in the dene.

Until another morn cool Rest has spread

Her sheltering tent, the shade of the Unseen.

WILLIAM J. GALLAGHER.

Chambers's Journal

SEVENTH SERIES

ON THE TURKO-EGYPTIAN FRONT.

By NIMROD.

THE Sinai Peninsula, more particularly that part of it lying east of the Suez Canal, has assumed considerable prominence recently by reason of Turko-German designs on Egypt and the Canal with a view to cutting our line to the East. To obtain an insight into the situation in the Near East a brief review of German aspirations in Asiatic Turkey, both before and during the present war, may be given. For some years past Asiatic Turkey has been regarded as a fitting ground for German settlement. To the Teuton mind the area in question is one of great potential value and open to wide development under German direction. It is now some years since German colonies were established in Asiatic Turkey, the most important being that of Mount Carmel, which came into being under the special ægis of the Kaiser himself. In turning toward Asiatic Turkey as a profitable field for their energies, the Germans have had in constant view the potentialities of the Turkish Empire as a recruiting ground to back them up in their Pan-German ambitions. With a railway from Berlin to Constantinople, and its continuation thence by the Anatolian and Baghdad line, the whole under German domination, the best parts of Asiatic Turkey would be at their disposal, and enable supplies to be drawn from the pick of the Turkish provinces. It may be argued that the interposition of the Balkan States along the above line would constitute a serious drawback; but this is more apparent than real, since the commercial advantages to be derived by these States would ensure their adherence.

The light of after events has shown clearly the thoroughness of German preparations in the Near East. The men selected to do the work have been chosen because they were specialists, and adapted in every way to discharge the duties demanded of them. Money has been lavishly, yet wisely, spent, and nothing left undone that could in any way, however slight, contribute to the end in view. Germany was quick to recognise the value of Asiatic Turkey as a replenishing ground for her supplies of cotton, of which she stands in such daily increasing need to maintain the output of explosives; whilst the copper-mines offer a favourable field for exploitation. The great drawback to the scheme of a German-controlled line through Asiatic Turkey,

though nominally under Turkish management, is the Black Sea, which fringes the northern confines. With this sea under Turkish domination the constant menace of Russian interference is removed; but under present conditions, and with a Russian Black Sea fleet supreme there, the case assumes an entirely different aspect.

The aim and extent of the plans as outlined above indicate the Pan-Germanic ambition, and the efforts that have been put forth to create a continuous Germanic Empire, directly or under the cloak of spheres of influence and protectorates, from Berlin to the Persian Gulf.

We now arrive at a vital factor in the success or failure of the idea—the domination of Egypt and the Suez Canal. It is common knowledge that Turkey would like to recover Egypt, and it is only natural that Germany should aid her in the attempt, and so secure her acquiescence in German designs. It was not entirely for philanthropic purposes that the Hedjaz railway through Syria and down to the holy places of Mecca and Medina was built, as has been said, under German supervision. Its strategic value in any operations against Egypt is too apparent to need discussion.

Thus we see that the participation of Turkey in the war, and the developments in Asiatic Turkey, have turned especial attention to the Sinai Peninsula as a theatre of the world war, where great and far-reaching results may be forthcoming. It will, therefore, be of interest to give some account of the region in question from its several aspects.

The peninsula with which we are concerned in this article is bounded on the north by the Mediterranean; on the west by the Suez Canal and the Gulf of Suez, the latter being the northern end of the Red Sea; and on the south-east by the Gulf of Akaba, which runs up from the north-eastern part of the Red Sea proper.

Strategically the peninsula is an important one, for, as already indicated, it forms a dividing line between East and West, and has along its western limits that vital chord the Suez Canal, whilst its close proximity to Egypt gives it enhanced value.

Historical records show that from the earliest times a garrison from Egypt was maintained in

Sinai even at so remote a period as three thousand years B.C. It is, too, a land of sacred celebrity as the home of the Ishmaelites, and the wild and lawless nature of these tribes of Biblical renown is reflected in those to be found within the peninsula at the present day.

The hordes of Mohammed marched through Sinai to spread the Mussulman faith by means of the sword, whilst along the Gulf of Akaba sailed the fleets of Solomon and Jehoshaphat. Here, in this land of sandy deserts and granite ranges, the host of Israel wandered after leaving Egypt. Indeed, the country teems with traditional memorials of the exodus. Of the many we may take Mount Sinai, where Moses is said to have expounded the ten commandments. The summit has a monastery built during the reign of the Roman Emperor Justinian in the seventh century.

A few miles south of Suez, hard by the sea-shore, is the celebrated Moses' Well, which sacred records tell us was the spot where Moses produced water for the Israelites in their forty years' wandering in the wilderness. It is an oasis in the desert, with some two hundred palms giving welcome shade in the torrid summer days.

Another spot of Biblical fame is the Moses' Cleft, a deep ravine in the mountains which tradition has it was cut by the rod of the patriarch. This remarkable gorge ends in a cul-de-sac, and is the site of the ancient city of Petra, the capital of Idumæa. It is said that Petra was a thriving commercial centre seventeen centuries before the Christian era. Thither was directed the merchandise of Arabia, Egypt, and all the countries of the East; in fact, the city may be characterised as dating from the birth of commerce. It passed through stormy times, and was assailed by Romans, Saracens, and Crusaders in turn. Late in the Middle Ages its glory waned, and the once proud city fell away until all that remained were the ruins of its former glory, which the hostility of the tribes in its vicinity has so far prevented from being opened up to scientific and antiquarian research.

The northern part of Sinai is mainly level plain, with considerable cultivated areas. The southern consists of ranges of granite and limestone rock, intersected by narrow valleys and ravines, with no cultivation. Farther out, beyond the foothills, are stretches of desert and sand-dunes, forming extremely heavy going for any troops or animals except the hardened camel. The peninsula has no roads, properly speaking; rough tracks are the only ways and communications, although in view of possible operations the Turks are endeavouring to effect improvement herein. During the rainy seasons of the year, which are by no means regular, the rainfall varying with each season, the ravines often form spates and torrents, filling pools and wells therein, and so rendering movement correspondingly easier,

for here the water question is the predominant factor. Wells are to be found scattered about in the oases, but the water is brackish from the saline deposits in the ground. To facilitate Turkish operations, wells are being dug under German supervision, and it is probable that pipe-lines may be laid down as the Turkish forces advance.

With the water difficulty is linked the question of fuel, its paucity constituting another drawback to operations on any large scale. All wood must be imported, although the Arabs and nomadic tribes, whose requirements are limited, meet the difficulty by using camel-dung as fuel. There is a certain amount of scrub in parts of the peninsula, but it is quite inadequate for a large force.

As a means of transport the camel is used, large numbers being found in the eastern parts of Sinai and throughout Syria. An average riding-camel is capable of doing from seventy to eighty miles a day, and if carrying baggage can be loaded up to three hundred pounds weight and accomplish a march of twenty-five to thirty miles. They require watering as a rule once every four or five days, and can usually live on the country and the scanty grazing to be picked up.

Sinai possesses on the whole an equable climate. During the cold season from October to March it is never unduly hot, and one can move about in the daytime without the necessity of wearing a sun-proof hat. Rain falls intermittently from December to March, some years the fall being very abundant, and filling the wadis or nullahs and the wells at the various oases. The movement of troops is entirely dependent on the rainfall, and no accurate forecast of events can be made until the rains eventuate or otherwise. From April to September the climate is distinctly hot, and no operations could be carried out without the most elaborate preparations both as regards transport and water-supply.

The resources of the Sinai Peninsula are practically confined to camels, of which large numbers would be available. Along the northern shore barley is grown, but in quantities sufficient only to meet local requirements.

Throughout the peninsula a number of wandering tribes are found, presided over by sheikhs, or chiefs, but their authority is purely nominal. Perhaps the most interesting of these nomad races are the Bedouins, reputed to be descendants of the Ishmaelites, and their general independence and air of freedom, not unmixed with lawlessness, lends colour to the popular idea. Farther south, toward Medina and Mecca, the Bedouins live mainly by brigandage, as well as by supplying transport to the pilgrims landing at Jeddah on their way to the shrine of the Prophet. Caravans are often attacked by these marauding tribesmen, and they not infrequently

bring off some big coups. The Bedouins are splendid horsemen, and the breed of animal they rear is famed for its speed and staying powers. It may be said that a Bedouin is born in the saddle, and he constitutes a good type of irregular cavalry for use in the form of warfare for which he is adapted; but, placed under any restraint or discipline, he would not be a success, as his free-born nature and innate love of independence would render him of little value as a regular soldier.

An outline of the Sinai Peninsula, its characteristics, climate, and resources having been presented, it will be of interest to examine the subject from a military point of view, and observe what prospects there are of success in an invasion of Egypt, and, by cutting our line to India and the East, of harassing our trade in that direction. From the present Turkish boundary, and the points where Turkish troops are located in adequate numbers along the Sinai borders, to the Canal is a distance of about one hundred and fifty miles, over a sandy, and to a large extent waterless, country. In any operations undertaken with the Canal as the objective a very considerable force would have to be employed to allow a reasonable chance of success. This force would require a large amount of transport and supplies, the various impedimenta of modern armies, guns of heavy calibre, with plentiful supplies of ammunition, and so on. It must be borne in mind that the ruling factors are water and fuel; and, as we have already seen, both must be carried, or as far as the water is concerned pipe-lines laid down to meet the extensive needs of such a force. Metalled roads are essential to permit of heavy guns and transport being brought across the desert wastes, where the going is so heavy from the soft sand that for infantry to accomplish a march of even a few miles per day is a creditable performance. Any scheme of invasion would demand careful preparation. Bases would have to be established at selected

points along the boundary, stores accumulated, pipe-lines laid down, and roads suitable for the movement of large bodies made where the merest tracks through the sand are now the only communications.

As the situation presents itself at the moment the prospects of a successful issue are remote, to say the least of it, for the Turks are not in a position to initiate the scheme and push it with the requisite energy and vigour. All that has been done so far is entirely due to German supervision and initiation; and, with all the thoroughness which the latter undoubtedly possess, what they have accomplished is far from overcoming even the preliminary stages in their plans against Egypt and the Canal.

For the purposes of invasion there are three routes by which a hostile force could advance—a northern, central, and southern. The first lies along the Mediterranean shore, to which it is confined owing to the vast inundations lying immediately to the south. It is not an easy route, because of the exceptionally heavy sand and the existence of quicksands in places along it; whilst it is commanded from the sea, and could be rendered impracticable by the co-operation of warships. Along the central route the water-supply is the acute difficulty, in addition to the sand-dunes. Much the same may be said of the southern road.

In any case, a force adequate in numbers to operate against the Canal would require a vast supply of water unless the wells and oases *en route* had been filled by an abundant rainfall. This would mean a corresponding increase in transport camels, so that it will be readily appreciated how formidable are the difficulties confronting the invaders. On the other hand, it should be noted that British forethought and preparation have provided an admirable scheme of defence for our most vital line to the East, which places all fears as to its security outside the region of practical politics.

PINCHER MARTIN, O.D.

CHAPTER VI.—*continued.*

IT must not be imagined that the inhabitants of the *Belligerent's* gunroom always behaved like this. On the contrary, they were an unusually well-conducted mess, and they broke out only when they were really exasperated, and their feelings got the better of them.

The sub, assisted by the senior 'snotties,' had drilled the Crabs into a high state of discipline and efficiency. He believed in using the terror of the stick as a deterrent rather than in employing the weapon itself, and as a consequence the junior midshipmen were never beaten really hard unless they misbehaved themselves. But as Cook himself once remarked, 'You can bet

your bottom dollar that for every sin they've been bowled out committing, there are fully fifty more that we haven't discovered;' and there was some truth in the remark.

One of the methods of smartening up the Crabs was an evolution known as 'fork in the beam.' This was a time-honoured custom which must have started in the days of wooden sailing-ships, since it is hardly possible to stick an ordinary table-fork into the steel beams of a modern vessel. It generally took place during dinner, when the younger members of the mess had been making too much noise.

The sub, standing up at his place at the end of

the table, would insinuate a fork into the electric wires overhead, and at this signal all the junior midshipmen and the assistant-clerk had to leave the mess, scamper twice round the boat-deck, and return in the shortest possible time. In the old-time evolution itself the 'snotties' used to run up the rigging and over the masthead, but Cook substituted the race round the boat-deck as being less dangerous. The last officer back had to repeat the performance; and, as the loser generally found that somebody had drunk his beer during his absence, there was always great competition to be away first. It usually started by a seething mass of seven Crabs being stuck in the doorway. After much struggling and pushing, they would eventually fall through into the flat amidst shrill yelps from the young gentlemen who happened to be underneath, and remarks of 'Get off my face!' 'Ow! let go my leg, you beast!' Then, sorting themselves out one by one, they would dart off, to return a few minutes later flushed and breathless after their exercise.

They were also organised as what were known as the 'dogs of war,' with the idea, as the sub explained, of instilling them with martial ardour and making them fierce. On the order, 'Dogs of war out—so and so!' they were expected to growl viciously, hurl themselves upon the person named, and cast him forth from the mess. Sometimes the assistant-clerk was the victim, sometimes one of the 'snotties' themselves; but, to make things really exciting, the 'dogs' were occasionally divided into two sides, Red and Blue, and each party endeavoured to expel the other. It always meant a frantic struggle, for the victim or victims resisted violently. They were none too gentle either, for clothes were torn, shirts and collars were destroyed, and bruises were by no means infrequent. Sometimes people's noses bled, and the fight waxed really furious; but cases of lost temper were comparatively rare, and the 'dogs' usually enjoyed the fun as much as any one else. Their parents, had they been present during the strife, might not have been quite so amused. They paid for the clothes.

The star turn, however, was the Crabs' *corps de ballet*, and it occasionally disported itself on guest nights for the amusement and edification of any strangers who happened to be present. Trevelyan, the senior midshipman, was the stage manager, and what the ballet lost through lack of histrionic power on the part of the performers it more than made up for by its originality. Their attire was sketchy, to say the least of it. It consisted mainly of bath-towels, sea-boots, and straw hats; and the songs and dances, to the strains of the elderly, asthmatic piano, and bag-pipes played by a Scots midshipman, MacDonald, usually brought the house down. If by any chance the performance fell at all flat through a lack of energy on the part of the performers,

they were promptly converted into 'dogs of war,' with the inevitable result. So, taking it all round, the occupants of 'the 'Orrible Den' managed to amuse themselves.

But because they sometimes became riotous and irresponsible in the gunroom, it must not be imagined that the younger officers were not learning their trade. Far from it; they worked really very hard, on deck, in the engine-room, and in pursuit of the wily and elusive *z*. Their day started at six-fifteen, and between six-forty and seven o'clock they were either away boat-pulling or at physical drill or rifle exercise. After this came baths, and from seven-forty-five till eight instruction in signals. Breakfast was at eight; and from nine till eleven-forty-five, and again in the afternoon from one-fifteen to three-fifteen, they were at instruction in seamanship, gunnery, torpedo, navigation, or engineering. Voluntary instruction in theoretical subjects took place for one and a half hours on three evenings of the week, and those more backward youths who did not volunteer were compelled to attend. Two nights a week, from eight-thirty till nine, there were signal exercises with the Morse lamp, and these had to be attended by all the midshipmen until they attained a certain standard of proficiency.

In addition to this, they had their regular watches to keep—day and night at sea, and from eight-thirty A.M. till eight P.M. in harbour; while no boat ever left the ship under steam or sail without a 'snotty' in charge. Their days, therefore, were pretty busy.

They generally managed to get ashore between three-thirty and seven P.M. about two days out of every four, and on Saturdays and Sundays from one-thirty; but no late leave was granted save in very exceptional circumstances. They amused themselves with hockey and football in the winter, and golf, tennis, and cricket in the summer; and at places where games could not be played, solaced their feelings by borrowing one of the ship's boats on Sunday afternoons, stocking her with great hampers containing provender of all kinds, and then sailing off for a picnic. There is an irresistible fascination in cooking sausages and boiling a kettle over a home-made fire on some unfrequented island or beach which appeals to the most sober-minded of us.

Your modern midshipmen are no longer the rosy-cheeked, blue-eyed little cherubs of fiction. Many of them are over six feet, some of them shave, and nobody but their aunts and female cousins refer to 'them as 'middies.' To call them by that diminutive term to their faces would make them squirm. They refer to themselves as 'snotties,' and 'snotties' they will remain till the end of the chapter. The name, rather inelegant perhaps, owes its origin to the three buttons on the cuffs of their full-dress short jackets, which ribald people used to say

were first placed there to prevent their sleeves being put to the use generally delegated to pocket-handkerchiefs. Any schoolboy will tell you what a 'snot rag' is; but I have never yet heard of a modern midshipman being without this rather important article of dress.

'Snotties' are a strange mixture. They possess all the love of fun and excitement of schoolboys, but once on duty are very much officers. They have to undertake responsibility very young, and at an age when their shore-going brothers are still at public schools their careers in the service have started.

Seamanship is not an exact science; it is an art. It comprises, amongst other things, experience, sound judgment, good nerve, a vast deal of common-sense, and a happy knack of knowing when risks are justifiable and when they are not. It is a subject which cannot be taught by rule of thumb after the first groundwork of elementary knowledge has been assimilated, and circumstances alter cases so greatly that no preceptor on this earth could lay down hard-and-fast rules for each of the thousand-and-fifty contingencies which may arise at sea, and which may one day have to be guarded against or overcome. The sea, moreover, is a fickle mistress. The navy is always on active service, in peace or in war, for its men and its ships are for ever pitting their skill and strength against the might of the most merciless of enemies—the elements. From the very moment that midshipmen join their first ship they are expected to take part in the great game, and sometimes it is a game of life and death. They start off by being placed in charge of boats in all weathers. They may be steam-boats, or boats under sail; but whichever they are, the 'snotties' are learning their trade. If they do something foolish they may do great damage to valuable property, may even be the cause of men losing their lives; but they generally succeed in getting out of scrapes and difficulties with some credit to themselves.

The strenuous training and habit of early responsibility may convert them into men before their time; but they still manage to retain their boyish instincts, and when they are off duty these generally appear uppermost. At times they are noisy, riotous, and altogether irrepressible; but when it comes to work they are very much all there.

II.

'Ain't got a fill o' bacca abart yer, 'ave yer?' asked Joshua Billings, A.B., producing an abbreviated, blackened, and very foul clay pipe from the lining of his cap and gazing at it pensively. It was twelve-forty-five P.M., the middle of the dinner-hour, and Joshua, having just assimilated his tot of navy rum, was at peace with himself and the world in general.

'Sorry,' Martin answered, 'I ain't got nothin' but fags.'

'Fags!' the able seaman growled. 'Why you young blokes smokes nothin' but them things I dunno. They tastes like smokin' 'ay. W'en I fu'st jined I takes up me pun' o' bacca regular, an' I done it ever since. It's got some taste abart it. Fags! S'welp me, I dunno wot th' blessed navy's comin' to!'

Martin looked rather sheepish.

Billings grinned. 'Seein' as 'ow you ain't got no bacca, then I s'pose I've got ter use me own,' he went on, producing a well-filled pouch from the waistband of his trousers, and proceeding to ram some coarse, dark tobacco into his pipe. 'I never believes in usin' me own s'long as I kin git a fill orf another bloke. Got a match?'

The ordinary seaman handed a box across, and his companion lit up.

'Comin' ashore along o' me this arternoon?' Joshua asked, puffing out a cloud of smoke with a satisfied grunt.

Martin thought for a moment. For an ordinary seaman to be asked to go ashore with a man of Billings's age was undoubtedly a great honour; but, at the same time, he was rather doubtful as to what might happen. Joshua, on his own statement, had an unquenchable thirst for malt liquor, and always felt 'dizzy like' outside public-houses, and Martin had no wish to join him in a carouse with the prospect of ending the afternoon under the supervision of the local constabulary.

'Goin' on th' razzle?''* he asked cautiously.

Billings laughed. 'Razzle!' he exclaimed. 'No, I ain't on that lay. I'll 'ave jist one pint when I gits ashore, but no more'n that. The fac' o' the matter is, Pincher, I'm in love.' He paused to give his words time to sink in.

'In love!' Martin echoed with some astonishment.

The A.B. nodded gravely. 'Yus,' he said; 'an' I want some one to come along an' 'old me 'and like, some bloke wot looks young an' innercent like you.' He endeavoured to look young and innocent himself, gazed heavenwards with a rapt expression on his homely face, contorted his mouth into what he considered was a sweet smile, and sighed deeply. 'I tell yer,' he added, resuming his normal appearance and winking solemnly, 'she's a bit o' orl right, an' I reckons she's took a fancy ter me. Leastways she 'inted that she'd come to th' pictures along o' me ter-night if I arsked 'er polite like, an' 'ave a bit o' somethin' t' eat arterwards.'

'You in love!' Martin gasped again, for to him it seemed impossible that any woman could succumb to the doubtful charms of the hoary-headed old reprobate. 'Garn! you're 'avin' me on.'

Joshua seemed rather annoyed. 'Oh no, I ain't,' he retorted testily. 'An' if yer gets

* Going on the 'razzle' = going on the spree.

talkin' like that me an' you'll part brassrags.* She ain't th' sort o' ooman ter take a fancy to a young bloke. Wot she wants is some one ter look arter 'er an' 'er property. A bloke wi' hexperience, the same as me.'

'Property! 'Oo is she, then?'

'You mustn't go tellin' the other blokes if I tells yer,' Billings said, sinking his voice to a whisper. 'Promise yer won't.'

'Orl right, I won't.'

'She's a widder 'ooman wot keeps a sweet an' bacca shop, an' sells noospapers. She's makin' a good thing out o' it, too—clearin' 'bout three pun' a week, she sez she is; an' as my time's comin' along for pension, it's abart time I started lookin' round fur somethin' ter do w'en I leaves the navy. She ain't no young an' flighty female neither, I gives yer my word. Got a growed-up darter, she 'as, seventeen year old, an' I reckons it's abart time th' poor gal 'ad another father ter look arter 'er. You see,' he added, 'if I gets married to th' old un orl the blokes wot knows me'll come to the shop to buy their fags an' noospapers, so it ain't as if I was bringin' nothin' to th' business. I'm a bloke wi' infloence, I am. 'Er larst 'usband drove a cab, 'e did, an' I reckons she's betterin' 'erself by marryin' a bloke wot's bin in the navy.'

'An' wot's this 'ere gal o' 'ers like?' Pincher wanted to know. 'Is she a cosy bit o' fluff too?'

'Cosy bit o' fluff!' exclaimed Joshua with some warmth. 'Wot d'yer mean, yer lopped tickler?† She ain't fur the likes o' you, any'ow.'

'Oh, ain't she?' Martin retorted. 'Well, I ain't comin' ashore along o' yer, then!'

'Ere, don't git yer dander up,' Billings interrupted, changing his tone. 'I didn't mean nothin'.' He was really very anxious that Martin should accompany him, for he had a vague idea in his head that the presence of a younger man would lend tone to the proceedings, and to him a certain air of respectability.

'Don't act so snappy, then,' the ordinary seaman returned. 'I'm as good as any other bloke.' He remembered that he was a member of the ship's football team, and this alone made him a person of some importance.

'Well, if yer really wants ter know, th' gal's name's Hemmeline, an' she's walkin' out wi' a ship's stooard's assistant bloke from the flagship.'

'Ship's stooards ain't no class!' Pincher snorted, expanding his chest to its full capacity.

* To 'part brassrags' is to sever friendly intercourse with a chum. Chums frequently use one another's rags in polishing the brasswork of the ship; when they quarrel they naturally cease to do this.

† 'Tickler' is a derogatory term for an ordinary seaman.

'They ain't fightin' blokes same as me an' you.'

'No, they ain't,' Billings agreed, puffing slowly at his pipe. 'They ain't got no prospex neither. Look 'ere, Pincher,' he added, 'she's only bin along wi' 'im fur a week, an' if yer fancies 'er, my infloence wi' 'er ma'—'

'Meanin' that I can take 'er out?' Martin queried.

Joshua nodded. 'That's the wheeze,' he said, expectorating with deadly precision into a spit-kid at least eight feet distant.

'But wot's she look like?' Pincher demanded with caution. Up to the present he had felt rather frightened of women; but to have a proper sweetheart in tow was one of the things he really longed for. It would complete his new-found manhood. But he had his own ideas of feminine beauty, and, whatever happened, the young lady must be pretty.

Billings grinned. 'She's orl right,' he explained. 'She ain't 'xactly tall, nor yet 'xactly short. Sort o' betwixt an' between like. She ain't too fat, nor yet too lean; she's sort o' plump. Yaller 'air, she 'as, an' blue eyes, an' plays th' pianner wonderful, 'er ma sez.'

This rather vague description of the fair Emmeline's charms seemed quite enough for Martin. 'She sounds orl right,' he said. 'I think I'll come along o' you.'

Joshua seemed rather pleased. 'That's th' ticket,' he said. 'We goes ashore in th' four o'clock boat, mind. Say, chum,' he added in a hoarse whisper, 'you ain't got 'arf-a-dollar to lend us, 'ave yer?'

Martin looked rather dubious. 'Arf-a-dollar!' he sniffed.

'Yus,' urged the A.B. 'I've only got three bob o' me own, an' I've got ter take th' lady to th' pictures, an' give 'er a bit o' supper arterwards. The show's orf 'less I kin raise some splosh some'ow. W'y don't yer come along too, an' bring the gal?'

'Carn't do it,' the ordinary seaman murmured. 'Me leaf's up at seven, an' I don't want to go gettin' in th' rattle fur breakin' it. But I'll lend yer a couple o' bob if yer promises faithful to pay me back. I'll give it yer afore we goes ashore.'

'Good on yer, chum,' said Billings effusively. 'I reckons yer knows 'ow to be'ave to blokes wot takes a hinterest in yer. You take my tip, though,' he added, wagging an admonitory forefinger. 'Don't yer go lendin' money to any other blokes wot ain't fit to be trusted.'

'I'll watch it,' Martin laughed.

And so it was arranged, and this was how Pincher Martin embarked on his first love affair.

(Continued on page 453.)

BRITISH INVENTOR WHO SPARED THE LIFE
OF GEORGE WASHINGTON.

By HAYDEN CHURCH.

WAR has turned the thoughts of dwellers in the Pitfour region of Aberdeenshire, and particularly those descendants of his who still live there, to memories of Lieutenant-Colonel Patrick Ferguson, the inventor of the repeating rifle, one of the most famous sons of this part of Scotland. Accordingly there is renewed talk of a fitting memorial—there is none, in fact, in existence at present—to this clever inventor, brave soldier, and gallant man who fell in South Carolina in 1780, and not the least of whose many claims to renown is the fact that he once deliberately spared the life of George Washington.

Probably not one Briton in a thousand has ever heard of this gallant young officer—he was only thirty-six when killed by an American bullet—who fought so bravely in the service of King George III. His invention of the repeating rifle was the fruit of efforts on his part to find some means of discounting the effectiveness of American marksmanship, and it resulted, of course, in a revolution, though a belated one, in the making of small arms.

None of the encyclopædias and other works of reference to which the present writer has turned since learning of the memorial project gives more than the most meagre account of his exciting career, and for the following details regarding it I am indebted to a quaint but interesting memoir of Colonel Ferguson written by a relative. This has been placed at my disposal by one of Ferguson's descendants—namely, Colonel Ferguson, the present owner of the family estate at Pitfour, Aberdeenshire. A rather amusing circumstance, by the way, is the history of this brochure, published in 1817, and written by Adam Ferguson, LL.D., who already had a *History of the Roman Republic* and other profound works to his credit. This biographical sketch was written at the request of the then editors of the *Encyclopædia Britannica*, who found it too long. The doctor, however, being, like many another author, reluctant to sacrifice aught that he had once set down, stoutly declined to shorten his work, with the result, as he tells us, that 'it was not inserted.' As a fact, the memoir is too long for an encyclopædia, but no whit for any one interested in an exceptionally fascinating career.

In his work the biographer lays special stress on the innate gentleness of character of this man who deliberately chose the profession of soldiering, and who afterwards invented so much deadlier a weapon than had previously existed. To this kindliness of disposition in one of the bravest of men it was that the first President of the United States owed his escape from an

untimely end, which might have changed the whole course of American history.

Patrick Ferguson was the second son of James Ferguson of Pitfour, one of the Senators of the College of Justice and Lords Commissioners of Justiciary in Scotland. His mother was Anne Murray, a daughter of Alexander, Lord Elibank, one of whose descendants is the Master of Elibank and the Lord Murray of to-day. Born in 1744, young Ferguson early chose the life of a soldier, and finished his education at a military academy in London, where he studied fortification, gunnery, and other details of military science.

It is interesting to be told, in these days when warring Powers are accusing each other of training 'mere boys' as soldiers, that Ferguson's first commission, in the Royal North British Dragoons, was purchased for him at the age of fourteen. Less than two years later he had begun distinguishing himself. The first time he did so was in Germany, when, being on horseback a few miles in front of the army, with another young officer of the same regiment, he fell in with a party of the enemy's hussars, and, finding it necessary to retire, was pursued. Ferguson, in passing a ditch, dropped one of his pistols; but, thinking it improper for an officer to return to camp with the loss of any of his arms, he leaped the ditch in face of the enemy, and recovered his pistol. They halted, probably imputing his confidence to some support which he saw at hand, and allowed him to repossess the ditch, join his companion, and regain the camp undisturbed.

A few years later the young fire-eater fought a duel with one of the best swordsmen in France, challenging this formidable antagonist who had spoken offensively of Britain before he was out of bed in the morning! They went to the boulevards together, Ferguson considering how he might deprive this swordsman of the advantage of his superior skill, and the other regarding with contempt so young an antagonist. As soon as they had drawn, Ferguson rushed within his adversary's point, seized the hilt of his sword, and in the scuffle was so fortunate as to get possession of it. 'You are a brave fellow,' said the other, 'and I shall certainly do you justice whenever our affair is mentioned.'

Later Ferguson played a brilliant part in putting down a negro insurrection in Tobago; and then came the American War of Independence, in which his share was destined to be historic. 'The boasted skill of the Americans in the use of the rifle,' says his biographer, 'was held out as an object of terror to the

British troops, whom it was said the American marksman could unoffice by lodging his ball from a distance within the compass of the smallest mark.'

These rumours set Ferguson's ingenuity to work on a new species of rifle which he could load at the breech without the use of a rammer, and in such quick repetition as to fire seven times in a minute. The first exhibition of this invention was made before Lord Townshend, then Master-General of the Ordnance. It was afterwards tested by some privates of the Guards at Windsor, that the king (George III.) might have an opportunity of seeing its effects. When the king gave orders for that purpose, a few men who had learned the use of the rifle were brought to perform in his presence; but, being overawed, in their first attempts they shot wide of the mark. 'They would not,' said the captain, 'be so embarrassed in the presence of your Majesty's enemies.'

Ferguson then took a rifle himself, and, of nine shots which he fired at a distance of a hundred yards, put five balls into the bull's-eye of the target and four within as many inches of it. Three of these shots were fired as he lay on his back, the other six standing erect.

Shortly after this he went to America, and at the battle of Brandywine gave a signal specimen of the services of his rifle; for, being advanced in front of the column commanded by General Knyphausen, and supported by the rangers under Colonel Wemyss, he 'scoured the ground so thoroughly that there was not a shot to annoy the column in its march.' It was while he lay with a detachment of his riflemen on the skirts of a wood, in the front of General Knyphausen's division, that the historic Washington episode happened, which Ferguson related, as follows, in a letter to a friend.

'We had not lain long,' he says, 'when a rebel officer, remarkable by a hussar dress, passed towards our army, within a hundred yards of my right flank, not perceiving us. He was followed by another dressed in dark green, or blue, mounted on a bay horse, with a remarkably large cocked hat. I ordered three good shots to steal near to them, and fire at them; but the idea disgusted me. I recalled the order. The hussar, in returning, made a circuit, but the other passed again within a hundred yards of us; upon which I advanced from the wood towards him. On my calling, he stopped; but, after looking at me, proceeded. I again drew his attention, and made signs to him to stop, levelling my piece at him, but he slowly continued his way. As I was within that distance at which, in the quickest firing, I could have lodged half-a-dozen of balls in or about him before he was out of reach, I had only to determine; but it was not pleasant to fire at the back of an unoffending individual who was acquitting himself very coolly of his

duty; so I let him alone. The day after I had been telling this story to some wounded officers who lay in the same room with me, when one of our surgeons, who had been dressing the wounded rebel officers, came in and told us they had been informing him that General Washington was all the morning with the light troops, and only attended by a French officer in a hussar dress, he himself dressed and mounted in every point as above described. I am not sorry that I did not know at the time who it was.'

Only a day or so after this, Ferguson himself received a ball in his right arm, rendering that member for ever useless. It was thought at first that it would have to be amputated. Notwithstanding this, as soon as he was fit again he resumed his duties in the army, having in the meanwhile, 'with a spirit peculiar to himself,' as his biographer says, 'practised the use of the sword and of the pen with his left hand so successfully that he scarcely seemed to have incurred any change but a difference in his handwriting.'

Having re-joined the army, he fought, if anything, with more brilliancy than before. He had the command of a detachment that embarked at New York, on board of a little squadron, with instructions to destroy a nest of privateers which was infesting the trade of New York (then in British hands), and was partially successful in so doing, though the 'rebels,' having been previously warned, got away with most of their larger vessels. Soon afterwards Ferguson, with a strong force, surprised a Polish commander named Pulaski, who had joined the American army, and succeeded in breaking up his force, killing several officers and about fifty privates.

Ferguson himself fell in October 1780, in a fight with 'a swarm of backwoodsmen, the wild and fierce inhabitants of Kentucky and other settlements westward of the mountains.' This battle took place about two hundred miles from Charlestown. Ferguson intended to attack in co-operation with another British commander, who, however, failed to turn up. The Kentuckians, who were superior to Ferguson's detachment, and also well acquainted with all the approaches to his position, proceeded to surround him and cut off his retreat. On their sudden appearance Ferguson's detachment was immediately in arms, and, rushing with the bayonet on the first body of the enemy that presented themselves, forced them to retire; but, while they gained this advantage in front, they were attacked on the flanks by a fresh enemy. To these also the regulars presented their bayonets, and repulsed the enemy in three several attacks. 'As often as one of the American parties was driven back,' says Ramsay the American historian, 'another returned to their station. Resistance on the part of Colonel Ferguson was in vain; but his unconquerable spirit refused to surrender. After having repulsed a succession of adversaries

pouring in their fire from new directions, this distinguished officer received a mortal wound.' He had two horses killed under him, while he remained untouched himself; but he afterwards

received a number of wounds, of which it is said any one was mortal, and, dropping from his horse, expired while his foot yet hung in the stirrup.

A SPRIG OF APPLERINGIE.

CHAPTER II.

I HAVE been acquainted with Mr Carstairs for nearly fourteen years, and, though he has been all that time a member of my congregation, and often closely associated with me in many of my schemes, I cannot say that I know him.

At one time the study of character, the analysis of the genus *homo*, was a never-failing source of pleasure and interest to me. To a certain extent it is so still; but soon after I was settled in my present charge I found that the stress and strain of city church work, affording me little meditative leisure, was not exactly conducive to the cultivation of a taste in this particular direction.

As a subject, Mr Carstairs had interested me from the first day I saw him, but the opportunities of having him on my dissecting-table were few, as he was very reserved and unapproachable; and, as a widower, he lived quietly and was socially unknown. Had he and I been thrown together in the solitudes of Shinnel Glen in those early days of my enthusiasm, I feel certain I could have got 'nearer' him in fourteen days than I had in the whole fourteen years I had known him in the city.

And so it was that I arrived at his door, accompanied by Mr and Mrs Broadfute, with no intimate understanding of him to enable me accurately to forecast what my reception would be.

After seeing my old friends comfortably seated in the waiting-room, I presented my card, and was at once admitted to his private sanctum.

He was sitting, as all lawyers love to sit, with his back to the light, and as he rose to receive me there was a query in his eye which I answered at once.

'No, no, Mr Carstairs,' I laughingly said, 'I am not on a cheque chase to-day, so please do not bring out your cheque-book.'

'Believe me, Mr Crosbie, I didn't say a word,' he said with a smile, and he motioned me to a seat.

'You didn't, but I saw it in your eye, and you know "A nod's as good as a wink to a blind horse;"' at which we both laughed. Having created an easy atmosphere, without more ado I told him of my old friends in the adjoining room, of our accidental meeting in Princes Street, and of the purpose of my call on him. 'I know what Glenhead intends to discuss with you, Mr Carstairs,' I said; 'but I assure you I have no idea what he wishes to

say to you. All I am here to ask is that you may receive my old friend graciously, and hear patiently the little he has to say.'

He ran his long fingers through his thin white hair as if in perplexity. Then he lifted a letter from his desk and glanced at the date.

'I am not surprised to know that these people have called, Mr Crosbie,' he said; 'but I must say I didn't expect you to accompany them as their champion. I had made up my mind not to see them; but for your sake I will. Only, I must stipulate that you remain with us during our interview. You will thus'—

'But, Mr Carstairs,' I interrupted, 'I didn't bargain for that, although, personally, I am quite agreeable; but Glenhead might object.'

'No, I don't think he will. If he does, then I must decline to see him. In fairness to me you should be present.' He hesitated for a moment. 'You tell me you know what he wishes to discuss with me,' he continued. 'I infer from that he has already acquainted you with the whole story of the "eviction," as they are calling it in Toon-o'-Scaur. In a sentence I can tell you the story from my standpoint; then, when you have heard both sides and attended our interview, you will, I trust, not consider me unreasonable in declining what your friends wish me to concede.

'This little property, The Knowe, came into my possession about three years ago, on the expiry of a ninety-nine years' lease. I had no particular use for it at the time, and was agreeable that the old occupiers should continue the tenancy on a half-yearly basis. A few months ago one of my little grandsons developed a chest complaint, and the doctors recommend outdoor life as much as possible, and good, free hill-air. Now, when I was a young growing lad of sixteen or seventeen I was similarly affected, and was sent off south to live with an old maiden aunt at Grennan, adjoining The Knowe in Toon-o'-Scaur. I lived there for nearly twelve months, and returned home completely cured and as strong as a young horse. That is just over fifty years ago.

'I haven't been back in the locality since, but I have never forgotten the tang of that hill-air, and it occurred to me that I might make The Knowe suitable to modern requirements, and send my son's family down there. I am seeing to this now. The tenant—a Mrs Beck, whom of course I have never met, and whom I don't

know—has been duly warned out, the work has been contracted for, and operations will begin on the 1st of June. As I tell you, it is over fifty years since I was in Toon-o'-Scaur. A local factor, William Frizzel, is carrying out my instructions, and he informs me that feeling is very strong against me. It must surely be a strange community, Mr Crosbie, which objects to a man doing as he wishes with his own property. Your friend from Glenhead is the instigator of much of the trouble, and I am at a loss to account for this, as The Knowe is in the parish of Toon-o'-Scaur, and his place, Glenhead, is in Shinnel. I forgot to ask Frizzel in my last letter why Glenhead was exerting himself so much in the matter; but I'll probably find out to-day for myself. Now, Mr Crosbie, that's all. Will you kindly tell your friends I will see them now, provided they are agreeable to your being present.'

As I anticipated, Glenhead demurred. 'I'm terribly vexed to trail you into this, Maister Crosbie. I can brawly look efter masel'; so can the auld chiel next door, I'se warrant. Mair than that, man, that white collar o' yours aye mak's me want to backswallow, an' you'll be sairly in the road if I tine my temper an' stert to tell him in hamely Shinnel speech what I think o' him.'

I assured him I didn't mind being brought into the matter, told him there was no alternative, and that he mustn't lose his temper. Then I gave Mrs Broadfute my arm, and, with Glenhead bringing up the rear, we walked into Mr Carstairs's room.

Mrs Broadfute and I sat down beside the window, but Glenhead took up a position in the middle of the floor, and at once took speech in hand.

'Pleased to mak' your acquaintance, Maister Carstairs,' he began; 'very pleased indeed. Graun' weather for the young gress—splendid; an' we're needin' it, for the lambin' was early, an' April by-ordinar' droothy. Imphm! ay! Weel, Maister Carstairs, the wife an' me happened to be in the toon, an'—'

'Yes, Mr Broadfute, I knew you were calling to-day. Mr Frizzel wrote me to that effect.'

Glenhead gave a look of surprise, and, hastily extracting from his coat-pocket a long corn-straw, he put it into his mouth and began to chew vigorously. 'The ca' on the bygaun'—a good point—was lost. But he quickly recovered.

'Ay!—imphm! Weel, he was quite richt. We had set oor mind on comin' the day, an' I'm gled we werena keepit back. We ha'e a sad time wi' funerals doon oor wey, Mr Carstairs, an' I was by-ordinar' fortunate in pickin' a clear day when I wad be rinnin' nae chance o' showin' disrespect through my absence—imphm! Ye see, it's a douth, clammy countryside where we bide—terribly sair on fouk bothered wi' bronchitis an' asthma an' sic-like complements. Ye're no fashed

wi' asthma, are ye, Mr Carstairs? Big-chested, short-necked men o' your build generally are.'

Mr Carstairs was watching him closely. 'No. Why?' he asked, and his lips scarcely moved.

'Ah,' and Glenhead laughed. 'A ready answer an' a sherp question baith in ae breath! My word, but you toon's-fouk are gleg! Ay, faith, you're gleg!' and he laughed again. 'Weel, it's like this. I asked ye if ye were fashed wi' asthma because—weel, because I didna want you to rin ony risk without bein' warned. If ye had been, or was likely to be—or likely to be, Maister Carstairs, an' was comin' doon to live at The Knowe, ye wad be rinnin' in the face o' Providence.'

'How do you make that out?'

'Oh, man, it's the douth and the damp—no sae bad on fouk born in the place, but wi' incomers—man, it grups them quick, sterts wi' a kittlin' in the thrapple, then a bit wheeze an' a clocher, an'—an' a tightness that gets tichter, an' ye get dwamy an' weak about the knees. Then, man, the he'rt gets ower muckle wark, an'—an' it stops, an' ye're in the kirkyard planted an' clappet afore ye weel ken what's been wrang wi' ye. Dod ay, man, it's quick wark, an' ye'll be weel advised no to come to stay at The Knowe.'

Judging from Mr Carstairs's unperturbed face, the appeal was lost.

'Who told you I was coming to The Knowe to live?' he quietly asked.

'Weel—eh!—weel, I can hardly gi'e chapter an' verse, name and surname, off-haun', as it were, but it's the common talk o' the place, an'—'

'Well, the common talk is wrong.'

'Oh!' and again Glenhead looked surprised—and relieved. 'Ye're no comin' to The Knowe! Imphm! Ay, man. Then—then, Maister Carstairs, mebbe ye'll no be gaun to rebuild it either?'

'Yes; the work will be begun immediately.'

'Juist so—imphm! As you're no gaun to occupy it yoursel' then, you'll be meanin' a lettin' spec.?'

'Well, yes, partly.'

'Then it'll no pay—never—never in this world. But hover a blink noo; mebbe I'm speakin' ower quick. It might pay, Maister Carstairs—it might pay, I say, if ye wait till stane an' buildin' material gets cheaper. Everything in that line's at a ransom price the noo; but in a year or twae it's bound to drap. Tak' my advice, an' dinna be in a hurry. He's a gey daft man that thinks o' settin' doon a mortar-tub in Toon-o'-Scaur the noo, I tell ye.'

'I'm much obliged for your advice, Mr Broadfute; but everything has been considered, and, as I have said, the work will proceed.'

'Weel, weel, Maister Carstairs, your wey be it. But it's a peety—a peety for you. Imphm! There's anither maitter, Maister Carstairs. Have ye ony experience o' watter?'

'Have I had any experience of water?' and

it was Mr Carstairs's turn to look surprised. 'What do you'—

'Oh, I dinna mean as a compliment, sir. What I want to ken is, are you acquaint wi' the weys o' watter? Ye see, ye'll need watter in the hoose—eh?'

'Surely.'

'Weel, man, as watter'll no rise abune its ain level, an' as The Knowe is higher than the reservoir, ye'll ha'e to cairry it in gangs frae the Grennan. That'll no be what yin wad ca' a convenience, I'm thinkin';' and Glenhead drew in a long breath, flung his head back, and looked at Mr Carstairs as much as to say, 'Take your change out of that.'

Mr Carstairs smiled. 'But water can be raised above its level,' he said. 'A suction-pump is a simple and inexpensive contrivance, and what I said about building materials I say about this—everything has been duly considered.'

Glenhead chewed in three inches of corn-straw in as many seconds, and began to dump the carpeted floor impatiently with his hazel. 'Implm! juist so—juist so,' seemed all he was capable of saying, and I wondered when the tattie-swinging was likely to commence.

Mr Carstairs eyed him intently for a minute.

'Now, Mr Broadfute,' he said, as he sat nearer to his desk, 'I think it is high time you and I understood each other. I may or I may not see the drift of all your contentions; but I have no time for further probings, and we must come to the point. You are not associated in any way with the building trade; consequently my contemplated operations at The Knowe do not affect you. If you have my interest at heart, I think I have proved to you that I can manage my own affairs. Now, Mr Broadfute, tell me what you really wish to be at.'

Glenhead began to pace the floor slowly, stopping now and then to screw the ferrule of his staff into the pile of the Axminster. Then he looked round about and out at the window.

'Man, man,' he said emphatically, 'I canna speak as I want to in a place like this. Thae awfu' broon, dingy wa's mak' me catch my breath, an' this carpet I'm staunin' on feels maist unnaitral. Everything about me seems fremit and unfreendly. Eh, if I but had ye oot in an open field, wi' the sky abune an' the gress to oor feet, by Jingo! I wad open my mooth to some purpose. Ye ask me what I wish to be at. Weel, it's like this. I want you to alloo Mrs Beck to stey on at The Knowe. She's my wife's auldest sister; that's hoo it comes about I'm her spokesman. She's a frail, feckless body, an' she'll mebbe no bother ye lang.'

'Well, Mr Broadfute, I'm sorry I can't oblige you,' Mr Carstairs said, not unkindly.

'Ye what? Ye canna obleege me! Thun'er an' lichtnin', why can ye no?'

'Well, that's my business.'

'Oh, it's your business, is it?—implm!' and

a queer look came over his face. 'An' ye'll no think the maitter ower an' let puir auld Mrs Beck bide on?'

'Certainly not.'

'Then, by'—

He pulled himself sharply up. Then he slowly looked in my direction. 'Oh, Maister Crosbie,' he said ruefully, 'I telt ye ye wad be in the road when it cam' to this stage, an' I'm just into splendid fettle. Damn me, if this is no awfu'—implm! Quirky M'Queen wasna far wrang in what he said to me yesterday in Toon-o'-Scaur. "Glenheid," said he, "I wish ye luck in your veesit; but I doot ye'll mak' little o' yon auld skinflint." Ay, Quirky kenned, clever auld sowl! He aye has the last word wi' a' in Toon-o'-Scaur.'

'Is this clever individual who holds me in such high esteem your local lawyer, Mr Broadfute?' asked Mr Carstairs with forced gaiety and scenting professional jealousy.

'A lawyer! Quirky M'Queen a lawyer! Weel, frae his name it's only naitral ye should think sae. No, Quirky's no a lawyer; he's a decent, honest man, and he's gravedigger in Toon-o'-Scaur. Mair than that, Maister Carstairs, noo that ye're a proprietor in the parish ye're entitled to a lair in the kirkyard, an' nocht wad gi'e Quirky greater plesure than to get happin' ye.—Hoo's that for a feenisher, Maister Crosbie?' he asked, as he sat down beside me and laid his hand on my knee.

There was a silence for a minute. Then Mrs Broadfute took off her gloves and raised her veil over her brow.

'Have ye feenished, Robert?' she asked in a quiet, reassuring voice that made me sit forward expectantly in my chair.

'Feenished, wife? Ay, I've feenished. Lovan, woman, I was feenished before I had weel begun;' and Glenhead snorted and turned his back to Mr Carstairs's desk.

'If that's a', we'll juist gang oor weys, then, Robert; but before we say guid-bye I wad juist like to gi'e this to Maister Carstairs.'

From the bosom of her black satin gown she took out a sprig of southernwood. Rising slowly to her feet, she crossed over to where he sat. 'It's only a wee bit o' appleringie, Maister Carstairs,' she said, 'that I pu'd this mornin'. I was thinkin' o' you when I pu'd it; no that that mak's ony difference, I daursay, but I juist want to tell ye. We left Glenheid early this mornin', and when we got to Toon-o'-Scaur I asked Robert to stop. I got oot o' the gig, gued into a gairden, an' pu'd this. Naebody saw me, binna Robert an' the wee bit birdies, for it was early, no a lum reekin' or a leevin' soul aboot. Eh! but it was quate—quater than you toon's-fouk ha'e ony idea o'. An' everything was sae fresh an' clean, an' the bonny early mornin' sun skinklin' in the dewdraps was like the smile o' the Almighty. It was a queer thing to dae.

Robert here thocht sae, but I couldna tell what airted me, only I thoct, in a far-away wey, that ye micht like to ha'e't. Will ye tak' it frae me?'

Mr Carstairs had risen to his feet when she approached his desk.

'With pleasure and with my thanks, Mrs Broadfute,' he said, and he bowed as he accepted the gift.

'Impm! it's no much o' a posy, Maister Carstairs, but it's gey an' hamely to the smell. Juist tak' a bit whiff o't, an' I'se warrant ye'll alloo that nae hothouse flooers ye ha'e have sae sweet a smell. Ay, the smell o' a bit flooer or the lilt o' an auld sang will often bring back memories which yin thinks are locket an' dooble locket an' laid away for ever. I dinna pretend to ken what's passin' in your mind when you've that in your haun', but I'll tell ye what a wee bit o' applingie aye brings afore me. I see a wee white hoosie on the tap o' a stey brae, wi' a bonny gairden lyin' to the sun. There's a box-bordered walk leadin' frae a wee swingle gate up the gairden to a laigh porch covered wi' roses. There's a bit lassie, wi' lang fair hair an' an auld sun-bonnet, staunin' at the heid o' the walk, an'—an' a bashfu', backward-lookin' boy doon on the road swingin' the gate back an' forrit wi' his haun'. Then he comes into the gairden, an' seems awfu' interested in the nancy-pretty an' sweet-william, an' he hings aboot an' hings aboot; then I see him comin' slowly up. He stops an' pu's a bit applingie, an' when he comes to the heid o' the walk he hauds oot to the lassie his wee bit token. Then he—he draws her heid to his shooder an'—an' kisses her. Ay, ay. Dearie me, that was lang, lang ago; but the smell o' applingie brings it a'

back to me. Ay, I often see that picter, for—for I was that lassie, an'—'

Mr Carstairs passed his hand across his eyes. 'And I was that boy,' he said; and he slipped down into his chair and buried his face in his hands. Then he rose, with features mellowed and transfigured, and walking over to Mrs Broadfute, he raised her hand and kissed it. 'Thank you, Ma—Mary,' he quietly said; 'thank you for all this! Ay, and—and Mrs Beck—Mrs Beck's your sister? Believe me, I didn't know; but will you please tell her from me that—that it's all right!'

What a moment! What an experience! I felt thrilled and bewildered. It was the resurrection of a love of long ago, the laying bare of a dented corner which many a heart could show. I know there is a dent on mine, and the 'Amen' I involuntarily muttered, if not audibly expressed, was felt, and lay in the silence of the room like a benediction.

I have a faint recollection of seeing Mr Carstairs look at his watch, and of hearing him say it was lunch-hour, and that we must all join him.

I didn't go, and I cannot tell on what grounds I declined, because my thoughts were coursing adown the years and the scene I had witnessed, and the part that applingie had played had brought a dimness to my eyes and a pain to my heart, and I wanted—oh how much!—to be back in a bachelor manse, alone in my room, and with my own Bible where, faded and flattened between the leaves of Isaiah, is a spray of that old-world plant which daily reminds me of a dear dead love of other days of which I never speak, and which no one shall ever know.

THE END.

DO ANIMALS MAKE MISTAKES?

By F. G. AFLALO.

MUCH has been written of late years on the intelligence of animals, but of their stupidity very little. It is difficult to take up a newspaper without finding some reference to the marvellous behaviour of the beasts and birds. Among the favourite aspects of their cleverness is the wonderful way in which cats and dogs, more particularly when removed many miles by train, find their way home again. Yet who thinks it worth while to publish a single case of dogs losing their way or of cats going astray, often stupidly?

The writer has for many years taken great interest in the weaker side of animal intellect, and has found that the mistakes made by animals offer problems as fascinating as their exhibitions of unusual cleverness, and teach lessons no less valuable.

Before setting down a few anecdotes in support of this view it will be necessary to formulate

some brief definition of instinct, more particularly as differentiated from reason. That the dividing line between the two is less sharp than it has been drawn heretofore is being demonstrated by modern psychologists, but it should be possible to distinguish between them sufficiently for present purposes. Let me suggest a very homely illustration of the difference. An angler fishing for trout finds a sudden change in the behaviour of the fish. They may have been rising madly, but are now glued to the bed of the stream; or they may have refused all his flies, but now rise at every cast. At any rate, something has happened. Looking up from the water, the man on the bank perceives that the wind is in the south-west, and is bringing up black clouds which must soon be overhead. He surmises that he is in for a wetting. He does not stop to reason out the logical sequence of black clouds coming up with the wind, but unconsciously he

does reason it out, and concludes that it is going to rain. But the fish under water, without noting the direction of the wind, without having any notion of the distant clouds, know it also. They know by instinct that which the man divines by reason, reaching the same conclusion by a wholly different process.

This is only a very simple illustration of an obvious contrast. The analogy will not bear pressing too closely. In one sense, animals can also reason. Eagles have been seen to drop stones on bushes with the object of driving out small birds which they were powerless to seize while these were under cover. Falcons have been known to accompany a train in eastern Europe that they might pounce on the coveys of partridges which, as they knew from experience, it would surely put up at a certain spot on its journey across the plains. If both methods of foraging do not involve some measure of reasoning, then the existing definition of reasoning goes for nothing. Let me cite two further cases of the reasoning powers of some animals. An African lizard, while laying her eggs in the sand of a compound, has often been seen by the occupant of a neighbouring bungalow to make a false nest, and even to pretend to guard it, with the object of diverting his attention from the true nest and eggs. A tame fox chained to a post was observed to push its food as far as its chain would permit, as ground bait for the chickens. Then, having retired the full length of the chain in the opposite direction, it pretended to be asleep, and was thus able to pounce among the deluded birds when they were fighting over the spoils. But these illustrations show reasoning powers of no mean order. Now and then, indeed, an animal may reason to the prejudice of its instinct, which might have been a truer guide. A dog which had repeatedly stolen hens' eggs was effectually cured by having a boiling-hot egg, straight out of the saucepan, flung into his open mouth. The animal could never again be persuaded to touch an egg, having falsely reasoned that henceforth every egg would necessarily burn him.

Professor Lloyd Morgan describes instinct as hereditary modes of behaviour, differing from reason, which is rather the faculty of drawing logical conclusions from observed facts, even in a strange environment for which heredity affords no preparation. This intimate relation of instinct to normal environment is of the first importance. Thus the fact of English cattle exported to the Argentine poisoning themselves by devouring unwholesome native plants unknown to their ancestors is not acceptable as a case of instinct at fault. Quite different from this is the case of the camel, a foolish animal with which the writer has camped and ridden for weeks together. Although it must have been acclimatised in Morocco for at least twelve centuries, it has not even now learnt to discriminate between the plants upon which it

may feed with impunity and those injurious to its system.

Again, very young animals are liable to error before instinct has properly asserted itself, and such cases also must be excluded from the argument. Even human babies will suck sugar of lead because it is sweet; and, since most sweet substances are also wholesome, they rarely come to harm by obeying their instinct. It is true that young chicks soon learn to distinguish between caterpillars that are good to eat and others that are not; but this discrimination is, as Professor Lloyd Morgan is careful to point out, a case of *perceptual*, rather than one of *conceptual*, thought. These same chicks, by the way, are terrified if, in the hen's absence, a pigeon should fly over the farmyard, as they readily mistake its shadow for that of their hereditary foe, the hawk. Any schoolboy who has kept silkworms knows the poverty of resource in the young grubs during the first few days after they emerge from the egg. Unless removed to fresh food, they will starve to death on the merest skeleton of a mulberry or lettuce leaf, and seem to have no notion of crawling on to the fresh leaf alongside. As, however, young caterpillars apparently find no difficulty in ravaging the shrubs in the orchard both day and night, it is possible that the artificial conditions of domestication have impaired the silkworm's instincts.

A very curious and interesting case of the momentary failure of the all-important instinct of self-preservation in young animals came under the writer's notice one evening in Canada, when he had camped on the bank of the Miramichi. It was just getting dark when a cow-moose, with two small calves, scrambled down the opposite bank and forded the stream obliquely, landing a hundred yards or so above the camp. Then, for the first time, she suddenly became aware of the presence of the enemy, and without another glance at the calves went crashing headlong into the timber. The little ones, deserted by their dam, were seized with panic, and did not follow her to safety until they had first turned back into the water, in which they floundered helplessly for several moments.

There are, besides these cases of very young creatures, others which must also be disregarded. These mostly come under what we may term the 'artificial' category. As a case in point, there are remote regions in which the reindeer, walrus, and other haunters of the silences show little fear of man, just as there are birds in rarely visited islands which are said to perch confidently on the barrels of the sportsman's gun; but since instinct is developed under normal conditions, and sounds its warning under no others, it cannot be blamed for not taking into account the sudden introduction of an unknown quantity like man the slayer. Similarly 'artificial' is the case of a valuable African monkey which, one morning when its master was called to the telephone

while shaving, snatched up the razor that he had left on the washstand, and cut its throat from ear to ear. It simply obeyed its natural impulse to imitate what it saw its master do with impunity, and there was nothing to apprise it that the razor had so keen an edge. Equally unacceptable is the story of the cow and stuffed calf related by the well-known Jesuit missionary, Père Huc, though it is perhaps sufficiently amusing to relate for its own sake. It seems that a cow and calf were kept in the camp. One night the calf died; and, fearing that the supply of milk would forthwith cease, one of the native servants skinned the little animal, and having stuffed its hide with hay, propped it in a lifelike attitude. So successful was the ruse in deceiving the mother that she at once proceeded to lick the effigy of the calf in her usual vigorous way, when the stitches burst and the hay came tumbling out. Then the tender-hearted Frenchman, who had been watching the proceedings with interest, turned his head away, unable to bear the sight of the grief with which, as he imagined, the cow would discover the cruel trick played on her; but he might have spared his feelings, for when he next looked round she was contentedly munching the hay.

Sudden eccentricities of behaviour are also without value. The writer once heard of a gun-dog in Belgium which, having pointed game during a great part of the afternoon, suddenly flew at its master, and then waltzed away in circles until out of sight. The animal, which had probably been bitten by an adder or stung by a wasp, returned home the same night in its normal mood. Nor must we take into account cases in which sudden panic overcomes all other instincts, as, when alarmed, mountain sheep have been known to leap over a precipice, one after the other, to be dashed to pieces on the rocks below. Another case of the kind was witnessed by the writer during a voyage in the Black Sea, when a fine retriever, an accomplished swimmer in still water, was taken to sea by its owner, a Turkish gentleman, and set adrift. Overcome with terror at the novel experience of sea-bathing, the animal swam aimlessly round and round the ship, which was anchored in the roads off Trebizond, and, deaf to its master's voice, continued swimming until, when all but exhausted, it was rescued by hand and hauled on board.

So far we have merely eliminated, and it remains to offer a few instances of actual failure of instinct in adult animals under normal conditions.

There is a species of wolf in Abyssinia that feeds on rats. This seems poor fare for so fierce an animal; but in the arid regions of Africa many wild creatures have to be content with modest food, and the wolf thrives well enough. Its ordinary method of hunting is to lie in wait at the mouth of a burrow and pounce on the rat the moment it emerges. This often succeeds,

but it sometimes happens that the rat is too quick for its enemy, and dives below unscathed. If the wolf had the cunning of most of its tribe it would merely wait patiently for another rat to come forth, and then snatch the rodent up. But it has not. It has no more sense, in fact, than an angry child thwarted of its plaything, since the next thing it does is to tear at the earth and throw it up in futile rage. Where the wolf's instinct plays it false is not so much in making an absurd spectacle of itself, as there is rarely any one to behold its wrath, but rather in warning every other rat in the burrow that it is high time to scamper off to safety along the underground tunnels that lead away from the front-door.

Perhaps the case of faulty instinct most frequently referred to in books is to be found in the time-honoured fable of the ostrich hiding its head in the sand and fondly believing itself 'the world forgetting, by the world forgot.' The origin of this hoary legend is apparently wrapped in mystery, for the writer has searched all manner of sources, including a monograph, without being able to trace it. Like the baby plover or a hare on her form, ostrich chicks squat close to the ground if suddenly discovered, hoping thus to evade detection, and this may have suggested to some careless observer the fable of hiding the head in the sand.

As dogs furnish so many of the popular anecdotes illustrating abnormal sagacity, it will perhaps be of interest to cite three or four cases in which, to their own undoing, they have made mistakes that can only be regarded as extremely silly; and these errors are the more instructive because, in contradistinction to the majority of domesticated animals, the dog is commonly cited as having gained in intelligence from his long and close association with man. But the fallibility of canine instinct is susceptible of easy demonstration. The shepherd's collie is as clever a breed as any trained to work for man, yet the Ettrick Shepherd gives a striking illustration of the limitations of intellect in a collie that had helped his master to fold some newly bought lambs, a business which lasted until darkness was falling. Tired out, the master at last returned to his cottage, but there was no sign of the dog, and it was all in vain that he repeatedly whistled and called the animal by name. Next morning the faithful but stupid brute was found, hungry and trembling from cold, shut in the fold with the lambs, over which he still mounted guard. It was a display of devotion, no doubt; but, as the dog's master adds, 'almost any other collie would have discovered that the lambs were safe enough in the fold, but honest Hector had not been able to see this. He had even refused to take my word for it, for he would not quit his watch though he heard me calling both night and morning.'

A similar case of wholly misplaced devotion was provided by the now historic bulldog which,

though her instinct should have warned her that the intentions of the search-party were friendly, would not allow the police to recover her dead master's body, and had in consequence to be poisoned. Another instance of erratic instinct in a dog was that of one which had a trick of diving after coot and other waterfowl, and bringing them to the bank. On one occasion, having jumped off a low bridge, it seized in its teeth the branch of a submerged tree and held on with such tenacity that its master was compelled to wade in and pull the animal off by main force. From the trouble he experienced in detaching the obstinate little brute from its supposed prey, he was convinced that, but for his intervention, it would have been drowned rather than loose its hold. A still more extraordinary example of instinct playing a dog false was that of a terrier which, while asleep on the hearthrug in a first-floor room, heard its master whistle from the garden, and deliberately walked out of the window, dropping twenty feet on to the grass beneath. There were, it is true, extenuating circumstances. In the first place, the animal was not wide awake; in the second, the bow windows of both ground-floor and first-floor rooms were identical. Yet, even so, it is strange that the dog's instinct did not warn it to run downstairs—the door of the room was open at the time—in the usual way, as it must have done many times before that day.

The Rev. J. G. Wood, a very popular writer on animal subjects twenty years ago, owned a dog which, with a stick crosswise in his mouth, wanted to get through a hedge. Instead of laying down the stick and pulling it through the hedge after him, the animal actually took the trouble to make a gap wide enough to admit him, stick and all. Foxhounds do not always recognise their masters unless they are in the familiar pink; and when the writer was a boy there was a dreadful story of a well-known pack devouring its own huntsman, the man having ventured at night into the kennels in his shirt-sleeves. That magnificent creature, the borzoi, is one of the least civilised of dogs, and retains much of the savagery of its native Russian plains. Many years ago, at the time when the Duchess of Newcastle first introduced the breed into this country, a neighbour of the writer owned one that could never accustom herself to the idea of the pups, after they were weaned, being able to eat food that she had not procured for them. Best of all she loved, as in the wild state, to go forth and catch a rabbit for them; but, failing this, she would first eat the food provided for them, and then bring it up for them to eat.

Where instinct is at fault, experience is found to teach the beasts and birds very little and very slowly. Partridges continue to dash themselves to death against the telegraph-wires, though these have been stretched across the country for half-a-century; and, in spite of the constant depreda-

tions of rats and weasels, they still lay their eggs on the ground. The case of a hen hatching duck's eggs and rearing the little aliens comes rather under the 'artificial' category previously objected to, because she has no instinct to warn her of the fraud. Even women have before now been tricked with changelings. A familiar instance of alleged failing of instinct is that of small birds mobbing a cuckoo in the belief that it is a hawk, a type to which, with its long tail and wheeling flight, it bears some superficial resemblance. Twenty-five years ago the writer, who then lived on the border of Dartford Heath, used to watch this little drama of the air almost daily in the summer months, and even then he had grave doubts whether the little birds were really guilty of the mistake ascribed to them in the natural history books. These doubts have been confirmed by the opinion of so sympathetic a bird-lover as Mr Edmund Selous, brother of the famous hunter. Mr Selous agrees with me that the small birds know the cuckoo perfectly well for what it is; but he takes the remarkable view that their pursuit of it is not actuated, as commonly supposed, by hostility, but rather by affection for their former protégée. It seems extraordinary that any one who has watched them as often as he must have done could be under that impression; and the writer prefers to believe that they are actually hostile, their one idea, mindful of how they were fooled before, being to drive the intruder elsewhere before it has time to billet any more of its offspring on their peaceful homes.

The suicidal behaviour of lemmings on migration is also commonly cited as an obvious case of perversion of instinct; indeed, it is an episode for which no explanation is forthcoming. These curious rodents are apparently obsessed only by the desire to push forward. They are indifferent to hunger, and to the owls and stoats which hang on the line of march and devour them wholesale; and eventually they drown themselves in thousands. This is the most striking instance of Nature, careless of the individual, endowing animals with the instinct of self-destruction as the only possible check on hordes which would otherwise work irreparable damage.

Moths flying to the candle, another interesting illustration of the subject, is variously explained, and their fatal instinct is regarded by Metchnikoff—an admirable translation of whose more important works has been published by Dr Chalmers Mitchell, F.R.S.—as a case of sexual excitement analogous to the attraction exercised over male glow-worms by the green luminosity of the female. This theory receives striking support from the fact that it is chiefly the male moths and beetles that die in the flame; and, as the females survive and lay their eggs, the night-fires lighted by the farmers in some countries to attract insects injurious to the crops must necessarily fail of their purpose. The case of migratory birds being attracted by the powerful rays of lighthouses, and

dashing themselves to pieces against the glass, must not be interpreted in the same way, as both sexes are killed indiscriminately, and theirs is merely an error of phototaxis. Other errors of birds call for passing mention. The sparrow and the starling, which, in spite of repeated warning and disaster, continue to nest in chimneys over lighted fires, and thus condemn their early broods to die of suffocation, come rather under the 'artificial' head; but the same excuse cannot be pleaded for the moorhen, which frequently makes her nest so close to the level of the river that the slightest rise in the water is certain to submerge the eggs. Gilbert White alludes to terrible battles among the rooks in consequence of the birds flying to the wrong nests, and Romanes mentions the case of a bird having sat for months on addled eggs until she was forcibly driven off them.

Insects, ordinarily intelligent creatures, make a number of curious mistakes when misled by their instincts. There is, for instance, a ladybird with an unconquerable taste for honey; but, as the creature lacks the bee's equipment for procuring its favourite delicacy, it fails miserably, falling to the ground again and again in its efforts to extract the nectar from the flowers, and never seems to learn of its own deficiencies. There are other insects that normally lay their eggs in putrescent flesh, so that the grubs may find food ready when they hatch out; and these are so easily deceived by the 'high' smell of *Stapelia* flowers that they lay their eggs on them, though without any good result, as the grubs necessarily die of starvation.

Of all the insect world, the busy bee is most commonly praised as a pattern of all the virtues, and its instincts are supposed by many to be above criticism, particularly as regards the sagacity with which, like the ant, it is popularly supposed to find its way back to its nest in spite of all manner of obstacles. Yet Lord Avebury, whose knowledge of both bees and ants was very intimate, was sceptical of this infallible homing instinct. In his interesting book, *The Senses of Animals*, a signed copy of which he presented to the present writer many years ago, he demolishes this agreeable superstition; and he was upheld in his doubts by Romanes. Here, then, is another of our cherished nursery beliefs shattered; but facts are stubborn. Wasps have much in common with bees, and some of them construct little nests of mud, each with a single egg, and stock them with spiders to provide food for the young. This provident instinct is very attractive, but unfortunately it is very erratic. Thus Fabre, the well-known French student of the *Hymenoptera*, removed the egg from one of the cells, yet the mother-wasp continued to stock it with spiders, though she must have realised that with the egg no longer there such provision could serve no useful purpose. In the *Globe* of 1st May 1911 there was a still more extraordinary instance of this stupidity. A mud-wasp, having taken posses-

sion of three little vials which stood upright in an open box, deliberately proceeded to stock the centre one with spiders, but laid her eggs in the other two, with the result that her unfortunate offspring were doomed by their silly parent to die of starvation in sight of plenty!

An attempt has here been made to offer a few authenticated instances in which animal instinct was absolutely at fault, as well as some others in which its failure was probably too hastily assumed as the result of inaccurate interpretation of motive. There are among those who read these disclosures some who will no doubt find the animals concerned less attractive in consequence. Why? To the writer's way of thinking, there is something far more sympathetic in a conception of 'our poor relations' that recognises such little foibles as we share with them. Dead perfection in sentient beings would be intolerable; and man, whose privilege it is to err, should find more in common with the other animals for the knowledge that they also can be stupid on occasion.

'NEMO ME IMPUNE LACESSIT.'

SHE was dressed in blue when first I met her, with touches of mauve and soft gray green;
A reigning beauty 'mid desolate splendour, and the sweetest thing there that ever was seen.
She nodded her head as I passed her slowly—I was climbing the Rockies in mountain mist—
And she made me dream of home in a far-off country till I wondered—she had never been kissed.

Lovers she had, for dewdrops shyly caressed her, and night winds leant down whispering soft in her ear;
And the moonbeams loved her and wooed her gently lest her solitude grew to fear.
But the world passed by, and no man touched her—this beautiful thing in her own wild way;
And she gave many a lonely wanderer a heartache, but she soothed them down with 'Scots wha hae.'

I have met her since in lonely places, perhaps the one touch of colour in a desolate land;
On rock-bound coasts, 'neath Austral stars, shining by autumn maples and sea-girt strand.
For over the world she loves to wander, and wherever you meet her she'll whisper to you
Of placid loch 'mid the purple heather, in a land where men grow stalwart and true!

Often alone, for even wild flowers desert her, only the birds come and sing day by day;
For you see she was wayward, and apt to be wilful, and liked best the places out of the way.
Strong in her beauty of isolation, proud to stand by herself when others grew faint;
And the weaker blooms in the valley gazed upward to heights she had scaled, and thought her a saint.

She was so simple and strong and quiet, this fairy-like thing dressed in mauve and green!
No wonder the stars twinkle merrily o'er her in desolate places where she alone reigned queen.
But my camp-fire was smouldering, and in far-off country the heather was distant, as distant as you;
And I woke from a reverie to find the beauty beside me was a simple Scotch thistle asleep in the dew!

E. A. HENTY
(MRS EDWARD STARKEY).

Chambers's Journal

SEVENTH SERIES

JOURNALS AND JOURNALISTS.

VICTORIAN REMINISCENCES.

By C. L. G., Author of *The Life of Sir George Grove*, *The Hawarden Horace*, &c.

SOME people are born with blue blood in their veins. In mine I think there must have been a certain admixture of blue-black ink. Anyhow, the love of scribbling developed early, fostered, perhaps, by the desire to emulate the example of an elder brother, to say nothing of the fact of my Irish descent. For Irishmen are born journalists, as Bohemians are born fiddlers. At some coming-of-age festivities in the West of Ireland, the services of an itinerant musician were retained to speed the flying feet of the merry-makers, and in a local journal which chronicled the event he was described as 'Paganini's representative.' The 'art of elegant variation,' as Sir Arthur Quiller-Couch calls it in his Cambridge Lectures, was surely never more beautifully illustrated by the young lions of the *Daily Telegraph* in the palmy days of periphrasis.

My first appearance in print was in the pages of my public school magazine, of which in time I became one of the editors. My contributions ranged from the crudest parody to the most distressful sentiment, and the memory of them strikes me pink forty odd years after. I remember in particular one long and dismal ballad, of which even then I was half-ashamed; and a travesty of 'Is this a dagger that I see before me?' which was enough to justify the censure of burlesque in *Theophrastus Such*. I competed unsuccessfully for the English Verse prize, and felt aggrieved by my failure, for the subject was 'Music,' and I fancied myself as a musician, while the winner of the prize was tune-deaf, though he could string verses on any theme with extraordinary facility. I remember how on one occasion, twenty minutes before going into school, we gave him a subject, and he turned out an excellent elegiac poem, of which I still recall the last two lines:

And Life's dark billow brighteneth,
Smit by the orient beam of Death.

His muse, in those days at least, was always somewhat 'Pagan, I regret to say,' in Mr Pecksniff's phrase; and a slight sensation was caused by the appearance in the school magazine

of a poem of his, frankly antinomian in sentiment, and winding up with the *cri de cœur*:

Down with the crumbling fabric of the ages,
Down with the Old Creed, and up with the New.

But the most exhilarating 'literary lapses' of my school-days are associated with the 'Poets' Corner' of the local journal. My greatest school friend had a pretty knack for verse; and one day, after reading an effusion in this paper, which began,

Silently, slowly, sadly,
Falleth the autumn leaves,

we resolved to enter into a competition of ineptitude, and see which of us could gain a hearing for the most idiotic verses. As well as I can remember, I was the victor in the contest; certainly I was capable of writing worse doggerel than my rival, some of whose humorous contributions to the school magazine were not unworthy of comparison with those of A. C. Hilton, of *Light Green* fame, author of the immortal *Octopus* and *The Heathen Pass-ee*, the best parody ever written of Swinburne in the 'Dolores' vein and stanza, and the greatest achievement in the difficult *genre* of rewriting a famous poem and equalling the wit and point of the original. Strange to say, neither of my poetic contemporaries justified the literary promise of his youth, though one had a distinguished official career in India, and the other prospered in South America. But I was sealed of the tribe of doggerel bards, and have not yet abandoned the practice of stringing rhymes. It has amused me all through my life; it has even brought me in a little pocket-money; and I am the more encouraged to persevere when I learn that at some public schools enlightened pedagogues employ it as an educational instrument, in supplement to, or as a substitute for, the composition of Greek and Latin verse.

The next eight years brought me very little nearer my destined goal. At the university I never seriously considered the question of a career; and, apart from my share in a college squib, my only appearance in print was a four-line epigram which appeared in *Punch*. When I missed a First in Greats, of which at best I

had a slender chance, it seemed a case of gerund-grinding or nothing. I stayed up for a term, advertised in the Union for pupils, but none came. I 'also ran' for a Fellowship, a truly forlorn hope in view of the distinction of many of the competitors; though the examiners played for safety, and elected a sound, well-read mediocrity. I also wrote a weekly Oxford letter for a periodical just started at another university. But the post was unpaid; and when, just before the end of term, the best of my don friends recommended me for a mastership, I gratefully accepted the offer. The work, in a great provincial city, was easy and decently paid; and towards the end of the four years I spent there, thanks to the friendly services of one of the staff, I was allowed to try my hand at book-reviewing for the principal local paper. Never shall I forget the thrill of pride and importance I felt as I cut the string of the parcel which contained *The Cruise of the Jeannette*, one of the most tragic of all Arctic records, and other volumes. But there was no prospect of regular work. Nothing came of this trial trip; and an article accepted and published in an educational journal brought a somewhat discouraging letter from the editor, who observed that, though my paper was nicely written, it showed a lack of imagination. The editor was right, so far, at least, as he gauged my capacity as a writer of romance. Except for one appalling attempt which was published in the *Gentleman's Magazine*, and for which I received the sum of ten shillings and sixpence—a not extravagant recompense—I have never deviated into fiction. I could neither invent a plot nor write a dialogue. *Il faut se borner*, as the great Napoleon said, and I have found no difficulty in restraining myself from further excursions into an overcrowded field. But when I look back upon my credentials and equipment, my resolve to give up school-mastering and seek my fortune as a journalist in London seems to me a counsel of insanity. True, my post was a shelf; but it was a certainty, and I could live upon it. I had qualified in a Civil Service Examination for a clerkship in the Inland Revenue, but declined to take it—another piece of madness. As for the qualifications for the higher and more lucrative walks of journalism, I had none. I was a fairly good classical scholar, but I knew little history and no law. I had not even been called to the Bar. Of science I was destitute. I could not even describe the mechanism of the common pump. Close reasoning always fatigued me; my logic was generally faulty, and if I had a genius it was for the irrelevant. Indeed, I am sometimes inclined to think that it has been my greatest asset—that and a love of nonsense. (By the way, has any one noted the philological affinity of Lear and *Leros*?) This was inherited from my father, though he kept it under strict control, and it was from him that I learned the bogus charade

composed by his brother, my uncle, which ran as follows:

My first is the slave who never had a master,
My second is the man who invented sticking-plaster,
My whole is a number, half of which is more
Than twice its double twice repeated o'er.

My father and uncle were both distinguished mathematicians; but my greatest achievement in this direction was in satisfying the Civil Service Examiners in correctly adding up long columns of pounds, shillings, and pence. For the rest, I could read French, and I had heard a great deal of music, mostly good, though I was no executant.

Thus equipped, but without any introductions, I made the plunge, and the more I think of it the more I marvel at my audacity. A week before I started I had despatched an article to the editor of a London weekly. I was already an expert in the art of throwing literary boomerangs, and this was one of the dingiest of my missiles. It had come back to me certainly half-a-dozen times, but with the courage of desperation I despatched it once more. The journal I chose to assail had given me an opening by inviting illustrations of the Hibernian habit of mind, and my paper was simply a budget of anecdotes. But this time it hit the mark, and was printed in the first issue I saw on reaching London. I followed up this initial success by obtaining an introduction to the editors, who welcomed me with a kindness and consideration which never wavered in their lifetime, and was continued by their successor. Well might I agree with Michael Finsbury's remark in *The Wrong Box*, 'There is nothing like a little judicious levity,' when one of these good friends said to me on my first visit, 'I think you may be of some use in lightening the incorrigible seriousness of our paper.'

I never failed in after years to recount my experience to 'journalists commencing' who came to me for advice or when they seemed daunted by frequent rejections. I wish that I could think I had given them a tithe of the encouragement and help which was bestowed on me by some of the leaders of the profession when I was at the bottom of the ladder. The editors I have spoken of promised me work, and were as good as their word. As an article-writer I was not a success; but they gave me a good deal of miscellaneous reviewing, and Tuesday was always a red-letter day for me, for I was allowed to call in at the office and rummage in the book-shelves. Their patience was inexhaustible, and they were always ready to discuss suggestions. Often they indulged in reminiscences, and no name was oftener on their lips than that of Walter Bagehot; it was from them that I heard his famous definition of Socialism as a state of affairs in which 'every man would have one boot.' Some of my contributions were 'turned down;' but the editors had a peculiarly

generous way of recognising work on which extra pains had been taken, and more than once paid me at double rates. I had plenty of time on my hands, and a long review occasionally meant a solid fortnight's work. I assiduously frequented the British Museum reading-room; became familiar with the strange collection of students, researchers, and unemployables gathered under its dome; and, ignorant of the neighbouring attractions of Viennese bakeries, frequented the Museum restaurant and partook of its unforgettable haricots. One day I recognised, to my surprise, a dashing young man renowned a few years earlier in the world of pastime, whose applause of a lucky stroke of mine in a game of lawn tennis had almost turned my head. It was as though a village cricketer had been publicly acclaimed by W. G. Grace. I noted that he seemed embarrassed by my recognition, and only learned some time afterwards that he was lying *perdu* from his creditors. He vanished from my ken only to emerge twenty-five years afterwards in a squalid murder trial on the Continent, and died miserably in prison.

But man cannot live by reviewing alone, and I was lucky in fitting more strings to my bow, thanks chiefly to introductions furnished by my brother, a modern *Proculeius*, *notus in fratres animi paterni*. By his good offices, and on the strength of my connection with one paper of good repute, I gradually got a foothold elsewhere. It began with more reviewing, this time of novels, a dubious privilege, though it was my good fortune to be one of the first to pay homage to the genius of Mr Joseph Conrad. But music proved a better stand-by. Schumann once lamented the paucity of musicians who had the gift of literary expression, and of literary men who knew anything about music. In the musical world, as it was constituted in the eighties, a man like myself, who, though lacking a professional or scientific training, was genuinely fond of music, had gained a sufficient mastery of the ordinary jargon, and possessed a fairly good general education, enjoyed an unfair advantage when compared with most of the regular musical critics. Behold me, therefore, accepted as a regular contributor to a musical magazine, where I contrived to cover up my technical ignorance with a proper display of literary upholstery; and, a little later, on the recommendation of 'G.' (the late Sir George Grove, the most generous and appreciative of patrons), appointed as salaried musical critic to a new morning paper. It was always somewhat of an egg-dance; but I contrived so successfully to avoid detection that a few years later I narrowly missed promotion to a more exalted post, a failure which was indeed a blessing in disguise, and for which I have never ceased to be grateful. The appointment would have been practically a 'whole time' one; it would have restricted the expansion of my income, and it would sooner or later have led to

a resounding exposure of my shortcomings. As things were, being neither an obscurantist nor a revolutionary, and combining an adoration for the three 'B.'s, with a delight in the later Verdi, Wagner, Berlioz, and Bizet, I enjoyed my opportunities without greatly abusing them—at least I never used the word 'rendition,' or spoke of Beethoven as 'the Bonn master,' or of Telford as 'the unfortunate Brabantian nobleman'—heard an immense amount of music, and made many lifelong friendships with musicians. Meanwhile I had been extending my activities in other directions. When I heard that H. D. Traill had accepted the editorship of a Sunday paper I boldly applied to him for work, simply on the strength of the feeling that he was likely to be a kindred spirit. The confidence was happily justified, and led to an association, which lasted as long as he remained in charge of the paper, with one of the most versatile, gifted, and sympathetic of Victorian literary journalists. I wrote light leaders, and he allowed me to kick up my heels, except on one occasion when I was bidden to produce half a column on a Royal wedding. He apologised for asking me to undertake the task, but explained that he had always found himself simply incapable of striking the proper ceremonial note. It was my only effort in this style, and the Saturday afternoon spent in its composition is the only black spot in my memories of a delightful and stimulating chief. I never wrote for his successor. One brief interview made it abundantly clear that he did not want me, and that I could not without humiliation have taken orders from him. Traill's talk was always pointed and often witty. When I once told him of an Irish piano-tuner who used to steal the notepaper at the great houses where he was professionally employed, he said, 'Yes, like "the wanton lapwing," which, in the spring, "gets itself another crest."' How seldom it is that one is privileged to hear a witty comment or retort at first hand! The only other example that I can recall at the moment is the remark of an American lady who, when I told her of an actor who had changed his name of Sampson when he went on the stage, promptly observed, 'Well, that was silly of him, when Samson was the one man who could bring down a house.' It was always a puzzle to me how Traill, with his fine literary sense, his gift of satire which found vent in his famous *Plagues of Egypt*, and his contributions to the *Saturday Review* in its great days, managed to accommodate himself to the requirements of the *Daily Telegraph* in the years when Sala 'wielded his flamboyant quill.' It would be an exaggeration to say of Traill that he proved the truth of the saying that 'Journalism is the grave of literary ambition,' for he found time to write some excellent books; but it is none the less true that his newspaper work, while it increased his output, lessened his claim to remembrance as a man of letters.

Meanwhile I had begun again to meditate the doggerel Muse. Home Rule was the burning question in politics, and I found a hearing for sundry squibs and satires in the weekly and daily Unionist press. These not only brought me in a few welcome pounds, but led to the offer of regular employment on the editorial staff of an evening paper. I was in bed with influenza when the editor called to make the proposal; but he made his way to my sick-chamber, and after a brief and satisfactory interview left me practically convalescent. My luck in editors had not deserted me. My new chief was a handsome, attractive, accomplished, meteoric person, and, but for the lack of the spur of necessity, for he had means of his own, might have done great things. One did not associate him with orthodox views, and yet he had been private secretary to an archbishop, and, I have no doubt, filled the post to admiration. At the office he was highly efficient and critical, but always helpful and courteous. Away from it he was a man about town, somewhat Bohemian in his habits and haunts, but, so it seemed to me, more from a curious interest in humanity than from any vulgar love of excess. He would come back to his rooms at midnight or later, sit down to finish an article for the morrow, and turn up punctually at nine next morning. To put it plainly, he burned the candle at both ends; and when, to the great regret of the staff, he resigned the editorship a few years later, his health had already begun to fail. He lived for a while in America—he married an American wife—travelled widely, paid occasional visits to London, when he never failed to seek out and entertain royally his old colleagues, dying suddenly abroad while still a young man; a lovable, restless figure, whose achievements were far below his abilities, who spent his energies on trifles, never took care of himself until it was too late, and never forgot a friend.

My duties consisted in editing a column of light comments on current events, and providing a daily leaderette, which on alternate days had to be written overnight. For the column I could rely on a certain amount of assistance from some of my colleagues when they had done their appointed tasks; but for the leaderette I had to depend on my own resources. The result was that I had always to lengthen my leaderette in proof, whether I wrote it overnight or in the morning. I was always a slow and infertile producer, and when I left the paper one of my colleagues, in a farewell poem, described me, only too truly, as constantly engaged in 'patching' my 'meagre overnighter.' I never had too much to say, but rather the reverse; and the mornings on which I had to write a leaderette before setting to work on my column were often a mild nightmare. The time limit for sending in 'copy' was frequently extended, and, if it had not been for my good-natured and more nimble colleagues,

I should infallibly have let the paper down more than once. But it was not always like this. Some mornings the papers were rich in subjects, and paragraphs flowed easily from the pen. My post was not a sinecure, but it was decently paid when the hours of work are taken into account, for I was free at twelve noon. Good-fellowship prevailed in the room where I worked, though the atmosphere was somewhat thick, tobacco-smoke being blended with the odours of bacon and eggs, for one of my colleagues frequently arrived breakfastless, and had to send out for refreshment. We were most of us university men, young or youngish, some birds of passage, while others remained harnessed to the pen. One was a famous international rifle-shot; another, the most elegant of our group, was familiar with the men and cities of the Near East, had ranched in the Argentine, and subsequently served with distinction as correspondent for a great daily in two Continental capitals. A third, after an expensive youth, had settled down to a life of sheer drudgery, combining night work as a leader-writer on the *Morning Post* with the functions of 'general utility' on our staff. Small blame to him if his natural geniality was clouded by overwork and lack of sleep. Yet another, the youngest and most brilliant and most helpful of all my room-mates, soon shook himself free from the fetters of daily journalism, and found a more congenial scope for his varied and original talents in the domain of *belles lettres*. My immediate predecessor had gone to edit a weekly illustrated journal, returning to succeed my meteoric friend as chief, and then moving on to take charge of a leading daily. For a while the original editor and founder of my column, after several years' service on the Press in India, re-joined the staff of his old paper, and others came and went, so that I saw many changes in the seven years in which I spent my mornings in the Strand. The two chief leader-writers, who wrote on alternate days, occupied another room, and presented a striking contrast in personality. One was a bluff old soldier who kept a supply of biscuits in his writing-table, which he munched at intervals during his labours. The other was a gentle, reserved, accomplished visionary, who had written some graceful fantastic novels, and—if I remember aright—was a votary of the White Rose. But both faithfully expressed the traditions of the paper with little difference of style, though there was always more of the 'big bow-wow' of Toryism in the captain's articles. The sub-editorial staff, mainly concerned with the news department, were housed in another part of the building, and we saw little of them. Indeed, I gained my most vivid insight into the sub-editorial mind by overhearing a conversation between the chief of that department and the proprietor. Cardinal Manning had died the night before; the death of the Duke of Clarence

was announced early in the morning, and the sub-editor in bringing the news to the proprietor observed in his usual harassed manner, 'Cardinal Manning is simply wasted this morning, sir.'

Journalists, like barristers, have generally too little or too much work. Even in those days, when security of tenure was firmer than it is to-day, a writer for the Press, unless he was an editor or high on the staff of one of the great dailies, could not often afford to keep all his eggs in one basket. At one time I was a regular contributor to two dailies, three weeklies, and two monthly magazines. I passed the greater part of my afternoons and evenings in concert-halls or at the opera, and spent Sunday in clearing off arrears. I am glad to think that only one of the papers and magazines I then worked for failed to survive my co-operation, though I feel that I may have temporarily imperilled the prestige of the *Economist*, for which I once wrote political leaders for a whole month. But there were others that were less fortunate, and some day I may write a chapter on the 'Papers I Have Helped to Kill.' One, edited by an Oxford friend and contemporary, was financed by an eccentric nobleman who had previously

run a Universal Information Bureau. It was really quite a serious venture; but the design on its cover gave it the appearance of a society journal, and dualism is fatal in a newspaper. Another was the hobby of a generous patron of the arts and the drama, and during its brief career provided lucrative employment for quite a number of his friends. A third was the *Reflector*, founded and edited by the unique and ever-to-be-lamented 'J. K. S.'

It was a busy, diversified, but somewhat distracting life, and I was not sorry when, towards the end of the nineties, the offer of editorial work under an old friend enabled me to break away from daily journalism and its irksome drudgery, and to transfer my allegiance for what it was worth to the most appreciative, stimulating, and considerate of all the editors I have ever known. The time was singularly fortunate for such a change, for the star of the new Alfred the Great was already in the ascendant, and 1896 had witnessed the foundation of the *Daily Mail*—*grande et conspicuum nostro quoque tempore monstrum*. At this point, which virtually marks the close of Victorian journalism, these reminiscences may suitably conclude.

PINCHER MARTIN, O.D.

CHAPTER VII.—AN AFFAIR OF THE HEART.

L

MISS EMMELINE FIGGINS was a well-built, capable-looking young lady of seventeen. She wore her hair neatly coiled in a golden aureole on the top of her head. Her blue eyes were attractive and full of mirth, her mouth was well-shaped, and she possessed a pair of very red lips and twin rows of even white teeth. She seemed literally bursting with health, and her rosy, slightly sunburnt cheeks somehow reminded Pincher of the girls at home in his own village. She was dressed in a white blouse and plain dark-blue skirt, and a small gold locket hung round her neck.

The first time Martin saw her standing behind the counter in the little sweet and tobacco shop he thought her quite adorable. He experienced a vague feeling of jealousy when he saw the locket, though, for he thought it probable that it contained the photograph of the ship's steward's assistant from the flagship.

Billings, strangely redolent of violets—he had purchased a pennyworth of cachous subsequent to absorbing one pint of beer immediately on getting ashore—advanced with a sheepish grin. Martin followed close behind.

'Good-evenin', miss,' the former remarked, touching his forelock. 'I 'ope I finds yer well!'

The girl laughed. 'Thank you, Mister Billings,' she said. 'I am enjoying the best of

health, and I hope you are the same.' She regarded Pincher out of the corner of her eye; and that youth, very ill at ease, shuffled nervously and began to get red in the face. He was always rather frightened of women.

'I'm quite fit, miss,' said Joshua. 'This 'ere's Mr Martin—Pincher Martin we calls 'im. Friend o' mine, 'e is. Brought 'im along o' me ter be interjooiced.' He pushed the ordinary seaman forward by the arm.

'Pleased ter meet yer, miss,' said Pincher awkwardly, advancing and shaking hands over a row of glass bottles filled with sweets. 'I've 'eard a lot abart yer from my frien' Mister Billings.'

The A.B. warned him of his indiscretion by a violent nudge in the side.

'I'm glad I'm a celebrity,' the girl remarked, a trifle suspiciously. 'And what did Mr Billings say about me? I hope it was something nice.'

'Where's yer ma, miss?' Joshua himself interrupted, hastily changing the subject.

'She's out now, Mr Billings, but she'll be back home to tea at half-past five. She's expecting you then, I believe; and if this gentleman would join us I'm sure he'd be very welcome.' She looked at Martin.

'Wot say, Pincher?' asked Joshua with a wink. 'Like ter 'ave a cup o' tea wi' th' ladies?'

'Don't mind if I does,' said the youth shyly.

'Needn't come if you don't want to, mister,' the girl retorted sarcastically, tossing her head. 'There are plenty who'd be glad to be asked.'

Pincher felt more awkward and sheepish than ever. 'I should like ter come, miss, thankin' yer for yer kindness in arskin' me,' he managed to stammer. 'No offence meant, I'm sure, miss. 'Fraid I said it a bit awk'ard like.'

'No offence taken,' laughed Emmeline, moving off to attend to three customers.

'Now, Mister Billings,' she said, coming back in a few minutes, 'I can't stand gossiping here all the afternoon. This is our busy time, and the shop will be filling up soon, and I sha'n't know whether I'm standing on my head or my heels. What with mother being out, and that plaguy boy having a holiday, I don't know how I shall be able to manage. If you drop in again at half-past five, mother will be in then. Is there anything I can serve you with before you go?'

'I'll 'ave two packets o' woodbines, miss,' Joshua had to reply, quite forgetting that he did not smoke cigarettes, but unable to ignore the hint. He put down twopence.—'Wot abart you, Pincher?'

Martin looked blankly round the shop.

'A penn'orth of bullseyes or almond rock?' suggested the girl, with a malicious twinkle in her eyes. 'Or perhaps you'd fancy some jujubes or acid drops, fresh in to-day?'

'Thank you, miss, I don't fancy sweets,' the ordinary seaman returned, painfully aware that he was being made fun of. 'I'll 'ave one o' them there packets o' Egyptian fags. The six-penny ones.'

'We generally call them cigarettes,' Emmeline remarked.

'Lor!' Billings ejaculated, 'we ain't 'arf goin' a bu'st!'

'Let the boy have what he wants, mister,' retorted Miss Figgins tartly, her business instinct uppermost, and a little anxious lest Pincher should change his mind and choose something cheaper. 'They're very good cigarettes, I'm sure, and excellent value for the money. Don't know what he wants to go smoking for, though,' she added sweetly, gazing at Pincher with an innocent smile. 'I'm sure sweets are more in his line.'

Joshua laughed, but Martin felt he had never been so insulted in his life. 'Boy,' indeed! She had called him a boy, and had offered him sweets!

More prospective customers arrived; and, paying for their purchases, the two bluejackets started to leave the establishment, when Billings, remembering something rather important, turned back. 'Say, miss,' he queried in an anxious, confidential whisper in the young lady's ear, 'did yer ma say anythin' abart comin' ter the pictures along o' me ter-night?'

Emmeline paused in the act of weighing out

half-an-ounce of shag tobacco and laughed merrily. 'Go on with you!' she exclaimed roguishly. 'You're a proper caution, Mister Billings!'

'Did she say nothin' abart it?'

'I'm not my mother's keeper. She said nothing to me.'

'Sure?' queried the lovesick one, rather disappointed.

The girl winked twice and pointed to the door. 'Hop it!' she giggled. 'Don't come worrying round me when I'm busy with customers. Take your Mister—er—Martin with you; and if I were you I should buy him'—she sank her voice to a whisper and glanced in Pincher's direction—'a nice rattle! Ta-ta; see you both later.'

'Wot did she say yer wus ter buy me?' Martin wanted to know when they got outside.

'Didn't 'ear, chum,' Joshua answered hastily, unwilling to hurt the other's feelings. 'Wot d'yer think o' 'er? Bit o' orl right—wot?'

'She looks orl right,' Martin agreed, rather depressed. 'But she seems a bit 'orty-like for a kid o' seventeen. Tryin' ter 'ave me on, she was, abart them there sweets.'

'Garn! That's only 'er way. She don't mean nothin'. Yer can't expect a gal ter take a fancy ter a bloke orl of a sudden like. Don't get rattled abart wot she said. Come on,' Joshua added, glancing at a clock in a jeweller's window. 'It's only a quarter ter five, plenty o' time ter go an' 'ave a wet afore we goes back there ter tea.' He made off across the road in the direction of a public-house.

'No, yer bloomin' well don't!' Pincher exclaimed, overtaking him, seizing him by the arm, and swinging him round in the opposite direction. 'Yer said yer was only goin' ter 'ave one pint. S'welp me, yer did.'

'Don't act so barmy, Pincher,' Joshua expostulated, bitterly aggrieved. 'W'en I sez a pint I only means a pint directly I gits ashore. I didn't say 'ow much I'd 'ave arterwards.'

'Well, yer ain't goin' ter 'ave one now, any'ow,' Martin retorted. 'If you goes drinkin' now, I sha'n't come ter tea along o' yer an' Missis Figgins; an' I wants me two bob back, strite, I do.'

'Wot d'yer want ter go spoilin' a chap's bit o' sport fur?' Billings grumbled feelingly. 'I'm that dry I could jist do wi' a pint. No more'n a pint, I promises yer.'

But Pincher was adamant. 'If yer feels dry yer kin go and buy yerself some lemonade. Yer don't git no beer while yer along o' me.'

'Lemonade! 'Oo wants lemonade, 'orrible pisenous stuff full o' hacida an' sich like! Only fit fur kids ter swaffle!'

'Yer won't git no beer, so it ain't no use yer talkin'.'

'Oh, ain't it bloomin' well?' the A.B. ex-

claimed, beginning to get angry. 'Yer ain't lookin' arter me, yer knows. It's me wot's lookin' arter you.'

Pincher held out his hand. 'Orl right, then,' he said quietly. 'Give me back me two bob wot yer borrowed.'

Joshua glared at him in speechless astonishment. 'Give it back to yer?' he almost shouted. 'Not 'arf I don't!'

'Orl right. S'long; then; I'm not comin' along ter tea wi' Missis Figgins. Yer knows werry well yer can't go takin' ladies along ter th' pictures if yer starts drinkin' now.' Martin pretended to move off.

There was some truth in the remark, and Billings felt rather foolish. 'Ere, 'arf a mo'!' he expostulated. 'Don't shove off. Look 'ere, chum. She 'as a drop 'erself now an' then. Allus 'as a bottle o' stout along wi' 'er dinner, an' another along o' 'er supper. Told me so 'erself.' He looked hopefully to see if this information would have the desired effect, but Martin merely shook his head.

It took at least five minutes further argument, and much backing and filling between the two pavements, before Billings could be drawn off from the glaring portals of the 'Rose and Crown.' He seemed attracted to the place like a steel filing to a magnet; and it was all Martin could do to entice him away. But he succeeded eventually, and, with Joshua still complaining bitterly, the two adventurers entered a barber's shop to have their hair cut.

At five-thirty precisely they both returned to the shop to find Mrs Figgins there. She was a short, bulbous little woman of uncertain age, with her dark hair, slightly streaked with gray, drawn tightly over her head and tied in a knob behind. Except for her blue eyes, which twinkled through her spectacles as she talked, she bore little resemblance to her daughter, but, for all that, possessed a certain vivacity of manner and speech which more than made up for lack of good looks. She greeted them with cordiality.

'It's pleased I am to see you an' your friend, Mister Billings,' she said, when Pincher had been solemnly introduced. 'Such a day I 'ave 'ad you never would believe. Went to see my poor John's brother's wife at Dorchester. 'Er youngest, Halfred; 'im that was born last Easter, 'as come out all over in red spots, an' the doctor doesn't know wot to make of 'em. 'E's a fraud, I think,' she went on—speaking with great rapidity, and nodding her head to emphasise the point—'a reg'lar fraud, same as all doctors. I don't 'old wi' them an' their speriments. I said to Jane that the boy was sickenin' for measles, 'cause the spots are the same as wot Hemmeline 'ad when she was a baby; but the doctor'—

'Measles!' Joshua ejaculated, with vague visions of being put in quarantine. 'Infectious, ain't it?'

'Don't be scared,' the lady laughed. 'It's all right so long as you've 'ad it before.—Hemmeline!'

'Yes, mother?' came the girl's answer from the sitting-room at the back of the shop.

'Is that kettle boilin' yet? 'Ere's Mister Billings an' 'is friend ready for their teas.'

'All ready, mother. Look out you shut the outer door in case of customers coming.'

Mrs Figgins shut the door, and then ushered her guests into the sitting-room. It was a bright little apartment, with a cheerful fire blazing in an old-fashioned grate, before which, judging from the smell, Emmeline had been making hot buttered toast. The room was crammed with furniture, and was decorated with china ornaments, velvet hangings, and pictures, conspicuous among these being a large photographic enlargement of the late Mr John Figgins. It hung in a massive gilt frame, and the defunct gentleman was shown in black cut-away coat, dark trousers, high choker collar, white tie, and a very shiny top-hat. He gripped a walking-stick and a pair of gloves in one hand, while the other rested in *négligé* fashion upon a large marble column bearing a very palpable imitation palm. He had side whiskers and rather a fierce expression. There were also three large, highly coloured oleographs. One depicted the late Queen Victoria at the time of her 1887 Jubilee; another, entitled 'Lead, Kindly Light,' showed a sailing-ship in dangerous proximity to the Eddystone Lighthouse during a terrible storm; and the third, some immaculate soldiers in tight red tunics saying good-bye to a number of lachrymose, slim-waisted ladies on the platform at Waterloo Station. They were, it would appear, about to sail for South Africa—the soldiers, I mean, not the ladies.

On the mantelpiece stood a cabinet photograph of Joshua Billings in an ornate aluminium frame painted with forget-me-nots. The original glanced at it with a self-conscious smirk. It had been his last present to Mrs Figgins, and he felt it augured well for his prospects to see it in the place of honour.

But Pincher was not so much interested in the appearance of the room as in that of the round table in the centre of the apartment. It was spread for tea; and such a tea! There was a fine crusty cottage loaf and a generous plate of sliced ham; a mountain of shrimps lay cheek by jowl with an enormous pot of jam; while rounds of hot buttered toast, a large currant-cake, and a pile of mixed pastry stood on the outskirts of the more substantial comestibles. Martin sucked his teeth appreciatively. There were only four places laid, he was glad to see. The ship's steward's assistant from the flagship was evidently not coming:

Mrs Figgins settled herself in front of the teapot, and began pouring out, keeping up a rapid flow of conversation the while. 'Mister

Billings,' she said, motioning with her head to the place on her right, 'will you sit 'ere? an' you, Mister Martin, 'ere? Hemmeline will be opposite me. I 'ope you will 'elp yourselves to anything you fancy, and if hanybody likes heggs, I've got some werry nice ones fresh in from the country to-day. My poor John was foud of a hegg to 'is tea,' she added, gazing sadly at the representation of her late husband.

'I reckons we kin do werry well wi' wot we 'ave 'ere,' remarked Billings, glancing round the table with an approving smile, and helping himself to ham and hot buttered toast. 'Thank yer, Missis Figgins,' he continued, 'two lumps for me.' He took the proffered cup with a coy smile, put it down, and began to masticate noisily.

Pincher fancied shrimps to start with; but Emmeline, who had her own ideas as to how a lady should behave, scorned the more substantial eatables, and nibbled daintily at a piece of thin bread and jam.

'Ave a bit of 'am, my gal,' said her mother, helping herself to that delicacy, and handing the plate across.

'No, thanks, mother. I'll spoil my supper if I do.'

'Quite right, miss,' murmured Billings, with his mouth rather full. 'I never could under-

stan' 'ow folks wot 'as a reg'lar supper kin stow their kites full at tea-time. 'Orrible 'abit, I calls it. On board, ye sec,' he hastened to explain, lest he himself should be thought a glutton, 'we 'as a sort o' 'igh tea, an' a bit o' biscuit or sich like fur our suppers. It ain't wot you'd call a proper meal.'

Martin gasped. He knew that on board the *Belligerent* Joshua frequently had kippers for his tea, while six rashers of bacon and six fried eggs often formed his evening meal at seven o'clock.

Emmeline raised her eyebrows. 'Kites?' she asked, rather surprised. 'What's kites?'

'Stummick, 'e means, miss,' put in Pincher, anxious to air his knowledge. 'Mister Billings'—— He heard a horrified gasp, looked up, saw Emmeline frowning at him fiercely, thought better of what he was going to say, and then stared at his plate, with his face getting redder and redder. He had evidently put his foot into it rather badly.

But the girl did not intend to let him off. 'We don't mention those things in polite society,' she pointed out acidly. 'It's not nice.'

Pincher said nothing, but wished that the floor might open and swallow him whole.

(Continued on page 468.)

WITH A RED CROSS UNIT IN BELGRADE.

By a HOSPITAL ORDERLY.

DESPITE the lurking dangers from submarines and all the unknown terrors that might await us in Serbia, we were a cheerful little party which boarded the s.s. *Saideh*, bound from Liverpool to Salonica. But the first few hours proved decidedly anxious. No sooner were we at sea than all lights were extinguished. Orders were given that no one was to undress. Lifebelts were donned, lifeboat drill was practised in thorough fashion, and then we lay down to get what sleep we could.

The voyage, however, from first to last proved uneventful; but we doctors, nurses, and orderlies found plenty to occupy us. There were vaccinations and inoculations to be performed or undergone; there were lessons in Serbian and lectures on typhus twice a day; and, for the rest, there were the usual deck games.

On the 15th April, in gloriously hot sunshine, with sea like glass, we glided past the famous Mount Olympus, all snow-capped, into the harbour of Salonica. With a companion I leant over the deck-rail and watched our approach to land. We wondered whether the bay looked the same to St Paul when he sailed over this spot nearly two thousand years ago. But when within sight of the town, we found picture palaces rearing their gaudy façades here and there on the front, and electric trams clanging their way to and fro;

so we decided that the appearance of the city from the sea must have changed considerably since St Paul's visit.

After some delay, owing to the belated arrival of our stores, we started on our two days' journey to Belgrade—a journey I shall never forget. Close beside the course of the Vardar River, through mountain passes, our train ambled for mile upon mile between avenues of acacias in full bloom. So slowly did we travel, so luxuriant were the blossoms, that some Russian soldiers with us pulled off huge boughs with which to decorate the carriages. Soon we resembled some carnival car at a battle of flowers, for at nearly every station—and we stopped at every one—we were presented with large bunches of wild flowers by the peasants.

At times, as our train went rumbling along, we saw tortoises scrambling up the railway-banks; and once or twice an eagle devouring a sheep, perched on a rocky islet in the river, a sure refuge from disturbance. Once, for close on fifty miles, we passed through a continuous cloud of dragon-flies.

After travelling some twenty-four hours we arrived at Nish, one of the dirtiest, muddiest, and most uninteresting places in Serbia. Here we heard many tales of the terrible epidemic of typhus, which was by this time nearly over—how

people had fallen down and died in the streets, and how thirty thousand out of sixty thousand Austrian prisoners had succumbed to the disease. So many prisoners were taken during the Austrian retreat that the Serbians, when sending them to the rear, found it impossible to spare sufficient troops for their guard. In one instance nine thousand prisoners had to be sent to Kraguievatz. How to get them safely there was a problem. Not more than two or three men could be spared for escort. But the Austrians, after days of heavy fighting, were in a half-starved condition. They were, therefore, told to follow the telegraph-wires until they reached a certain town, where they could have a good meal and a rest. Thence they must again follow the wires until they arrived at Kraguievatz, where another meal would be awaiting them. All this they did implicitly, the whole nine thousand being in a very short space of time lodged in camp at Kraguievatz.

During our stay in Serbia we talked to many Austrian prisoners. Several had been waiters in London, and spoke perfect English. They were tired of the war, and, in fact, had never wanted to fight. All agreed that they were very well treated, as indeed they were. They were to be found everywhere—working on the railway, driving motors, acting as postmen, &c.; and except for their Austrian uniforms, one would not have known that they were prisoners.

After an enforced stay of some eight hours in Nish, we set out for Belgrade. All the trains stopped at Topsheda, as beyond that point the line was within range of Austrian guns. The rest of our party proceeded to drive to our hospital in Belgrade, distant about four miles; whilst I and a companion stayed behind to see to the removal of the four or five vanloads of luggage to a convoy of bullock-wagons. After hours of toiling in a blazing sun, with nothing to eat or drink, we managed to get the wagons loaded up and ready to start. Suddenly I heard the rumble of a train coming from the direction of Belgrade. Wondering how it had got on to the forbidden part of the line, I ran on to the track to have a look. At that moment a big shell burst thirty yards away, and feeling instinctively safer in company, I ran back as quickly as I could to the convoy. The Austrians had started bombarding the route along which we had to pass.

No one else seemed to worry much about this little episode, so we two novices plucked up courage and started off. Some of the shells fell very close to us, but we managed to maintain an outward appearance of perfect indifference, though I own my hand was not quite steady when I endeavoured to light a cigarette. We arrived, however, at Belgrade without mishap.

Life in a city subject to bombardment is full of side-shows. On our first morning we were quite excited at seeing a French aeroplane shelled by the enemy. As this proved to be

practically an everyday occurrence, we took scant notice of it after the first few days. At times we witnessed duels in the air; once, indeed, the airmen fought with revolvers, and in that, as in every other, encounter the Frenchman was the victor. On anniversaries, such as that of the assassination of the Austrian Crown Prince, and on the name-day of King Peter, we were deluged with souvenirs from enemy aeroplanes.

On one occasion we saw thirteen bombs dropped on the town, several of these being dummies with the attached announcement: 'Citizens of Belgrade, we are dropping thirteen bombs to-day in retaliation for your dropping thirteen bombs on —' (a town beyond Semlin which had been raided a short time before). These bombs resembled huge balls, and were surmounted with what looked like great waving ends of ribbon, which shone in the sun, and were quite two feet long and nearly six inches wide. Contrary to our expectations, they fell very slowly, taking more than a minute to reach the ground. On this occasion two aeroplanes simultaneously dropped a bomb each. We watched them fall side by side until they disappeared behind some houses in the next street. There were two loud reports, followed by clouds of smoke and dust rising slowly upwards.

Another excitement to which we soon became accustomed was bombardment by the enemy's guns. In nearly every case they hopelessly outranged our guns. However, our British batteries were very lucky; and although on one occasion twelve-inch shells fell thick around our battery, neither guns nor gunners (who retreated to a safe distance) sustained damage. On one occasion eleven shells burst in the heart of the town, happily doing little injury. For every shot received we gave as good, Semlin, the Austrian town on the other side of the Danube, being the chief sufferer.

One night we were startled to hear heavy gun-firing. Rushing up on to the roof, we saw the whole sky lit by the rays of searchlights, the flash of the guns, and the sudden blaze of exploding shells. The noise was terrific, and the spectacle most awe-inspiring; and yet one could not help likening it to a glorified fireworks display. As we afterwards learned, the cause of all this outburst was an Austrian patrol-boat endeavouring to come down the river from Semlin. Our batteries had opened fire, and the enemy on the farther bank responding, a general engagement ensued, which lasted some hours. The enemy boat was, I believe, finally sunk by shots from the Russian battery. The next morning a number of naked men were seen scrambling across the mud toward the Austrian shore. These were, no doubt, the survivors of the crew of the patrol-boat. The British officers were very much pleased over this affray, as they

managed to salvage from the sunken boat a fine gramophone and fifteen records, which were the means of giving us a delightful concert a few days later.

On Whitsunday several of us attended service at the church, where lie the remains of King Alexander and Queen Draga—a quaint little edifice standing in a picturesque churchyard. At the west end two wooden crosses leaning against the wall mark the graves of the unfortunate royal couple. Separating them is the grave of a pauper. Queen Draga's brother is also buried here, on the north side of the church.

Below our hospital stood the remains of the bridge, which was the main line of communication between Belgrade and Semlin. During the retreat of the Austrians last winter this bridge was the scene of a terrible catastrophe. When the news of the Serbian successes was made known in Semlin, engineers were at once sent to mine the bridge, and prevent the Serbs from following the retreating army into Austrian territory; but, a panic prevailing, the bridge was blown up too soon. It was appalling, an eye-witness told me, to see the artillery go galloping up the bridge and plunge in mid-stream into the swirling waters. Hundreds of soldiers, fleeing across the bridge, discovered too late their mistake, and, unable, in the terrible crush, to turn back, were slowly pushed forward until, slipping off the severed end of the bridge, they were carried downstream and drowned. Many, it is said, attempted to swim across, but the current of the flooded river was swift, and only a few—the strongest swimmers—were able to reach the other side.

We were never long in Belgrade without some fresh excitement. Once it was the attempt of six Austrian would-be deserters to cross the Danube. Five, succeeding in reaching our shore (the sixth was drowned), told pitiable tales of semi-starvation in Austria on rations of one pound of bread a day and nothing else. Another occasion of excitement was a *ruse* on the part of the enemy, a big raft rigged like a boat being sent down the river by night. Several of our batteries opened fire, sinking the raft, and by so doing disclosed their positions to the enemy. The latter, having a monitor at hand round the point at Semlin, promptly proceeded to bombard our artillery positions, without, however, inflicting any damage.

As autumn drew on, rumours increased and excitement grew apace. On the 25th September it was generally believed that two German and three Austrian divisions were assembled near Semlin. This created something like a panic, thousands of people leaving that night for Nish. However, as nothing happened, most of them returned in the course of a few days. On the 29th there was more excitement, crowds gathering to look across the river to Semlin, where, they

declared, large white flags were flying on the railway stations and on other important buildings. On all sides it was said that the Austrians were prepared for peace. Although I went up to our roof, I failed, even with the aid of field-glasses, to see anything in the nature of a white flag; but when I mentioned this to some Serbs they were very indignant.

During the last days of September and the first days of October the tide of events ran swiftly. Several German army corps appeared on the far side of the river; the railways on our side were closed to civilians, and the trains given over to the carrying of troops—presumably to the Bulgarian frontier, for the situation in the neighbouring kingdom was said to be very threatening. Even so, we continued to look upon events with perfect calmness. The French and British, it was rumoured, were landing at Salonica; and the newly arrived enemy formations at Semlin were to be moved on to the Italian front.

About this time a fresh batch of enemy aeroplanes appeared, and daily pestered us with their attentions, a courtesy we were unable to return, as our French aviation corps had been transferred to the Bulgarian frontier. On the 5th October a large 'albatross' flew continuously all day to and fro over the city, notwithstanding the shelling to which it was subjected. It was evidently taking observations of the batteries from which it drew fire. All that night there was leisurely but systematic firing—quite enough to make continuous sleep impossible.

On the morning of the 6th October the firing increased on both sides, for the 'albatross' was preparing to spend another day over Belgrade. Our Serbian out-patients began to grow uneasy, the more so when the first victims of the shelling appeared. There was a man with a shrapnel-bullet in his cheek, and three, as we subsequently found, in his coat-collar; there were also the less seriously injured members of a family whose house had been demolished around them. So we hurriedly got through with our out-patients, who numbered a hundred or more, and advised them to make their way quickly home.

At midday orders arrived that we were to be prepared to evacuate, if necessary, without delay. That afternoon, fearing that our big baggage would have to be abandoned, we packed our necessities in small bags. I also filled a big tin trunk with compressed foods, chocolates, &c.; for, if the Austro-Germans did cross the river, and the Bulgars cut the railway farther south, there was no telling how long we might have to wander about the country before we could find a safe exit.

Amongst many other things to do on that eventful day, I had to arrange for a room in the basement of the hospital, to which our staff could, if necessary, retire; and also make similar arrangements for the Serbian *voinicks*, as our

soldier servants were called. Choosing the best room, near the kitchen, for ourselves, I ordered it to be disinfected, whitewashed, and provisioned. On going downstairs, later on, to see how the work had been done, I found sixty refugees in possession of our nicely chosen retreat. This would never do; so the matron and I held a council, and finally decided to clear the coal-cellar as far as possible. To this retreat we then transferred the poor creatures. It was pathetic to see the children and the old women and a few old men huddled together on sacks, with one smoky lamp casting weird shadows over the grimy walls. But we could do no more than give them shelter, and two or three hot meals a day, all of which was willingly undertaken by our sorely tried but kind-hearted matron.

About tea-time there was a heavy bombardment of the town, and the air seemed filled with the shrieks and roars of the bursting shells. Three shrapnel-shells burst close to the door leading into the courtyard, where a Sister and I were standing. Fortunately we heard the approach of the shells, and had time to move indoors; but our escape was a narrow one.

All that afternoon and evening we were busy attending to the wounded, mostly gendarmes and civilians. From the thigh of one poor fellow, who had his leg broken, we extracted a yard of trousers and other clothing, which had been driven upward by the force of the explosion of the shell.

During the course of the evening the firing grew lighter, but the news we heard was far from encouraging. Seventy thousand shells, it was said, had fallen in and around the city—a statement which we, who had experienced it, could fully credit. The enemy had concentrated one hundred howitzers against our ten batteries of light guns; and though the latter had withheld fire, waiting until an attempt should be made to cross the river, it seemed unlikely that they would be able to hold the enemy for any length of time.

At 1.30 A.M., our work having slackened considerably, most of the staff retired to rest. At 2 A.M. the firing suddenly ceased, and for two or three minutes there was a dead silence, the precursor of an attempt on the part of the enemy to cross the river. Although, after the racket we had endured, the quiet was, in a sense, blissful, yet those few minutes were some of the most terrible I have ever spent—waiting for the renewal of battle, in trepidation lest the brave Serbs should not be able to stop the advance of the enemy.

Later I learned that during this first attempt two thousand Germans reached Serbian soil, but were unable to penetrate beyond the electric-light station, close to the river. An hour or so after the initial crossing took place several ladies and gentlemen arrived at the hospital. Fighting was going on within a hundred yards or so of

the street in which they lived, rendering that quarter of the town unsafe. After hot tea and biscuits all worked at making swabs, except those of us who were told off to attend to the wounded. At 7 A.M. the firing grew lighter. The matron and I ventured into the market, and found three stalls open. Not knowing what time might elapse before we could again replenish our larder, we purchased all we could get.

Whilst in the market we saw a continual procession of wounded being carried in hand manure-carts, stretchers and ambulances having given out. After breakfast so many wounded arrived at the hospital that we could do no more for them than remove their overcoats and boots, dress their wounds, and put them into bed. The hospital was like an armoury, littered with swords, rifles, and bombs belonging to our patients. Fearing that shells might fall on the building and hit the bombs and explode them, I picked up as many as possible and carried them to a place of safety.

That night I was on duty in charge of the wards, having under me several Serbian orderlies. From time to time rifle-bullets and pieces of shell came whizzing through the window and embedded themselves in the walls, frightening terribly a poor woman in one of the wards who had been severely wounded. All night I sat by her side holding her hand; and when I left her to make my half-hourly round, she called without ceasing until I returned.

In the early hours of the morning (8th October) I was relieved from duty. Throwing myself on my bed, I slept soundly for five hours in spite of the din. All that morning we were kept busy, for the wounded were pouring in to the hospital. Fighting was going on in the streets of Belgrade, the Serbs contesting every inch. Nearer and nearer came the battle, and once, in its ebb and flow, it reached the street next to the hospital.

It was at this period of the contest that I was called downstairs to help a poor fellow who had crawled from the fighting-line to our steps, and could get no farther. There I found him sitting on the steps, wounded beyond all hope. He died in the act of being lifted on to a stretcher.

At 10.30 A.M. we received an order from the authorities to send all patients who could possibly walk to Torlak, seven or eight miles distant, and to transfer the cot cases to the military hospital. Redoubling our energies, we helped the less seriously wounded to dress, packed them off on their journey, and sent the cot cases on stretchers, or in our own cart, to the military hospital, not far away. At one hospital at the farther end of the town an order was received that every man, however bad, able to get out of bed was to go at once to man the trenches, and this though rain was pouring in torrents.

The wounded were still crowding in upon us, but we only applied dressings to the new arrivals, and sent them on at once to the military hospital.

That afternoon we discussed the advisability of evacuating the hospital, and decided to do so. No sooner, however, had we commenced the evacuation than a mounted officer galloped up and handed in an order for us to remain. The situation, we learned, was rapidly improving, and reinforcements in large numbers were arriving.

The hospital, therefore, was reopened; and, whilst the Sisters were preparing beds, several of us went into the main street to collect wounded. Never shall I forget the sight that met our eyes. It was still raining with unceasing vigour. From the farther end of the street, where fighting was in progress, came a stream of wounded, some walking steadily enough, some limping or being helped by less wounded comrades, some dragging themselves on hands and knees, and some lying helpless and moaning on the pavement or the road. Before long our wards were again nearly half-full, and our dressing-room crowded with cases of less serious injury.

I was standing in the hall some time later, when I was surprised to see a troop of soldiers enter and march straight up to the main ward. Following them upstairs, I found they had orders to move all our patients from the hospital. After we had superintended their removal, our work as a hospital was limited to dressing minor injuries; but even this was done with difficulty, as we had no longer any supply of water, and but few candles and lamps to work by.

About 7 p.m. Dr Ryan arrived from the American hospital. After a brief review of the situation, he gave us orders to evacuate before it was too late. The greater portion of our belongings was locked in our rooms, in the hope that in a few days' time we should be able to return. So we packed a few hand-bags, and piled them in our pony-cart. Then, carrying what we could, we stepped out into the rain, and started on our journey to Torlak.

One of our party had a lamp to guide us on our way; but we had hardly got going before two gendarmes came running up, and ordered the light to be extinguished. This did not, however, trouble us, as a great part of the city was already in flames, and the flare and blaze of the burning town lit up our way. We had not gone far before we found the road well-nigh blocked with traffic. On the one side were strings of bullock-wagons, serving as field kitchens and ambulances, or for the removal of the household effects of farms; on the other was an endless stream of refugees plodding doggedly onward, the halt and the lame helped by the strong and merciful, and the children crying pitifully. Many had had no food all day, nor would have, in all likelihood, for some days to come. Others were resting on the grass or lying asleep in the roadside ditches of running water.

Before leaving the hospital I had filled my pockets with cigarettes and matches, and these I gave to all the wounded men who were travel-

ling on the road with us. One man made no answer to my repeated offer, so I lit a match, and found that his face had been shattered by a shell.

Twice, as we ascended to the summit of a hill, we turned back to take a sad farewell look at Belgrade. Poor Belgrade! Her streets and houses torn by shot and shell, and now aflame in every quarter of the city! Above the glare, as though to mock her, a stream of rockets burst, so that all might see her misery. This was our last view of the 'White City,' the pride of Serbia.

For hours we tramped on through mud and rain, in pitchy darkness, save for the occasional glimmer of a lantern, which gave us a momentary view of our surroundings. At times we stood in a water-logged ditch, waiting for our cart, which had been held up in the slow-moving jumble of confused traffic.

At last we arrived at Torlak. There we were lucky enough to meet some of our battery officers, who offered us a lift in a motor-lorry. Although our cart, colliding with a military bullock-wagon, had been thrust over a twenty-foot bank, and was now lying at the bottom, our hosts would not let us stop to extricate it. One half of the Serbian artillery had already retired; the retreat of the other half was to be expected. In this contingency it was desirable to start before the artillery could overtake us on the road. So, giving instructions to the servants to meet us when and where they could, we started off on our sixty-mile journey. A few days later they overtook us—servants, cart, and what remained of our luggage. We were very lucky ever to have met; for the morning after we left Torlak the artillery, retiring to positions on the hills behind the town, had galloped at full speed along the road filled with refugees, who, unable to move out of the way, were mown down by the onrushing guns.

Continuing our journey in an open railway truck, we reached a small town some hundred miles to the south of Torlak. Here we spent a few days, if not in comfort, at least in peace and far away from the awful din of battle. Yet for many of us, even now, continuous sleep was impossible, owing to the imaginary sounds that assailed our nerve-racked ears. At our next stopping-place, Nish, we found the streets gaily decorated to welcome the long-expected arrival of the French troops, who, alas! never came.

After a short stay in Nish we were sent on to Skoplje (Uskub) by train. A section of the line was blown up by the Bulgars three minutes after our train had passed, thus cutting off all railway communication between Skoplje and the north of Serbia. In due course we arrived at Salonica, where we secured passages in a transport to Lemnos. Thence we worked our passage home in a hospital ship.

GOD'S COWARD.

By Mrs STANLEY WRENCH.

CHAPTER I.

'OH! he'll be killed! He'll be killed!'

A woman's voice shrieked the words. There was a clatter of pails, a loud bellow from the farmyard, and a shout of terror from the man. 'Help! help!' he cried.

The frightened maid-servants screamed in chorus, again came that savage bellow, and Honor Wilmoth hurried to the window. What she saw there caused her to fling up the sash and leap out 'as lithe an' lissom as a maid o' sixteen,' said one of the scared maids afterwards; but, though the momentary shock had driven every vestige of colour from her face, she did not hesitate.

That morning they had taken Daisy's calf from her. During the forenoon the disconsolate creature had lowed incessantly, the plaintive crying proving most distressing to the ears of all within reach. In the afternoon they had tethered the cow to a post in the yard near the milking-shed, so that when her former companions were driven home at dusk she would be within reach of their company.

Maddened by her loss, Daisy had sulked in silence; but old Thomas, the cowherd, who understood animals, complained and begged for her removal.

'Twon't do no good, missis,' he said stubbornly. 'Tis agen natur'. The cow 'ave got no business there. 'Er'll do somebody a mischief afore long.'

Honor Wilmoth looked at the old man, a peculiar expression in her blue eyes. 'Master has her put there, I suppose, Thomas?' she asked.

'E 'as,' he assented gruffly. 'E 'as; 'e said 'twould be company like fur 'er; but master don't understand cows. 'Is books don't learn 'im 'ow to deal wi' sick critters.'

For a second she had hesitated, then pride came to her aid. 'Let the cow remain, Thomas,' she said. 'Master must be obeyed.'

But even as she spoke Honor Wilmoth fancied there was the flicker of a sneer on the old retainer's face; she caught the ghost of a giggle from the kitchen where the serving-maids listened; and as she went back to the long, low room where David Wilmoth sat, a book of poetry before him, she found herself fretfully wondering why she had married this man, this poetaster, this dabbler in rhymes, with a temperament as widely diverse from her own as the hardy purple heather is from the most exotic orchid-bloom. He, 'star-brother' and 'sun-brother' to wandering tribes of gipsies, a man to whom romance was as necessary as daily bread, who talked of the beckoning blue hills

as though they were spirits, and who saw the poignant beauty of upland, woodland, and sea, wholly lacked a practical side, though at the same time he persisted in thrusting his whimsical ideas upon a workaday world. Honor Wilmoth had come of a yeoman stock for generations, understood to a fraction the value of each farming operation, owned the land she farmed, and farmed well; but when she married David Wilmoth she made the mistake of insisting that he should share her responsibilities. His fanciful theories sometimes cost her dear.

This one threatened to do so. Even in the moment of jeopardy she remembered that old Thomas had a large family of young children by his second wife, none of them old enough to be bread-winners, and old Thomas was in very grave peril.

Daisy had broken loose, and as Honor Wilmoth threw up the sash it seemed as though a tragedy would be played before her very eyes. Across the yard, his eyes big with fright, the old man sprang backward and forward, shouting breathlessly, yet every moment more and more at the mercy of the infuriated animal, who, having driven him into a corner, pawed the ground, and with head lowered made rush after rush towards him. In spite of his age, old Thomas was agile enough just to escape the horns; but this could not last long. At each rush she gave him shorter shrift, and the screaming maids sobbed that he would be 'hornched to death by that mad critter.'

Honor Wilmoth took in the whole scene. Upon the granary-steps, safely out of reach of the cow, her husband stood, his face terror-stricken and devoid of colour. It was this, as much as the danger, that drove her forward. Catching up a sheet which lay upon the grass-plot bleaching in the sun, she wrenched open the wicket gate, and flew across the heaps of rotting manure. With a dexterous twist of the wrist she flung the sheet full over the charging creature's head, and, leaping forward, dragged up the corners so that for a second or two the cow was blindfold.

The sudden onslaught took the creature by surprise, and the momentary pause gave the cowherd opportunity to quit his corner.

'Quick, Thomas!' she panted.

Thomas was quick, but the cow was quicker. Even as the old man hobbled forward to secure the rope, she tossed her head, and half-freed herself from its encumbrance, and the danger seemed redoubled, for, on her seeing two antagonists, her fury grew apace.

Then old Thomas did a thing of which in

saner moments he would never have dreamed. Lying beside him on the heap of straw and manure was a pitchfork, and, seizing this, in desperation he prodded the creature to drive her back.

'Out o' way, missis,' he panted. 'Out o' way. I'll drive 'er in barn.'

Bellowing in pain and anger, Daisy was forced towards the open doors; they swung to with a bang; there was a scuffle and intermittent lowing; and the two, mistress and man, panting fast, stared at each other.

'A near go, missis,' said old Thomas, wiping the sweat from his brow. 'A near go that.'

She nodded. Her heart was beating fast.

'Never 'ad a cow goa fur me like that afore,' said the cowman. 'Lor' bless me! if you 'adn't 'ave come when you did, missis, I dunno what 'u'd ha' 'appened. 'Er 'orns were wi'in an inch o' my shoulder more nor once.'

'What a nerve 'er've got, to be sure!' he cried, a quarter of an hour later, drinking his cider, and explaining to the two maids who had watched the affair exactly what had been his feelings. 'What a nerve 'er've got! Never seemed to turn a 'air. As cool as a cucumber 'er were.'

'Er ought to ha' bin a man,' said one of the women. 'Queer how God do mix up things, b'ain't it? There's master now, allus moonin' about, wi' 'is 'ands lily-white, messin' about wi' books an' rhymin', an' she, the best farmer in county, never content 'cept 'er be up an' doin'. Master ain't got no nerve neither. See what a way 'e were in.'

'Reckon missis 'll gi'e 'im a talkin' to,' giggled the other maid. 'Er eyes were like fire when 'er see 'im there never offerin' to 'elp. Law, 'ow white 'e did go, to be sure, when 'e see that mossal o' blood on Daisy!'

'Poor critter!' sighed old Thomas; but his thoughts were with the cow. 'Never ha' I 'urt a critter in all my born days, but a man's life be 'is life,' he ended solemnly; 'an' 'twere touch-an-go wi' me just then. I 'u'dn't ha' 'urt Daisy, though, 'cept I were druv'. I'd as soon ha' 'it one o' the chillern.'

'Why didn't master come down to 'elp 'e?' asked one of the women. 'There 'a were, starin' like a stuck pig—gre't gowk! No patience wi' 'im, I ha'. Menfolk 'aven't no business to ha' nerves like wimmin. Nought but a coward 'e be, arter all.'

Old Thomas set down his tankard, wiped his mouth, and carefully stowed away his red pocket-handkerchief. 'I dunno, I dunno,' he muttered. 'Master be a queer man, 'tis true; but 'e be different to you an' me, my wenches. I dunno whether I should call 'im a coward, I dunno. Maybe 'e be one; but if so, 'tis God's coward 'e be.'

'Law, Thomas, what queer things you do say!'

said the elder of the two women. 'Whatever do you mean?'

He scratched his gray head. 'I dunno,' he said. 'Master 'mazes me. 'E do seem to be womanish by whiles, an' yet 'e b'ain't neither. 'E'm just one o' God's cowards, I reckon.'

They waited for him to explain.

'It be no good blamin' a man fur what 'e ain't got,' he said, 'ner fur what 'e've never 'ad. 'Tis like loutin' a looney fur not doin' work same as t' other folks. Us calls short-witted folks God's soft-bakes; an' if Providence sees fit to send one man into the world short o' brains, 'tis as like 'E'll see fit to send another short o' pluck. Some folk can't abear the sight o' blood, an' some be feared o' the dark, but 'tis no manner o' use blamin' 'em for't. 'Tis God's cowards they be, that's all.'

It was, perhaps, a pity that Honor Wilmoth could not hear her servant speaking. She and her husband walked together from the farmyard, she with heightened colour and gleaming eyes, eyes that shone like two points of fire; he with white face, his deep-blue eyes like twin pansies dew-bedimmed, his hands clenched as was his custom when under deep emotion. Not a word did either speak until they reached the low-ceiled room with its oak rafters running across. It was a step down into the room, and she stumbled slightly. The man put out his hand involuntarily, but she snatched herself from him. The heavy oak door closed.

'Coward!' she cried. 'Coward!'

Such scorn lay in the word that it lifted him out of his dreams.

'Honor!' he cried. 'Honor!'

But the sound of her own name stung her to madness.

'I thought I had married a man,' she cried tauntingly. 'Oh, I can assure you it was a pretty picture for the world to see this afternoon—a pretty picture indeed. An old man and a woman at the mercy of a mad cow, and what should have been a man fainting at sight of a pin-prick.'

Against his will, he shuddered. Some devil seemed to urge her on. All the surging crowd of bitter thoughts, all the repressed emotion of months past, all the half-formed regrets, the restlessness that had encompassed her, all the vague and fretful longings, all the dissatisfaction at not being able to understand this man whose name she bore, these, in their live form, came pouring forth, and David Wilmoth stood back amazed.

It was a man who faced her, pale at her accusations. But he throbbed beneath the sting of the lash, and something beat fast, hurt, and grew numb within him. He had always looked on Honor as different, he knew her to be different, from himself; she, a radiant being, a thing of splendour and flame, but—his woman still.

For poetaster and peasant are the same beneath their different masks, and primeval man scarcely differs a jot.

His deep-blue eyes grew black with suffering, and, seeing the hurt that lay there, she joyed in her cruelty, for a woman stung in her secret soul recked little—nay, revels in bringing pain to the author of her own sorrow. All the gamut of emotion in the artist soul of him responded, thrilled, and quivered beneath her touch of scorn. Yet even when his chance for speech came he had no words.

But one word of hers remained. Coward!

There was a long silence in the low-ceiled, oak-timbered room, the wood fire leapt, and the scent from the fir-cones drifted out like incense. He and she had gathered the cones the day before; and now, as he remembered that walk, their talk, the nearness and dearness of her, something hurt him all at once, and brackish tears stood in his eyes. How little he understood a woman, after all! He had thought her wholly his, and she could say these terrible things to him. Coward! coward! coward! The words seemed written in the fire, leapt into life in the lurking shadows, and shouted themselves in the wind as it wound past, gathering up all the little breezes of the way as they shivered and shrank in the twilight.

A daffodil sky lit up the west, and at any other moment he would have thrilled at the sunset; through the open window came the dull booming of the breakers on the shore, and a pearly mist hovered over the sea. Framed in black oak, smoked by centuries, the lattice window made a picture, but the man stared at it with eyes that saw nothing save the one ugly word, and his brain seemed a whispering-gallery tossing the taunt backward and forward.

The light faded; the waiting woman sat up and choked back a sigh. She was restless and unhappy, for already shame began to stir. Who was she to judge a creature of wholly different calibre from herself, perhaps of finer senses, who could tell?—a man who found in trees and brooks and meadows nature spirits, denizens of other worlds; who had an inner life, and a curious power of vision, with the psychic side so intimately a part of himself that it could not be dissociated? Who was she, peasant daughter of the soil, to call him to judgment?

She halted, wavered, half-turned to touch his hand; then pride stepped in. He should speak the first word.

Presently he rose, and without speaking made for the door. Even then she waited, expecting him to give some sign. But the heavy door swung to behind him, leaving her alone. Honor Wilmoth's lips tightened.

She rang for lights and tea, and dallied over the teacups. But he did not return, and as she ate buttered toast she turned over the tragedy of her life and shivered.

David Wilmoth had been tramping the coast, sketching, dreaming, indulging in visions called up by romantic scenery and his inner consciousness, when he met his fate in the woman he had married. Their courtship was short, passionate; but even now, as she remembered and gave herself up to the wonder of it all, Honor Wilmoth thrilled. She had loved him, this creature from another world than hers, and he—he adored her. Nay, more, she knew he worshipped her still. But like all the women whose bleeding feet have trudged the path before her, she tore that worship to shreds and cast it from her, flung the mantle of self-pity over herself, and let Ego loom large. Like the rest of women, she waited only for a finger out of the dark to wrest that pitiful mantle away.

The door opened. She turned eagerly. Oh, how eagerly she held out her hands! But it was only the evening post come in. She took up the letters wearily. Seed and provender catalogues she thrust aside. There was one letter, addressed in thin spidery characters on pale-gray paper, a foreign stamp and post-mark in one corner. His mother. David had told her she was an invalid, and always lived abroad. They had already settled to go out to Capri next year to see her. She wrote seldom, but her letters were packed with kindness. She had welcomed Honor as a daughter; and Honor, who had met with scant love in her life, leaned toward the frail old lady who yearned toward England, yet must needs remain an exile. She lingered over the letter, but one passage sent the blood flaming to her face, and her heart beat fast. It was strange this message should come now!

'My thoughts and prayers are always with you, my dear,' she wrote. 'One day, Honor dearest, when you have a little one of your own, you will understand. Day after day I bless God and am thankful he met you, the woman who could understand him. My boy's letters are so happy, and I, who have trembled for the time when I should be forced to divide his love, bless you for his happiness. He was such a delicate child, such a wisp, I sometimes feared the wind would blow him away, and his big blue eyes would stare up at mine like great pansies. It hurts me to see pansies now. His father died, as you know, before he was born; and all those months before I bore him I lived on the Borderland of Life and Death, my soul filled with vague longings. Was it small wonder my boy was born a frail, tender spirit, shrinking from everything that seemed terrible and likely to hurt, and as full of the wonder-spirit as though he had been a true Celt? No Viking he, but Gaelic in heart and mind, and the old Highland nurse I had whilst he was a "tiny" sowed seeds of make-believe in his baby mind, so that sometimes

I have watched him and believed in dual personalities.' . . .

There was more, just the tender, happy reminiscences one woman pours out to another; but Honor Wilmoth shuddered. She laid the letter down, and thrust her fingers in her ears as though to shut out the sound of her own words.

'Coward!' she had cried.

Yet only the day before, when she had whispered her hopes to him beneath the fir, she had thrust her fingers in his hand, twining them round his passionately, caressingly, her whole soul in her shining eyes.

'Pray God he will be like you, David,' she had whispered then. 'There have been enough of peasant boors; let our son be a poet.'

Pagan spirit that he was, David had loosed a ring he always wore, and flung it into the sea before he turned to take her in his arms.

'Propitiation to the sea-gods,' he said; and, smiling at his quaint fatalism, she had gathered the fir-cones, and that night they had solemnly burnt them in the fire.

'Incense to the wood-gods,' he murmured, and to-day, with more fir-cones burning, she was hurt at the remembrance. How she had failed to understand the mystic in him! How she had fallen short of his demands! Now, a woman's letter had lifted the veil from her eyes. Now she understood his dread of ugly and hurtful things, his fatalism, his sense of the Infinite, and she had called him—coward!

She started up, hearing the cry of a dog. On the twilight air it seemed pitiful, strange, and wrapped with ill omen. She listened. The creature keened again, and to her overstrained nerves the cry struck dim terror to her senses. Yet she knew it was only Dan the sheepdog shut in an outhouse by old Thomas as he went home.

Hardly knowing what she did, she went out, unlatched the hovel door, and let the great shaggy beast escape. It rushed out, ran round and round as though seeking some one, then headed straight for the orchard, from whence a path went down to the sea. Again, without knowing why, she followed.

The last daffodil gleams had faded from the sky, a pearly mist lay across the sea, and a low muttering in the caves below told of the turn of the tide. The sibilant swish mingling with the screech of the gulls was eerie and strange; but all at once, straining her eyes, she became aware of something oddly different. The very atmosphere seemed to have changed as she sat there. A gray mist had come down, blotting out the island away to westward; the low ridges of shark-tooth rocks in the bay below were lost in silver smoke-like masses of drifting haze; but away to the right, where the mist curtain had not yet dropped, a curious pillar of gray haze hung 'twixt sky and sea. She rose, scrambling to her feet quickly.

'A waterspout,' she said, for Honor Wilmoth was learned in weather lore. 'We shall have the mill-stream swollen again.'

Swiftly she hurried homewards. The lamp was lighted in the parlour, its beams lighting up the flagged path. She could see her husband within, his curly head bowed over a book. For full five minutes she stood back, unseen, among the shadows and gazed, a struggle going on within her.

She wanted, all that was womanly within her wanted, to rush forward, fling herself at his feet, and beg for forgiveness; she wanted the feel of his arms around her, his voice in her ear as he whispered it was hers for the asking; and yet—something held her back.

In after years, as she went over this scene again, she knew it was pride, the cursed yeoman pride that was her heritage. Of a stiff-necked people of the soil she came, stubborn, resisting even in the face of a knowledge of right.

There was something besides, although she could not fathom its mystery. Like every woman, mated or free, let screaming propagandists prate as they will, she wanted to feel her master; had he commanded at that instant she would have obeyed, laid herself meekly at his feet, listened for his every behest. Woman still plays with emotion as did Eve in the Garden of Eden.

(Continued on page 472.)

CURFEW.

1096.

ADOWN the centuries, o'er land and sea,
There wakes an echo of the curfew bell
To ghostly tolling of the dead years' knell.
Erst, by the Norman despot's wise decree,
It rang to lessen murder, robbery,
Chance fires, and arson; rang, by gloom to quell
Seditious plots, which to rebellion swell
Where lately conquered foes strain to be free.
Alike within the peasant's hut of wood
And baron's lordly keep swift died the light
Of quickly covered fire, of feeble rush
And candle, lamp and torch. In kindly mood,
Toward those whom cockcrow woke to toil, fair
night
Gifted sound sleep, deepened by winds' low hush.

1916.

SINCE Rufus reigned, eight centuries have wrought
A transformation strange. Churchman and sage,
Bard, scientist, and monarch, on his age
Have each left mark ere passing. Time has brought
New lands to form our Empire. Near and far,
In pride of place, we basked beneath the sun,
Unwitting that the friendly-seeming Hun
In secret wove 'the crimson web of war.'*
Now swings a noiseless curfew bell to shield
Our armies, homes, and ships from terrors grim
That fly by night, strike upward from the wave,
Rain fire, and spout destruction. So we yield
Obedience loyal, and to twilight dim
Reduce the brilliance years of science gave.

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

IT is difficult to realise that till the end of the nineteenth century there was no German navy to speak of; that the grandiose scheme of challenging British might upon the water had not then entered the exalted mind of Berlin. In a secluded corner of remembrance I have just encountered the most attractive and veracious story of the genesis of the navy of our enemies, a piquant tale which, for its historical value, should be accorded the fullest means of circulation. Mr Poultney Bigelow is one of the higher Americans, a man of the culture and tastes of the best Europeans, one of wide outlook and human sympathy, a lover of his own country, a warm friend of the Allies. Americans, as I know them, are of many types and consciences and minds; those I have called the higher Americans—who will be recognised as a distinct class, an aristocracy of mind and heart, by all who have studied them in their own country—are splendid men. Now the father of Poultney Bigelow was United States Minister to France; and the boy, being sent to school in Germany, was favoured with the opportunity of associating as playfellow with the present Kaiser, then the young Prince William, who showed a distinct partiality for him. This early association has been renewed many times since then, and one esteems Mr Bigelow in that—fiercely as his love and admiration for the Allies are burning, and his hatred of German methods and ideals is increasing—he will say no unkind word of him with whom he played as a boy in the new palace grounds at Potsdam. Toward the Kaiser as a man he confesses gratitude, and for his talents much respect. Nor is he conscious of having ever uttered in word or print anything that could not be repeated in the Emperor's hearing, and with profit to the listener.

* * *

It is becoming so hard to understand the development from simple boyhood to that peculiar mental and temperamental state the Kaiser has reached that it seems to many of us that, when all is over, these tales of the Prince William, with omen and suggestion embraced in them, will have an enduring and increasing attraction. The fearful tragedy of the Prince, self-harnessed to an appalling Fate, may have a morbid interest

No. 291.—VOL. VI.

for those who thousands of years hence consider the possibilities and destinies of human beings. Those happy boys, the Hohenzollern and young Bigelow, used to kick a football about in the palace on wet days until broken panes of glass attracted the tutor's attention. One time the Prince led his young American friend by a mysterious staircase into the theatre where Voltaire had acted in his own plays during the famous Potsdam days, and there they amused themselves hauling scenery up and down, and strutting about in imaginary rôles. To this day the Kaiser is essentially a showman, an actor. He is just a gigantic poser, which is less than an actor, since in the posing there must be continual self-consciousness, while the spirit of the good actor is transmuted, and he becomes for the hour in a peculiar measure in body and mind the figure he represents. To a varying extent all of us are actors. We assume manners; we lead our dispositions and temperaments upon carefully arranged paths; we say and do things in particular ways according to a considered scheme; continually we study effects and how they may be improved; and rarely are we our own plain selves until our daytime trappings have given place to the thin garment of the night, and the pose of form and features lapses to plain naturalness in the darkness through which we sleep and rest for the better and more successful acting of a following day. But, to most of us, this acting in our early years soon becomes a second nature; the ways of action and the thoughts that go with them become a settled system; they are no longer affairs of full consciousness; they are purely natural; they are the character. Yes, it seems that this character is made by acting; and when character is made, when the habit has become the settled system, working subconsciously from the mind, the acting is ended. It is a fair and honest development. But with a few the character does not fasten, the acting continues beyond the proper period, the practice of posing develops, and hateful hypocrisy, cunning, and almost every human ugliness supervene. The absurdity of the comparisons that some still make between Napoleon and William of Hohenzollern is proved in one of a hundred ways on this very point. Napoleon was a vain man. He had a great regard for appearances; the

[All Rights Reserved.]

JUNE 24, 1916.

glamour of fine and imperial display appealed to him as it does to most men who have the opportunity of exhibiting power, and he had a keen sense of drama and staging. He, also, would ride on a white horse. But Napoleon was only subconsciously an actor; he played always from his own perfected character, and in the great moments he was himself, and neither poser nor hypocrite. So in Napoleon, with his natural nobility, there was a true greatness, and there was little that was mean. On the contrary, the Kaiser is a poser always. We have had continual proof of it ever since the war began. He is acutely conscious and careful of every movement of limb and muscle, every uttered phrase, every effect produced. We who remember his riding the white horse through Hyde Park at the funeral of Queen Victoria on that icy morning of January, and saw the posing then, have considered Kaiser William in a way of suspicion since.

* * *

But William has already discovered, and is destined to discover more, that while acting and posing may serve a useful purpose in minor and individual life, they go not well with emperors. Heaven is teaching a tremendous, a terrible, lesson in sincerity to the world at the present time. Insincerity is the cardinal fault of all mankind. Few are free from it. In sincerity we Britons have advanced greatly since the beginning of the cataclysm, and in sincerity we shall gain most from the war. But ours is an insincerity, hardly conscious and culpable, of a very different degree from that of the Kaiser and his associates. At worst it has been no matter of posing. The insincerity of the leaders of Germany, and particularly that of its ruler, admits of no extenuation; it is insincerity at its worst, devoid of all honourable and decent purpose, completely conscious, insidious, crafty. It is the shoddiest of play-acting. The Germans have nearly raised hypocrisy to an art, but it has lacked the essential virtue of concealment. And the Kaiser has found also that acting and posing go not well with militarism either. Mr Bigelow suggests to us that the Prussian stage can produce no great actor merely because none such could survive the barrack-room methods of a Prussian *Hof* intendant. He says the Emperor is the impresario in chief, and under him are lieutenants who conceive of Shakespeare as a product of Prussian *Kultur*, and consequently amenable to military discipline. Every Prussian actor makes love at exactly the same angle; and when the hero dies, or fights, or commits murder, the Prussian has the supreme satisfaction of reflecting that death, murder, love-making, and the other stock features of the drama are perpetrated on every stage in Prussia in exactly the same manner, according to paragraphs prepared by the Minister of War or his dramatic lieutenant. A departure from

orthodox dying and declamation on the Prussian stage would render the impresario of that particular theatre suspect on the ground of incomplete patriotic education. The Prussian aristocracy would resent an innovation in this field as promptly as they would the failure to click the heels together when bowing. And the Kaiser is looked upon as being perhaps too much of an impresario, because he not only manifests personal interest in all the theatres under his control, but by a shrug or a movement of the lips can discourage a play of great merit. If he were a ruler over British or French subjects, says our thoughtful American, he would do little harm by his intervention in details of architecture, painting, sculpture, singing societies, theatrical representations, and the whole circle of the humanities. But as he has under him a people so docile intellectually as that over which he rules as a demigod, he can give a character to the literature and the art of his day that is wholly Prussian and patriotic, yet bad artistically. So, with the horrid incongruity of militarism and acting, war and hypocrisy, patriotism and posing, the Kaiser makes a sad picture. History, when she comes to take account long years hence of the figures of this upheaval, will surely sicken at the handling of this mean and miserable thing; the prince of posers, the boy-actor who never did grow up and lose his consciousness of posing.

* * *

With only a little imagination and arrangement of facts and sequences, we may attribute the origin of the German navy to William's inborn and persistent love and practice of posing and pretence. Anyhow, if in this suggestion we go too far, we have Mr Bigelow with us to share the fault. It was in the days when the Prince and the American schoolboy arranged the scenery and played their parts in the theatre at Potsdam that the German navy had its first cause. It was in this way, as Mr Bigelow informs us. One of the chief amusements of these boys was to sail on a toy frigate which had been presented to the husband of Queen Louise by our King William IV. It was a perfect model of a full-rigged three-master British man-of-war before the days of steam, and at a distance revived memories of battles under Rodney and Nelson. But when the observer approached nearer it was seen to be merely a plaything about the size of a man-of-war's launch, though the yards and sails and halyards were complete in all their details. The boys cruised on this toy frigate after imaginary buccaneers; and, under the direction of an experienced petty officer of the navy, they trimmed the little yards, flattened in the sheets of the headsails, and manipulated the baby pieces of artillery with all the enthusiasm of children playing at real war. 'William,' says Mr Bigelow, 'delighted in this work, and it

would not be much of an exaggeration to call this little British plaything the parent ship of his latter-day navy.' Here is the authority for the suggestion made some lines above, and it is peculiarly interesting. One parts from it with the reflection that when the Prince acted the high admiral as a boy, and scoured the Potsdam lake in search of pirates, his navy of one toy ship was a braver and more honourable thing than the mass of iron which has cost his people thousands of millions of marks, and now lies in idle hiding, while its underwater auxiliaries sneak through the depths to play the part of pirate and murderer against the innocent trading-ships not merely of their enemy, but of friendly peoples, and send to their deaths the women and children who are aboard.

* * *

And here I am reminded that I have a tale to tell that has not yet been presented to British readers, preoccupied as they have been with their own cares and sorrows. It is a tale of one of the achievements of the German navy that sprang from the little ship the boys sailed at Potsdam when their ideal seemed to be the chasing and punishment of foul buccaneers. When in Spain I have listened with pleasure and admiration to the music of some of the Spanish composers who are too little recognised out of their own country. Foremost among these composers—and a great performer on the pianoforte too—was Enrique Granados. In his music there were the colour and the softness and the vivacity of Spain; he gave us the tone of the country; his Spanish dances are charming things. He, a gentle, soulful, happy creature, was one of the great spirits of modern Spain, one of those with whom the nation was reaching forward to her new and better life. Among his people he was loved. He gave them delight, and they saw that in him, with his ideals and his genius, the value of Spain would be better represented to the peoples of foreign lands. Granados, real Spaniard, had had his genius developed and trained in Paris, where he was popular. When he returned to Spain he had great ambitions, and one of them was to be the first Spanish composer to give a Spanish opera to other countries, to tell through it some of the spiritual qualities, some of the soul, of the country that gave him life. No Spanish opera had been presented at any of the great musical centres of the world. Spanish opera was thought to be a thing that did not and could not exist. Even in Spain they were sometimes apt to consider it in that way; and so at the Opera House at Madrid there were continually and uninterruptedly presented the works of German, French, and Italian composers, and Spanish musicians writhed under the performance of *Carmen* by a French composer, showing Spain as she was not and could not be. It was through Granados chiefly that it was hoped that much, if not all,

of this would be changed. He set himself to compose an opera in which Spain would be heard and felt. When in his land I was told of his work upon it—how he had taken the great Spanish painter Goya for his *motif*, and with the title of *Goyescas* was shaping scenes in the life of the artist, slender scenes that by the subtle suggestion of the music would be made to sing of Spain. It was an opera in which the music should wholly and completely make the atmosphere, as music had never better done before. It was a vast ambition, but it succeeded. The opera was completed. Granados, a few months before the war began, took it to Paris, and there it was listened to in semi-private with admiration and enthusiasm. He achieved the first stage of his grand ambition—the high authorities of the Opera House there accepted the work, and set themselves to prepare for its production. Such an honour had never been achieved by Spanish composer before. It would have been produced in the autumn of 1914; but there came the war, and this plan, with a million others that were good, fell at the first crash of gunfire.

* * *

It was a disappointment; but Enrique Granados was courageous and resourceful, and there are other lovers of music in the world besides those of Paris. New York had heard and envied; it gave Granados the invitation to let it see and hear what Paris had to go without. A fine offer was made to him, and was accepted. The honour of having a Spanish opera produced in the greatest style in a great foreign city was still to be that of Granados. All arrangements were made, and with loud acclamation Granados sailed from Spain to a sure conquest of North America. Spanish scene-painters made the setting for it; Spanish singers played the parts. The production took place brilliantly at the end of last January. It was received with joy, this fine development of the piano sketches that Granados had previously composed into splendid pictures suggested by the imagination of the extraordinary painter whose life reads not as romance but as a fairy tale. *Goyescas*; or, *The Rival Lovers*, was a great success. Granados was very happy. Spain was delighted. On the following morning a New York critic wrote: 'Like Charpentier and Moussorgsky and Borodin, Señor Granados is a democrat. He sings not of two or three characters or one love affair, but of the cumulative feelings of the masses; and this does not make for clarity of spirit or incisiveness of outline. But it does make for power and a broad sense of humanity, and in his choruses and dances we do feel that Spain is before us; not the Spain of Philip II., but the Spain of the toreador, and perhaps of the philosophic anarchist. And this is probably what Señor Granados wished. So let us state here that in his wish he has been successful.' Following upon

the production the New York papers were full of comments on the new opera and pictures of it. A little later Señor Granados, the señora with him, set out on the return voyage to Spain, to receive the great welcome and the congratulation that were being prepared by all his fellow-countrymen from Don Alfonso downwards. The journey was made, as was most convenient, by way of England. . . . Señor and Señora Granados were sent to the bottom of the sea by a German torpedo that blew up part of the *Sussex*. I need not tell you what they thought, and will for ever think, in Spain about this murder of one of the nation's greatest children returning to his native land. Letters from my Spanish friends and the Spanish newspapers have given me the story in its full poignancy, and with the raging feelings of scorn and hatred that it has aroused. Oh great German navy that was said to be born when the Prince William sailed his little ship on the pool at Potsdam, and dreamed of a mighty empire!

* * *

The more we examine, with the assistance of Mr Bigelow, the makings of this imperial poser, the more pathetically interesting does the subject become. The American gentleman tells us that no game much interested the Prince that did not suggest war. Master Bigelow, being fresh from America, was credited, if not with Indian blood, at least with intimate knowledge of Red-skin tactics. Consequently the boys talked much of Fenimore Cooper, the Deerslayer, and Chingachgook at their first meeting, and at the second little Bigelow gave his friend an Indian bow with gaudy tassels at each end and a bunch of arrows with blunt heads. These warlike

reminders of America's first families had been a present to the giver from his mother, purchased probably from an alleged Mohawk chief who invariably presided in those days over the souvenir-shops at Niagara Falls. As soon as the Prince had these precious implements in his possession he radiantly suggested a war game on the Iroquois plan, and victims were not far to seek. The boys elected themselves exclusive members of the Ancient and Honourable Order of Red Men, and declared all others to be Palefaces; and as the outcasts were mainly of the much-drilled and very correct Prussian aristocracy, they took youthful pleasure in chasing them through the bushes of the great park, seizing them by the hair, lashing them to trees, and then metaphorically shooting them full of arrows. They gave out blood-curdling war-whoops and did war-dances that might have surprised Sitting Bull. The juvenile mind of Bigelow was heavily taxed to supply information regarding aboriginal custom on the Upper Missouri and the Rio Grande; but, having once been placed in the chair of Redmanology, he had, as he says, to speak *ex cathedra*, because to have confessed that he had never seen an American Indian would have prejudiced his palace prestige. Such were the earliest efforts of Prince William in posing and pretence. Since then he has been continually posing and lying. But if it was play in those far-off days at Potsdam, it has been posing in deadly earnest all too often since. Soon, however, if all goes well, the posing of William will be at an end. Out from war's cruel din and flame the truth ascends.

PINCHER MARTIN, O.D.

CHAPTER VII.—continued.

'YER promised ye'd come along o' me ter th' pictures ter-night, Missis Figgins,' remarked Joshua, finishing his ham and looking round the table. 'Thought we'd go an' ave a bit o' supper at a restorong arterwards.'

'Promised you, did I?' the widow returned, handing him a plate of jam-puffs with a sweet smile. 'Ave one o' these? Or do you fancy a piece o' cake? It's 'ome-made.'

Joshua helped himself to the pastry. 'Yus,' he said, 'yer promised ye'd come.'

'Oh, did I?' the lady said archly, determined to keep him on tenter-hooks. 'Think I've got nothin' to do but to go to them silly pictures? 'Oo's goin' to mind the shop, I should like to know?'

'I don't want to go out, mother,' Emmeline put in.

'Course you don't, my gal,' said her mother. 'It's not respectable for gals to be hout after dark unless they're hescorted.'

'No,' Billings agreed, pausing in the act of biting a large chunk off his jam-puff; 'it ain't fit an' proper fur gals o' your age to go abart unpertected like.'

Emmeline glared at him. 'Oh, isn't it?' she retorted. 'And who asked you to put your oar in, Mister Billings? I'll have you know I'm quite capable of looking after myself, and I wouldn't go along of you if you were the last man on earth. You'd best take mother along to the pictures, and not worry your head about what I'm going to do.' She tossed her head.

Billings, covered with confusion, retired from the contest and resumed his meal.

Mrs Figgins, anxious to keep the peace, looked up apprehensively. 'No need to let your tongue run away wi' you, Hemmeline,' she chided. 'Mister Billings agrees wi' what I think about it, an' there's no call for you to get snappy.—All right, Josh—Mister Billings,' she added; 'I'll come with you. What about your friend?'

Joshua, insinuating a massive fist under the tablecloth, squeezed his loved one affectionately by the hand. 'That's orl right,' he murmured, greatly relieved and very happy.

'But what about Mister Martin?'

'Is leaf's up at seven,' Joshua explained. 'E can't come.'

'Thank goodness for that!' Emmeline remarked with a loud sniff. What she meant exactly Pincher could not imagine, but it was quite obvious that she meant to hurt his feelings. She succeeded, for he felt more of a fool than ever; and it was just as well, perhaps, that at that moment the shop door opened with a clang to admit a customer, and the girl left the room.

From a purely gastronomic point of view, though Martin did not do full justice to it, the meal was undoubtedly a success; but he returned to the ship that evening in a very saddened frame of mind. He was bitterly disappointed with Emmeline. She was pretty and attractive, he felt bound to admit; but it was only too evident that she was not the least taken with him, and, moreover, had no hesitation in showing it. She had a nasty, snappy way of saying things, too. Billings had wilfully misled him, and had borrowed two shillings under false pretences. He had led Pincher to believe that he would be received with open arms; but all that Joshua really cared about, apparently, was the feathering of his own downy nest, ungrateful old sinner that he was! Drat Billings! Drat Emme—No; drat the ship's steward's assistant from the flag-ship!

II.

Wilfrid Parkin, the ship's steward's assistant from the *Tremendous*, was a gay young dog. He was a tall youth of about Pincher's own age, with sleek, well-greased black hair. His clothes were always immaculate and well brushed; he affected a crease down the legs of his trousers; and, when he was ashore, the odour of scent and pomatum generally emanated from his person. With his peaked cap set jauntily on the side of his head, a cigarette pendulous from his lower lip, and his double-breasted coat, white linen collar, and black tie, he imagined himself to be vastly superior in breeding and deportment to any man clad in the uniform of a bluejacket. Sometimes he even wore brown kid gloves, hoping that this would cause ignorant people to take him for an officer.

He was not beautiful to gaze upon, but downright ugly, in fact, for his putty-coloured face was covered with pimples, which he vainly endeavoured to eradicate with somebody's patent ointment. But in spite of this, and other blemishes, he had female admirers by the score; and even the level-headed Emmeline, for some inscrutable reason, had fallen a victim to his charms. She would not have admitted it if she had been asked, of course; but the giddy

Wilfrid had shown a preference for her society, and Emmeline had not objected.

Men disliked Parkin for his affectation and conceit. On board his ship he had a very poor time; but ashore he was absolutely it, so far as the ladies were concerned. He was a shining light at the local skating-rink, where, in company with one or other of his girl friends, he waltzed and two-stepped to his heart's content. When he could obtain the necessary leave he always attended dances—'Entrance fee, one shilling; evening dress optional'—and was never averse to singing 'They all love Jack,' or some other very nautical song, at a tea-party at which ladies were present.

Now it came to pass that one wet afternoon, when there was no football, Pincher, feeling the want of exercise, was forced to take refuge in the skating-rink, and almost the first person he saw was Emmeline Figgins gliding round with the immaculate Wilfrid. They both skated well; but whereas the girl did it with a really natural grace, her companion, desperately anxious to create an impression, put in sundry little kicks and twirls of his own invention which made his performance border on the ridiculous. He was showing off, in fact.

Now Pincher could barely skate at all, much less dance, pirouette on one leg, or hurtle round backwards; and, seeing Emmeline, he became rather nervous, and wished to seek safety in flight. But he had paid sixpence to come in, and could not very well demand his money back; so, with a pair of skates in his hand, he stood sheepishly by the edge of the rink watching the others. Emmeline spotted him the next time she came round, smiled cheerily over her shoulder, and said something to her companion, who shook his head. She was evidently in a good temper, and Martin smiled back at her.

The next time she drew near, it was more slowly. Checking her speed, she came gracefully to rest by the padded balustrade immediately opposite where Pincher stood. She was flushed with the exercise, and looked quite adorable. Parkin hovered in the background.

'Well,' she asked gaily, extending her hand, 'aren't you going to say, "How d'you do?" Mister Martin?'

'How d'ye do, miss?' said Pincher, shaking it, but half-suspecting she was about to make a fool of him.

'This is Mister Parkin,' Emmeline went on, presenting the spotty-faced one. 'Mister Parkin—Mister Martin of the *Belligerent*.'

'Ow do, Parkin?' remarked Pincher with a nod.

'Pleased to meet yer,' murmured the other, with a low bow and a lofty expression. 'What terrible weather we are 'avin for the time of year, are we not?'

The ordinary seaman stared at him in astonishment; while Emmeline, unable to restrain herself, burst out into a little chuckle of amusement.

'What's the matter now, Miss Figgins?' Parkin asked, rather aggrieved.

'I'm amused at your polite talk,' she said, laughing openly. 'You do put on such airs sometimes, Mister Parkin. I can't help laughing.'

'Oh, can't you?' retorted the pimply gentleman. 'You needn't go saying them things in front of—er—he was going to say 'ordinary seamen,' but noticed Martin was looking at him, and substituted 'other people.'

'I'll say exactly what I please, Mister Parkin,' she returned with asperity, deliberately turning her back upon him.—'Can you skate well?' she asked Martin.

'I kin jest git round, miss, but can do none o' them there fancy touches.'

'Well, be quick, and get your skates on,' she said. 'I'll help you. Mister Parkin is tired of my company, I think.—You'd better go and look for some one else to skate with,' she added to Wilfrid over her shoulder.

'You said you was going to skate with me the 'ole afternoon,' he protested angrily.

'Can't help what I said,' Emmeline retorted, tossing her head. 'I've changed my mind. Run away, like a good boy, or I shall get angry with you.'

Parkin, after further useless expostulation, eventually skated off, greatly annoyed. To think that Emmeline, his Emmeline, as he chose to consider her, should dare to throw herself at the head of an ordinary seaman, while he, Wilfrid Parkin, admittedly one of the best skaters in the place, should be sent packing! It was insufferable—absolutely insufferable! Assuredly he must teach this young woman that it was an honour for her to be seen in his company at all.

Martin himself hardly knew what to make of it. The last time he had met the girl she had been deliberately rude, and had done her best to hurt his feelings and to make him feel awkward. But now she was all smiles, and was looking at him in quite a friendly way. He half-suspected a trap of some kind, and that she intended to make a fool of him, after all; but, murmuring his thanks, he strapped on his skates, removed his cap, and stepped gingerly on to the floor. He got on better than he expected, though he took good care not to try any rash experiments, and rather enjoyed it. He was skating with quite the prettiest girl on the rink, for one thing, and he was pleased to see Parkin's sullen scowl of jealousy every time he flashed by with another lady on his arm.

'Look at that horrid little thing, Jane Crawley!' Emmeline whispered in Martin's ear. 'Stuck-up little minx! Giggling and laughing with Mister Parkin, she is. Thinks it'll annoy me, I suppose.'

'She don't look up ter much,' Pincher agreed, glancing at Wilfrid's companion as they went past.

Emmeline sniffed. 'She's not. She's in

Skeets the draper's. Early closing day to-day; that's why she's out. Never could stand them shoppies; they give themselves such airs. Can't think what he sees in her.'

'Can't think why you likes Mister Parkin,' murmured Pincher, blurring out his thoughts without really meaning to.

To his great surprise, Emmeline laughed. 'I don't like him,' she said. 'I thought I did at first, but I'm beginning to find him out now. He's that conceited, you've no idea. Thinks he can order me about, too; and I won't stick that.'

'I don't think 'e's much class,' Martin observed, holding her hand tighter. 'Puts on a lot o' swank fur a bloomin' dusty boy.'*

Emmeline nodded. 'I'm fair sick o' him. He's—Hullo! Hold up!' But it was too late, for Pincher stumbled heavily and sat down with a thump. His partner released him just in time to save herself.

Parkin, passing with Jane Crawley, had just touched Pincher's outer skate. Whether it had been done intentionally or by accident Martin never really knew; but if it was deliberate, the result far exceeded Wilfrid's expectations. Pincher merely sat down on the floor rather too hard to be pleasant; but Parkin, letting go his partner, pitched forward, and came into violent contact with the wooden flooring with a resounding bump.

The two girls went to the rescue of their respective men, and a crowd soon collected. Pincher, little damaged, picked himself up with a laugh; but Parkin's injuries, though not really serious, were far more spectacular. The front of his coat was thick with dirt, both the knees of his trousers were badly torn, and he applied a handkerchief to his dirty face to stanch a copious flow of blood from his damaged nose.

'Look 'ere!' he exclaimed, quivering with passion and advancing on Pincher with his fists clenched. 'You did that a purpose!'

'He did nothing of the kind!' Emmeline burst out. 'And well you know it. It was your own fault. You and your showing off!'

'It was 'is fault!' shrilled Jane Crawley, pointing an accusing finger at Martin. 'I saw 'im stick 'is foot out!'

'No, I didn't,' Pincher protested. 'Never see'd yer eomin'!'

'Course he didn't,' Emmeline corroborated. 'How could he see you if you were behind him?'

'I tell you 'e did!' shouted Jane, becoming excited.

'I didn't,' Martin expostulated.

The crowd peered over each other's shoulders and laughed, for there seemed every prospect of a fight on skates between Emmeline Figgins and Jane Crawley, and another between Pincher Martin and Wilfrid Parkin. The situation was most exciting.

* A ship's steward's assistant is always known as a 'dusty boy.'

'You'll 'ave to pay for my trousers, any'ow!' Wilfrid blustered, looking down at his torn garments.

The onlookers tittered. 'That's it,' some one said jocularly; 'you 'ave the law on 'im, my son.'

'Sha'n't pay a penny!' Pincher said.

'That's right, little un!' came a voice from the crowd. 'Don't you be put upon!'

'I'll bloomin' well make you!' shouted Parkin, squaring up. 'I'll give you a thick ear if you don't!'

'I ain't afraid o' you!' Pincher retorted, glaring at him. 'You 'it me an' see wot you gits!'

'Go on, Will. Give 'im one,' advised the pugnacious Jane.

'You'll do nothing of the sort,' said Emmeline quietly, stepping between the two men. 'If you want to kick up a shindy, Mister Parkin, you'd best do it outside.'

'I say it was the sailor's fault!' reiterated the other lady shrilly. 'I saw 'im'—

'Now then, what's all the fuss about?' asked the rink manager severely, pushing his way through the throng. 'We can't 'ave these sort of goings-on 'ere. You've 'eld up the 'ole proceedings. Somebody fallen down—what?'

'E tried ter knock me down a purpose,' said Pincher, indicating his adversary.

'You're a liar!' retorted Parkin. 'It's like this,' he went on, trying to explain the situation. 'I was skatin' parst this man, w'en all of a sudden 'e puts out 'is foot an'—

'He did nothing of the kind,' Emmeline inter-

rupted. 'It's him who's telling lies, and well he knows it.'

'Well, I can't 'ave these goin's-on 'ere,' the manager returned, glaring at them all in turn. 'I must ask the ladies and gentlemen concerned to step outside and settle their differences elsewhere. Come on, please.'

'Come on, Mister Martin. We'd best go. I hate all this fuss,' Emmeline whispered. She moved off.

Pincher, nothing loath, unstrapped his other skate—one had already come off in his tumble—and followed her, but not before Parkin had hurled a final remark.

'Orl right, Mister Martin!' he said very venomously. 'I'll be even wi' you over this 'ere!'

'I'll take you on any day you likes!' Pincher threw back. 'I ain't 'afraid o' you, you great skinny lamplighter!'

'And I'll never speak to you again, Wilfrid Parkin,' Emmeline put in. 'Call yourself a gentleman! I don't think!' She snorted loudly to show her contempt.

'Come on, come on! Don't let's 'ave any more o' this, please!' from the manager.

'Orl right, old puddin'-face. Keep yer 'air on!' Pincher observed with a smile.

The lookers-on laughed loudly, for the manager was rather unpopular, and his face really was too fat to be pleasant.

'Pudding-face!' he gasped. 'Who are you calling pudding-face?'

But Pincher was out of earshot.

THE PASSING OF THE 'HOHENZOLLERNS.'

By DEREK INGRAM.

THE pages of *Chambers's Journal* have frequently been employed for extended reference to the passing of some great institution or custom, and it is hoped that occasion will soon arrive for recording the absolute disappearance of the world's most hideous blot—the *Kultur* of our enemies. In the meantime, however, the 'Passing of the Hohenzollerns' is already an accomplished fact, this phrase signifying the end of Germany's postal stamps for her vanished and vanishing colonies—the postage-stamps showing the Kaiser's yacht, the *Hohenzollern*.

It is significant that the apostles of *Kultur* should have chosen something representative of 'blood and iron' for their colonial postage-stamps; it serves to remind us of the doctrine which Dr Bönn, of Munich, expounded when he said they 'solved the native problem by smashing tribal life.' Behind German colonisation, as Mr Gordon Le Sueur points out, lies no record of great accomplishments inspired by lofty ideals and high aspirations; the history conjures up no pageant of romantic enterprise or vista of perilous

undertakings in unexplored parts of the globe by the spirit of daring and adventure; it holds no pulse-stirring stories of the blazing of new trails; and scattered over its pages we do not find imprints of the steps of pioneers of true civilisation, nor are its leaves ear-marked with splendid memories.

The 'leaves' of this lost colonial empire are, to the philatelist, the postage-stamps which mark the epoch of Germany's 'mailed fist' policy in Africa, in China, and in the Pacific Islands. These tiny scraps of paper are a living memorial of the 'Passing of the Hohenzollern,' for all stocks of them found in the captured colonies have (unless destroyed) been overprinted by the Anglo-French authorities, signifying their conversion to postal use under a more enlightened régime.

War-stamps have always held a peculiar fascination of their own. The philatelist sees something more in the stamps of war than in the less historic issues of peace-times. The war-stamps issued during this world-wide conflict in which we are still engaged, however, are entirely

different from all their predecessors—different because they are not stamps reminiscent of a war, but lasting memories of THE war.

The provisional stamps which signify the 'Passing of the Hohenzollern' show the full meaning of the *Entente cordiale*, and will remain an everlasting reminder of the first signs of decay of the much-advertised German colonial empire. Imagination cannot grasp the great historical and sentimental associations that will ever hang round these stamps—'scraps of paper' that will mark a new era in the history of the world.

In addition, the collector of war-stamps learns of many significant incidents which are often deserving of a wider publicity. A case in point is the following. Toward the end of August 1914 a force under Lieutenant-Colonel Bryant reached Kamina, well over a hundred miles inland from Lome, the capital of Togoland; and there a stock of stamps and some thirty thousand pounds in gold were discovered. The secret of the hiding-place was revealed by native looters, who had themselves dug up specie to the value of five thousand pounds or more. The severest military measures were at once taken, with the result that practically the entire amount was recovered within forty-eight hours. The stamps were buried in the earth in strong metal boxes, and after they had been dug up one of the soldiers is reported to have remarked that 'the Germans teach everything to entrench'!

The British ensign was hoisted in Samoa on Sunday, 30th August 1914, and thousands of the Hohenzollern stamps were overprinted with the letters 'G.R.I.' and their new value in British currency. Sixty sets of all denominations were sent to the Admiral on board the flagship *Australia* for distribution amongst the officers of the Australian fleet.

The reign of the Hohenzollern in Tsingtao (Kiau-chau) was a very short-lived affair; the stamps in question were received there from Berlin late in 1900, and had been destroyed by the Japanese before the end of 1914.

The 'ship type' of postage-stamp for Germany's second oldest colony, New Guinea, or New Britain, as it is now, also dated only from 1900, and was replaced in September 1914 by some of the most interesting of the 'occupation' stamps issued by the British authorities. The name German New Guinea was somewhat of a

misnomer, the more so as the seat of Government was situated at Herbertshohe, on Gazelle Island, in the Bismarck Archipelago. At one time the *Kultur*-ites had aspirations of altering the name to German Australia, but it didn't come off.

The Cameroons, too, were not blessed with their Hohenzollern postage-stamps until the end of 1900, and the extinction of this unhappy type has been accomplished by the overprinting of the surplus stocks with the initials 'C.E.F.' (Cameroons Expeditionary Force) by the British authorities, and quite recently by wording in French signifying our gallant ally's part in the administration of this territory. The native policy in the Cameroons under the German rule was one of frightful oppression, as indeed was the case in all her foreign possessions, and there is no doubt that the 'Passing of the Hohenzollern' has been hailed with real delight.

Botha's triumph in South-West Africa was marked by the immediate extinction of the 'rusty ship' stamps; but this great event was unaccompanied by any provisional postal issues, for the territory in question was placed under the administration of the Union of South Africa, and therefore makes use of the stamps of that Dominion, bearing a portrait of King George.

The 'Hohenzollerns' have yet to be effectively removed from East Africa, where German post-offices were established on 4th October 1890 (at Dar-es-Salaam and at Bagamoyo), although no special stamps were issued until 1893. The lover of 'things collectable' certainly has no leaning toward German methods. In the story of Berlin's intrigue in East Africa it is recorded that it was under the pretence of 'autograph collecting' that the signatures of Arab and native chiefs were obtained to various treaties, artfully presented by the German conspirators, who hurried back to Berlin early in 1885 and founded a company to exploit their 'concessions.'

In conclusion, let the enemy's 'scraps of paper' be regarded with the same respect as the German Imperial Chancellor accorded to a more serious document. Our own war-stamps are splendid evidence—though they be but 'scraps of paper'—of the ascendancy of the more civilised races over their Hunnish adversaries, and of the sequence of events which has brought us—philatelists and others—the greatest blessing of our time, the 'Passing of the Hohenzollerns.'

GOD'S COWARD.

CHAPTER II.

WHEN she entered the parlour he looked up from his book with a quiet smile.

'Listen to this, Honor,' he cried, with crooked forefinger, and he read:

'Full well he knew that in a soundless place
His own wraith stood, and, with a moon-white face,

Watched its own shadow laugh and shake its spear
Far in a phantom dell against a phantom deer.'

The woman shuddered. It seemed as though with her a shadow had entered the room. But he did not appear to notice her mood, and to all intents and purposes had forgotten the episode

of the afternoon. So the moment for speech passed.

'The mill-stream is rising, ma'am,' said one of the maids who brought fresh logs. 'They do be sayin' a waterspout have burst, an' the Reddle be risen.' She knelt to put the logs she carried upon the fire, which was now burning low.

Honor Wilmoth wrung her hands. 'Oh, what will happen?' she cried. 'What will happen? The old mill-house is not safe. Last time when the floods came I warned Tamar of the risk she ran by staying there. I told the old mother too.'

'Tis the old mother, ma'am, as 'u'd stay,' volunteered the girl. 'Tamar was for gettin' away long since, but old Mrs Merry wouldn't stir. Said the house had allus done for her an' hern, an' 'twould last her time yet. Tamar couldn't get her to come away.'

'Some one must go down,' said Honor firmly. 'They must not stay there to-night. Tell them I say so.'

The girl flushed. 'I don't see how they can move, ma'am,' she said. 'Tamar were brought to bed wi' her babe yesterday. Old Thomas said so. 'Sides, if anybody went the old woman 'u'd sauce 'em, and 'u'd never come. Terrible old creature Mrs Merry be.'

The Merrys were the ne'er-do-wells of the place. Old Mrs Merry was accounted a witch by the rest of the villagers. When the fisher-folk failed to get a good catch they laid it to her spells; when anything went awry on the farm the labourers said Mother Merry had laid her eye on the thing and bewitched it; and only the day before old Thomas had declared that the reason Daisy was so upset was that Mother Merry had 'looked her over.' A woman with the evil eye was shunned by every one.

Her daughter was a light o' love; and even Honor Wilmoth, charitable as she was, and disposed to regard the folk on her land in the light of children for whom she was responsible, hesitated about letting the Merrys have the old mill-house for shelter when they were turned out of the village and refused shelter anywhere within reach. She had impressed upon them that the lodging could be but temporary; but old Mrs Merry had lived in the house during the early part of her married years, had been born within sight and sound of the mill-waters, and restoration to recollected things turned the poor old creature's brain; she became fierce and vindictive towards anybody who approached, and the mill-house was shunned by every one save Honor, who attempted in vain to persuade her to quit the crazy building.

When the maid left the room Honor turned to David. He was looking toward the window, a far-away light in his eyes. This fretted her. How could he be so regardless of everything that concerned her and her affairs? These folk, living in one of her houses—she was

responsible for them—for Honor had the feeling of *grande dame* toward her farm and the fishing-village.

'If the dam bursts,' she said coldly, 'the house will be swept away.'

'Some one must go,' he said. 'You told Hannah some one must go and get them away.'

But she wrung her hands.

'The villagers hate them,' she said stonily. 'Not one of them would put out a finger to save the witch, as they call her; and as for Tamar and her baby'—— She shrugged her shoulders. 'Our village prides itself upon its morals,' she said, a curious note in her voice.

It was then he looked at her, and she would never forget the light in his eyes. Reproach, mingled with bewilderment, lay there. For a second a vague irritation touched her, and with a tightening of the lips she turned to gaze into the heart of the fire. Without understanding why, against her will, for she kept her lips compressed, a haze of tears blinded her to the ruddy glow. When she turned with a soft word on her lips, and her hands outstretched, he was gone. The door had closed quietly; she had heard no sound. She was alone.

The devil that was in her returned—inherited instinct, perhaps, though woman is ever emotion-tossed. Her lips curled scornfully.

'He hates even to think—to speak of danger,' she whispered; and she went out to the kitchen, sending one of the maids to the mill, and bidding her take the dog with her. She had forgotten that she herself had freed the beast an hour before.

Then back she went with a book to the fire. But she could not rest. From time to time she crossed to the window and looked out, a dull premonition of disaster holding her. The wind moaned fitfully, and all at once from the chimney-top an owl shrieked.

'I wonder where David went,' she said. 'He ought not to be out on such a night.'

But she knew that he joyed in the wind and the rain, despite his apparent delicacy; and when, after a little lull in the moaning, the wind sprang up, rattling the casement and hurling sheets of rain against the panes, she guessed that his weather sense had whispered to him a storm was brooding, and that he had gone forth to meet it. The great drops hissed in the fire, falling down the wide chimney, and again Honor thought of the trio in the old and unsafe mill-house—the old woman, the mother, and the little child.

It was a wet and wind-tossed Hannah who came in, panting, with her news.

'I couldn't get across, ma'am,' she cried. 'Reddle be like a ragin' mill-pond, an' the bridge be swept away. There's no way o' gettin' there 'cept by swimmin'. Mill-stream have overflowed. I reckon the old house 'll ha' to go.'

Honor Wilmoth rose, pale, determined, and put on a cloak and hood.

'We must get the men,' she said. 'They must take a boat.'

'No boat 'u'd stand such a current, ma'am,' said the maid. 'La! 'tis so high you've no idea.'

'Tell Mary to get hot blankets ready,' said Honor. 'We may want them.'

Mary set her lips as she listened to the message.

'If she's goin' to bring that—woman—here, you an' me 'll quit, Hannah,' she said.

But she got the blankets in readiness. Honor Wilmoth's domestics were not wont to disobey.

The hot blankets were not needed for Mrs Merry or her daughter, after all. Midway to the village Honor met old Thomas and half-a-dozen others carrying ropes and dragging a boat from the beach below.

'Best go back, missis,' said the old man. 'Best go back. Us be a-goin' to see what can be done. Maister ha' got 'cross all right. 'Tis the comin' back as matters. Mill-stream be ragin' like Lucifer.'

Honor caught his arm. 'Master!' she cried. 'Where has the master gone?'

'To mill-house,' he answered, trudging on uphill. 'Told us to get boat an' come on. 'E've gone to fetch them wimmin out; but, law sakes! afore he gets there I reckon mill-house 'll be down.'

She caught her breath. David gone! David the head of proceedings! She was bewildered, but listened to the men as now and again they muttered of what had happened. It seemed as though they were no willing helpers, but plainly they dared not disobey. Still—David in command! She could not understand it. Danger, too—grave danger, if what the men said was true. How dared David do this thing, he who shrank from danger at any time?

'Meadows be all flooded,' said Thomas. 'I never mind sich doin's since I were a boy. Mill-stream bu'st then. It were that there waterspout as caused it to-night, though. I did say'——

A tremendous crash broke on their ears, followed by such a tumult that the little procession paused, staring at each other with pale, frightened faces.

'Mill-house be down,' muttered Thomas, breaking the silence. 'I said as 'ow them old timbers 'u'd never last. Law sakes! 'e'd never 'ave time to get there an' across to low meadow.'

Honor caught her breath for a second, then urged them onward. 'Oh, let us hurry, let us hurry!' she panted. 'Perhaps he got there before the house was down. He might manage to get them across the low meadow then.'

But in her heart there lurked a terrible fear. The old mill-house lay in the valley through which the mill-stream rushed, a tumultuous little

stream even in fair weather, but when swollen by rains and fed by a score of smaller brooks a raging torrent. The Reddle was another river that ran downwards to the sea, and sometimes overflowed its banks, spreading to the smaller mill-stream, when the two in company would wash the low-lying meadows, turning the mill-house into a water-swept island home.

There was one spot where a ford had been made, and Honor guessed they were making for this. But she was racked with fear, a fear that every moment grew into despair. A dark, whirling mass of waters met the eye. Nothing else was to be seen; not a light was visible. The place where the mill-house had stood was empty.

The men lighted lanterns, and proceeded to launch the boat, shouting encouragement across the watery waste. But no answering cry came, though they rowed across and about for a quarter of an hour.

'Best get 'ome, missis,' said old Thomas. 'Best get 'ome. If us finds 'im'—— He paused, and laid a shaking hand on her arm. 'Missis,' he said in a quavering voice—'missis—I—I see'd this arternoon. Ay, I knowed what you thought; so did 'e. But, missis, 'twere God's coward 'e were; the sight o' blood'—— He stopped, and a queer sob broke from him. 'E were a brave man, all the same,' he said, and turned away.

How long she waited and watched Honor never knew. Drenched to the skin, her long black hair down, regardless of time or circumstance, she stood there, straining tearless eyes across the water-washed meadows, watching the progress of the boat as it wound its slow way along the river. They dared not journey too quickly, so they were swept with the current, pausing now and again, as they were whirled to the shallows.

But the gray dawn was creeping up in the eastern sky when at last they dragged her back, hopelessness writ in every face.

It was old Thomas who took Honor's hands in his own rough, horny palm. 'It were God's will, missis,' he said. 'E were a brave man, 'e were.'

She heard the maid sobbing beside her as they slowly climbed the hill, but her own eyes were dry. The wind had sunk to rest; the pearly dawn grew brighter.

What was it they had said? Swept out to sea? Bodies back on the ninth day?

And he—her man—the man she had thought a coward, had died a man's death, after all.

Sparrows were cheeping beneath the eaves; through the lattice-panes the dawn was red, sign of more rain to come. She knelt beside the dead ashes of the fire, and stared dully at the fantastic shapes the charred cones and wood wrought in the grayness. Yesterday he and she

had gathered those same cones beneath the fir-trees; yesterday he had flung his ring into the sea. 'Propitiation to the sea-gods,' he had said. Now the sea had him. 'Incense to the wood-gods,' he had cried as he flung the cones into the fire. He would want a wooden coffin. On the ninth day he would return—God's coward, but a brave man. A tiny moan broke from her lips.

The big oaken door swung open; there was the sound of dripping garments. She turned. Had his ghost already come to mock her?

No ghost—warm, living flesh and blood, though oilskins dropped upon the carpet, making a pool as he stood. But his deep-blue eyes were radiant with a great joy.

'Oh Honor,' he cried, 'such fun. Talk about Leander and the Hellespont'—

It was then she broke down and sobbed piteously, and in spite of his dripping form he had her in his arms. Very woman was she at last, and he, man, the master.

'Why, Honor,' he cried, 'you're wet through! Where have you been? Yes, they're all safe—Tamar, the old woman, and the baby. You'd never guess how I did it. Old Dan the sheep-dog came with me. He was out yonder—broke loose, I suppose. Anyhow, he came. You remember the other dog, his mother, the one that worried the sheep? Old Mother Merry had her. Well, those two dogs swam like blazes. I strapped the baby to Dan, and we let the others pull us to

Lower Mill. They're safe enough, in the dry, but I thought I'd come and let you know.'

She clung to him and told her story. Why had they not thought of Lower Mill, a strong building farther down the valley, with an easy way of approach from the mill-house above?

'Such a night!' he cried again. 'Such a night! And, oh, Honor! the blueness and mystery of the dawn, changing to a sky like—like'— He hesitated, and she knew he was about to say 'blood.' The hateful word never escaped him. 'The dawn came up like flame,' he said. 'I shall write a poem on it.'

She shuddered.

'Come along,' he cried. 'You'll just get off those wet clothes. There's a fire in the kitchen, and blankets hanging before the fire. You'll do as you're told, Honor—strip and get into those blankets. I'm going to get a mustard bath.'

So Honor Wilmoth got the hot blankets, after all. Next week the *Arcady* published a wonderful word-poem, 'The Dawn,' signed D. W. Such are the whimsicalities of life.

'Ay, the maister be a won'erful man, missis,' said old Thomas—'a won'erful man. Who'd ha' thought o' usin' dogs to tow 'em in to safety?' He bent his gray head slightly to one side, regarding her with a puzzled air. 'Maybe, in a manner o' speakin', it be they books o' 'is'n as put notion in 'is yead,' he said. 'Law! I called 'im God's coward, but 'tis a brave man 'e be.'

THE END.

THE Y.

By I. I. BRANTS.

FREQUENTLY of late this queer monosyllable, or, rather, single letter, shortest of all geographical appellations, has appeared in our newspaper columns when information is given or comment is made on the great floods which have destroyed the wealthiest districts of Holland. Every schoolboy knows that 'Amsterdam on the Y' is the capital of the Netherlands. But every schoolboy does not know what this Y is, or what it means, or how to pronounce it, or, curious to say, how to spell it. Some people say 'Ee' with unconvincing boldness. Others look up from their paper with more becoming hesitation, and venture a questioning 'Why?' And a third and numerous set, whose atlases spell the word Ij, pronounce it accordingly.

Everything about this Y is upside-down. In the first place, what people, even Amsterdam people, call the Y is not the Y at all. A modern Amsterdam boy will tell you he has had a bathe in the Y, when, in fact, he has been swimming in the Zuyder Zee near Amsterdam. About the middle of last century things were different. At that time Amsterdam really was situated on the Y, a gulf of the Zuyder Zee,

north and west of that city. A series of floods which, between the years 1170 and 1410, ate more and more deeply into the North Sea coast gradually formed the Zuyder Zee. Even after that date this process continued eastward and westward on a minor scale. Thus, in the bight of Amsterdam, the Y pierced ever farther into the defenceless fenlands, until the city of Amsterdam came to be threatened by what the Dutch appropriately call the Waterwolf.

After endless deliberations, the situation became so critical that it was decided to make an end of the flooding danger, just as the recent Zuyder Zee floods threatened to make an end of the endless Zuyder Zee deliberations, and of the Zuyder Zee itself to boot. The Y was changed into a polder—that is to say, into a piece of land below the level of the sea or the nearest river. Originally a morass or a lake, it has been drained and brought under cultivation. All that remains is the estuary of the river Zaan, which used to connect the south-west arm of the Zuyder Zee with the Y. The Y itself is land, good solid meadow-land, not even imperilled by the present floods.

Now, as for the spelling, it is Y, or in Dutch IJ, with a capital I and a capital J, the one after the other. In old Dutch orthography the pronunciation of a vowel was prolonged by writing after it an *i* or an *e*. The sound *a* as in 'craft' became *ah* on being written *ai* or *ae*. The name of the famous cartoonist Raemaekers should therefore be pronounced Rahmahkers, and Maeterlinck should be pronounced Mahterlinck. The sound *i* as in 'pit' became long as in 'pier' on being spelled *ii* with two *i*'s, or, in order to avoid confusion, with one ordinary *i* and one tailed *i* or *j*—*ij*. Later on it became customary to represent a prolonged vowel by doubling the spelling, as in Maarten Maartens. At the same time the long *i* or *ij* came to be pronounced, just as in English, *î*, as in 'spite.' It was therefore necessary to invent a new spelling for the prolonged *i* sound as in 'pier.' This was represented by placing an *e* after the *i*—*ie*. Now the Dutch alphabet does not contain the letter *y*. Through confusion with foreign alphabets, the *y* was put in the place of the *y* between the *x* and the *z*, and was consequently considered to be one single letter. As a capital it is therefore written IJ, with capital I and capital J. The spelling Ij for the land (or water) round Amsterdam, therefore, must be condemned. The pronunciation of the name Y or IJ is like the English I, but rather more nasal.

The original meaning of the word Y is 'water.' It is from an ancient root common to most European languages. In Dutch it is lost, except in geographical names. In the north of Holland, in Friesland, it occurs as Ee (pronounced *ay* as in 'pray') in the Ee Canal of Dokkum, the Dokkumer Ee. In the south, in Brabant, it occurs as Aa in the river Aa of Breda (pronounced Brudd-Ah, with the emphasis on the last syllable). Aa's likewise are to be found all over north Germany, and even in Russia, where the holy river of Livonia bears this name. In Denmark, aa is the common name for a small

brook. Our old English ancestors knew it as *éa*, and have left traces of it in such names as Angles-ea, Guerns-ey, Jers-ey, Aldern-ey, Orkn-ey, and in the word 'island.' The *s* in 'island' was introduced through confusion with the word 'isle' from the Latin *insula*. In Middle English it was spelt 'iland,' and in Old English 'igland,' *ig* meaning both 'water' and 'water-land' or 'island,' just as does the Scandinavian *oe*, which we find in the Faroe Islands—literally the 'sheep island' islands!

Still farther afield it is interesting to follow the Y into the Old German *aha*, the Gothic *ahwa*, and the Latin *aqua*, all meaning 'water,' which may be rediscovered in such names as the French Aix-les-Bains, Aix-la-Chapelle, or Aken (Dutch), or Aachen (German), in Alp-ach, in Tann-ich, and of course in the French *eau*. Many Latin geographical names in *-acum* or *-iacum* have the same origin, especially in Keltic lands. This ending seems as much connected with the Latin *aqua* as with the Keltic root *agh*, which again means 'water.' Thus arose French names, such as Annecy from Anne-acum, Cognac from Cognacum, strange though it may seem that the latter should have anything to do with water! Thus also arose the Dutch Gulik (Juliers) from Juli-acum, and the English York from Ebor-acum. The Latin name for the Northern Peninsula, Sca(n)din-avia, seems to be from the same root.

This leads us to the old Indian *apas*, 'water,' modern *ab* as in Panjab, the 'land of the five waters,' and to the *abh*, 'water,' of our Keltic-speaking ancestors, as in Aboyne and Avon; also to (*a*)*gwy*, as in Wycombe, and to *aisne*, *uisge*, *uis*, as in Wisby, the capital of Gothland, the Usk, the Ouse, the Oise, the Aisne, Touraine, Isère, and the Parisian fortress of Issy.

For all its queer spelling and pronunciation, and general upside-downness, the IJ or Y, therefore, is quite a simple, quite a normal, quite a common feature in European geography. It is just water which is land, or land which is water—as you like it.

THE MONTH: SCIENCE AND ARTS.

STUDYING METALS BY X-RAYS.

THE Röntgen rays have come to be regarded as essential to the operating theatre. Will they become as indispensable to the laboratory of the metallurgist? Recent experiments which have been carried out by Professor W. H. Bragg, D.Sc., F.R.S., in collaboration with his son, Lieutenant Bragg, certainly point to such a conclusion. These two investigators—recipients of the Nobel Prize—have been utilising the rays in the study of the structure of metals and other substances, and the results of their researches were recently communicated to the

Institute of Metals. The method of research, as Professor Bragg points out, depends upon a principle which is already well known—namely, that when a regular train of waves falls upon a surface separating two media, part of the train is reflected and part goes on. If the part which goes on meets another separating surface, a second portion is reflected, and some of this emerges from the second medium in the same direction as the beam reflected from the first surface. It will happen in general that the two reflected beams are out of phase, and to that extent destroy one another. Whether they do or do not depends upon the relation between

the wave-length, the angle of the inclination of the beam to the reflecting surfaces, and the distance between the surfaces. This principle explains the colours of the soap film, of the thin layer of oil upon the surface of water, and of steel when being tempered. If the reflecting surfaces are many in number, the effect is made more intense, and at the same time more precise. This is clearly seen in the beautiful colours of potassium chlorate crystals, as shown long ago by Lord Rayleigh. These crystals are formed of alternating layers, twinned on their surfaces of separation; and for some obscure reason the thickness of all layers is the same in the same sample. When white light, containing all wave-lengths, falls upon such a crystal at a certain angle, then only that wave-length is reflected for which the proper relation between the wave-length, the angle of incidence, and the spacing holds good. If the angle is altered the wave-length which is reflected is no longer the same. Hence the beautiful play of colours which the crystal shows. X-rays consist of waves which are something like ten thousand times shorter than the wave-length of light. To obtain the parallel effect we must look for reflecting surfaces which are ten thousand times closer together than the twinning surfaces of the chlorate of potash crystals, which are only about one forty-thousandth part of an inch, or thereabouts, from one another. These reflecting surfaces nature has also provided in the layers of atoms in the crystal. It may seem curious that a layer of atoms should act as a reflecting surface; but, after all, it is not necessary that such a surface should be continuous. No doubt, a natural face of a crystal contains a layer of atoms arranged regularly; and behind the natural face are other layers all similar, and placed at regular distances. Thus all the necessary conditions for this peculiar reflection experiment are present; and, as Professor Bragg shows, when a pencil of X-rays of a definite wave-length is allowed to fall upon the face of a crystal which is turned round gradually so as to alter the angle of incidence, the reflection of the beam as a whole is non-existent except when the angle is correct; then it flashes out strongly. When this angle is observed, the relation of the wave-length to the spacing is known. The instrument used by the investigators is described as the X-ray spectrometer. In place of the telescope is a chamber containing gas, which is ionised by the X-rays, and the resulting electrical effect is observed in an electroscope. It is important to note that the measurement of the result is quantitative, in which respect the new instrument has an advantage over the old. It may be mentioned that the X-rays are already being employed for the purpose of discovering 'blowholes' and other faults in castings, thereby saving considerable time in subsequent

machining operations; but other fields for service will doubtless be discovered very quickly.

A SAFETY TRAM-GUARD.

Passengers alighting from a tramcar and passing behind it occasionally come in contact with vehicles going in the opposite direction. In order to prevent mishaps of this character, a Sheffield inventor has devised a simple and highly effective guard. This consists of an arm which projects from the rear of the vehicle at right angles, forming a slight barrier. On the arm is written the word 'Danger.' At night the sign is illuminated to attract the pedestrian's notice, the source of the illumination being the same as that of the car. The sign can be hinged either at a point immediately above the truck-beam or at any other convenient spot at the back of the car. When not in use, as, for instance, when the vehicle has been reversed, it can be folded across the front of the car, or it can be removed and attached to the other end, which now becomes the dangerous rear. If desired, a bell can be attached and connected to the driver's platform, so that by pressing a button additional warning may be given of pending danger. The device is inexpensive, can be readily attached, and is so designed and built as to be free from the risk of breakdown.

NOVEL METHOD OF SOWING SEEDS.

No one will gainsay the ingenuity of the American in inventing time and labour saving devices. The latest illustration of this is a novel means of sowing seeds. Making drills and sowing seed by hand in the usual manner are not only tedious and back-breaking operations, but they are also wasteful, because far more seeds than are necessary are planted, involving thinning out at a later date, when the seedlings have attained a certain growth. In the latest American idea the seed is sold already spaced and embedded in a tape. This tape is composed of a special fertilising material which, decomposing and associating with the soil immediately contiguous to the seed, assists its germination and growth. The tape is sold in coils up to forty or fifty feet long; but it can, of course, be cut to the length required. All that it is necessary to do is to plant the tape in accordance with the directions given. Sowing in this manner can be carried out rapidly and with the minimum of physical exertion. Provided that each seed is fertile, and that the ravages of birds and other pests are overcome, the seedlings will appear in due course a regular distance apart. Not only is thinning-out avoided, but economical use of seed is assured, no more being sown than is actually required.

EXPLOSIVES FROM THE AIR.

The great war is giving a decided impetus to one branch of applied science which under

normal conditions would have progressed somewhat slowly. Chile is the universal provider of nitrates, which are generally used for fertilising purposes, but which also furnish the necessary ingredients for certain explosives. Science, by the extraction of nitrogen from the atmosphere with the aid of the electric current, has shown how to supplement these natural deposits. Two methods of fixing the free nitrogen are generally practised. The one consists in passing air through the flame produced by the electric arc, which is caused to spread out over a wide field by the aid of magnets. The nitrogen thus becomes oxidised to form nitric oxide, and the fumes being brought into contact with water, nitric acid is formed. The acid thus obtained may be used for various purposes, or may be transformed into nitrates for fertilising purposes by treatment with caustic lime. In the second process the atmosphere is blown over red-hot calcium carbide, which absorbs the free nitrogen, thereby forming what is known as calcium cyanamide. The simplicity of the processes has not failed to impress every nation, since the war has revealed the danger of depending upon imported supplies of natural nitrates. Should a country be cut off from the outside world, as is the case with the Central European Empires to-day, a condition of grave national peril naturally results. Germany and Austria have discovered this fact, although they have been free to purchase extensive quantities of nitrates from Norway, where the extraction of nitrogen from the air is being practised upon a growing scale. These resources are also being supplemented by the laying down of huge plants upon the extensive lignite-fields of the German Empire, this cheap fuel serving for the generation of the electricity in lieu of the water-power which is available in Scandinavia. It has now been announced that an English inventor resident in the United States of America has discovered a third process for the cheap exploitation of atmospheric nitrogen, whereby synthetic ammonia, which forms the basis of all nitrates employed in the production of explosives, is obtainable upon a cheap and extensive scale. Incidentally the process is equally applicable to the cheap production of fertiliser. Particulars concerning the process are not vouchsafed; but apparently the United States, which, like the European Powers, has been largely dependent upon Chile for her nitrate-supplies, intends to exploit the process. Fortunately in that vast country ample water-power abounds for the cheap generation of the electricity which is vital to the process. Great Britain is also dependent upon Chile for the natural product, and upon Scandinavia for the atmospheric product. The danger of this is not appreciated at the moment, but under certain circumstances it might become critical. While we have few waterfalls suitable for generating the electricity, the more economical utilisation of our coal resources might be profit-

ably taken in hand. Our collieries are surrounded by unsightly dumps of poor coal which would prove an excellent fuel if large generating stations were erected upon the sites, thereby saving fuel transit charges. In this manner the current could be generated at a figure comparable with that obtained by harnessing water-power. While such huge stations would meet our requirements during the present crisis, their future success would be assured by their production of fertiliser, for which the demand is certain to assume large dimensions.

A NEW ANTI-VERMIN BODY-BELT.

One of the penalties of war and of life in the tropics is the ravages of insects, which never fail to establish their domicile upon the human body if the opportunity is provided. Soldiers on active service are especially exposed to such a plague. Not only are vermin a source of intolerable torment, but they are extremely dangerous, inasmuch as it has been conclusively established that body lice are carriers of typhus and relapsing fever. In our issue of February, page 141, there was a description of a body-cord for subjugating the trench plague. Another means of counteracting this pestilence is the Kergold anti-vermin belt, which has proved its value as an efficient protection against the attacks of all germ-carrying vermin. The belt is made of soft material, is about three inches in width, and of sufficient length to pass round the waist, being secured in position by tapes which are fastened in front. The medicament permeating the substance of the belt comprises eight insecticides and antiseptics, prepared according to the formula drawn up by one of the foremost analytical chemists in this country. The belt not only protects the wearer around the waist, which is the section of the human body for which these uninviting insects evince a distinct predilection, but secures him immunity from head to foot. Although worn next to the skin, the belt offers no inconvenience, owing to the soft character of the material employed, and as it is secured tightly in position no chafing or irritation can arise. Although the medicament is destructive to the pest, it is perfectly harmless to the wearer. The medical properties of the belt last for approximately six months. Though it has been introduced especially for soldiers, it may be worn by those who are compelled to live in tropical countries where other insect pests abound which not only render life trying, but are actually dangerous. It should also appeal to those who are compelled to toil on the high seas, where under certain conditions the pest is likely to secure a foothold and prove dangerous to health.

ALCOHOL OR FOOD.

The Germans, in common with the other protagonists, have severely curtailed the consumption of alcohol. Indeed, at the moment

a determined agitation against any manufacture of alcoholic liquors is assuming formidable proportions, the matter being considered not as affecting the *moral* of the fighting-men, but in the interests of feeding the people. According to the investigations which have been conducted by eminent scientists, as much beer is being consumed in the Teuton Empire every day as would supply sufficient grain to feed eleven million men. From the economic point of view the country is suffering a loss of one-seventeenth of its food-supply through grain being turned into spirituous liquors. These authorities point out that to make a pint of beer the equivalent of one-half of the present daily allowance of flour to the civilian population is used in the form of barley, and that the flour which is thus wasted would be sufficient to make five and a quarter ounces of bread. In the year previous to the outbreak of war two million seven hundred thousand tons of potatoes—about one-sixteenth of the total production—were used, together with sixty-six thousand tons of barley and a round two million bushels of fruit and turnips, to produce the spirituous liquors consumed by the country. The economic waste arising from this misuse of food products, especially in such strenuous times, has roused the more energetic propagandists to agitate for the total extinction of the liquor traffic. So far as the army is concerned, every effort is being made to limit the consumption of spirits to medicinal doses—tots of rum, arrack, and cognac to the men in the wet and cold trenches being generally favoured. The German military authorities have discovered, as an experience of the war, that it is the temperate soldier who is best able to withstand the rigours and hardships of campaigning. But among the Germans beer-drinking has become a tradition, and at the moment enormous quantities are supplied to many of the troops, under the plea that as the drinking-water available is likely to be contaminated, beer must be supplied as a substitute. But the outbreak of war afforded some of the total abstinence advocates among the General Staff the opportunity to enforce their desires, notably General von Bissing, who reduced the quantity of alcohol to be issued to the troops under his command to a very small amount, and absolutely forbade its distribution to the wounded except upon prescription by the doctor. While there is very little likelihood of Germany becoming a 'dry' country even under the exigencies of war, it is stated that the Germany of the future will differ very pronouncedly from the Germany of the past in regard to its beer-drinking habits. The total prohibition of alcoholic liquor, which so many people desire at the present moment, in order to release greater quantities of foodstuffs for the civilian population, has encountered strenuous opposition from certain prominent members of the medical fraternity, who have declared that nothing could be done on the

battlefield without alcohol. The result is that at present the Empire is divided against itself upon this momentous question; but it would seem as if a *via media* had been found in the limitation of the supply of grain available for the manufacture of alcohol to the amount which is not needed for use as food. This compromise is to some extent a sop to the German society which has been formed to wage war against the misuse of spirituous liquors.

THE LONGEST RAILWAY TUNNEL IN AMERICA.

One of the most notable railway engineering feats of the moment is in active progress in Western Canada. This is the boring of a tunnel twenty-six thousand four hundred feet in length, which, when completed, will rank as the longest and most important work of its kind upon the American continent. For some years past the Canadian Pacific Railway has been occupied with the question of reducing the working expenses of its line through the Selkirk Range. The country is exceedingly rugged; while, owing to the line being exposed to the ravages of snow-slides and rock-slides, it has been necessary to construct long lengths of timber snow-sheds, the maintenance of which involves a heavy expenditure per annum. The tunnel will avoid the greatest natural obstacles upon the most formidable section of the line—that through Rogers's Pass. The new line will burrow through the Sir Donald Range, and it will reduce the summit-level of the section from four thousand three hundred and thirty feet to three thousand seven hundred and ninety-one feet; while the length of maximum grade, which is 2·2 per cent., will be reduced from 22·15 to 6·6 miles. Furthermore, there will be a saving of four and a half miles in distance. The outstanding feature of the work, apart from its magnitude, is the system of tunnelling which has been adopted. The specifications called for a double-track bore, and in order to expedite the work it was decided to drive a small 'pioneer bore' from end to end parallel with the centre line of the main work. This smaller bore was taken in hand from each end. Simultaneously the excavation of the main tunnel was begun, although, of course, the two operations were not being prosecuted at the same rate, the main object being to complete the 'pioneer bore' with all possible speed. At intervals of about one thousand five hundred feet along the pioneer bore cross-cuts are made into the alignment of the main tunnel, and at each of these points side-drifts are being driven, the débris being removed and carried outside through the smaller tunnel. Thus the main work is really being attacked from several points at once. The cost of the enterprise is provisionally estimated at two and a half million pounds. In addition to the construction of the long tunnel, heavy work in connection with the approaches must be under-

taken, the most notable being an embankment in the Illecillewaet River valley, which will require a round nine hundred million cubic yards, and a cutting which will necessitate the removal of approximately three hundred thousand cubic yards of earth and rock. Owing to the speed with which the novel method of boring has enabled the work to be prosecuted, and the absence of such unexpected developments as characterised the driving of similar works through the Swiss Alps, it is anticipated that the two headings will meet about September next. If this is achieved the contractor will anticipate the contract date by several months. Seeing that a premium is being paid for every day saved upon the contract time the contractor will reap a handsome bonus, which he concludes will offset the cost of driving the preliminary drift. The work is being followed with keen interest by railway engineers, and in the event of the method proving a distinct success there is no doubt that a similar practice will be largely followed in future.

NEW ROOF AND WEATHER TILE.

There has recently been devised a new variety of tile, which appears to have distinct merit. By a novel feature in its construction, the Surrey tile, as it is called, is much more economical in use than the ordinary variety, three hundred and seventy of the former, it is claimed, doing the work of five hundred and fifty-four of the latter, and thus effecting a saving in the cost of material, labour, and carriage. The new covering, besides being warm and artistic in appearance, is almost as light and cheap as slate. There are several patterns available, and a new unit in roofing called a spacer allows of ordinary plain tiles or slates being laid wider apart than usual, thus promoting economy in the use of older roof-coverings. Gables, angles, and other parts of roofs can be finished off with the usual tiling methods, and a satisfactory and artistic roof is obtained throughout.

THE EXHAUSTION OF THE GALICIAN OILFIELDS.

According to statistics which have been recently published, the Galician oilfields, which have contributed so much to the world's supply of liquid fuel, are becoming exhausted. Since the year 1909 the annual rate of decrease has averaged approximately two million barrels per annum, though in 1913 it was only one million barrels. The decline is experienced at Tustanovice, the most important centre in the territory. One result of this pronounced and steady diminution in the supply was the partial abandonment of oil-fuel upon certain sections of the Austro-Hungarian railways, where coal was reverted to. A few years ago hand-dug wells were common in the country, the peasants deriving from this method of raising the oil a sufficient income to meet their needs. But this practice

has ceased. Some idea of the speculative nature of the oil-industry even in a proved region is readily grasped when we learn that in 1913 no fewer than eight hundred and sixty-one of the Galician wells were unproductive. The constant necessity to drive to greater depths for the valuable liquid is shown by the fact that two hundred and fifty-two wells in the Boryslav-Tustanovice district now reach a depth exceeding four thousand feet, the deepest being five thousand four hundred feet, or more than a mile. It may be observed that the decrease in the yield is not attributable to devastation caused by war, inasmuch as the foregoing statistics refer to the year preceding the outbreak of hostilities.

REMOVING RUST FROM NICKEL.

Nickel is a metal which is particularly liable to rust, but the rust may be removed in a simple manner. A little grease should be well rubbed into the affected part, and this alone will remove some of the oxide. The remainder may usually be got rid of by allowing the grease to remain for several hours, and then rubbing it off with a rag dipped in ammonia. Should this prove ineffective, a few drops of very dilute hydrochloric acid should be used. It is, however, essential that this agent should be wiped off very quickly after being applied, otherwise the acid will remove the nickel as well as the rust, and the remedy will prove worse than the disease. After all rust has been removed, the surface should be well washed with clean water and wiped dry, when the usual metal polish may be safely applied, and the affected part restored to something approaching its original appearance.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE FLOWER-WALK IN KENSINGTON GARDENS.

A FRAGMENT.

THE spring-tide snows of cherry-trees abloom,
And glades of wind-swept bluebells, leave no room
Within my heart for aught but still delight.
While here I linger, breaks upon the sight
An unexpected colour. 'Tis the blue—
Poignant and iridescent, matchless hue—
That clothes the neck of Juno's regal bird.
Behold him proudly sweep! As if he heard
My murmured pleasure, straightway he outspreads
His mighty fan; a coppery radiance sheds
Its varied lustre over all the space
Where jewelled ovals lend their brilliant grace.
Ah, hear! For, on a branch hard by, the dove
In throbbing accents breathes her note of love!
Magnolia-buds to waxen cups unclose,
And, behind all, the shimmering water flows.

CELIA HANSEN BAY.

Chambers's Journal

SEVENTH SERIES

THE KING-MAKERS.

By W. E. CULE.

CHAPTER I.—THE BOY.

'YOU are a fool!' cried the King.

Rudeness is often more disconcerting than truth, and the silence that followed was heavy with dismay.

It was the insulted Premier himself who hastened to retrieve the situation. His tone was mild, apologetic, soothing; he even forced himself to be playful. 'I am not in a position to dispute the verdict,' he said, smiling. 'I am afraid my colleagues of the Executive would heartily endorse it. But our business for to-day is really concluded, and your Majesty need not be detained longer.'

The King was already conscious of his folly. He could not but feel a resentful gratitude for the tact which had been brought so quickly to the rescue. He had the impression that he had been deliberately provoked to his outburst, but that impression did not harmonise with the provoker's good-humour afterwards. Leaning back in his chair, he drummed pettishly upon the elbow-cushions, half-shamed, half-puzzled. 'I have had more than enough,' he muttered sullenly.

'And so have I, your Majesty. Yes, that is all for the present.'

Again the King fumed inwardly. It was the schoolmaster's dismissal of a troublesome pupil. The other two men at the table did not venture to look into his face. He knew that they disapproved emphatically. So his Majesty rose, and the councillors rose also. They remained standing until he reached the door, and his last glance saw them still there, respectful, but mutely reproachful. In the corridor a tall figure in steel and scarlet saluted mechanically, and he passed up the broad old staircase to his suite of rooms.

The Premier slowly collected his unappreciated papers. There was nothing in his powerful face to suggest resentment, yet surely he had enormous reason. 'It has been a very trying day,' he said urbanely; and the remark was almost a benediction upon the youth who had just left them. Yet his next words had a note of acerbity in them, most excusable under the circumstances. 'It is unfortunate that such tiresome details should have to be discussed,' he said, 'but they

are matters of State! And the King remains—what he was! We must hope for the best! I shall be ready for departure in half-an-hour, Berten. Will you travel in my car? The Secretary, of course, will remain in attendance.'

'With pleasure,' said Berten, the Foreign Minister, who had never before admired his colleague as he did at that moment; and accordingly they parted, each proceeding to the room assigned for his use while the King was in residence at the château.

In a few moments the Premier laid his papers down in his circular chamber in the south-west tower. He was a well-built man of sixty, with a cast of feature that suggested his far-off Hebrew ancestry. His smile was charming, his gaze peculiarly swift and direct. He did not seem to carry too heavily the burden of the recent scene. Once in his room with the door closed, his manner was even cheerful as he sat down on a lounge in the circular window to enjoy a cigar. The window was open, and he had a pleasant view of the cliffs and the sea. To the left, fading away in the blue haze, ran the long ridge which ended with the clump of rocks known as the Broken Tooth, and its indistinguishable lighthouse. Farther still, in the mouth of the bay, must lie the Orphan Rock; but this was beyond the range of sight.

Perhaps he did not observe these things at all, but kept his thoughts strictly to problems of statecraft. Presently, however, he heard a footstep on the gravel below his window. He did not change his position, and the steps passed rapidly on; but soon he saw a figure come into sight near the edge of the cliff, a youthful figure, which immediately vanished over the verge by some invisible path. Still the Premier sat deep in thought; but three minutes afterwards he was disturbed by the ash of his neglected cigar falling upon his vest. Taking up the handkerchief which lay beside him, he carefully collected the powder and discharged it through the open casement, shaking the handkerchief two or three times. Then he gathered up his papers and went down to meet his travelling companion.

The figure he had seen on the verge of the cliff was that of the King. After leaving the

council, his Majesty had gone to his rooms, to find his valet waiting.

'Your Majesty will change?'

'Yes. At once,' said the King irritably. 'I must get away. I must get away at once!'

Felix saw that something had occurred, and strove to please. 'The new costume—the tourist costume—has arrived,' he said eagerly. 'Perhaps your Majesty will try it?'

It lay, indeed, upon a chair, ready for use—a well-cut suit of tourist flannels, similar in all respects but that of cost to a thousand others which were flitting through the kingdom of Zorne at that moment. The King looked at it, and was not displeased. For a little while, instead of being one wretched youth on a pinnacle, he would be a humble unit of a multitude innumerable. In these garments he would go down to the Pavilion to obtain a little volume of poems, and then he would take a walk—anywhere.

In ten minutes the transformation was complete, and the King of Zorne made a very passable tourist in knickerbockers. Even the Senate would have had to look twice to recognise him.

'It is excellent,' murmured Felix, sensitive to the relieved atmosphere. 'Your Majesty finds it comfortable?'

'It will do,' said the King; and then, 'I am going to the Pavilion. But I must not be disturbed.'

'I will remember.'

Conrad descended the staircase, and rejoiced inwardly when the guard in the corridor hesitated for an instant to perform his automatic salute. Walking to the southern end of the château, he passed into the shrubbery. He met nobody, and, with something of the sensations of a truant, kept to the leafy gardens as long as he could, only leaving their shelter when it became necessary to make for the cliff and the Pavilion. It was then that he was seen by the Premier.

The Pavilion was a delightful wooden structure nestling in an elbow of the cliff. Invisible from the château, it looked straight out over the Adriatic, and a rugged cliff-pathway passed its threshold to the beach beneath. When the Government of Zorne had bought the château as a convenient royal retreat—it was only ten miles by road from the capital—the King had decided that this was the choicest corner of the whole estate. Hence he kept it jealously to himself and his ease.

Lately there had been little ease, owing to the unceasing antagonism of a force against which he struggled in vain, and the summer-house had seen him in bitter moments. He sighed now as he approached the building, and immediately afterwards flushed as only the thought of the Premier could make him flush. Then he pushed open the door—the place had been

cleaned and prepared for him in the morning—and went in.

Not far in, however, for he had not taken two steps before he discovered an intruder. In his own easiest chair lay a young man asleep. He had opened the window to enjoy the breeze, which cooled pleasantly a face and brow which bore signs of recent heat and fatigue. He was quite young—only a few years older than the King himself, apparently—with the fair hair and skin that suggested a Teutonic nationality. His boots were stretched at glorious length across the floor.

The King was in no mood to be pleased by such an adventure. Imagine his sensations, then, when he saw that the stranger, in addition to his chair and his cushions, had actually appropriated some of his clothing! Before settling down he had taken off his coat, and in its place had donned a loose yachting jacket of his Majesty's, which he had evidently recognised as an agreeable substitute for his own heated garment. It was only a trifle small, and it gave an irritating suggestion of ease to his whole attitude.

The King did not pause to consider his course of action. He stepped heavily on the boarded floor, and at once the intruder opened his eyes. But he was neither bewildered nor abashed, and the eyes he opened so calmly took only an instant to comprehend the situation. He did not even move his head, but surveyed the King steadily. And steadily the royal anger rose.

'You are trespassing, sir,' the King began as courteously as his wrath would permit. 'These grounds are private.'

The intruder yawned. Otherwise he did not move. 'Indeed!' he said.

'Yes. And, confound you, sir, you are wearing my coat!'

The young man's lazy blue eyes examined the King's features with considerable care. He was not impressed; he seemed, in fact, amused. When he spoke it was with indescribable effrontery. 'Ah,' he said calmly, 'they certainly did tell me that this old house was the Château Rombard. You must be—the Little King!'

It was indeed a day of humiliation for his Majesty of Zorne. In spite of his effort at self-control, he started perceptibly, and a flush that was as much of shame as of anger rose to his cheeks.

The intruder watched these effects with a certain indolent enjoyment. 'Your Majesty must not be annoyed,' he said as calmly as before. 'I used a term which is common enough in Zorne, as you may know.'

'Indeed!' stammered the King, in angry bewilderment.

'Decidedly. And your Majesty will doubtless understand my use of it when I say that I am something of a Socialist, and therefore no respecter of kings.'

This was the first Socialist the King had met in personal contact, and he was unlikely to forget the occasion. But the fellow's audacity was bound to have a cooling effect upon him.

'You are?' he asked, with growing self-control.

And the intruder went on. He combined impudence and audacity with a sincere admiration for his own cleverness and a genuine regard for the sound of his own voice. 'It is exactly so. Kings, in my view, are at the best frightfully expensive symbols of an absurd social order. Or we may regard them as persons who appropriate an undue share of the pleasant things of life, seldom through any virtues of their own. Such were my thoughts when I heard that this was the Château Rombard. I reflected that in strict justice it was probably as much mine as your Majesty's; and when I saw this summer-house I decided to enjoy a share of my property for an hour or two. So I took the liberty of making myself at home.'

'And—and my coat?' asked the King grimly.

'As much mine as yours, your Majesty. And you have had much more use of it hitherto.'

The King considered. He was a little amused; indeed, he might by this time have lost his anger altogether had it not been for that one phrase, 'the Little King.' Not even the keenest sense of humour could erase that insult from the victim's memory. Yet he was now so far master of himself that he could almost hold his own.

'Knowing so much of kings,' he said, 'you must be aware that they like to be obeyed. I regret to seem inhospitable; but there are several guards at the château. They will come when I call them; and, since you declare yourself a Socialist, they may be excused if they mistake you for an Anarchist, and throw you over the cliff. Such distinctions are a little difficult to them!'

The intruder was interested at last. 'Your Majesty improves on acquaintance,' he said. 'If you spoke more frequently in that tone things might be—different. But for the present I have given my answer, and I beg that you will not disturb me further.' And with sublime impudence he closed his eyes, appearing to glide off at once into a pleasant slumber.

Conrad showed now that he had fully recovered his equilibrium. 'Oblige me,' he said smoothly, 'by accepting my hospitality for ten minutes more. After that, if my servants prove objectionable, you will, I am sure, excuse their zeal. They are under the impression that these grounds are more mine than yours.' With this remark he strode out of the Pavilion and on to the path which passed the door.

An appeal to the servants, however, was not at all to his taste. Not more than fifty yards away grew a clump of low bushes, and when he reached these he quietly threw himself down on the grass behind them. Having found there

a point of vantage, he lay with his eyes fixed upon the Pavilion, confident that in a few minutes his enemy would emerge in prudent and timely flight. And that would close a somewhat remarkable incident in as satisfactory a way as could be hoped for.

For two, three, four minutes he lay still and expectant. Then his calculations were thrown into irrevocable disorder. Suddenly and mysteriously—for there had not been the slightest sound of any kind—a man's head came into view on the rugged pathway which led up from the beach to the cliff-brow. Instead of passing in front of the Pavilion window, however, the owner of the head kept well down, creeping silently and swiftly around the corner of the building and on to the head of the path. There he paused, and the interested observer saw that he was a powerful man in fisher costume, who rested motionless for a while, alert, watching, listening, in sinister silence. Then he made some sign with his hand, and immediately two other men crept to his side with the same mystery and precaution. One of these bore a coil of rope, and the other carried what appeared to be a sack.

The King lay as motionless as a log.

The three men stood for a moment at the entrance to the Pavilion. All were breathlessly still. Then the leader gave another silent signal, and the frail door was dashed wide as the two subordinates hurled themselves into the interior. For a brief space there was some confusion, but except for one stifled exclamation all was done with remarkably little noise. In his pretended slumber the unfortunate jester had rendered himself an easy prey for the abductors. Indeed, he had no opportunity of seeing their faces, the man with the sack having accomplished his share of the capture with faultless celerity and skill.

The King was intensely interested, but his excitement did not incline him to interfere. He did not imagine for a moment that any life was in peril. The noise was over almost at once, and for a very short time he waited and watched in vain. Then out from the still open door came the first fisherman, to sweep the neighbourhood with another keen, searching, and suspicious glance. For fully half-a-minute he stood, a mute sentinel; then he raised his hand again, moving cautiously towards the cliff-path as he did so.

Immediately the other two men came out after him, bearing between them a fourth. This fourth had been neatly bound in the sack, gagged, and rolled in a rug; and, as he was no great weight, they handled him almost with ease. They commenced the descent, and vanished after their leader.

The King's natural desire to help the helpless—it was only a faint desire in this case—was easily overcome by the counsels of prudence.

He lay still until he felt that all peril had passed. Then he sped lightly to the Pavilion, where he found everything in a surprising state of order. The fishermen were evidently persons of method and discretion, with a capacity for details. Indeed, the whole affair betrayed prearrangement and organisation to an almost startling degree.

After a careful and admiring examination, he closed the door behind him and left the building. During all these movements he had been thinking swiftly, every faculty spurred to its utmost. Without hesitation now, he ran along the cliff-top, sheltering himself as much as possible until he was among the shrubs that screened the entrance-gate of the park. And here, as he had anticipated, he found a bicycle hidden, dusty indeed, but evidently of excellent quality. A small travelling-case was strapped to the saddle.

When this adventure is charged against his Majesty's reputation, let his youth be remembered—a youth cramped for three years in the iron bands of royal etiquette, with the inflexible Rubin as mentor. It had been, too, a day of mingled rebellion, trial, and bitterness; but it was also a day of early summer, with the world's returning youth in every breath from the sea. Last, but not least, there was this adventure,

in which he had witnessed an abominable outrage clearly directed against his own person. It was so bold as to suggest some strong force in the state which would dare all things to injure him; and while it did not give him any sensation of fear, it roused his resentment to an extreme degree. Surely these influences were well calculated to overwhelm for the time all sense of responsibility, and to lead him to take with a light heart a path of which he could not see the end.

In a moment he had run the cycle out to the road, where he walked it some fifty yards or so to a commanding point. There he stood, his face turned seaward, until a small boat shot out from under the cliff bearing three men. There was probably an inert figure lying in the bottom, but it was quite invisible from such a distance. As soon as the shelter of the cliff was passed a sail was run up, and the little craft went steadily out to sea.

Conrad turned to the cycle and gave it a friendly smile. 'The adventure was as much his as mine,' he said. 'May he not tire of his share in it! As for you, you're as much mine as his, and hitherto he alone has had the use of you! Let us correct that injustice!'

WAR, WINE, AND WALNUT.

By Sir JAMES YOXALL, M.P.

WARS affect wine-importing, of course; it is easily evident that too much '*Hoch der Kaiser!*' has been bad business for hock. Our quarrels with France kept claret and burgundy out of Britain for ten and twenty years at a time, and our friendship with Portugal let port and the gout come in. But what about walnut? I do not mean walnuts, but *walnut*. It is partly a matter of tables—dining-tables, upon which wine came, and under which, after four or five bottles apiece, men went. It is partly a matter of muskets, too; muskets, which in war—But there, I have proved the link.

This triple subject came to me by chance. A project for a war-tax on wines set me searching the House of Commons Library, that graveyard of projects. I wished to study the statistics of wine-taxing in the past, and did so; but I found the mere figures as dry as corks. What lay behind them, however? Patriotism. It was not taxed prices but patriotism which changed our national taste in wine-tippling. 'Give me a bottle which doesn't come from the French or the Spaniards,' the Georgian gentry used to cry.

In the year 1702 those few bibulous forebears of ours consumed no less than two thousand and fifty-one tuns of French wine; and a tun was four hogsheads, mind you, two hundred and fifty-

two gallons—in all, a matter of four million pints! Then we fiercely went to war with France, and our consumption of French wine dropped to one hundred and thirty tuns. Twenty-seven and a half million pints of sherry were being drunk here the same year, too; but Spain also joined our enemies, so straightway the tuns of Spanish wine brought to London fell from thirteen thousand to one thousand five hundred. I use figures as round as the casks.

As for walnut, walnut timber, it also for a war reason ceased to be used here. Oak, heart-of-oak, had been the only timber used for British dining-tables right up to the end of the reign of James II. But walnut furniture, beginning to be fashionable under William and Mary, became the rage under Queen Anne. Walnut dining-tables of that period are excessively rare, however; slabs of walnut-wood had become scarce, apparently. Why?

It is known that under George I., who succeeded Queen Anne, mahogany furniture became general, and remained so for a century, until walnut came in again for a time when Queen Victoria was young. It was around 'the mahogany-tree,' as Thackeray called the dining-table, that the three-bottle men swigged, and under it that they snored. Most people know

that, of course; but hardly anybody knows why walnut, the beautiful and durable English walnut timber, should have gone out of use so quickly. The 'reign of walnut' in furniture was brief, from about 1689 to 1720 only. Why?

I used to think that a whim of fashion accounted for this quick change from walnut to mahogany. But, like many of the things which one used to think, that was wrong. A friend of mine who is a biographer of the great Duke of Marlborough lit up the matter for me by a casual remark the other day; he said that the Duke commandeered all the walnut in England for military purposes. English walnut had become nationally registered, so to speak; all the trees were cut down, and all the timber was cut up. And why? To make butts or stocks for the muskets which Marlborough's soldiers carried to victory at Blenheim, Ramillies, Malplaquet, and Oudenarde.

History repeats itself, they say. She does; she even plagiarises herself. For news came from Brussels a year ago that all the walnut-trees and walnut timber in Belgium had been looted; the wood had been commandeered, and carried away to Aix and Essen to be made into rifle-stocks for German recruits. So that now again there must be, as there was in the eighteenth century, a dearth of this beautiful timber, for walnut-trees grow very slowly; during a century to come there can be no dining-tables made of Belgian walnut, just as none could be made of English walnut between the reigns

of George I. and Victoria. Even minor history repeats itself, therefore, and the lesser Clio sings the same song over and over again; yet who could have thought that this particular connection could be related 'over the walnuts and the wine'?

But what of port and the gout? Well, Portugal stood our constant ally, and her vine-growers profited by that. Port, 'rich, fruity port,' as it was in those days—port, the very life-blood of gout—was drunk with patriotic gusto all over the United Kingdom, by Irish squires, Highland lairds, and English fox-hunters; in port wine they drank damnation to France, '*France tant jolie*,' that realm of beauty and delight, the 'sweet enemy' which is our gallant ally now. Therefore I sometimes get in a toe a twinge of the self-same pain that racked my great-great-grandfather's foot; therefore those Chippendale mahogany leg-rests which one sees in old-fashioned clubs still have occasional use.

Will German-grown wine ever get back into large patronage in this country? There was little of it imported during the eighteenth century, even when 'Germany' stood for peace; Rhenish wine mounted up to one thousand four hundred and thirty tuns during our French and Spanish quarrels; but in peace-time it dropped, all through the century, down as low as eighty-eight. Perhaps 'German' was then thought to stand for 'sour'? It certainly stands for that, and for worse, with the whole world now.

PINCHER MARTIN, O.D.

A REALISTIC STORY OF THE INNER LIFE OF THE ROYAL NAVY.

By TAFFRAIL, Author of *The Bad Hat*, *The Decoy*, *An Eye for an Eye*, &c.

CHAPTER VII.—continued.

III.

'REQUEST-MEN an' defaulters—'shun!' bawled the master-at-arms, as the commander passed aft along the quarterdeck and took his stand behind a small scrubbed table upon which were a pile of papers and several ponderous-looking books.

'Petty Officer Weatherly!'

The petty officer left the line, stepped smartly forward to the table, clicked his heels, and saluted.

'Petty Officer William Weatherley,' the M.A.A.* went on, 'requests hextension o' leaf till two P.M. on Monday.'

The commander looked up. 'Can he be spared?' was his first question.

'Request's signed by the torpedo lieutenant, sir,' the M.A.A. explained; for Weatherley,

being a torpedo gunner's mate by calling, was one of Hatherley's myrmidons.

'Why d'you want this extension?' the commander asked, playing with a pencil.

'Urgent private affairs, sir.'

'Yes, quite so. But what are the private affairs, and why are they urgent? Week-end leave expires at nine o'clock on Monday, you know.'

'I can't very well say, sir,' the petty officer said, glancing at the crowd of ship's corporals round the table. 'My reasons are rather private, sir.'

'Oh, I see. Can you tell me?'

'Yes, sir.'

The commander left the table, beckoned the man after him, and walked aft out of earshot of every one else. For quite a minute they talked together, and then the officer nodded, and

* M.A.A., master-at-arms.

Weatherley, with a pleased grin, saluted and marched off.

'Request granted, master-at-arms,' the commander observed, coming back to the table. 'Next man.'

The M.A.A. made a note in his book. 'Able Seaman Billings!' he called.

Joshua ambled aft at a jog-trot, halted in front of the table, and, from sheer force of habit, removed his cap.

'Keep yer 'at on!' growled one of the ship's corporals in an undertone. 'You ain't a defaulter!'

The commander turned his face away to hide a smile, and Billings, covered with confusion and rather redder in the face than usual, resumed his headgear.

'Able Seaman Joshua Billings. Requests a turn o' week-end leaf out o' watch.'

'Has he got a substitute?'

'Yessir.'

'Why d'you want leave out of your turn?' the commander asked, eyeing the A.B. with a half-smile hovering round his mouth. 'You've been ashore a good bit lately, haven't you?'

'Yessir, I 'as,' Joshua answered, fidgeting. 'But ye see, sir, it's like this 'ere. I've got werry himportant business ashore 'ere, sir, an' I wants to git it fixed up.'

'What sort of business? Money, or something of that kind?'

'No, sir. 'Ardly that. It's ter do wi' a lady, sir—lady wot lives ashore 'ere an' keeps a sweet an' bacca shop wot sells noospapers. I'm—I'm——' Joshua paused, licked his lips, and shifted his feet nervously.

The commander smiled. 'Are you—er—in love with the lady?' he asked.

The master-at-arms and one of the ship's corporals cleared their throats noisily.

'Yessir, that's abart it. Yer see, sir,' Billings went on, in a sudden burst of confidence, 'I sez ter meself that it's abart time I started lookin' round fur somethin' ter do w'en I leaves the service, seein' as 'ow I'm close on me pension, an' I sez ter meself'——

'Yes, I quite understand,' the commander interposed kindly. 'Time is short, and you needn't go into details as to how it happened. You've behaved yourself well for the last couple of months, so I'll grant your request. You mustn't make a habit of it, that's all. Look out, too, you don't get into trouble, and, above all'—he looked up with a smile—'beware of evil companions. I wish you luck in your affair, Billings.'

'Thank you, sir. Same to you, sir.'

'Request granted. 'Bout turn, double march!' broke in the M.A.A.

Joshua saluted and trotted off, very much pleased with himself.

Several other requests were dealt with, and then came the turn of the defaulters.

'Ord'nary Seaman Martin!' shouted the M.A.A.

Pincher, arrayed in his best serge suit, in the hope that his smart appearance might mitigate his offence, ran nervously forward and halted in front of the table.

'Orf cap! Ord'nary Seaman William Martin. First, did remain habsent over leaf two an' a narf hours, an' was happehended an' brought aboard by the naval patrol. Second, did create a disturbance in St John's Street, Weymouth, at 'arf-parst nine p.m. hon th' night o' the eleventh hinstant.'

The commander rubbed his chin thoughtfully and gazed at the buff charge-sheet on the table in front of him. 'Where's the petty officer of the patrol?' he asked, without looking up.

'Petty Officer Bartlett!'

The petty officer hurried forward, and halted with a salute.

'Make your report,' said the commander.

'The night before last, sir, at 'arf-parst nine, I was in St John's Street with the patrol, w'en I sees a bit o' a crowd collected, an' some one tells me that two sailors was fightin'. I 'urries forward, sir, disperses the people with the hassistance o' a policeman, an' finds this 'ere man, sir'—he indicated Martin with his thumb—'fightin' with hanother man.'

'Who was the other man?'

'Ship's stooard's hassistant from the flagship, sir. I've forgot 'is exac' name.'

'Well, go on.'

'Well, sir, I happehends 'em both, an' takes 'em off an' keeps 'em under harrest, at the same time informin' the orficer o' the picket wot I done.'

'Who was the officer of the picket?'

'I was, sir,' said Lieutenant English, coming forward.

'Did you see those men fighting?' asked the commander.

'No, sir, not actually fighting. I saw them both immediately afterwards.'

'Were they drunk?'

'No, sir. They were excited, and the ship's steward's assistant's nose was bleeding badly.' There was no necessity for the officer to describe Pincher's injuries, for that youth had a remarkably fine specimen of a black eye.

'Did they resist the patrol?' the commander asked, turning to Petty Officer Bartlett.

'Not this man, sir. 'E came along quite quiet. The other man kicked up a bit o' a dust.'

'H'm! I see,' the commander observed with his lips twitching.—'What have you got to say?' he added, addressing Martin. 'First, why did you break your leave?'

'Please, sir,' Pincher explained with the air of an injured innocent, 'I 'adn't no intention o' doin' it. I comes down ter th' pier at seven o'clock an' finds the boat jest shoved orf. The

clocks wus all wrong, sir. I sez ter meself I'll come orf by the late oficers' boat at arf-parst ten; so I goes back, sir, 'as a bit o' supper, an' then, at 'bout arf-parst nine, I meets Parkin'—

'Who's Parkin?'

'Im wot I was fightin' wi', sir.'

'Go on.'

'I meets 'im in the street, sir. We ain't the best o' friends, 'cos me an' 'im 'ad a bit o' a shimozzle'—

'Shimozzle!' echoed the commander, looking rather puzzled. 'What on earth 's that?'

'Bit o' a dust-up, sir,' Pincher explained.

'Well, go on.'

'Well, sir,' the culprit resumed, 'we 'ad a bit o' a hargument at th' skatin'-rink abart a week ago. 'E was walkin' in the street along o' a lady, sir; but as soon as 'e sees me 'e leaves 'er an' comes across ter me. "You dirty little 'ound!" 'e sez, usin' 'orrible langwidge, "I've got yer now!" "You keep a civil tongue in yer 'ead, Mister Parkin," I sez, polite like. 'E don't wait fur no more, sir, but ups an' 'its me on th' 'ead. I couldn't stand that, sir, so I 'its 'im back. We 'adn't bin at it no more'n five minutes,' he added regretfully, 'w'en the patrol comes along, sir.' Martin, who had been carefully drilled as to what he had to say by Billings, himself a past-master at the art of inventing excuses, reeled off his tale glibly enough, and then paused for breath.

The commander seemed rather perplexed. 'Why is it that Parkin and yourself are such bitter enemies?' he asked, looking up with a frown. 'Why can't you behave yourselves like ordinary people?'

'It's like this 'ere, sir,' Pincher said, going off into a long-winded and very complicated explanation, which brought in Emmeline, the affair at the skating-rink, and how it had all happened.

'Oh, I see,' the commander observed. 'A girl's really at the bottom of it—what?'

Martin hung his head and made no reply.

'You've got a very good black eye, I see, and a swollen mouth. Did you do him any other damage besides making his nose bleed?'

'Yessir,' said Pincher hopefully, looking up with the ghost of a smile. 'I thinks one o' 'is eyes is bunged up too.'

'Indeed! Well, so far as I can see, it's a question of six of one and half-a-dozen of the other.—Where's his record?' the commander asked, turning to a ship's corporal, who was holding an enormous conduct-book open against his bosom. 'H'm! No entries. Clean sheet. What division's he in?'

'Mine, sir,' said Lieutenant Tickle, coming forward.

'What sort of a man is he? Had any trouble with him?'

'None at all, sir. Does his work quite well.'

The commander turned to the misdemeanant.

'Well,' he said, speaking quite kindly and quietly, 'you haven't been in the service very long, my lad; but the sooner you realise we can't have this sort of thing going on the better. I don't object to fighting—we're all paid to do that when the time comes; but if you want to take on one of your squadron-mates, you'd better do it somewhere where you won't be seen. Brawling in the streets only gets the navy into disrepute, so bear it in mind.' He paused.

Pincher hung his head.

'I can't say which of you was to blame,' the commander went on, 'but I can't overlook your offence. However, it's the first time you've been up before me, so I'll let you off lightly. You'll have seven days No. 10;* and next time you want to fight anybody, or anybody wants to fight you, you let me know, and we'll provide you with boxing-gloves, and let you hammer each other on board during the dog watches. This man was bigger than you, eh?'

'Yessir.'

'Well, I'm glad to see you've got pluck, and I'm glad you gave him more than he gave you. That's all. Don't come up before me again, mind.'

'Seven days No. 10! 'Bout turn! Double march!' ordered the master-at-arms.

Pincher ran off, rather pleased with himself. It was the first time he had been a defaulter, and he had dreaded the ordeal; but he found the commander was quite human, after all. Moreover, he had expected to be punished far more severely for the affray; while the leave-breaking offence, for which he was liable to a mulct of one day's pay and stoppage of one day's leave, had been completely ignored. The fact of the matter was that the commander, though he took good care not to say so, sympathised with Pincher in his heart of hearts. He liked a man who stood up for himself, and when he had interviewed the other defaulters he called Tickle to his side.

'That fellow Martin of yours,' he said; 'he seems a plucky young devil for his age?'

'He is, sir,' the lieutenant agreed; 'quite a promising lad. I've had my eye on him for some time. He's got plenty of—er—guts too, sir. English tells me that fellow who went for him was double his size.'

'So much the better,' the senior officer grinned. 'I wish he had knocked him out.'

For the next week Pincher was undergoing the rigours of No. 10 punishment. He didn't like it at all. To start with, he had to turn out of his warm hammock at four-thirty A.M., had his meal-times cut down to the barest minimum, while all his spare time was taken up in rifle exercise, physical drill, or extra work of some kind. It was far too strenuous to be pleasant,

* No. 10 = a particular form of punishment.

particularly as his leave was stopped, and he could not go ashore. However, with Billings's assistance, he found time to write a letter to Emmeline, which the A.B. delivered.

'DERE MISS FIGGINS'—it ran—'i am in trubble, having got in the rattle for fighting Mister Parkin larst thursday night in Weymouth. i made his nose bleed agen, and bunged up one of his eyes. i got a black eye and a swollen mouth, and seven days No. 10 for my trubble; but i hopes to come ashore agen next friday. i'm glad he got the wurst of it. Hoping this finds You as it leaves me—[It is to be hoped that Emmeline, also, had not got a black eye and a swollen mouth]—I remains, miss, your obedient servant,
WM. MARTIN.'

The missive elicited a reply.

'DEAR MR MARTIN'—it said—'I am sorry to hear that you have been punished, but Mr Billings says it is not serious. I am glad to hear that Mr Parkin got the worst of it. I do not like him. The shindy at the skating-rink was all of his making, and he deserves what he got and more. Mother will be pleased if you will come to tea on next Friday at five o'clock P.M. I will be in, and you can tell us all about it. I hope your face will soon be all right. My Mother says Zambuk ointment cured Father's face when he fell off a cab once, and I have asked Mr Billings to get you some. With compliments, I am yours sincerely,

'EMMELINE FIGGINS.'

For several nights Pincher slept with Emmeline's note beneath his pillow.

(Continued on page 500.)

EXAMINATION OF WITNESSES.

THE HUMOUR AND THE PATHOS OF IT.

By 'BARRISTER-AT-LAW.'

IT is an impressive fact to remember that thousands of people every year are compelled, in the interests of justice, to be examined and cross-examined in our courts of law. They represent every type of character, and are drawn from all classes of society. There is the flippant witness, always ready with a pert answer; the dogged witness, generally a very ignorant individual; that unfortunate person, the nervous witness, who says 'yes' when he or she means 'no;' the humorous witness, the *bête noire* of young barristers; the cunning, canting, positive, perjured witness; and many other kinds which I need not enumerate. Most go through the ordeal of examination without suffering any material damage; on the other hand, many receive injuries of a more or less serious nature, whilst some leave the courts with their reputations absolutely ruined. A few suffer the unhappy fate of being taken straight from the witness-box and placed in custody on account of the self-incriminating evidence which their examination has revealed. The witness-box is, indeed, the scene of many dramas, comedies, and pathetic incidents. It is my purpose in this brief article to illustrate this by a few cases which have come within my own experience, or of which I have heard from reliable sources.

The perjurer is probably responsible for more dramatic surprises in the courts than any other type of witness. The reasons for his false swearing are, of course, varied. Sometimes his conduct results from a desire to get a friend cleared of a criminal charge. The most amusing instance of this kind of perjurer I have ever heard of occurred in a case at Warwick. A certain

man was charged with burglary. The prisoner's defence was an alibi. He swore that at the time when the burglary took place he was with some friends at a public-house several miles away from the scene of the crime. These friends turned up at the court to support the prisoner's statement. The first of them to be put in the witness-box was an Irishman. He told the court that at the time the burglary was committed the prisoner was with him. He was very emphatic as to the time it was in the evening when the prisoner was with him. The reason he was so positive was, so he alleged, because he had particularly noted the time by the public-house clock.

On rising to cross-examine him, the prosecuting counsel made one request to the witness which completely shattered the man's evidence. He asked the Irishman to look at the clock in the court, and tell him the time. The man at once became confused, and, after looking at the clock for some time, at last muttered, 'Such a rum un!' He couldn't tell.

'Can't you tell a clock?' asked the counsel.

'Shure, sir, I can't tell un,' was the reply.

The extraordinary thing was that only one out of the six witnesses was able to tell the time from the clock. It was simply a case of a well-planned alibi, which would have certainly been successful had not the prosecuting counsel chanced to reveal the men's inability to read the dial of a clock.

Undoubtedly the most despicable miscreant is the witness who goes into the box and falsely swears against a prisoner either from motives of hate, revenge, or any other cause. Probably one of the most dramatic exposures of such a witness

ever known was achieved by Abraham Lincoln, the famous American President, when he was a young man. A young fellow named Grayson was charged with murdering another young man called Lockwood by shooting him. The evidence against Grayson was very black, the chief witness for the prosecution being a French-American named Sovine, who was with Lockwood at the time he was murdered. This man swore that he saw Grayson fire the fatal shot.

Now Mrs Grayson, the mother of the prisoner, after vainly trying to get one or other of the well-known lawyers in her district to defend her son, was fortunately driven to entrust the task to the then unknown and untried Lincoln. This was his first case. Few lawyers on such an occasion have so ably and brilliantly acquitted themselves as did Abraham Lincoln in his defence of Grayson.

To the amazement of everybody in the court, the young lawyer never uttered a word or cross-examined any of the witnesses at the trial until Sovine appeared in the box. His cross-examination of this man was a masterpiece, and as it is so short and dramatic I give it in full.

Lincoln—‘And you were with Lockwood just before, and saw the shooting?’ *Sovine*—‘Yes.’

Lincoln—‘And you stood very near to them?’ *Sovine*—‘No; almost twenty feet away.’

Lincoln—‘May it not have been ten feet?’ *Sovine*—‘No; it was twenty feet away.’

Lincoln—‘In the open field?’ *Sovine*—‘No; in the timber.’

Lincoln—‘What kind of timber?’ *Sovine*—‘Beech timber.’

Lincoln—‘Leaves on it are rather thick in August?’ *Sovine*—‘Rather.’

Lincoln—‘And you think this pistol is the one used?’ *Sovine*—‘It looks like it.’

Lincoln—‘You could see the defendant shoot, see how the barrel hung, and all about it?’ *Sovine*—‘Yes.’

Lincoln—‘How near was this to the meeting-place?’ A revival meeting was being held, to which Lockwood was going at the time of his death. *Sovine*—‘Three-quarters of a mile off.’

Lincoln—‘Where were the lights?’ *Sovine*—‘Up by the minister’s stand.’

Lincoln—‘Three-quarters of a mile away?’ *Sovine*—‘Yes, I answered ye twice.’

Lincoln—‘Did you not see a candle there, with Lockwood or Grayson?’ *Sovine*—‘No. What would we want a candle for?’

Lincoln—‘How, then, did you see the shooting?’ *Sovine*—‘By moonlight,’ defiantly.

Lincoln—‘You saw this shooting at ten at night, in beech timber, three-quarters of a mile from the lights, saw the pistol-barrel, saw the man fire, saw it twenty feet away, saw it all by moonlight? Saw it nearly a mile from the camp lights?’ *Sovine*—‘Yes. I told you so before.’

On getting this answer, Lincoln put his hand into a side pocket and drew forth a blue-covered

book. By this time the people in the court had been worked up to a high pitch of excitement, and were watching the gaunt young advocate with breathless interest. The book turned out to be a well-known almanac. Having got the permission of the court to put it in as evidence, Lincoln soon proved that on the night of the crime the moon was unseen, and in fact did not rise until one the next morning. Then, with dramatic suddenness, he turned to the judge and asked that Sovine should at once be arrested and charged with the murder of Lockwood, saying that ‘nothing but a motive to clear himself could have induced him to swear away so falsely the life of one who never did him harm.’

The wretched Sovine at once collapsed, and there and then confessed that he had killed Lockwood accidentally.

Though we all abhor the deliberate perjurer, yet all of us must feel deep sympathy for one who, imagining that he is speaking the truth, swears falsely, and leaves the witness-box with the black stain of perjury impressed upon his character. The best and most famous instance of this type of witness that I know of was a Catholic priest who was a witness for the Claimant in the Tichborne case. Writing of him, Mr Serjeant Ballantine said: ‘This gentleman gave his evidence in favour of the claim with great firmness and evident honesty of intention. He was subjected to a severe cross-examination, and suffered greatly under it. He was one of those men, of not an uncommon type, whose feelings had been reached without a sufficient aid from reason; who did not dissect sufficiently from materials before him what he really knew from what had been impressed upon his mind from other sources. Witnesses of this kind cut but an awkward figure in the hands of a skilful counsel; the more so that they feel that they may have been misled and have conveyed erroneous ideas. Such a feeling is very trying to a conscientious man, and it was evident that this gentleman suffered greatly.’ Indeed, the poor man suffered such mental anguish that soon afterwards he went out of his mind, and ended his days in a lunatic asylum.

Clergymen make, as a general rule, bad witnesses. One of the reasons is that they so often use such exaggerated epithets in describing incidents and impressions as to lay themselves open to ridicule. The following true incident admirably illustrates my meaning. A middle-aged and eminently respectable clergyman of the Anglican Church, in the course of giving evidence, described the conduct of a young man and woman as debased and disgusting. The reason he gave for his severe judgment was that he had seen the man kiss the girl and hold her hand. In his cross-examination he was asked whether he had ever kissed a girl and held her hand. The worthy man frankly admitted he had. ‘But,’ he naively explained, ‘she was a Sunday school

teacher.' This answer, of course, convulsed the whole court, and gave the impression that he was a canting humbug.

Medical witnesses are a fruitful source of 'sport,' the main reason being that often doctors engaged in the same case will give, quite honestly, diametrically opposed views and opinions on the matter before the court. Their weakness for using highly technical and scientific words quite needlessly is often amusing. A good instance in point is the case of a young medico who, asked to describe the injury of a man he had examined, said, 'I discovered considerable ecchymosis under the left orbit, caused by extravasation of blood beneath the cuticle.' In answer to the judge, he admitted that he meant the man had a black eye. Medical witnesses are often guilty of giving unnecessary and foolish details in the course of their evidence. I was present in court at Quarter Sessions quite recently when a very self-complacent doctor was describing the condition in which he found a prisoner, who was charged with attempting to kill himself by cutting his throat with a razor, soon after the wretched man had made the attempt. Having carefully described how he found the man, and the nature of the self-inflicted wound, he concluded his evidence by gravely stating, 'The man was living.' The chairman of the bench, humorously looking at the doctor, and then at the prisoner in the dock, very much alive indeed, said in a dry tone, 'I can well believe it, doctor.' The court tittered, and the unfortunate witness blushed exceedingly.

The following cross-examination of a doctor, though very amusing to read, is full of pathos, for it unjustifiably branded a quite able practitioner with the stamp of professional incompetency. It forcibly illustrates how a clever and astute counsel may bluff a nervous witness into giving opinions and making statements contrary to his true judgment. The cross-examination occurred in a case where the knowledge of the doctor as to whether certain bones belonged to the skeleton of a woman or a man was of considerable importance. The object of the cross-examiner was to show that the doctor's opinion was unreliable.

Counsel (handing up to the doctor the two lower bones of a leg)—'Will you please take these, doctor, and tell the jury whether in life they constituted the bones of a woman's leg or a man's leg?' *Doctor*—'It is difficult to tell, sir.'

Counsel—'What! can't you tell the skeleton of a woman's leg from that of a man's?' *Doctor*—'Oh, yes. I should say it was a woman's leg.'

Counsel (smiling and looking pleased)—'So, in your opinion, doctor, this was a woman's leg?' It was a woman's leg. *Doctor* (observing counsel's face, and thinking he had made a mistake)—'Oh, I beg your pardon, it is a man's leg, of course. I had not examined it carefully.'

Counsel—'Is it the right or left leg?' It is very difficult for the inexperienced to distinguish right from left. *Doctor*—'It is the right leg.'

Counsel (with a great show of surprise)—'What! the right leg?' It was the right. *Doctor*—'Pardon me, it is the left.'

Counsel—'Were you not right the first time, doctor? Is it not, in fact, the right leg?' *Doctor*—'I don't think so. No; it is the left leg.'

Counsel—'Please put the skeleton of the foot into the ankle-joint of the bones you already have in your hand, and then tell me whether it is the right or left leg.'

By this time everybody was highly amused by the contradictory answers of the unfortunate doctor, who nervously proceeded to adjust the bones. Having done so, he turned to his tormentor and said, 'Yes, it is the left leg, as I said before.'

Counsel (uproariously)—'But, doctor, don't you see you have inserted the foot into the knee-joint? Is that the way it is in life?'

At this strange climax the court simply rocked with laughter. The counsel sat down, having achieved his end by making the wretched doctor appear an incompetent fool.

Sometimes, but very rarely, I am glad to say, counsel are needlessly cruel. One case in particular I remember in which counsel brutally abused his power by unjustly and needlessly forcing a witness to reveal a dark incident in his past for which he had fully atoned. In his youth he had committed a felony for which he had been punished by the law. After he had come out of prison he had moved to a part where he was not known, and by years of honest industry and high endeavour had become greatly respected and honoured among his fellow-citizens. The first question he was asked on cross-examination was whether he had ever been convicted of felony. It was pitiful to see the effect the question had upon him. Obviously labouring under deep emotion, he admitted that he had twenty-nine years previously. The judge then interfered, saying in a kindly voice, 'You were only a boy?' 'Yes, my lord,' answered the distressed man in a low voice. I am pleased to say that judge, jury, and all present felt nothing but pity for the witness and disgust for the man who had caused him such unnecessary torture.

With this last sad story I will conclude my brief sketch of the humour and pathos which often arise from the examination of witnesses. Of course, in so short an article it is only possible to touch the fringe of the subject, and convey some slight idea of the wealth of human tragedy and comedy to be found in our courts. Before I write 'finis,' allow me, as counsel, to give all my readers one piece of advice gratis—avoid litigation as you would the devil.

A BLOOD-FRENZY.

By L. B. THOBURN-CLARKE.

WE three girls had always been chums, and when the youngest of the trio married the manager of the new 'run' that had just been 'opened up' on the Maungakawa Ranges, we were naturally the first guests that she asked to stay with her.

It was a lovely autumn evening, very bright and clear, when Alice St Maur and I arrived at the station, and were greeted by Winifred with enthusiasm. We had enjoyed the twelve miles' ride through the bush that covered the slopes of the Ranges, and admired the wonderful ferns that concealed the ground or else towered in tall trees far over our heads; but we were not impressed with the station. Winifred was intensely proud of her new home; but as it was our first experience of a newly 'opened up' station, the four-roomed weather-board house, long thatched stables, and tiny roust-about's cottage appeared rather miserable affairs, set in a wide green slope that stretched down towards the plains. We were, however, immensely impressed with the strong fences that surrounded the stockyards and home paddocks.

The 'run' had once been a Maori settlement, but had been deserted by its original inhabitants for many years, although the tiny burying-ground was still intact, and carefully surrounded by a high fence; for the Maoris are very jealous of their burial-places being desecrated by the whites. The view was magnificent, and from the front of the house one could look down the hills over the wide plains to the Thames Ranges, blue and misty in the distance. Behind the house, however, the primeval forest reached close up to the paddocks, while immense trees extended on either side like huge wings.

So far, the manager had been too busy fencing and building his house to attend to the 'falling' of the bush. Besides, it offered good sport, as the great trees were crowded with pigeons, and no station-hand is averse to varying the eternal diet of mutton. So the bush was practically intact, and extended for miles on the summit of the Ranges.

The life at the station did not turn out equal to our expectations. Winifred had not been married very long, and she and her husband appeared quite happy without any help from outsiders. The 'rouse-about's' wife did all the cooking, and consequently we were thrown upon our own resources. There were no books to read, only the stockmen to talk to, and naturally they didn't want to be bothered with two girls straight from town. We were unutterably dull. We longed to go home, but were afraid to hurt Winifred's feelings by suggesting such a thing. Fortunately we were rather adaptable girls, and

developed a fancy for sketching and collecting ferns. These pursuits occupied the greater part of the day, and in seeking the ferns we explored the bush for perhaps two miles at the back of the house and on each side of the station.

The bush was composed of immense trees matted together with creepers, and numerous parasitic plants as well as ferns grew in profusion on the trunks and branches. In fact, we could not have penetrated the forest at all if it had not been for the cattle-tracks that led in every direction. These had been made by the wild cattle, large numbers of which were said to haunt the forests of the Ranges; but for some time we did not see any, and were inclined to think that the stockmen were romancing about these animals. They were said to be the descendants of some cattle that had escaped from the early settlers. They were very wild and ferocious, especially in stormy weather, when the herds, with their leading bull, ranged through the forest attacking every one they met. The particular bull that led the mobs in the Ranges was a big red-black brute, whom the stockmen had nicknamed Black Bill. The high barred fences around the home paddocks had been built especially to keep him out, as he would descend upon the tame cattle, kill the steers, and carry off the heifers in a mad stampede to his hiding-place among the gullies and forests of the Ranges.

One morning there was an unusual commotion in the yards. The stockmen were riding backward and forward, yelling and shouting to each other; while we could hear the roust-about rolling barrels into the kitchen.

'What is the matter?' I asked, as we sat down to an extremely early breakfast.

'We are going to kill a beast and salt its flesh down,' replied the manager. 'Winifred is about tired of mutton. You'll see your first "kill," young women.'

'Oh!' shuddered Alice; 'I'd run a mile rather than see an animal killed!'

'You needn't stay,' said Winifred with a laugh. 'I knew you wouldn't like to see it; so I have packed a luncheon-basket with scones and sandwiches, and you can spend a day picnicking in the bush. When you come back this evening the beast will be cut up and the worst part of the "kill" will be over.'

'I'm jolly glad she didn't want us to help with the salting,' observed Alice, as we strolled across the home paddocks.

'So am I,' I replied. 'I hate rubbing salt into raw meat.'

'We'll have a good time sketching. What do you say to our climbing into a tree? We

could see the rounding up of the cattle, and then walk through the bush and eat our lunch on the Lion Rocks. Then, if Winifred alters her mind, we shall be too far away to be called back.'

We both laughed, and scrambled over the high five-barred fence. Then we turned and looked back.

The stockmen were bunched near the stables, and as we gazed in their direction one spurred his horse and galloped towards us. 'Don't go far,' he yelled when some yards away.

'Why?'

'Well, it's the first "kill" we've had on these Ranges, and there's no knowing how the station cattle will behave; and if the wild brutes scent blood there'll be a nice how-de-do. Better stay close at hand.'

'You're a croaker, Slim,' the manager called out.—'He's only trying to frighten you, Harrie.'

'He's new,' observed the stockman, jerking a thumb contemptuously in the direction of the manager. 'When he's lived on the Ranges as long as I have he'll have learnt a little sense. Take my tip, and don't go too far into the bush.' He turned and whirled off after the rest of the stockmen, who were galloping down the slopes towards the plains.

'There's one thing, we'll be safe enough if we stick to the rocks and the trees. The cleverest wild cow could not reach us,' observed Alice.

'But a blood-frenzy!' I said, feeling just a little bit nervous.

'Pooh!' cried Alice contemptuously. 'Do you believe all the old tales you hear? I don't.'

Alice seemed quite certain, so I meekly followed her to the mass of dead and living trees, from the branches of which we were to watch the rounding up of the station cattle. These trees had died and fallen; but, held by the mass of creepers, they had lodged against an immense living tree, forming a sort of triangle, up one side of which it was possible to climb and thus reach the lower branches of the upright giant. In a few minutes we were sitting on our perch about seventy feet from the ground, looking eagerly down to the plains where the stockmen were rounding up the cattle.

It was all very exciting, for the cattle were half-wild, and objected to the whole proceeding; but in a very short time they had been driven into the home paddocks, and the victim, a beautiful red steer, was being 'cut out.'

It was no easy task, for the steer dodged in and out of the herd, which bunched in a mob, or else galloped furiously up and down the paddocks. But at last he was separated from the herd and driven into the stockyard; while the rest of the mob, urged by stock-whips and yells, rushed madly through the slip-bars and down the slopes back to the plains.

'Shut the slip-bars,' yelled Slim to the stockmen, 'or else the beasts will come back again.'

The stockmen apparently paid no heed to

Slim's command; for, after driving the cattle on to the plain, they returned, leaving all the slip-bars down. We could see the cattle galloping up the Ranges; while, far below, the angry herd bunched together, evidently far from pleased with their treatment, and resenting the absence of the red steer.

'Why,' exclaimed Alice, 'the silly creatures are coming back!'

The cattle, with tossing heads and short, sharp bellows, were moving back towards the nearest slip-bars. Just at that minute we heard the sharp crack of a rifle, which meant that the steer was killed.

'Come along, Alice,' I said; 'let us go on to the rocks. I don't want to see the steer cut up.'

'Very well,' she replied reluctantly; 'but we must hurry. The cattle are really coming back. They look very angry.—Slim,' she called to the stockman, who was walking across the paddock, 'the slip-bars are down, and the station cattle are coming back.'

'Good Lord!' yelled Slim as he dashed back, and in a few minutes he was galloping off to shut the slip-bars; but the cattle were too furious to be stopped, and we could hear them bellowing and apparently rushing backward and forward as if seeking an opening in the fence.

'Come along, Harrie,' cried Alice; 'we'd better make a move. Winifred will be calling us in just when things are getting interesting.'

'But we cannot see the station from the rocks,' I objected.

'Of course we can't; but there is another of these forest monuments a few hundred yards away, and from that we can see the fun, and yet be far enough from unpleasant sights.'

We scrambled down, and ran hurriedly along a cattle track until we reached a wide opening in the forest, in the centre of which stood another forest giant with a group of dead ones leaning against it. The middle tree was so tall that the view from the summit commanded the whole of the station and a stretch of sloping country at the side. By this time the station cattle were bellowing madly, and the crash of their hoofs in the undergrowth of the forest made us hurriedly seek a perch at the top of the tree.

The scene in the home paddocks was exciting. Some men were busy skinning and cutting up the steer, while the rest were putting up the slip-bars that shut in the stable. Every one was working at lightning speed. They had hardly cut the steer into quarters and carried it into the house when a herd of cattle dashed madly for the slip-bars of the home paddocks, and broke them down with the mere force of numbers. Immediately every living thing vanished like magic, leaving the paddocks in the possession of the herd. The furious animals paused in a great circle, suddenly silent, their heads raised as they sniffed the air. Before they had been enraged at the loss of their com-

panion, but now they had caught the blood-scent. With a wild bellow they rushed across the paddocks straight to the place where the steer had been killed. With lowered heads they dug their horns into the earth, tossing the turf in clouds over their companions, stamping and trampling until not a blade of green grass was left. The triangle was knocked down, while the unfortunate steer's skin was torn into a hundred shreds as the infuriated cattle charged and galloped madly about the place.

'I never believed in a blood-frenzy before,' observed Alice; 'but it is true enough. What a noise they are making! Come along, we'd better be getting to the Lion Rocks; these cattle are safe behind the fences, and by the time we want to go home again they will be quiet enough.'

'Hadn't we better stay here?' I remarked. 'Why, there's Slim on the stable roof! What is he saying?'

We listened, but could not hear a word, the cattle were making such a row. He yelled and yelled, and then vanished apparently through the thatch of the stable roof. Still we didn't feel very much alarmed at not hearing what he had said, but descended the tree and made our way toward the Lion Rocks—a great mass of boulders in the heart of the forest, and about half a mile from the station.

We were walking quietly along, when we heard cattle bellowing in a different direction. Then came the crashing of undergrowth as some cattle forced their way through the forest. Bellow answered bellow, echoing horribly among the gullies and mountains.

'The wild cattle!' I cried, as I dashed madly for the rocks, which loomed up near at hand. Alice followed me closely; but we had only scrambled half-way up the steep sides of the rocks when a big red-black bull broke cover hardly three yards away. Alice screamed, but I was too frightened to utter a word. Fortunately the rocks were too steep for the wild cattle to attempt to climb, but they circled round and round, bellowing furiously. Then, answering the bellows of the herd in the home-paddocks, they dashed off to join in the blood-frenzy.

'Thank goodness they've gone!' cried Alice, as she sat down on the top of the rocks. 'I wish we hadn't come.'

I wished most heartily that I had stayed and salted meat. Even the reddest and rawest meat would have been preferable to sitting on a tall rock besieged by wild cattle. Alice was inclined to return to the tree-top, but I had too vivid a recollection of Black Bill's expressive countenance to risk meeting him on foot. The bellowing from the direction of the paddocks was terrific. Evidently the two mobs were holding a mass meeting on both sides of the fence.

We ate part of our lunch, and watched the sun reach the zenith and then decline. The frantic bellowing was not so insistent, and both

Alice and I decided that we would make a dash for the tree.

We crept very softly down the rocks, and were just about to run, when an angry bellow not far away sent us scampering back to the top of the tall boulders. The sun set and the moon came up gloriously bright, and the cattle were very quiet. We could not hear a sound.

'It's now or never,' observed Alice, slipping softly down the face of the rocks. 'The wind has changed, and perhaps the brutes will not smell us.'

I followed silently, and together we ran as fast as we could to the nearest clump of dead and living trees, and climbed up to our former perch on the branch. We gave a sigh of relief when we found ourselves safe. It was comparatively close to the next stronghold, which we intended reaching as soon as we found out if all the cattle were at a safe distance. We could not hear a sound, and apparently the cattle had gone away.

'It's all right,' said Alice.

'Are you sure?' I asked. But I was just as anxious as Alice not to spend the night in the tree-top, so I meekly climbed down in her wake, and again we dashed through the forest. Once more we gained our objective; but unfortunately the sound of our running awoke the sleeping herd, and in a moment they were crowding around the foot of the tree, tearing at the dead bark and ferns with their horns, and making us tremble with the added fright that the dead trees might fall away, and leave us stranded seventy feet above the ground, with not a single branch to help us to descend.

A sudden thunder-shower came down and drenched us, but sent the wild cattle stampeding through the woods, and quieted the home herd. We were wet to the skin in a few minutes, and although the night was fairly warm, we were very miserable. We felt that we must make a final dash this time to the fence, along which we hoped to crawl to the house. Then, to our horror, we saw, when the moon came out, that the wild cattle had broken down the fence, and that we were prisoners, for both of us were afraid to face the home herd on foot.

Alice groaned, and sat huddled up on the branch, while I dangled my feet over the edge and calculated how long it took to die of cold and misery. Suddenly we heard a loud 'Coo-ee!'

'Yes!' we screamed, both together.

'Where are you?'

'In the tree.'

'Sit tight, and when I dash up be ready to get on my horse.' Never before had any voice sounded so sweet as Slim's did. 'One at a time, mind.'

Alice scrambled down the dead trees, clinging to the creepers. Slim galloped up, caught her, and dashed off; while the night resounded with the bellows of the returning wild cattle. I was

certain Slim would not be able to return for me, for I knew how dangerous it was even to venture on horseback among the cattle when they were filled with blood-madness.

'Are you frightened to wait until the cattle are quiet again?' yelled Slim.

'No!' I screeched in response. I was in deadly fear, but I wouldn't own it for worlds, and sat shivering and miserable on my branch. The wild cattle were very uneasy, snorting and bellowing beneath me; but at last they quietened down, and I could hear them chewing the cud softly. I was sure I was quite forgotten; but suddenly I heard the sound of a horse's hoofs, and, peering down, I saw Slim waving to me from the side of the fence. He had apparently ridden round by the plains so as not to attract the wild cattle's attention. I climbed quietly down and waited breathlessly, as he dashed forward at a gallop and dragged me on to his horse before the wild cattle could charge. He

galloped off, with the wild cattle in mad pursuit, making a wide detour to the plains, so that the maddened herd grew tired and returned to the station, while we made our way cautiously to the front of the house and safety. Never shall I forget that mad ride through the vivid moonlight, and the snorting, furious beasts behind.

But even then we were not free of the wild cattle. For three days they held up the station, bellowing and stampeding, and tearing up the turf until there was not a green patch left even on the hillsides. It was useless to attempt to drive them away; it was even dangerous to endeavour to do it, so they were left alone. Then one morning they suddenly stampeded through the forest, carrying off the home cattle with them, bellowing furiously as they crashed madly away; but that was the last the station saw of either the tame or the wild cattle for many months. As long as I live I shall never forget the blood-frenzy of the wild cattle of the Ranges.

A GREAT SOLDIER'S HOLIDAYS.

By W. H. BERNARD SAUNDERS.

NIGHT was closing in—and a winter night, too, with a driving rain and a southing wind—when I arrived at the little roadside station of Addington, in Northamptonshire, where I was in the heart of the holiday district of General Gordon. In the gathering gloom, a mile or so away on the right bank of the Nene, a light or two glimmered, and that was Addington. A footpath by a ruined water-mill across the valley, now flooded, led to it. Whether there is a highway I cannot say. I do not think there is, for the stationmaster was very precise in directing me to the footpath.

I found the ruined mill all right, and might have regarded the large pool, the boundaries of which were now lost in the gloom, with more interest if I had then heard of its evil reputation. A quaint old footbridge crossed the river, the waters of which were swirling along from Naseby battlefield to the North Sea with a rush that became hushed as they eddied into the gloomy depths of the mill-pool. Over the bridge the path descended into the meadows. It was not yet too dark to see the footpath, and it led straight to the edge of the flood-water, into which it disappeared.

Surely I must have mistaken the station-master's directions, for this was no sort of a path-way to carry a stranger to Addington! Looking across the great waste of water, I saw something move upon the surface in the distance. It came upon the face of the waters, and was approaching me, and speedily assumed the form of a slender girl of about eleven or twelve, with a scarlet cloak over her shoulders, and she came tripping across the flood on large stepping-stones.

The dark and ominous ruined mill behind me, with its deep and gloomy pool, the moaning of the wind through the mill, the hissing of the rain as it fell into the flood, the wildness of the whole scene, made the child's presence a startling incongruity. The great square stepping-stones extended into the flood, and she skipped from one to another. A false step, and she would have fallen into the water. It was not a mere crossing of a stream, but the stones peeped out of the flood across the meadow for half a mile, with a wide waste of flood-water all around.

As the red-cloaked figure skipped off the last great stone on to the path where I stood, I asked if that was the way to Addington. She told me it was, and that I 'couldn't miss it.' I was not so sure about that myself; but before making the trial I asked the child what she was doing in such wild, stormy, and dangerous surroundings in the darkness. She was running to the station, she told me, for the evening papers, which she fetched every evening, and then delivered them in Addington village. No, her father could not fetch them, because he was ill, and had been for a long time, and she had no brothers. The money she earned helped to keep them.

The rain-laden wind blew keenly down the Nene valley; but to attempt to negotiate the stepping-stones with an umbrella up was impossible. However, here I was in the Gordon holiday country, and he had no doubt crossed these stones many times under very similar circumstances; so, keeping the lights of the village in front, I struck out across the flood, and realised the truth of the old proverb that difficulties overcome become blessings.

I am not going to describe the old-world village which opened before me, and the beautiful woodland country that I beheld from my bedroom window next morning. The valley of the Nene in the county of squires and spires has, like Devonshire, a charm of its own; but it is not grandeur—it is a soft, rich sweetness that thrills the heart and consoles; and, knowing the character of General Gordon, I did not find it difficult to see why it was that this little corner of rural England had been for years the holiday-resort of one of Britain's greatest heroes.

I quickly found that Addington, and the neighbouring village of Twywell even more than Addington, is steeped in golden memories of Gordon. A question about the parish churches, and Gordon appeared in the replies. What about those iron-furnaces in the distance? and Gordon was in the answer. I half-suspected that the great stepping-stones I had crossed were placed there by Gordon; but I found that they had been the original sleepers used when the railway was made half-a-century ago, and some benefactor in the district, on the advent of wooden sleepers, had secured the stone blocks and placed them where they now are to provide communication across the valley in times of flood.

Yet it is strange that it is only or chiefly in the villages of Twywell and Addington that these memories of Gordon may be found. Neighbouring villages have perhaps heard that General Gordon spent his holidays at Twywell or the immediate vicinity; but it is in a very narrow circle that these memories can be found. Strange as this may at first seem, yet to those who knew the General it is not difficult to understand. He loved to be unknown, little thought of, little esteemed, from a genuine and natural conviction of his own unworthiness. The slight, blue-eyed man, whom the villagers might pass without taking a second look at, if they were not told about him, lived for long periods at Twywell, known and loved by every man, woman, and child—especially by the children—in that and the adjoining villages. He was known to them as the 'little blue-eyed Colonel' when he first began to spend his holidays in the district. He romped with the village boys, knew every child in the village personally, and was the friend of every man in the place.

Yet beyond this magic circle little was known in the county concerning his association with the district. While the newspapers of England, and of the world, were filling their columns with the heroism of the General who laid down his life for his country, Twywell knew that he was theirs, that he belonged to them almost more than to any other part of England, that Twywell was in his thoughts almost always, that Twywell people were in his mind in the dark days of his imprisonment in Khartoum. Twywell people knew that the praise, the glory, the heroism of a great

life were reflected on their own village; that the rector of Twywell and the schoolmaster of Twywell and the people of Twywell were his friends—his holiday friends.

In General Gordon's *Journal* he speaks of going to Twywell 'to take a lodging.' But the rector of Twywell, the Rev. Horace Waller, F.Z.S., was his lifelong friend; and after the General's death the rector gave a lecture in the neighbouring little market town of Thrapston on his friend's life, and in this lecture he said: 'The General knew Thrapston well, although Thrapston might not have known anything about him at that period, for his retiring temperament was such that he hated anything like popularity. Had it been otherwise, they might perhaps have hoped to get him to give some details of his wondrous work publicly; but he never knew him to summon up courage sufficient to mount a platform or to take part in a conversation at a dinner-party. There was something in the man that made him tentatively shrink from anything which would tend to draw out from him any account of his deeds, or to express his opinions in public. It had been in times gone by the speaker's peculiar privilege to know General Gordon very well indeed. He did not know that any one had a much more copious correspondence with him than he had during some of the most eventful years of his life, and it was a special pleasure to him to receive these letters in the General's small handwriting.'

The country around Twywell had a fascination for General Gordon. He loved the countryside all around, and the ironstone works in the villages of Twywell and Slipton interested him immensely. There was no rush or turmoil or excitement in the General's holidays. It was his delight to mix and talk with the ironstone labourers; and even at Khartoum he had his humble holiday friends in his mind, and would send to the rector of the parish kindly inquiries about the ironstone workers, mentioning many of them by name, and referring to events or circumstances which had occurred in his vacations amongst them.

It was on one of his holiday visits to Twywell that Gordon made his first Holy Communion. He was a man, as every one knows, of deep religious convictions; but although the friend and sometimes the visitor of the rector, he would never sit in the rector's pew in the church, but would invariably take his seat amongst the ironstone workers, sitting as one of them.

The Twywell schoolmaster's daughter, Miss Gray, mentions how the soldier and hero of great campaigns would help at the Easter or Christmas decorations in the parish church. He would set himself amongst the workers, and would make wreaths of ivy-leaves. He could sew them together very skilfully, but found it rather difficult to thread his needles, so he got the schoolmaster's little daughter to do this for

him, while he made the wreaths. Every Sunday during his holidays the blue-eyed officer would be seen at each of the services, and always sitting amongst the working men of the congregation.

His lodgings during his holidays were in an unpretentious little house covered with a creeper, which is very much to-day as it was when he had his rooms there for his holidays. On one occasion a handsome present of game was sent by some of the neighbouring gentry to his landlord and landlady, Mr and Mrs Fowler, for the General. Mrs Fowler asked him for his instructions or wishes regarding the game. He replied, 'Do what you like with the game; but don't forget my little loaf, basin, and teapot.' That well represented the General's simple life and frugal fare.

His Christmas holidays were frequently spent at Twywell, as the children of the village, now grown up, have good reason to remember. He made them all happy with a great Christmas-tree in the schools, brilliantly lighted and laden with everything that could delight the heart of village maid or lad. He made devices, too, for the decorations of the walls of the church at Christmas-time, and even years after his death these devices were used. He was never happier than while taking part in the boys' village games, and going into the cottages of the villagers. Many a matron in Twywell and the neighbouring villages still speaks of the General calling in to talk with her father and mother, and taking the little ones on his knee, and bringing out dolls or toys, of which he had a stock like a Santa Claus. The organ in Twywell church bears the inscription: 'To the glory of God, and in memory of Beatrix Waller and Charles George Gordon of Khartoum, this organ was erected.' Miss Beatrix Waller was the young daughter of the rector; and, being threatened with consumption, she made her first Holy Communion at a very early age, kneeling beside her father's friend the General at the time, and died shortly afterwards.

Some curious stones surround the base of the cross on the Communion-table of Twywell church. These stones were picked up on Mount Calvary by the General; and concerning this little incident the old schoolmaster of Twywell, who is now living in retirement in Addington, and who had the privilege of being admitted to the personal friendship of the General during his holiday visits to the district, says, 'Wherever Gordon went it is recorded of him that he not only proved himself a great man, but also that he was a humble Christian.'

Many interesting stories are told at Twywell and Addington concerning the General. The schoolmaster, Mr Gray, has a varied stock of them. He relates that while Gordon as a young man was engaged in the Crimean war, a sergeant who had saved a little money asked him to send

this money to his wife in England. Gordon consented to do so, and the sergeant handed him seven pounds. Gordon added three pounds to this sum, and sent the woman ten pounds. It was not until the troops returned home that the sergeant learned that his seven pounds had grown to ten in transit.

One day while staying at Twywell a letter reached Gordon, and it had reference to an incident that speaks loudly concerning the General's character. While the forces were before Soochou, General Gordon noticed a little Chinese boy struggling in the mud, the top of his head and a pigtail alone being visible. This was a particularly barbarous method of Chinese punishment. Probably all the regiments in China might have passed by without noticing the lad; but little escaped the eye of the General. He stopped, pulled the boy out of the mud-hole, and told a soldier to take him to the rear, wash him, and look after him. Afterwards the General made the rescued lad his especial care, and had him educated at his own expense. One can imagine the pleasure of the General, during one of his holiday visits to Twywell, on receiving a letter from this boy containing portraits of himself, his wife, children, and his mother. He had been appointed an interpreter attached to Her Majesty's Embassy at Hong-kong. The letter also contained valuable information as to political affairs in China, was written most intelligently, and added that the advice given him in various letters by General Gordon had been published in the form of a pamphlet, and had been circulated all over China.

The impression created in Twywell, and still held at Addington, is that General Gordon had little idea of the value of money except as an agency for relieving other people's necessities. It not infrequently happened that while staying at Twywell it would be found he had been compelled to walk considerable distances, sometimes ten or twelve miles, because in rambling about he had met with cases of distress, and had given away every penny in his pocket, not reserving to himself even the price of his railway fare home.

THE CRUCIBLE OF GOD.

INTO the crucible of God is cast
The labouring earth and all that dwell therein—
Groaning and travelling in pain and sin,
Weighed down by heavy burden of the past—
There to be cleansed by sorrow's bitter tears,
Tried in the fire, purged of all the dross,
Humanity itself nailed to the cross
Until—regenerate—man reappears.

That Love Divine who maketh all things new,
Who out of winter's death unfolds the spring,
Can bring His children—broken, sorrowing—
Out of the crucible, with life endue,
Here in this new-made world new dawns to see,
And taste again life's joy and ecstasy.

FRANCIS ANNESLEY.

Chambers's Journal

SEVENTH SERIES

A TOUR IN THE BALKAN COUNTRIES.

By Professor E. H. PARKER.

IN the autumn of 1882 I hastened to Constantinople in order to gaze upon that bewitching capital before the Turkish Empire should disappear altogether, as the quidnuncs of the day asserted it would. Lord Dufferin was then holding the fort in Pera. The news of Tel-el-Kebir was subsequently conveyed to me by an affable Spaniard as I sat, *rusticus expectans*, on one of the benches near Zaragoza Cathedral, contemplating the stone bridge over the gliding Ebro; and a few weeks later I had the pleasure of inspecting the battle-ground, the destroyed forts, and a little later again of visiting Arabi himself at Colombo. But Turkey did not collapse, after all, and Abdul Hamid the Second, who had 'Amurath succeeded,' seems still to be 'cabinet'-making somewhere in Asia Minor.

Whilst the Italian war about Tripoli was going on in 1912, another uncontrollable desire to see the whole Balkan arrangements took possession of me; and, after some preliminary canters in Germany and Austria, I found myself driving up to the higher town of Agram, in order to inspect the headquarters of the Ban, or Governor, who was just then causing ructions amongst the southern Slavs by his summary, not to say tyrannical, treatment of them. The Croats call themselves *Hrvat* (one syllable), and their capital Zagreb. Their Ban, appointed by the Crown of St Stephen—that is, by the King of Hungary and not the Kaiser at Vienna—is locally styled the Banus, and at the time was, strange to say, himself a Croat or *Hrvat* named Cuvaj (pronounced Tsuvai). Without entering into the now ancient history of the quarrel about suspending the constitution, &c., I may mention that Slav students of all kinds filled the streets as they shook the dust of the Agram university from their feet and returned to their native places in protest. Some of these students were genuine Slavs—Serbians and Bosnians; others were Bulgarians and even Rumanians, whose Slav sympathies were much stronger than any strain of Slav blood they may have had in them. At all events, there was great excitement, and plenty of muffled talk about acclaiming King Peter of Serbia as the coming monarch of all the southern Slavs. This was in the middle of April, as I was on my way by easy stages to Belgrade; but there was so much electricity in

the air that I decided to go out of my way a little to Sarajevo, and see how things looked there.

Whatever may be thought of Austrian policy since the Treaty of Berlin in 1878, and, above all, since Count Aehrenthal's bold annexation of eight years ago, it cannot be denied that economically the country has been wonderfully developed within the last generation. There were plenty of opportunities for observing this, and for conversing with Austrian military officers, with Turkish, Bosnian, and other local passengers, railway officials, and others, as the train carried us along. Especially is this the case with Sarajevo itself, which is now quite a smart, orderly, and prosperous town. Under the Turks, Bosnia seems to have been an obscure province, with a ramshackle capital *sans* inns, *sans* roads (*not sans* smell), *sans* everything. Our hotel, the 'Europe,' was being cleaned up for the coming season, and was therefore not looking its best; but it was sufficiently good, and, moreover, clean. The bazaar quarter of the old town is still quite Turkish, and the neighbouring Husref Beg Mosque is particularly interesting, with its spacious courtyard and magnificent tree under which the Mussulman population spends a good portion of its time in performing ablutions. I made the interesting discovery in the train that Croatian and Bosnian are as much the same language as are Dutch and Flemish, or Danish and Norwegian; the only difference is that Croatian is printed in Roman letters, whilst Bosnian is expressed in very slightly modified Russian letters; the public notices seemed to me to be absolutely identical not only word for word, but letter by letter. I drove over every part of the town, old and new; up Castle Hill, over the bridges of the river (Miljacka), walking through those parts of the Moslem quarter where there was no space for a carriage. For all I know, the place may have been seething with suppressed political emotion; but, if it was, I did not see or hear the slightest trace of it; peace, perfect peace, reigned everywhere; and yet it was here that the Austrian Archduke and his consort were murdered less than two years afterwards.

From Semlin to Belgrade you cross by the enormously long but somewhat tortuous iron railway bridge, partly blown up by the Serbians when war was declared. The Agram

students were just then engaged in demonstrating before King Peter's palace, the New Konak, which is quite close to the Hotel Moscow, practically the fashionable centre of the city, where all visitors, politicians, and military men congregate to dine, sup, play cards, or drink coffee, as the case may be. The 'lower orders' of the Serbians certainly seem to be a manly and independent race; social and political equality comes to them as to the manner born. It was interesting to observe how a big peasant, with his feet encased in awkward-looking bast shoes, wearing his sheepskin or blanket attire, with or without his wife or friends, would stalk into Belgrade's most fashionable restaurant, take possession of a table, and in a quiet but firm voice order the swallow-tailed waiter to bring the desired refreshments.

There is nothing of the metropolis about Belgrade. At that date only one short stretch of street in the whole town was asphalted. Nearly all the execrably cobbled chief streets were 'up' for repairs, waiting for money which was not there, and we were nearly shaken to pieces in plunging and bumping all over the place inside and outside the city, into ruts, over fields (to avoid the roads), helter-skelter, in a really effective two-horsed carriage, which the toothless but hilarious old jarvey recklessly drove through and over everything at breakneck speed. He had not much German, so we had to make the best shift we could with Russian. The waiter who served us with an excellent dinner was an advanced republican and a Rumanian; he confided to us—whilst detailing the latest news about Galician, Carinthian, Dalmatian, Bosnian, Herzegovinian, Bohemian, Slavonian, Ruthenian, Serbian, and other southern Slav aspirations—his own private sentiments that all the Balkan kings and princes should be incessantly hanged.

There are not many things to see in Belgrade: the old fortress, now presumably in ruins, with a splendid view over the Danube; the Toptschider Park (*toptschi* means 'cannon,' and *dere* 'vale'); and—perhaps the most interesting and pathetic of all—the obscure little chapel where lie buried without ceremony or record the remains of the murdered King Alexander and his Queen Draga. How long will it be before the Karagevitch dynasty plucks up courage to erect a suitable memorial?

Sofia is another unfinished capital, with vast empty spaces unbuilt upon. They were just beginning the new cathedral when I was there. King Ferdinand is much better housed than King Peter; but the real centre of affairs, here again, appears to be the Hotel Bulgaria close by. The courageous lady who accompanies me upon my otherwise solitary travels called my attention to a party of eight 'statesmen' who suddenly entered and took possession of a prepared table

next to us. The conversation was partly in French; but what with Bulgarian, Greek, Serbian, Russian—everything but German—the other languages were my despair. However, I remarked, 'I'm sure these fellows are concocting something about a Balkan alliance.' Just at that time MM. Deschanel and Roussel were going the rounds of the Balkan States, and possibly I may have gained some imperfect political notions from local newspapers I could not read or understand very well. Of course, we saw the Alexander mausoleum, the statue to the Czar Liberator, Prince Boris's garden, &c. The impression left upon me was that the man in the street was full of gratitude to Russia, and that the Czarlet Ferdinand was considered 'too much a friend and admirer of Hungary;' but these are questions of high politics upon which I am an incompetent judge.

'And so on to Constantinople.' The genuine Turk in his panoply of power first appeared at Mustapha Pasha, where I busied myself with the passports, putting up my capable companion to superintend the examination of our baggage. But the gallant old Turk, with a magnificent wave of the hand, would not think of even opening a single trunk of the five. However, he asked in French, '*Pourquoi est-ce que vous allez à Tzarigrad?*' The reply was, '*Naturellement pour voir les Turcs; j'admire beaucoup les Turcs, et je ne les ai pas vus dans leur propre pays.*' This was conclusive.

There was a wild scene at the Constantinople railway station, where the porters rushed upon passengers like a pack of wolves. The language question being hopeless, we simply stood over our five trunks with folded arms and forced calm until all the other passengers had left. Then I selected a fine old Turk nearly seven feet high, and pointed to the trunks, all of which he gathered up like so many parcels. We marched with him to the Customs' inspection, and here again I kept in the background with success. Immediately the brawny Turk with the five trunks showed his face at the door there was a rush of carriages, all the drivers pushing and shrieking. Glancing hastily round at the respective horses' knees, I pointed in silence to a two-horsed vehicle. The brawny Turk was slapped on the back and solemnly presented with a franc; not a word had been spoken from first to last; and we drove off pell-mell along the narrow street to the Old Bridge, the new one being under repair—this latter the one our submarines blew up last year. In old Japan the foreign visitor, in the absence of specific instructions, was always taken by the jinricksha-man straight to one definite place; so in Constantinople the European wight who is speechless is straightway conveyed to Pera, and in a few moments we were in the 'Palast,' one of the best hotels in Europe.

The next day we had a fine view of the Sultan 'going to Selamlık,' and heard rumours of a review

of twenty-five thousand men the following day at Chichli, a few miles beyond Constantinople. Any one could go, but the point was to get a good place and see everything. An obliging personage of high status (non-European, of course) was kind enough to transfer to me his invitation card from the Sultan's Household, but with the remark that it was only for one person. A polite *effendi* belonging to the Foreign Office, whose duty apparently was to watch interesting foreigners at the 'Palast,' afterwards translated this card for me, and I observed with alarm that there were inconvenient stipulations about dress. Out of gratitude to the *effendi*, I endeavoured to make myself interesting by explaining how the Turks hailed from China, and were really the old Huns in disguise. However, the next morning we secured a carriage, and off we careered over roads (fortunately mostly unpaved) almost as bad as those of Belgrade. It was for all the world like a drive to the Derby, 'swells' and humble folk tumbling over each other in their haste to see the Sultan.

Arrived at a certain aceldama, where there were signs of battle array, we had to descend and show our ticket. Again a bewitching smile had its effect upon the uxorious Turk in charge, whilst another conducted us with great deference to a spacious tent immediately adjoining one of red silk. These were the Sultan's and the ambassadors' tents; and as we were the first arrivals, we had ample time to take bearings. In due course the various carriages drew up. There was the good old Sultan, who manifestly had very little say in the administration of Turkish affairs. He was a short, stout man, thicker from 'aft forrard' than from port to starboard, with a congested face and watery eye, like the general in the *Kleine Garnison*—perhaps the only witty book any German has ever written. The heir-apparent, wearing spectacles, was also there; he had rather a 'fell' expression of face. Shevket Pasha plainly ruled the roast; but the amount of bowing and scraping he did whenever he addressed the Sultan reminded one of the Russian devotees crossing themselves in front of an icon. Most of the other prominent Turks of the day were also there, and for two long hours, under a blazing sun, the patient Sultan stood 'taking the salute' as one of the finest armies in the world filed past. If these are the men who fought us in Gallipoli, I can understand our difficulties; but I suspect they are reserved for Constantinople. At first the Sultan sat on a blue satin chair; but, as none of his Ministers had the sense or the decency to do anything for his relief, he humbly got up, turned his own chair round, and stood behind it, desperately endeavouring to keep his watery eyes out of the sun. A French lady, apparently an ambassadress, said, '*Mais, le pauvre Sultan, on doit faire quelque chose pour lui!*'

Yes, there they were, all the European

ambassadors, some of them with their ladies, but none of them aware who the two innocuous but mysterious strangers in their midst were, or how they got there. There was ample opportunity to study each diplomat in detail; all that was necessary was, when a pair rose for a chat or to stretch their legs, to go and occupy their chairs. The Persian ambassador and his staff were seedy-looking individuals clad in most unpicturesque black, with no linen showing. The minor 'Powers' alone figured in uniform. The Austrian ambassador was a fine-looking old gentleman with white hair, who hobnobbed chiefly with the portly Baron Marschall von Bieberstein—rather a *sans gêne* personage, who, however, when he spoke to ladies, was 'as polite as the Lord-Liftenant.' The most 'correct' men of the 'crowd,' in morning costume, seemed to be the British and American ambassadors, the latter a fine, shapely, tall man, who alone appeared popular with everybody, possibly because he had no 'business' to speak of in Constantinople at all. I did not identify the French or Russian representatives very clearly; but as the review was coming to an end the Sultan gave it to be understood that he wished to greet all the ambassadors. Accordingly they stepped over to his tent, and shook hands one by one, I think the ambassadresses included. It reminded me of a function in which I once took part at Washington, when I (similarly losing myself in a 'crowd') had the honour of shaking hands with President Cleveland. But we ourselves did not on this later occasion presume to shake hands with the Commander of the Faithful.

Though a ferocious war with Italy was going on, and the Dardanelles were closed, Constantinople was perfectly calm; and, except that Pera was enlarged, improved, and provided with electric trams, and that parts had been destroyed by fires, it was just as I left it in 1882. I had several penny cups of excellent coffee under the trees opposite the grand mosque just as thirty years before, and visited all the old scenes, including drives on the Haidar Pasha and Scutari side, through the great cemetery, &c. The excellently administered new Museum is a real novelty, and the sarcophagus of Alexander the Great therein, genuine or not, certainly one of the art wonders of the world. The only sign of 'the war,' barring the great review, was an occasional rough picture hoisted on the new bridge (opened formally whilst we were there) depicting Italian (and British!) super-Dreadnoughts going down *à pic* under the merciless blows of Turkish fowling-pieces.

Thence by steamer to Constanza and rail to Bucharest, the only city of any real pretensions in the Balkan States, chiefly remarkable for its plentiful and excellent two-horsed carriages. MM. Deschanel and Roussel were there again, and Bucharest newspaper opinion was very hostile to King Ferdinand of Bulgaria. It was

said that he had sold his country for a mess of pottage, and had abetted Count Aehrenthal's policy of smashing the nascent inter-Slav *entente*. Some of the dailies even gave details of a plot to get rid of Ferdinand altogether. It must be remembered that the Balkan League was not yet on the *tapis*, and that no one but those manœuvring to bring it about had the least idea that a joint attack was on the point of being made upon Turkey, so that, in a way, we saw the beginning of things without quite understanding what it was all about.

Our way back lay through Hungary. When, some years previously, travelling in the reverse direction from Vienna, we had already noticed the intense hostility to everything German; even on the frontier, at Pressburg, the railway officials pretended not to understand our German questions. In Budapest, where there are one hundred thousand Germans, no Hungarian will speak German if he can avoid it, and all place-names, street-names, and (where possible) even postal addresses are in Hungarian; in fact, we had to buy a handbook and learn a little Hungarian for ourselves. It was amusing to find the very first word was *Kaffé-ház* ('coffee-house'). This universal hatred of Germans being such but a few years ago, it is difficult to understand with what object the leading Hungarians are attaching themselves to the German leading-strings now. Many years ago, when we admired the elder Kossuth and the struggles of 'the Hungarian people' for liberty, we probably did not know that 95 per cent. of the nine million Magyars were serfs, ground down, as they are now, by a merciless aristocracy.

As we passed through the rich plains of Hungary in 1912, the railway attendant, a pure Hungarian, in long political conversations emphasised this *sic vos non vobis* position of the cultivator in general and his own family in particular. The Crown of St Stephen has five million Slavs, three million Rumanians, and one million Jews and Gypsies under it, not to mention over two million hated Germans. If it had conciliated the Slavs and Rumanians and extended the same political rights to its own Magyar people it might have become a real power, possessing the sympathy of Great Britain and Russia, capable at the same time of maintaining itself against Germany and German-Austria. But, like Ferdinand of Bulgaria, its admirer, it seems to have been fascinated by the snake-like advances of *Kultur*, and is apparently playing deliberately into the hands of Germany, and thus courting disaster. Count Khuen Héderváry's monstrous inciting of the Banus Cuvaj, in 1912, was disapproved openly and publicly even by the Vienna Premier, Stürgck; Khuen Héderváry had to resign, and Lukacs (pronounced Lukatsch) was appointed in his stead to try to patch matters up. Khuen Héderváry's foolish policy could not have been accidental or the fruit of ignorance, for he had once been Ban himself, and perfectly understood local conditions. I have some Hungarian friends of my own, whom I have assisted in searching for the place 'somewhere in Asia' whence they came; even the younger Kossuth, who died recently, sent me an occasional message on the subject; but I have never had the opportunity to discuss Hungarian policy with any Magyar.

PINCHER MARTIN, O.D.

CHAPTER VIII.—A FAIR SKY.

I.

'LEAF!' sniffed Pincher disconsolately. 'Wot's the good o' seven days' leaf ter a bloke wot ain't got no money?'

'No money!' exclaimed Billings, rather surprised. 'Why ain't yer got none? Thought yer wus one o' these 'ere chaps wot counted every penny.'

'I've bin spendin' a good bit lately one way an' another,' Martin explained, removing a half-used cigarette from the interior of his cap and lighting it.

Joshua grinned. He knew well enough that an ordinary seaman's pay of one shilling and threepence *per diem*, less various necessary personal expenses, did not go far when one was 'walking out' with a young lady.

Pincher loved his Emmeline very dearly, and Emmeline, she said, had come to love him; but he was bound to admit she was rather an expensive luxury. Moreover, he was far too proud to allow her to pay her share of their

amusements when he was with her, which was pretty often. So, what with picture-palaces and visits to confectioners' shops, his eight-and-ninepence a week went nowhere. He had even been forced to borrow from his shipmates—always a difficult matter.

Then there had been the affair of the locket, over which Pincher felt he had been badly done. He had had his photograph taken, and had had it mounted in a rolled-gold ornament of chaste design for which he had paid the sum of seven shillings and sixpence, and this he had presented to Emmeline to be worn round her neck in place of the one which already hung there. He had imagined that this nine-carat gold case hid the features of some other admirer. It did nothing of the kind. Its interior, when he was allowed to investigate it personally, contained nothing but a faithful likeness of the girl's father—top-hat, side-whiskers, and all. Emmeline seemed rather amused. Pincher never quite got over it.

'Carn't yer get a hadvance o' money from th' paybob?*' Joshua suggested. 'E ain't a bad old bloke so long as yer goes ter 'im wi' a yarn o' bein' desperate 'ard up, an' yer pore ole farther's 'ome bein' sold up, an' 'im an' yer ma an' the kids goin' ter th' work'ouse.'

'I've tried that,' Pincher answered glumly. 'Leastways, orl excep' the yarn wot yer said. 'E simply tells me I'm in debt ter the Crown 'cos o' clothes an' other gear wot I've bought, an' that 'e carn't do nothink.'

'I calls it a houtrage!' said Billings sympathetically, looking very solemn. 'The way they bleeds us pore matloes is enuf—enuf—I carn't think o' wot I wus goin' ter say,' he added lamely; 'but it's abart time somethin' wus done. S' welp me, it is!'

'An' abart time you pays back that two bob wot you borrowed off me,' Pincher chipped in, remembering the debt.

'Two bob!' cried Joshua, screwing up his face and trying hard to appear as if he didn't know what Pincher was driving at. 'Wot two bob?'

'Th' two bob I lends yer the night yer took Missis Figgins along ter th' pictures. You knows orl abart it.'

'Thought it wus a present ter me,' said the old sinner, unable to feign further forgetfulness, but affecting to be very grieved. 'A bit o' a return like fur me trubble in introjoocin' yer to th' gal. That's wot I thought it wus; strite I did.'

Pincher laughed, for Billings's dissimulation was so very palpable. 'Don't act so barmy,' he observed. 'Yer knows it wasn't. Yer don't 'ave me on like that.'

'But two bob ain't no good ter yer fur Christmas leaf,' protested the A.B., veering off on another tack.

'Carn't 'elp that. I wants it back.'

'Well, you shall 'ave it,' Joshua grumbled. 'But I calls it a dirty sort o' way ter treat a chap wot's done fur you wot I 'ave.'

'Garn! don't act so wet, I tell yer.'

'Orl right! orl right! Don't go an' git rattled abart it,' said Billings resignedly. 'You shall 'ave yer money. You shall 'ave it if I 'as ter go without bacca fur a month; but where'd you be, I should like ter know, if yer 'adn't got a bloke like me ter look arter yer? Look wot I done fur yer since yer jined this ship! Bin yer sea-daddy, I 'ave, same as if you were my own son, an' yet yer treats me like this! Hingrati-toode's wot I calls it. 'Orrible hingrati-toode! Orl you young blokes is the same!' He sighed deeply, and regarded Pincher with a pained expression.

The latter seemed rather concerned. 'If yer looks on it like that, Billings, o' course I carn't'—

The A.B. waved an arm with a gesture of

dissent. 'It's too late ter start talkin' now,' he observed sadly. 'Th' 'arm's done. You shall 'ave yer money, but you've gorn back on a pal, an' orl fur the sake o' two bob. Two bob! Wot is it?'

'Let's 'ave it, then,' said Pincher, holding out a tentative hand.

'Ave it! Yer don't reely want it, do yer?'

'Course I do.'

'I'll give it yer afore I goes on leaf.'

'I wants it now,' Pincher persisted, remembering Joshua's extremely short memory.

'D'you think I ain't honest?' the latter demanded. 'Cos, if yer do, jest say th' word, an' see wot yer gits!'

'I never sez you wasn't honest; but I wants me money back!'

Billings saw that further argument was useless, sighed once more, replaced his pipe in his mouth, fumbled under his jumper, and produced a leather purse from the money-belt round his waist. Its contents chinked opulently; but, shielding it from Pincher's wistful gaze, he extracted a shilling and two sixpenny-pieces and handed them across. 'There ye are!' he grunted. 'Don't git sayin' as 'ow I doesn't pay me debts.'

'Yer pays 'em a bit be'ind time,' Pincher retorted with some truth, secreting the coins on his own person.

Joshua laughed in quite a friendly way. 'Tizzy-snatcher!' he growled, with his eyes twinkling.

But Pincher was bitterly disappointed about the leave. The men were to be sent away for seven days, one party being at home for Christmas and the other for the New Year. His watch were to start the following day; but, beyond the two shillings he had just obtained from Billings, he literally had not a penny to pay his train fare home. He could get the usual third-class return ticket from Weymouth to London, and from there on to his home, for the single fare; but even that would cost him the best part of a sovereign. He had tried hard to induce the fleet paymaster to give him an advance of pay, but that harassed officer, pointing out that Pincher was already in debt to the Crown, firmly declined to do so. Then Martin had endeavoured to borrow money from his ship-mates; but they, though sympathetic, wanted every penny they could lay their hands on for their own purposes. He then thought of writing to his people for the necessary sum, but abandoned the idea, because he knew well enough that they, on their very limited income, always had great difficulty in making both ends meet. Christmas, moreover, was always an expensive time, and there were three younger Martins to be considered.

It was really rather galling, and he half-regretted having spent all his money on Emmeline. Since joining the service he had been home on leave before, of course, but not as

* Paymaster.

an ordinary seaman of a first-class battleship, and he was well aware that as such he would be a person of some importance in the village. The blacksmith's son, Tom Sellon, had left Caxton a mere country yokel to join the army. The winter previous, as a strapping, full-fledged private of one of his Majesty's line regiments, he had come home on a few days' furlough resplendent in a wonderful red tunic. His arrival created no small stir, for Caxton lay in the heart of the Midlands, and its inhabitants were unused to the pomp and circumstance of war. Sellon, moreover, thought a great deal of himself. According to him, Great Britain was inhabited by two classes of people, those who were in the army and those who were not, and he treated all 'civvies,' as he called them, with kindly tolerance. He stood treat in a lordly sort of way at the 'Flying Swan,' and condescended to drink what beer the village magnates offered him in return for this hospitality. He was not averse to being friendly with their pretty daughters either. In short, a scarlet tunic and an air of self-assurance had worked wonders, for before he donned the red coat Tom had been a mere nonentity. Now he was a personage, with a capital P, and had even pretended to be rather diffident about accepting half-a-sovereign which the squire, who had known him since childhood, pressed into his palm one Sunday after church.

Now, Pincher, who knew little of the army, cordially despised soldiers in his heart of hearts. He longed to cut out Tom Sellon, but this cursed lack of money at the critical moment had upset all his plans. He could have wept from sheer vexation, for there seemed no alternative to spending Christmas on board.

But it so happened that the railway company wished to know the number of men proceeding by rail the next morning, and at 'Quarters' that afternoon Tickle ordered all the men of the star-board watch of his division to fall in on the right. Pincher went with them.

'Are any of you men not going away by rail to-morrow morning?' the officer asked.

Four hands went up at once.

'Why aren't you going?' Tickle asked the first man.

'Spendin' the leaf in Weymouth, sir.'

'And you?' to the next.

'I lives in Dorchester, sir. Goin' on by a later train.'

'Ain't takin' th' leaf, sir,' said the third.

'Why not?'

'Nowhere to go, sir.'

'Have you no parents, or relations, or any one else you can go and stay with?'

'I'm an orphing, sir,' the man rather flummoxed him by replying. 'I'd rather stay aboard the ship than go an' see me old uncle wot lives in Peckham, sir. 'E's married agen, sir, an' 'is wife keeps a fried-fish shop.'

Tickle smiled and passed on. 'And what about you?' he queried, coming to Martin.

'Ain't got no money, sir.'

'Have you been to the paymaster for an advance?'

'Yessir.'

'What did he say?'

'Said I was in debt, sir.'

'How much does it cost you to get home?'

'Best part o' a quid—sovereign, I means, sir.'

Tickle thought for a minute, nodded, numbered those men who were going, and then dismissed them.

Pincher thought nothing more of the conversation, but that evening he was told to go to the ship's office.

'Is your name Martin?' asked an assistant-paymaster when he arrived.

'Yessir.'

'You want some money to go on leave with, eh?'

'Yessir, please,' said the ordinary seaman, feeling hopeful.

'We can let you have thirty shillings. Is that enough?'

'Yessir,' Pincher exclaimed, his eyes glistening.

'Are you willing to pay it back at the rate of three shillings a month?'

'Yessir.'

'All right. Sign that receipt.'

Pincher, astounded at his good fortune, hurriedly scrawled his name, was handed a golden sovereign and ten shillings in silver, and left the office with a satisfied grin all over his face and the coins jingling in his hand. He was so pleased at his good luck that he didn't stop to consider where the money came from. All he cared about was that he had got it, and that he could go home and cut out Tom Sellon, after all.

As a matter of fact, it was Tickle himself who had acted the part of a nautical fairy god-mother. He had noticed that Pincher seemed very unhappy, and had guessed the reason, and at first thought of lending him the money outright. Thirty shillings more or less meant nothing to him. But then, remembering that Martin would probably refuse the loan from feelings of pride, he hit upon a better plan; so he went to the fleet paymaster, handed him the money, and requested him to pay it over to Pincher as if it were an official advance.

'My dear Tickle,' protested Cashley, 'you'll never get it back! The boy's already in debt to the Crown, and his pay's only one-and-three a day!'

'Let him pay it back at the rate of three bob a month, sir,' suggested the lieutenant. 'I'm not particular. He looks so damned miserable at not being able to get away on leave that I must do something. Don't tell him it comes from me, though. He won't take it if he knows that.'

'All right. I'll see to it,' the fleet paymaster

acquiesced, smiling. 'I suppose,' he asked jokingly, 'you wouldn't lend a poor old buffer like me twenty or thirty pounds to buy the wife a turkey and a plum-pudding?'

'I'd watch it, sir!' Tickle laughed. 'What about that new car you bought a fortnight ago?'

'That's why I want to borrow from you,' Cashley grinned. 'However, I'll fix Martin's money up for you, though I must say I think you're a tender-hearted fool, Tickle. You'll be badly had one of these days.'

Tickle merely smiled. The prospect did not alarm him.

So the next morning, at seven-thirty, Pincher, arrayed in his best clothes, left the ship with a sweet smile and a little bundle of necessities done up in a blue-striped handkerchief. An hour later he was sitting in a third-class carriage on his way to London, munching a doubtful-looking sausage-roll, and listening to a slightly intoxicated sailor next to him, who insisted on giving the company what he called 'a little moosic.' It consisted of a few fragmentary remarks in a deep-bass rumble about the perils of a sailor's life, sudden hiccups as full stops, and frequent gurgling noises and sounds of enjoyment as the songster upended a quart bottle of

Bass's light dinner ale, and applied the business end to his mouth. He eventually finished the song and the bottle at the same time, and, shying the latter playfully through the open window, volunteered to fight the whole carriage. This pleasure being denied him, he solemnly kissed the company all round, and then went comfortably off to sleep with his mouth wide open, his head resting affectionately on Pincher's shoulder, and his feet on the opposite man's lap. Thus he remained until they arrived at Waterloo, where, on disembarking, he never noticed that one of his carriage-mates, by the skilful use of a burnt cork, had decorated his upper lip with a large black moustache.

History does not relate if he arrived home in this condition, for, after vainly endeavouring to induce various laughing porters and the amused guard of the train to 'come an' ave a wet, ole dear!' and then, when they refused, wanting to show there was no ill-feeling by exchanging headgear, he was last seen proceeding at three and a quarter knots on rather an erratic course towards the nearest refreshment-room.

But Pincher got home safe and sound without any difficulties of this kind, and by four o'clock was in the bosom of his admiring family.

THE MAHARANI AHALYABAI.

By DEMETRIUS C. BOULGER.

WHEN, some time ago, the Government's 'Agent' in Central India installed the Maharajah Holkar, a young prince of much promise, on the *gadi* of Indore, he apostrophised him in the following terms: 'The House of Holkar has proud traditions and a great name which is writ large in the annals of India. It has produced famous soldiers and wise administrators; but the name which stands out above all others, and which is still revered through the length and breadth of Central India in the same way as the memory of the great Queen-Empress Victoria is still venerated throughout British India, is that of your great predecessor Ahalyabai.'

Who was Ahalyabai? Not one out of a hundred British schoolboys of the sixth form ever heard her name. What part did she play in Indian history? Not one out of ten students of that history probably could give a correct answer without appealing to a book of reference. Pending the probable appearance of a fuller life, here is her story, briefly told.

India in the eighteenth century may be compared to Italy in the fourteenth and fifteenth centuries, when the hand of every man was against his neighbour, and the Marathas rode, bent on plunder and conquest, like the *condottieri* of Hawkwood and Carmagnola. Prominent

among these free-lances was Mulhar Rao Holkar, who founded a dynasty as Subahdar of Malwa in the first half of the eighteenth century, which still exists under the style of Maharajah Holkar of Indore. He was a great soldier, and fought among the best, when others fled, at Panipat against the Afghan invaders. Five years later (1766) he died, leaving the destinies of his wide-stretching dominions on both sides of the Nerbudda to a degenerate grandson, for his only son, Khande Rao, had predeceased him, killed at the siege of Kumbher in 1754. Fortunately for his people and family, that son had left a widow, the Ahalyabai of this narrative.

The grandson referred to was not merely a degenerate, he was regarded from his childhood as an imbecile, and showed before he died that he was a raving lunatic. Still, he was his grand-sire's heir; and Ragobah Dada, uncle and regent of the Peishwa, the titular head of the Marathas as the descendant of Sivaji, at once recognised him, and sent him the *khellat*, or robe of authority. It was in her son's name, then, that Ahalyabai first assumed the practical control of State affairs.

Her son was very young; and, although he seemed a demon, time might bring improvement and reform. There were some tales to the effect that Ahalyabai, under great provocation, shortened his days; but, however great the temptation

may have been, Sir John Malcolm averred after the closest investigation that there was not a word of truth in the allegation. He pronounced the Maharani spotless of crime, and he wrote during the lifetime of her chief Ministers and contemporaries.

Male Rao (or Mullee Row in the old euphonic spelling, which had at least the merit of showing people how to pronounce Indian names) was the Lord Sahib, and proved in the nine months of his sway that he knew his title signified absolute power. His mother had always been the patron of the Brahmins, which is the surest way to sanctity among the Hindus; but it pleased her son to take up the opposite attitude, and to persecute them. Had this persecution been of an ordinary character it might have been borne in the hope of amendment and contrition, but it was displayed with a devilish ingenuity that appalled spectators and precluded the idea of reform.

The statement rests on unimpeachable evidence that when he handed gifts to the Brahmins, a custom he could not avoid at certain religious ceremonies, he placed in the bags containing them deadly scorpions, so that the priest in thrusting his hand into the sack received a severe and sometimes a mortal wound. Specially marked was his glee when the priest, on being informed there was gold, thrust his hand in eagerly, only to withdraw it with a shriek of pain. Male Rao's excesses constituted a public danger and calamity; but no one could suggest a remedy, for to lift one's hand against a reigning prince was the most heinous of crimes. An accidental occurrence terminated the long-drawn-out agony. In a moment of rage, Male Rao struck and mortally wounded an embroiderer who was working for him. The victim, it is said, had sufficient breath before he expired to inform the prince that he would thenceforth be possessed by his *jin* (or spirit), which would haunt him to his dying day. To appreciate the full significance of the threat it is necessary to be versed in the superstitions of the Hindus, and then it will not seem surprising that the murderer should have broken out in paroxysms of delirious fear, for to be cursed or possessed by a *jin* is a fatality from which princes themselves had no immunity. Notwithstanding that his saintly mother hastened to his bedside, and vowed to build the most beautiful temple for his recovery, forgetful of his crimes and mindful only that he was her son, the maniacal ravings showed no cessation, and in a few days all was over, for the good of the unhappy victim as well as his people. All agreed that Male Rao's disappearance was due to the intervention of a merciful Providence.

None the less the family of Mulhar Rao in the male line then became extinct, while Male Rao's only sister, Muchta Bai, was debarred from the succession by marriage into a family of another caste. The Holkar dynasty was thus

threatened with extinction after but a brief career. Ahalyabai stepped into the vacant place, and took on herself the heavy burden of ruling the people and controlling the numerous and miscellaneous forces which had followed Mulhar Rao in the wars. It was a bold and risky step, for female rule was a novelty in Hindustan, and seemed especially unsuitable in a military confederacy like that of the Marathas. Still bolder did it seem when the Maharani announced that her aim was to promote peace and prosperity among her people, and not to follow the policy of aggression and expansion then in vogue among all the Maratha chieftains.

For one moment her position was in danger. The Dewan (or Minister), Gungadhar Jeswant, believed that he was master of the situation, more especially as he had obtained the support of Ragobah Dada, uncle of, and regent for, the reigning Peishwa, by the promise of a large sum of money. Full of confidence in himself and the excellence of his arrangements, he proceeded to exhort Ahalyabai that it was her duty to adopt an heir and to leave the government to men. But before this lecture was delivered the Maharani had made her position secure by herself purchasing the support of Madhoji Scindiah, the most powerful of the Maratha princes. The Peishwa might be the titular head of the Marathas, but the power and ability of Madhoji were incontestable, and his support more than sufficed to balance that of Ragobah. When Gungadhar delivered his address advising her to retire to the women's quarters, Ahalyabai was ready to meet his attack. She told him that he was the servant of the State, to which he had been disloyal in intention, if not in act, by promising part of its revenue to a foreign prince, and she dismissed him from office.

Quickly realising the mistake he had made, Gungadhar pleaded for forgiveness. His offence was condoned, and he was restored to the service in a post of minor importance. He repaired his temporary lapse by loyal devotion to his mistress during many years. Ragobah Dada at first seemed disposed to coerce Ahalyabai, but she appealed to the young Peishwa, Madho Rao, in person, who sent an order to his uncle not to molest 'the respectable widow of Khande Rao, whose right to the management of affairs was indisputable.'

The Maharani's first act showed her capacity to rule. She had no intention of playing the part of a warrior-queen; but at the same time the large bodies of armed men in her service required a leader. She selected for this responsible charge Tukoji Rao Holkar, who, despite his name, was not related to the ruling House, although he belonged to the same caste. A better choice in every way could not have been made. He served her as the leader of her army with absolute loyalty and obedience for nearly thirty years, to the day of her death; but,

although he never claimed a higher title than her Subahdar, it may be mentioned that the line of the Holkars was destined to pass through him and his descendants. Tukoji spent his life in camp with his army south of the Nerbudda, while Ahalyabai dispensed justice, peace, and happiness north of it in the Chambal Valley and along the Vindhyan range. Only once was she herself compelled to draw the sword, when her northern neighbour, the Rajput Maharana of Udaipur, invaded her territory. She hastened to meet him on the frontier, and with a single blow turned the attack aside. Yet she knew the value of the counsel, *Si vis pacem, para bellum*; and when she appeared before her warriors, at each corner of the howdah of her elephant she caused to be placed a quiver full of arrows.

It must be admitted that her neighbours treated her with great chivalry, deeming it dishonourable to attack a woman. Even the Nizam and Tippoo Sahib shared this feeling. To that forbearance as well as to her own merit—but the forbearance was due to her merit—must the thirty years' peace in Malwa be attributed. Sir John Malcolm, speaking from his intimate knowledge and as a practical statesman, held that the success of her rule was due to the excellence of her own relations with Tukoji Rao Holkar, which involved a separation of the civil and the military power. He wrote: 'The divided authority established in the Holkar State from the day of Tukoji's elevation had a character which, judging from common rules, was not likely to admit of its subsisting a week; but it remained for above thirty years undisturbed by jealousy or ambition. This is to be ascribed to the virtue and moderation of the parties, to their respect for each other, and to their having distinct and, generally speaking, distant spheres of action.'

What were the salient features of her government that made it the standard of excellence in administration throughout Central India? 'Let it be done as in the time of Ahalyabai' was a sufficient order, Sir John Malcolm tells us, to allay discontent and to satisfy the most importunate suitor. The principles of her rule may be summed up in these words: justice and protection of property. She sat unveiled in open durbar, the observance of *pardah* being by no means obligatory among the Marathas, and she heard and tried every case herself. With unwearying patience she went into the details of each petition; and where her own officers were the accused she was especially critical, and spared no effort to get at the truth, for she 'deemed herself amenable to God for every abuse and exercise of power.'

The foundation of her fiscal policy was moderate assessment. She upheld the rights of village officers and landed proprietors, for she believed that the basis of all public prosperity and happiness was security of tenure. She pro-

tected property against the exactions of the tax-collector, and set her face against the system of appropriating in the State's name a large slice of the fortunes of her deceased subjects. Many cases were cited to prove this, but perhaps the most striking was that of the widow of the rich *bunniah*, or banker, Davychand, because Tukoji Rao was implicated in the affair. He had demanded in the name of the State a large portion of Davychand's wealth. The widow fled to the palace with the tale of her wrongs, and Ahalyabai not only clothed her in a royal robe to show the world that she was under her protection, but she also sent Tukoji a peremptory order to withdraw his claim.

In addition to the State revenue Ahalyabai had considerable personal wealth, her *jagirs* bringing in an annual revenue of four lakhs, equal in those days to forty thousand pounds. The treasures of the Holkar family, estimated at two millions sterling, were also in her possession; but one of her first actions was to devote them to charity by sprinkling water mixed with leaves of the toolsee-tree over them. We shall see a little later how that charity was dispensed. With regard to the State expenditure, the public accounts were most carefully kept, and it was only after every civil liability had been discharged that the balance was despatched to Tukoji to contribute towards the maintenance of the army in the Deccan.

The Maharani knew the value of prestige. She kept her agents, men chosen for their ability as well as personal devotion, in the various Indian capitals of that time, Poonah and Nagpore, Hyderabad and Seringapatam, Lucknow and Calcutta. They spread her reputation by extolling her virtues, so that 'Mohammedans joined with Hindus in prayers for her long life and prosperity.' It is an aphorism in Hindu political philosophy that good princes see their counsellors grow gray in their service. Ahalyabai had but one Prime Minister in the thirty years she ruled, Govind Punt Gunnoo, who succeeded Gungadhar Jeswant. For twenty years Khundee Rao managed her estates and controlled her fine palace, which still stands above the Nerbudda at Maheshwar, the Mhysir of the old chronicle. But perhaps of all her followers the most devoted was Baramul Dada, her *kower*, or personal domestic, who kept a diary of her daily doings, which he handed in his old age to the safe custody of Sir John Malcolm. His duties had been not merely to wait on his mistress, but also to discharge the religious and highly honourable task of washing her tutelary deities. He was full of reverence for her memory as the best of womankind. One of the entries in the diary shows how Ahalyabai passed the day. It is divided into nine parts: (1) The Maharani rose one hour before daybreak to say her prayers; (2) then she listened to the reading of the sacred books; (3) distributed food to the poor and

gave alms to the Brahmins; (4) then breakfasted on a purely vegetable diet, having given up animal food; (5) prayers and a short rest; (6) she then went in durbār dress to the open court, where she sat from two till six; (7) she afterwards dined, and then rested; (8) at nine she resumed work, and continued at it till eleven o'clock; (9) at eleven o'clock she retired for the night.

It was not only of human beings that Ahalyabai was the protectress. She was good and considerate to animals. Birds, fish, and beasts all came under her fostering care. She had fields specially planted for the birds, tanks filled and kept full for the fish; her servants carried buckets of water to the cattle tilling the fields. That a thing had life was sufficient claim to her care and protection. She was fond of uttering the warning, 'Let us mortals beware how we destroy the works of the Almighty.'

When necessary, however reluctant to punish, she could be severe. She fully realised that trade and travellers required protection. Both were threatened in Malwa when she came to the throne by Bhil marauders on one side and Gond freebooters on the other. She saw that the claim of the Bhils to levy a toll (called the Bhils' cowry) on the caravans passing through their hills was not wholly without justification. So she agreed to its continuance on the condition that the travellers and traders who paid it were entitled to protection, and that the hillmen should be responsible for stolen goods. But with the Gond freebooters sterner measures were required. Their leader was Mundroop Singh, whose castle of Sillanah occupied what was believed to be an impregnable position on the banks of the Nerbudda. He long defied her orders, and at last her patience was exhausted. Sillanah was stormed by her soldiers, and Mundroop was hung in chains from the battlements which he had vainly deemed no enemy could scale.

Ahalyabai was the patroness of the Brahmins, and she dispensed the treasure of the Holkars in what we would call Church endowments. Temples and shrines built, founded, and endowed by the Maharani are to be found to-day from one end of the Peninsula to the other, amid the snows of the Himalayas and the jungle solitudes of Ceylon. In Benares, the Holy City, the Bisheshwar, or Golden Temple—the most sacred of all its temples, dedicated to Siva, who, under the name of Bisheshwar, is the titular god of the city—was built at her expense, although the gilded dome and roof were provided long after her day by Runjeet Singh, the Lion of the Punjab.

Gaya, in Bengal, is one of the most famous places of pilgrimage for all Hindus. Within its limits are to be found the forty-five stopping-places for prayers and the offerings of *pindās*, or funeral cakes, at each of which in olden times

the pilgrim never failed to arrest his steps; but in these degenerate days the most zealous only halt at seven of them, while the majority are satisfied with three. At Gaya, Ahalyabai founded, on the site of an older temple, the present existing Vishnupada Temple, which is erected over the footprint of Vishnu. It possesses a striking façade, and the entrance to the temple itself is through silver doors. The concluding act of the pilgrimage is to place an offering of rice and water in a silver basin behind these doors, which represent part at least of the family treasure of the Holkar family specially dedicated by Ahalyabai to the works of charity.

The pilgrims have the pleasure or the pain of one more sacrifice ere they depart, unless, indeed, it is required of them before they begin the round of the holy track. The *gayawals*, or priests in charge of the temple, are expectant of their toll—five rupees from the humblest pilgrim, and as much as a lakh of rupees, it is said, in the case of a prince. Surely those writers must be wrong who place this part of the ceremonies elsewhere than at the beginning.

But if one wishes to get a true idea of Ahalyabai as a builder of temples, it is to Maheshwar, her capital on the banks of the Nerbudda, that the traveller should go. Temples dot the hillside rising steeply from the river to the ghâts, and behind the temples rises the lofty palace of Ahalyabai, where she had her chief residence and held her court. From the opposite bank all these buildings may be seen reflected in the river. There is another remarkable building in Maheshwar. This is the cenotaph erected to Ahalyabai by Jeswant Rao Holkar and his widow, Krishna Bai. It was begun by Jeswant Rao in 1799, and completed by his widow in 1833. Inside the temple is a life-size figure of Ahalyabai, and the family deities of the House of Holkar are still kept there. It is not strange that Jeswant Rao should have associated the name of his father, Tukoji Rao, with the temple dedicated to the princess he styled his 'mother.'

The closing years of Ahalyabai were darkened by a great tragedy. Besides her son, she had, as previously stated, an only daughter, Muchta Bai, who married Jeswant Rao Panseah, by whom she had an only son named Nulheabah. He was a youth of promise, and might have played an honourable part in Indore affairs, although barred by the law of caste from the throne; but he died before he reached his fourteenth year. A year later his father, Jeswant, also died, and the distracted widow decided to commit *sati*. To all her mother's entreaties to spare her this last blow, and not to leave her alone in the world bereft of all her family, Muchta Bai turned a deaf ear. It is said that she addressed Ahalyabai in the following words: 'You are old, mother, and a few years will end your present life. My only child and now my husband are gone; and when you follow, life, I

feel, will be insupportable ; but the opportunity of terminating it with honour will then have passed away.'

Failing to convince her by argument, and unable to prevent her by force from committing what was considered in that age as the most honourable act on the part of a Hindu widow, Ahalyabai was present at part at least of the dread ceremony, including the ablutions in the Nerbudda. For three days after it was over she remained in her palace, refusing food or to see any one save her faithful attendant, Baramul Dada. When she returned to her work and public duties she found consolation in erecting to her daughter's memory a beautiful little temple which Sir John Malcolm calls one of the most appealing memorials of maternal love that he had ever seen.

Ahalyabai was only sixty years of age at the time of her death in 1795. Her name was regarded as auspicious, for it was that of the wife of Gautama the Rishi, one of the personifications of Buddha. We get a slight glimpse of her appearance in the following story. Anuntia Bai, wife of Ragobah, of the Peishwa's family, was exceedingly jealous of the greater fame of her neighbour, so she sent a special envoy of her own sex to bring her back a faithful report of the princess's appearance. The envoy went,

and, as was not difficult, saw Ahalyabai in open court, and returned to her mistress with the following report : ' Ahalyabai has not beautiful features, but a heavenly light is on her countenance.'

The princess was averse to flattery and disliked being praised for what she did. It is recorded that a Brahmin compiled a history of her rule full of compliments and praise, and then proceeded to read the work to her. After listening for a little time she took the book from him, exclaiming that she was 'only a weak, sinful woman,' then tore it in fragments and cast them into the river.

These incidents throw light on the character of a woman who, in the midst of general war and strife, kept peace for thirty years in the part of India under her sway. All the other rulers fought for ambition and pride of place ; she alone set before herself the ideal that 'peace hath its victories no less renowned than war,' and thus her reputation survives as a bright example across the centuries. Her most expressive epitaph is furnished by the test set to her successors : 'Rule us as in the time of Ahalyabai, and we shall be content and happy.' Such is the burden of the prayer of the peoples of Indore and Malwa.

THE KING-MAKERS.

CHAPTER II.—THE BOY—*continued.*

IT was an unfrequented road, and the danger of recognition was not great ; nevertheless the King sought to avoid it as far as he might. When meeting or passing pedestrians he took care to avert his face, while the occupants of the few vehicles he encountered noticed only a cycling tourist with downbent head. In this way he covered a league or so, and came to a place where a quiet stretch of road was shadowed by a wood. Finding an entrance among the trees, he made his way to a secluded spot on the edge of a small stream.

He was hot from the exercise, hot with the spirit of adventure. In a few minutes he had spread before him the contents of the intruder's valise, which he found to be very much what he had expected and hoped. The clothing he took no heed of then ; but the shaving materials were of immediate interest ; they were of respectable quality, and the brook gave him all else that was necessary. In ten minutes the mirror showed a countenance amazingly changed, incredibly younger. Then, indeed, he had crossed his Rubicon.

'Excellent !' he murmured with intense relief.

This done, he made further investigation. There seemed to be nothing in the valise that might not be useful in his new and irresponsible rôle, nothing that could be described as cumber-

some. On the other hand, there was nothing really valuable except a large purse which lay neglected at the bottom, and which he found to contain three gold coins and a little paper money. Probably the intruder's remaining wealth had been carried upon his person in some more convenient receptacle. At all events he would not need it now. Perhaps the most interesting item was an envelope containing two papers, which had apparently been placed in the valise because they were not immediately required. The first paper was an ordinary passport form, made out in the name of Charles Segel of Belgrade, described as tourist, aged twenty-five years, medium height and weight, fair complexion, of Serbian nationality, and of the Christian religion. The King read the description with particular interest.

'Almost as much mine as yours, Charles !' he said sweetly ; and then he opened the other paper. His interest deepened when he found that this was another passport, complementary to the first, and marked 'Special.' Bearing his own seal, and signed in Premier Rubin's own hand as Minister of the Interior, it commanded all the officials and dependants of the kingdom of Zorne to treat the otherwhere described Charles Segel as a special servant of the State, to assist him in his journey, to further him in

his mission, and to afford him any aid, information, or assistance he might require, on production of this pass, the cost thereof to be charged to the Office of the Interior.

'H'm!' said the King, not a little impressed; 'this would take the man anywhere—even to my own palace! It almost accounts for his amazing impertinence. One of Rubin's secret agents, no doubt; perhaps the chief of them. And yet—and yet that would not account for his impertinence to me! The situation becomes more and more amusing, but more and more bewildering!'

He carefully deposited the papers about his person, and took possession of the purse by a similar process. 'It is not strange,' he reflected, 'that a simple Socialistic principle like that of my friend should become popular. It has a certain human interest which would make an appeal to almost any one! And now for the road again.'

Confident in his new disguise, he made no further effort at concealment, and was justified by covering the six or seven miles to his own capital without interruption. Up till now he had no plans, and was satisfied without them. The exhilaration of his escape, the delightful miscarriage of the plot, the sudden and extraordinary break in his iron chain, were enough for the time. For a while he was free to run his own course and to seek his own ends. So far, there was no end other than a day or two of freedom. Raschadt was full of people who might be expected to know their king, but it was also full of strangers. It was as safe for him as any place in Zorne. At the moment he was entirely under the influence of some dare-devil strain inherited from those distant progenitors of his who had battled so recklessly against the Turks, backed by an unuttered resolve that he would never return to his bonds—no, never! He did not know what would happen at last, but for the present he would be a spectator at a play that was certain to be interesting!

In a little while he was a gray unit in an increasing volume of traffic on the great new road that pierced the suburbs and shot straight to the city's heart. He did not inquire his way, for in this case it was impossible to lose it. Then the suburbs were passed, and the warm, red-roofed old city climbed its gentle hill towards the citadel—a quaint and very lovable old city, where the new waged a noisily aggressive battle against the old. The King was one of the new things; but he rejoiced in the red roofs and the long, low windows.

His vague plans had rest and refreshment in the forefront, and it was thus that he found the 'Silver Heart.' His wandering eye perceived it just off the main street, all red-tiled like so much of the old city, and with tables set in a small garden-courtyard to the left of the main entrance. Lightly and cheerfully the King wheeled his

bicycle into the enclosure, and deposited it by a table which stood in the shade. Then he sat down, and immediately struck a handbell which stood before him.

A rotund waiter appeared, beaming.

'Speak English?' queried the King without a second's hesitation. For his mood now was a curious compound of the whimsical and the sardonic.

'Ye-es, sir,' said the waiter with a smile. He was a Frenchman.

'Then, beer,' said the King, with a great sigh of relief, 'and—bread—and—cheese!'

They were brought, more or less according to order (for in Zorne they know no beer but lager), and his Majesty refreshed himself with an appetite delightfully keen. One by one the few other customers went out, some of them nodding their friendliness to the English tourist as they passed. And the King rested, the subdued noises of the old city rolling by at a respectful distance.

The waiter came back, benign and cheerful. The King envied the man because he looked so round and happy.

'Well, friend,' he said, 'is the "Silver Heart" a good house for Englishmen? And can I have a room here?'

'Most certainly, sir. It is a beautiful house—extremely. I will call the master.'

The master came, aglow with good humour, to welcome the new guest, and the waiter, who had spent a winter in England, acted as interpreter. Formalities were few, and in a little space his Majesty, with Segel's travelling-case in his hand, followed the master into the house. In a book in the hall he wrote, in a bold, flowing hand that was not his own, the famous name, 'Peter Robinson, London,' and immediately afterwards found himself light-heartedly examining the plain but comfortable furnishings of a small room on the south side of the 'Silver Heart,' with a glimpse of the main street and the market square obtainable from its neatly curtained window. And this little room was his shelter and his home during the days that followed, when the history of his throne and kingdom unrolled itself before his astonished gaze in a series of startling and instructive pictures.

The series began so soon that he had no time to review fully his own position; and once it had begun, it moved so rapidly that he could only watch in almost speechless admiration. The moving spirit in that gay panorama flashed the scenes on to the obedient pages of the two daily newspapers, the *Gazette* and the *Herald*. There was no uncertainty in the presentation, no doubt as to the character of the story. A Council was held at the City Hall late on the night of the disappearance, the old Secretary having come up post-haste from Château Rom-bard and summoned the available members by telegraph. Next morning the *Gazette* and the

Herald published each a special sheet with the flaring headlines :

FLIGHT OF THE KING.

ESCAPE BY SEA.

AMAZING SITUATION.

And the news had scarcely found time to go outside the city gates before the later editions were ready with their further instalments. It was then that the people learned all the stages which had led to their young monarch's unprincipled desertion of his duty, his growing petulance and impatience, culminating in brutal insults to his most devoted Ministers; his intractability, and his deepening distaste for the routine duties of the throne; his hours of sulky indolence in the summer-house on the cliff. The means of his flight were too simple to require discussion. There was the cliff-path always at hand, and there were the marks of a boat in the shingle. Also, some one had noticed during the day a small steam-yacht lying off the coast under the shelter of the Orphan. And the King had given some hint in his last interview with his valet. 'I must get away,' he had said. 'I must get away at once.'

What more required to be told? What more, indeed, except the *Gazette's* interview with the Premier, in which that statesman showed himself at his unsurpassable best? Shocked, depressed, and disappointed indeed he was; but his spirit was still undaunted, his courage was still unbroken. He refused with dignity to discuss or even to describe the King's misconduct. He even excused him generously on the plea that he had been called too young and too untrained to his exalted place, lacking the knowledge that place was another name for responsibility. But the people must not be dismayed, must not even be disturbed. It was just possible, of course, that a perfectly rational explanation would be forthcoming, and no one who loved Zorne would care to discuss the absent King's conduct in the meantime. It was their plain duty to hope for the best. In any case, the public interests were in loyal and faithful keeping. The Executive Council had met, and the Senate had been summoned; and an apparently casual note in another place reminded the readers that Conrad had been only one of three favoured candidates for the throne, and that the other two were still living—Prince Max of Swarzfeld and the Duke Ernest of Cromburg. It was for the Senate to deal with this most amazing but not altogether hopeless situation. In the meantime the most thorough investigation was being made.

'H'm!' said the King, who had read all these doings with considerable interest, and was almost convinced, at times, that everything told of him was true. 'I never thought half enough of Rubin! He is certainly not such a fool!'

That thorough investigation was supremely

successful, for it discovered, in the King's favourite volume of poems in the Pavilion, a pencilled note in his Majesty's own hand. Even the Premier was forced to admit that it was Conrad's scrawl, though he did so with great reluctance. Some attempt was made to hold back the contents, but there was no resisting the clamour of the public; and when the public obtained the truth it reeled with dismay, and then danced with frenzied indignation. 'Take back your crown,' ran this interesting message. 'I have no further use for it. In haste.—CONRAD.' And when the King had read those words he was bound to admit that they afforded a very fair indication of his own mood on that unfortunate afternoon, and on many other occasions. He almost wondered, indeed, whether he had not actually written them!

History tells us that the Senate met on the third day. The King was one of the great concourse of people that gathered in the marketplace and along the hill to see them pass up to the citadel. The Senate, of course, were ostensibly the king-makers on this occasion; but he noticed others present who were likely to feel a keen interest in the proceedings; notably, the Ambassadors of those Central Empires which, after the great war, had been forced to let little Zorne choose its own King and Constitution. When he saw them he recalled inevitably some well-known scripture which mentions the eagles and the carcass in the same pregnant phrase.

Next morning, after a somewhat restless night, he read in the *Gazette* a fairly full report of the Senate's deliberations, and was more than ever convinced of Rubin's ability. He saw much that was beautiful in the Premier's handling of the situation, every incident working like a move in a well-played game. Finally, a large majority carried a resolution declaring the throne vacant, and empowering the Executive to deal with the matter forthwith, and to convene the Senate further when they had a proposal to make. Only the King's small and negligible party, desperate and sullen, abstained from voting, and the Premier created a considerable sensation by joining them in that course. All the reports agreed that his whole bearing betrayed grief and depression to an extreme degree.

'Better and better,' said the King. 'If Rubin had only been satisfied to be my Premier, what a Premier he would have made! Or if I had only been satisfied to let him alone! I suppose my successor will be Max of Swarzfeld. Things are pointing that way, and from what I have heard of him he will be more to Rubin's taste. He will not trouble to make foolish plans! Now, what shall I do to-day?'

For want of better occupation he went to see the lions of the city. During those days there was generally a large group of tourists and idlers before a full-length portrait by the French painter

Renier, in Room VI. of the Art Gallery in the City Hall. This was a portrait of Conrad I., crowned and in his state robes, and the curator of the gallery spent much time in noting and answering the questions and remarks of visitors or critics.

On this particular morning he had a curious experience with a little group of English and American travellers, one of whom, an attractive-looking youth, lost no opportunity of acquiring knowledge and airing his views.

'Say,' he cried over the shoulder of a portly lady whom the curator supposed to be his mother, 'why did they have such a young man for a King? Why not somebody a bit staid-like—like your Prime Minister?'

'The kingdom also is young, sir,' said the curator stiffly.

'But why such a feather-headed kind of a fellow?' persisted the questioner, to the evident dismay of the portly lady. 'What had he to recommend him?'

The curator flushed and stammered. He had several languages, but was not expert in all of them.

'There were others considered of,' he said nervously. 'Two other princes had much weight. But we wanted a pure Zornese for Zorne; was it not highly proper? And the King was the last of a noble family, once a bulwark against the Turks. More, he was reported of a good spirit, generous, brave. Our hopes in him were considerable.'

'Much good he has done you!' was the candid comment. 'But what's the next step? Who's this Prince Max? Is he Zornese too?'

'He has Saxon blood also,' said the curator coldly.

'I see. Is he a good sort?'

'We know little of him, sir.'

'Then you'd better get to know more. It seems that the Premier's settled on him for the next king. Eh?'

'You did not see that in the papers?' cried the curator almost resentfully.

'Did you expect me to be able to read the local press? I got that by thinking. Isn't it true?'

'It is the Senate that decides,' was the indignant retort.

'Then the Senate had better make haste, that's all. I believe the Premier hasn't lost any time. He'll settle this little affair before the Senate can say "Peter Robinson."'

Then the group broke up, and the poor curator, shocked and bewildered, retired to refresh himself. A little reflection enabled him to smile over the memory of the conversation and the amazing indiscretions of 'those Americans;' but when he noticed, a little later, that the portly American lady had another companion, and that the young man, after wandering about alone for a little while, left the hall without rejoining

her, a somewhat disturbing suggestion or shadow of a suggestion occurred to him. He returned to the King's portrait, and studied it with infinite care for some time. Then he shook his head, and resolved that the suggestion was so preposterous that he could not dare to mention it to any one. Fortunately he held to this prudent course until the story could do neither harm nor good to any of the persons who might have been interested in it.

In this and similar ways had the King filled his long hours of leisure; but it now became necessary that he should decide upon some definite course. His freedom had been decreed by resolution, and there was no object to be gained by remaining in Raschadt. His supply of gold was rapidly vanishing, while it was impossible to claim his own personal wealth even from the bankers and yet preserve his incognito. Moreover, it could not be long before the abductors discovered that they had trapped the wrong bird—so far, they had given no sign; and as Rubin had gone too far to retreat, the situation would become more exciting than safe. Something must be done, and at the end of that memorable week it was impossible to retrace his steps, even had he wished to do so. The swift current of events had put that out of the question. Besides, he saw now that his own conduct on that day of trial was utterly beyond explanation. Even if it were credited, it would leave him ridiculous for ever.

'Well,' he mused, 'I have the whole world before me, but no special desire to go anywhere. It is quite as difficult as having nowhere to go. I wonder what Rubin would like me to do! It would be so simple and so safe to do the contrary!'

As he wondered thus, he was lounging in the hotel reading-room, turning the pages of an illustrated Viennese weekly which had arrived an hour before. It was chiefly interesting to him because it contained pictorial representations of the Zornese Crisis, and several excellent photographs of himself and of his coronation festival three years ago. He examined these with critical interest, and was glad that he had not only shaved, but had also had his abundant locks cropped close in the prevailing English fashion. Hardly any one, even with the magazine in hand, would have identified him as the Little King who Ran Away. He observed that the Viennese journalist was emphatic in his opinion that Prince Max was the favourite for the throne of Zorne, and he was interested to read that since his own flight he had been seen both at Monte Carlo and at Naples.

'Some would take these names as guide-posts,' he thought cheerfully. 'But somehow they do not appeal. They are probably the places Rubin would choose for me. Let us see further.'

It was at this moment that he found himself under observation, and at once realised that he

had been under observation for some time. A gentleman of prosperous but unassuming exterior came up to the table as if to look for a journal. Apparently the journal he wanted was the one Conrad was using.

'Pardon me,' said the intruder civilly, 'you have not finished with it?'

He spoke in French, and Conrad answered in the same language. 'Yes,' he said, 'you may have it.'

But the intruder still waited. 'You are English, sir, I understand. May I ask if you are long from England?'

Conrad was immediately on the alert, but he gave no sign of suspicion. 'Not long,' he said pleasantly, and left the room immediately after. He remembered that yesterday he had met this person in the corridor near his own room, and that previous to that meeting he had seen him examining with close interest the list of visitors to the 'Silver Heart.' He was not greatly alarmed, for the possession of Rubin's comprehensive pass should be sufficient for the present; but he saw that his position must become untenable in the near future.

He awaited with interest the next move on the part of his pursuer, and was not surprised when it came that same evening at supper. He occupied a small corner table which he had selected on the day of his arrival, and which his friendly waiter had always reserved for him since; but he had scarcely commenced his meal when the person who had previously addressed him came into the room. He made a detour to

reach his victim, and addressed him familiarly, though quite respectfully, in English: 'It is a fine evening.'

The King merely bowed. His English, he knew, should be passable, for he had obtained some of it, at considerable pains, at Oxford; but he did not know why this person wished to hear it.

'We are having a beautiful summer,' said the persecutor blandly.

This time the King did not bow. He stared straight through the bulk of his tormentor with a rude unconsciousness that he knew to be thoroughly English. Several persons who saw that stare were sorry for the other party to the scene; but, utterly unabashed, he made one more effort: 'May I ask, sir, if you know London well?'

At that moment the waiter came near, and Conrad beckoned to him. 'Remove my meal to another table,' he said calmly. 'I am not comfortable here.'

The waiter obeyed, asking no questions and making no sign; the other visitors stared, all agog; and the intruder, after a moment's disconcerted silence, subsided into his own chair at a little distance.

Conrad settled himself with satisfaction that was strongly mixed with uneasiness. 'That was English too, I think,' he said to himself. 'But the atmosphere of Raschadt is becoming close and oppressive. Evidently I must go. Rubin's fishermen would not make the same blunder twice.'

SOME SALT ISLANDS OF THE WEST INDIES.

By CHRIS H. TICE.

TO the north of the Republic of Haiti, and off the eastern end of the island of Cuba, there is a small British colony comprised in a group known as the Turks and Caicos Islands. It is perhaps scarcely too much to assert that in Britain the place is practically unknown outside the Colonial Office. The small population of five thousand is almost wholly composed of coloured people, the descendants, by devious lines, of negro slaves. There are probably not more than two hundred and fifty whites in the colony.

Politically it is a dependency of the Government of Jamaica, four hundred miles to the south-west. Commercially it is of more importance to the United States of America than to either Britain or Jamaica. This arises from the nature of its staple industry, which is the production of salt, and also from its proximity to America. It is, of course, not asserted that America is the only consumer of salt in any quantity, but that each country naturally buys in the most convenient market. Britain not

only produces salt from her own mines, but can, if necessary, obtain supplies from the Mediterranean ports, and from other sources nearer home. At all events, the United States of America and Canada are almost the exclusive consumers of the salt of these islands. Many thousands of bushels of unrefined salt are used annually in New York alone for the making of ice-cream.

The appearance of the islands from a ship's deck is not without beauty. Though they lie very low and are almost treeless, there is about them that same air of sunlit peace which seems to surround all these western isles. Closer acquaintance, however, discloses in each case an interior as flat as the Fen district of England, if not less interesting. But if nature lacks beauty upon the land's surface, she canopies its wastes with skies of which only Ruskin could adequately write, and girdles it with seas of translucent loveliness.

In a group which comprises about thirty settlements, three only are engaged in the salt in-

dustry, but these three embrace over a half of the total population. They are named Grand Turk, Cockburn Harbour, and Salt Cay respectively.

The process of production is by solar evaporation. The interior of the islands in each instance is more or less of a lagoon cut up into artificial ponds. The sea-water is conducted by channels into large, shallow reservoirs. As occasion requires, it is turned by wind-machines into smaller ponds called the making-pans. These vary in size from half an acre to two acres in extent, the depth of both pans and reservoirs being about eighteen inches. Here the water is allowed to stand whilst the friendly elements of sun and wind quietly bring about the necessary crystallisation. The prevailing climatic conditions are singularly kind to the salt merchant. During the winter months—that is to say, the cooler season extending from November to March—the ponds remain untouched except for occasional cleaning operations. With the advent of the hot season, beginning in April, however, the pan-raking begins. The south-east trade winds sweep across the islands with refreshing persistency, and this, combined with the sun's rays, makes evaporation very rapid. The water in the pans, which during the evaporating process is called 'pickle,' takes on a pinkish tint, and in a few days the salt is formed, in thicknesses varying according to the time it is left in the sun and exposed to the wind. Barefooted labourers enter the pans and rake up the salt into heaps, whilst others cart it away. As the pans are raked salt-water from the reservoirs is turned in; and, except during the period of the heavy rains in May, evaporation proceeds right through the summer months. The salt is deposited in heaps, for the most part in the open air, and, save where it is exposed to dust, retains a spotless appearance, the glitter being severely trying to the eyes. In the height of the season there may sometimes be two hundred thousand bushels thus deposited awaiting shipment. The average annual export is one and a half million bushels.

Turks Islands are not the only West Indian Islands owning salt-ponds. Great Inagua, one hundred miles to the south-west, possesses considerable pond acreage; but the ponds have long ceased to be worked, chiefly owing to the extremely isolated position of the island. What was once a scene of busy activity presents to-day a picture of desolate abandonment. Such also has been the fate of Rum Cay, in the Bahamas. A slightly better condition prevails in the Republic of Santo Domingo, where the industry still receives some attention in one or two ports; but the total output is not comparable with that of the first-named group. There is still much doubt as to the future of the colony in view of its situation on the new Canal route; but at least it possesses in its pond-area communal means which must be of permanent value, if the

conditions of tenure and of labour are wisely regulated by the Executive.

It may well be imagined that the nature of this work is not without its influence upon the atmosphere. Whilst it is generally held to have a beneficial effect upon the health of the community, it has its own peculiar difficulties. As an instance, all steel or plated articles must be kept entirely free from dust if they are to be preserved. A few hours' exposure will often suffice to spoil a plated surface. With the prevalence of such conditions it may easily be understood that the retention of a smooth skin is also almost an impossibility. Hence the subject of complexion is a frequent one amongst the white ladies of the community; and from knowledge of a few of these feminine conferences one concludes that many would willingly sacrifice any supposed benefits to health if the salt could be eliminated from the atmosphere. No industry is entirely free from disadvantage to those engaged in it, either workmen or employer. Actual contact with the brine or with the salt crystals, if continuous, causes the skin to crack. Whilst vessels are being loaded, always at piece rates, the labourers often contract a sore on the ends of the fingers, the result of carrying the bags in which the salt is shipped. Similarly, the fetlocks of the cart-mules frequently become sore from long standing in the salt mud whilst the carts are being loaded.

THE MULL OF OE.

WE saw it when the evening light,
Soft on the landscape falling,
Set distant windows flashing bright,
And mellow thrushes calling.

The lark's loud song in liquid rills
Rained on us as we listened,
And tarns, deep-shadowed by the hills,
Like pools of silver glistened.

Far to the east peered o'er Argyll
The lordly hills of Arran;
Southward lay Rathlin's windy isle,
And many a headland barren.

With stately sweep a gallant barque
Sped west, her white sails flowing,
Where Donegal's wild cliffs were dark
Against the sunset glowing.

But at our feet, beneath the sun,
Between brown bog and heather,
Stretched greenest turf, where lambskins run,
And children play together.

Here, 'twixt the sea and mountains, God
A sturdy race has planted;
These are the hills their fathers trod,
And psalms of battle chanted.

They won their freedom by the sword,
This race of hardy yeomen,
Who march to war, and pray the Lord
For strength to smite the foemen.

J. SCOTT.

Chambers's Journal

SEVENTH SERIES

THE FRENCHMAN AS A SOLDIER.

By JAMES MILNE, Author of *The Epistles of Atkins, News from Somewhere, &c.*

'POILU' is the nickname, or, at least, the colloquial name, by which the French soldier is called, just as we say 'Tommy Atkins' of the British soldier. It is derived from the French word *poil* ('hair'), and means 'the hairy one.' The allusion is to the fondness of the French soldier for a beard—anyhow, while on active service—and to the rude picturesqueness which he encourages in a general way. It is a purely modern name, and it does no more justice to the French fighting man than 'Thomas Atkins' does to his British comrade.

'A rose by any other name would smell as sweet,' says Shakespeare; and the French soldier is a king of warriors, call him what you like. His warlike qualities have sung themselves down the ages, and to-day he confronts the Germans with all his old *élan*, saying of his dear *Patrie*, and of himself in relation to her:

'Through fire, air, and water
Thy trial must be;
But they that love life best
Die gladly for thee.'

You only begin to know what a fine fellow the French soldier is when you see something of him on active service, and have put away certain preconceived ideas that you probably had about him. One of these is that he is a gay, careless, laughing man, who loves to sit on a fence, smiling at the sun and flirting with the girls who may pass by, but always ready with his gun for the enemy. There is a fine mixture of love and war in that picture of the French soldier, and many writers have endeared it to us; but it has hardly anything to do with him in this great time of Armageddon.

We all know the stage Irishman, as Charles Lever and others have created him for us in entirely readable stories; the rollicking man who ever gets the best of life in the easiest possible manner, and does not care for anything else at all. There is no such Irishman; there never was such an Irishman; and in the same way the stage French soldier, as we may call him, probably never existed, and certainly has no relationship to the *poilu* whom you see just now all over France. Athos, Porthos, and Aramis, the three musketeers of Dumas's famous romance, were fine lads; but if they were to-day in the French army commanded by General Joffre, he would not

know very well what to do with them, and they would be tremendously out of their element.

Naturally the French temperament is sunny and bright, ready for a jest where there is any temptation to it; but there are not many temptations of that sort in this war, which is a hard, serious, grim business—conditions that have affected men in the field. Happily they are still open to a joke, especially when it can be exercised upon the enemy. Somewhere he had hung a string of small bells along the front of his trenches, so that if the French made an attack the tinkle, tinkle would give warning. A young French officer noticed the trick, and when night came he and a few of his men crawled out and attached strings to those bells. Then they crawled back to their own trenches and began pulling them. They went tinkle, tinkle, tinkle, and the Germans, called out by what they thought an onslaught, fired off their ammunition for hours on end, indeed until dawn revealed the joke that had been played upon them.

It greatly amused the Frenchmen who were responsible for it; but their Gallic sense of laughter would hardly have responded to another anecdote, of the British this time, behind the Allied lines where some Boches had just been brought in as prisoners. They made themselves as agreeable as possible, the story goes, and so were allowed to take part in a 'sing-song' held in the evening. The musical talent had got rather low, when it occurred to the typical British sergeant in charge of the programme that some amusement might be got out of the prisoners. Accordingly he rose up and said, 'Our friends Fritz an' 'Ans will now oblige with th' 'Ymn of 'Ate!'

It is a good story of good British origin, but it would be like Greek to a French soldier. He simply would not understand it. He is, as Mr Thomas Atkins would say, 'not built that way'; although the serious, logical, satirically grim side of him would quite grasp another, not more true, story about two Sikhs of our Indian army. It relates with nice picturesqueness that they had been bothered by a German sniper, and determined to go after him. Next morning they returned with the report, 'Sahib, we found the man with the rifle; here is the rifle!'

You have only to study the French soldier, in

his plain uniform of blue or gray, to understand that he is not the laughing, merry soldier of so much tradition. Clothes and the man! There is a good deal between the two, an intimate, revealing psychology, just as there is a relationship between arms and the man. The *poilu* is capped by a steel casque, invented since the war began, to protect his head from stray rifle-bullets and wandering fragments of shell. It does all that, but it also gives him a curiously Puritanic look. He strikes you as an old Crusader adapted to modern requirements. His helmet, saving its dull colour, makes you fancy him charging an army of Saracens in the name of Christianity. His uniform, so coloured as to make as little show as possible against the countryside, tells you that he is really fighting modern Huns equipped with all the resources of modern science. You know, in fact, that 'Monsieur Poilu' is a little unmilitary, lacking in the exactness of step, the precision of deportment, the correctness of physical attitude which you associate with the highly drilled soldier. It is so, and for that very reason the French soldier has his own personality and qualities, and they make him the great fighting man he is.

Every Frenchman has a sense of the artistic, and he likes to blend his own being into it. He hates to be merely like everybody else, knowing that is to go unobserved, to have no dramatic existence at all, which would be a poor manner of living. When he becomes a soldier he is very limited in the fashions of his raiment, but he manages, with a woman's eye for the picturesque, to achieve it through an easy air of indifference. When one speaks thus of 'Monsieur Poilu' in this association, one means not the professional French soldier, who is neat and natty all the time, but the other soldier called up by the thousand and the million, he who almost loves to look unmilitary. He lets his hair and beard grow to fantastic lengths, proudly wears his mud-stained, ragged clothes, and is not worried a bit if he looks 'a fearful object.' He wants you to know that he has been through the wars; but he also wants you, whether he be in a line regiment, in the Chasseurs, in the famous Alpines, or is even a Zouave, to know that he takes war against the Germans as he would take daily life in Paris, with every just seriousness, but without alarm or any putting of himself to unusual trouble.

When the war began, the gray uniforms of the old regiments of France, and the little red *képi* of the infantry and their baggy red breeches, were all about the pleasant summer roads. Now the blue sky looks down upon a blue overcoat which hides most of the uniform. It has, itself, become a mixture of blue-gray colours, and so the picture made by the French soldier is far less gay than the picture Napoleon's men made in their historic

time. But there has come into the face of the present French soldier something of the physiognomy which prints convey to us of Napoleon's veterans—the heavy dark moustache uncut because there has been something else to do, the beard which has gone unshorn for the same reason, the lanky black hair, the beaming black eye, and the fine sense of physical fitness in every movement of the body.

What most strikes you about the French soldier, perhaps, is his simplicity, which would be plainness in anybody not of Gallic temperament. We know that in art simplicity is about the most difficult thing to arrive at, and that it is the key to all that is greatest in the arts, whether painting, writing, or the putting on of beautiful clothes by a beautiful woman. Somehow the French soldier, with his uniform all tattered and torn, still remains a master of that artistic simplicity, possibly because it is the characteristic of his nation, simplicity and naturalness. You will see a wounded soldier limping along the boulevards in Paris, not with a special shoe on his foot such as its wound might demand, but with just an old boot of which the upper has been cut away where it would press on the sore. That is the simple practicalness of the French soldier; and, as his officer also follows it, you can imagine how amused a French general was when an English officer who had come to him with despatches took out a khaki handkerchief. 'Ah, good!' said the French general; 'the Germans will not see when you blow your nose.' The remark was not meant to be satirical; but the fact is that French generals and colonels and sergeants and full privates all think that we somewhat coddle our soldiers—anyhow, as compared with the treatment, always good, but always simple, which *la Patrie* gives to 'Monsieur Poilu.'

Here is a little story which has never been published before, the point of which throws light on the mental character of the French soldier. A Parisian workman, who was a corporal of Chasseurs, had made a German prisoner, and was taking him behind the French lines. The German, who spoke a little French, opened the conversation by saying, 'Germany was great like this'—lifting his hand above his head; 'now she is low like this'—swinging his hand down towards the earth. 'Ah,' said his guardian with an inimitable accent and mien, 'don't bother, old man; you will be more astonished before it is all over, for you will be lower even than the earth.' The jest there was a grim allusion to the grave; but it was merely uttered to sting the German prisoner. He was perfectly sure of kind treatment in some internment camp; only the Frenchman could not resist the temptation to let him have a word from the heart, a word to illustrate how bitterly the French feel about the 'methods of bar-

barism' on which the Germans conduct the war. Perhaps it was the same Frenchman who was met, another time, sitting atop one of the famous French 75's, which he patted kindly, with a wink to the passers-by, as much as to say, 'Ah, in the name of God, we have something here which will make the Boches sit up.'

The state of soul of the French soldier at the front is a great and beautiful thing. He has forged for himself the soul of the fighting man, and it will carry him on as long as the war lasts, until victory comes. He has forgotten the whole of his life except the high mission to which he has now been called—that is, to repel the invasion of his country by a war-lusting enemy, and to make such another invasion and such another outrage against civilisation impossible for all time. Fear? Yes, he knows how terrible and bloody the ordeal may be, but he does not fear. He remembers the proud traditions of the Latin race, and he fights on, thinking of nothing but winning. Something humorous interrupts, as when a Belgian farmer appears on the front of a brigade, and charges it with having stolen one of his pigs, or at least scared it away from its sty. The brigade is vastly amused, and probably, in its heart, regrets that it has no knowledge of that pig, living or eaten. The smile is momentary. Like the visit of the Belgian farmer, it passes, driven away, perhaps, by a new tune from the great guns on either side of the trenches.

Simple in mind, as in raiment, is the French soldier, certainly if he be a countryman, as witness an anecdote of one who had been wounded in the leg, and cried defiantly to the enemy, 'Too low!' Within a few minutes he was slightly wounded in the hand, which he had exposed over the top of the trench. 'Too high!' he cried this time. Then he was struck by a third bullet, which traversed his shoulder. Obligated to abandon the fight, because he was losing much blood, he threw himself on the ground and cried angrily at the enemy, 'You lot of fools, why waste all your shot on me?'

That is not at all a striking story, but it is a revealing story in the sense that it shows us the working of natural feelings in a man—what he does instinctively, without thought, when he is in the firing-line. He is indifferent to everything but the call of the moment, and in that individual case we have an example of the completeness with which every fighting Frenchman is devoted to the task of destroying Prussian militarism. The task lies on the nation as a whole, but it is every man's task individually.

You must always remember, in speaking of the French soldier, that he is a citizen soldier, a civilian as well as a warrior. He has been a civilian most of his life, and he will be a civilian again after the war. He is probably a married man; he may even have a family; and that adds to the responsibility with which he takes his

part in Armageddon. His people at home are very dear to him, very near to him, and they link him all the time with the great mother of all Frenchmen, *la Patrie*. When war broke out some English people were staying at a little French fishing-village opposite the Channel Islands. 'You will all go and fight?' said an Englishman to a party of French fishermen who were discussing the war. 'Ah, certainly,' said they. 'What else? If anybody attacked your mother you would go and defend her, wouldn't you? The mother of all Frenchmen, it is *la Patrie*.'

The other mother of Frenchmen, the human mother who gave them birth, comes out in a letter found on a hard-fought battlefield. It was from the mother of a young soldier, and it said to him, 'Think at this moment, before your own mother, of the other mother, *la Patrie*. Do your duty as a soldier; and if Providence protects you, you will return to do your duty as a son.' Across that letter its recipient had written in pencil, 'It is by order of mamma, and it is for the country.' Very touching—was it not?—especially as that young soldier did his duty nobly, and will never return to his mother. He was found seriously wounded, and he died within a few days, glad to be a sacrifice in a great cause. If he had been less seriously wounded, he would probably, like two comrades of whom one hears, have been willing to joke with a high official on the reticence of the official war *communiqué* which is issued in Paris.

'How are you?' asked the high official of the wounded men. 'We are making slight progress,' answered one, and M. le Ministre understood and laughed. 'How are you?' he said, turning to the second. The reply was, 'Situation unchanged; nothing new to report.' 'I am afraid, gentlemen,' said the Minister, 'you have the best of the joke; but I am glad to see you joke so effectively, and I hope you will both soon be very well.'

The epistles which 'Monsieur Poilu' writes from the field of battle differ a good deal from those written by our excellent Mr Thomas Atkins. The latter either writes a plain, straightforward letter of how events happen, or he has something humorous to say, something invented perhaps by himself. The *poilu*, on the other hand, possibly a highly educated civilian before the war, dips a good deal into psychology, tells you of his feelings under fire, describes for you the appearance of a battle. 'Zip, and there is a leaf cut off close to you.' You can see that happen, so clear is the description given in one short sentence. 'We have got them! Good! Now, then, you take the big fellow on the horse.' That is another French vignette of what war means; ay, and it conveys its meaning to the mind.

It is all short, crisp, and logical, the pattern on which the French mind works, even when it

turns satirical, as in an invitation by a French professor become soldier, and busy on the Yser. 'I have,' he wrote, 'the honour and the pleasure of inviting all of you to my shooting estate across the Belgian frontier. There is big game there, and it takes some killing, believe me.' He added that if the sport proved more strenuous than was expected, he could provide other attractions, such as an aeroplane manoeuvre, or an orchestral concert in which Joffre's Sonata No. 75 would be the strong piece.

When night, with its kindly darkness, falls on a battlefield, the French ambulance-men go out to collect the wounded, and one of them gives us a significant account of what that means. 'With acetylene lamps to light us, we cross the battlefield in all directions and pick up the wounded. As to the dead, alas, how numerous they are! We find them petrified in their last attitude, their last *élan*; and hear the crying and moaning of the wounded scattered in the cornfields and among the damp meadows. I know of nothing more poignant than that.' It is very tearful reading, but beautiful reading.

The French soldier, when he is parting from his family, is sad but heroic, and he shows both feelings unrestrainedly. Will he come back again? Will he not? Who is going to answer that? Only time. There may be a gloriously happy return when the war is over, or long before then there may come a letter like this, for ever the French soldier has 'one eye on death, and one full fix'd on heaven:' 'Sweetheart, fate in this present war has treated us more cruelly than many others; for I am dying, and am sending you this dying message. Forget me if you can; create for yourself some happy home which may restore to you some of the little pleasures of life. For myself, I shall have died happy in the thought of your love. My last thought has been for you, for those I leave at home. Accept this kiss from him who loved you.'

That letter was to a sweetheart; and there is another, found on the battlefield of the Marne, which also ought to be enshrined in the national archives of France. 'Adieu, my wife and darling

children,' it reads; 'adieu, all my family, whom I have loved so much. Calling up my last energies, I am writing this stretched out with my two legs broken, under a hail of lead. My last thoughts are for my children; for thee, my dear wife, the companion of my life, my beloved wife. *Vive la France!*'

You have a nation in arms called to a holy mission by the inscrutable ways of Providence, and these despatches from dying men are evidence of how the call has been answered. 'If I am spared' is a phrase often to be found in the letters of French soldiers, as also of British soldiers. Men pour their hearts out, but there is no posing, and no heroics. 'The French nation will march to the front like a single man,' said a well-known woman-novelist in Paris the morning it became clear that Germany meant war. She was thinking of the many things that had divided men in France, chiefly religion and politics; but she was thinking also of the fact that all the children of France loved her devotedly, and would rally to her standard. She was right, more than right, as the war, in its slow but inevitable progress to victory, has shown.

Never have the spirit of the French soldier and the majesty of the French nation shone more brilliantly, a calm, serene thing like a star in the sky of the world. The traditional and heroic soul of France has come back to her again; nay, that soul was never lost. It has flamed down the centuries; it has always been a torch in the progress of civilisation and the well-being of man. To-day it flames on, fed by the inspiration of a thousand years, to deeds as great, as self-sacrificing, as purifying for the world, as the French people, turned soldiers to a man, have ever in their glorious history achieved.

'Rise up, ye dead men!' cried Sergeant Pericard, when all his companions had been killed, and only their spirits remained to help him to hold a trench against the Germans. But he held it, and his cry will ring down the ages as so much heroic music of the superb spirituality which France has shown in this 'crack of doom' which we call Armageddon.

THE KING-MAKERS.

CHAPTER III.—THE GIRL.

THE kingdom of Zorne was such a recent thing that the modern palace, which faced the old citadel on the hill, was still unfinished. Men were daily at work upon the barracks in the north courtyard; and in the meantime, except when the King was actually in residence, the Lieutenant of the King's Guard occupied rooms above a small tobacco-shop in the market square.

Under present conditions his office was a sinecure, but Lieutenant Heldmann did not

neglect it for that reason. Leaving duty at nine, he was accustomed to walk down the hill to his rooms with all his old regularity and dignity. The brilliant uniforms of the Guard were newer even than the kingdom, and had not yet lost their novelty for the citizens and the citizens' children. The citizens turned to look after the lieutenant, sometimes perhaps with mingled admiration and pride; and very frequently the children turned to follow him at a little distance until he had vanished up the

tobacconist's stairs. He walked with his head high and clanking spurs; his long moustache and imperial were gray, and his nose spoke strongly of command; and it was observed during this remarkable interregnum that his air had grown more formidable and his nod more curt. He was probably quite aware of the smiles of those who reflected that this gorgeously arrayed officer was guardian of an empty palace.

On this evening the lieutenant came a little late, after a day of much irritating reflection. He had dispensed no greetings on his journey, and passed so quickly to his stairs that he was gone almost before the tobacconist was aware. But a hushed whisper checked him ere he reached the landing: 'Lieutenant!'

The martial figure paused. The tobacconist came up three steps. He was small and bald, and he wore an apron. 'There is a visitor for you—a foreigner, an Englishman.' That was all.

'Thank you,' said the lieutenant briefly, and with no trace of surprise; and then he continued his ascent.

The visitor was spread negligently upon the lieutenant's couch, smoking a cigarette. In the dusk his features were indistinct, but there was no mistaking his dress. The lieutenant closed the door, and stood in a questioning attitude. As a matter of fact he had not expected any such visitor; but there was no limit to the sight-seeing intrusions of the tourist class. To-night he was inclined to make short work of them.

'Good-evening, lieutenant,' said the visitor easily. 'I have waited half-an-hour for you.'

The lieutenant started. That voice had a note that set all his pulses in disorder. After a moment he stepped forward to gaze into the boyish face that smiled into his. A man's voice and eyes cannot be transformed, and suddenly Lieutenant Heldmann dropped upon his knee, his cap in his hand.

'Your Majesty!' he gasped.

'Very neat, Heldmann,' said the King heartlessly, 'but quite unnecessary now. Do get up. Take a cigarette. Yes, smoke. I am not a king now, you know.'

The lieutenant did rise, and tried awkwardly to cover his confusion. He did not smoke, but stood; and when the King pushed a chair towards him he simply rested his gloved right hand upon it.

The King sighed. 'As you will,' he said lazily. 'Let me explain, then. I wanted to borrow a little money, Heldmann, to enable me to leave Zorne, and there was no man in the city to whom I could safely go. But last night I saw you crossing the square, and found that you lived here. So to-night I have come to borrow all you have, promising to repay it as soon as I have passed the frontier.'

The lieutenant, all through this explanation, stared mutely into the speaker's face. When

the pause came he drew his wits together. 'Then your Majesty has not—has not'—

'Run away!' laughed the King. 'Not yet. But I'm going to. It's just this, Heldmann. Some rascals tried to kidnap me, and by an accident seized another man instead. So far, apparently, they have not discovered their mistake; and in the meantime I am getting away, after seeing the little play out to its present point. And it has been a very interesting play, though a little more rapid than I had expected.'

Then he told the story, finding a certain bitter enjoyment in the astonishment of his listener. Certainly the poor lieutenant was a somewhat ludicrous figure as he struggled through his bewilderment to his tardy conclusions. Long before the end came a light had broken in upon him.

But Conrad did not allow him to speak his thoughts even when the tale was told. 'Hush! that would be scandal,' he said grimly. 'Well, I should like to see his face when he discovers who his prisoner is—or, rather, isn't. I shall try to imagine it. It will add a new spice to the flavour of my freedom.'

'Freedom?' echoed the lieutenant blankly; and a long pause followed the question. But then the older man had completed his survey of the position. 'Then your Majesty escaped the plotters? And you are safe?'

'That is, so far,' said the King.

'And it is not yet too late?'

'It is pretty late,' was the cynical retort.

But the lieutenant's right hand tightened upon the rail of the chair, and his left crept to his sword-hilt. Who would have suspected him of an impractical heroism? Formerly he had been head of the old Raschadt gendarmerie, and had been as much amazed as delighted when the transforming influence of the new order of things had placed him in charge of the Palace Guard, with a new title and a brilliant uniform. Perhaps this change—which was, however, more apparent than real—had awakened in him a hitherto unsuspected ambition of a military character. And now—now he seemed to have been swung suddenly into a very whirlpool of events, to be caught up into an inner circle of State intrigue. Doubtless in that moment he saw himself high among the king-makers. But this was only stiffly and awkwardly expressed in his words and gestures, which made the listener smile in secret.

'No, it is not too late. I see light; I see a way! The man who managed the abduction—from your description—I am positive that it was Fenckener, the Inspector of Coast Lights; and Fenckener is the Premier's nephew!'

'The deuce he is!' said Conrad slowly.

'He is, though few people know it. He has control, of course, of the lighthouse on the Orphan, and the lighthouse-keepers; and I feel

positive that the man he seized by mistake is a prisoner on the Orphan Rock. Why, there is no doubt about it! We must see him, if necessary release him, and bring him forward as a witness; and then the author of this accursed plot may look to himself! I shall be even a little sorry for him. Why, I will go to the Orphan myself—I and my son Bernard. My son, as your Majesty knows, is assistant editor of the *Gazette*.'

Then Conrad sat upright. The loyalty and devotion in those stirring proposals did not strike him at the time. He was only annoyed by their absurdity. 'My dear man,' he said, 'are you crazy? I came here for help to get away, not for help to stay! As for the crown, I have—well, I have simply thrown it to the devil. And he is going to deal with it!'

The lieutenant's valorous excitement subsided. In the dusk his face subsided too.

'Heavens!' said the unkingly monarch, 'why is it necessary to explain? They have broken my chains for me, and I am a prisoner no longer. I could not go out gracefully myself, but I can go now that I have been sent; and, in spite of being sent, I triumph, because the sender is amazingly deceived. Thus all the circumstances are favourable, and I go. Henceforward my life is my own. Besides, I tell you frankly I was very tired of it all. It was all very well to have the best intentions—you know I had them once; but there was—well, there was an invincible obstacle. Take my word for it, Heldmann, an invincible obstacle. So I simply retire from the stage—if you'll supply the funds!'

There was a long pause, while the lieutenant slowly realised the new situation. And then, of course, he began to plead, to reason, to argue, to entreat, bending his tongue to unaccustomed phrases, searching his mind for some new point that only proved as ineffective as the others. The King sometimes laughed, sometimes gave a keen, telling retort, sometimes snubbed the old man with a roughness that was inexcusable even under these trying circumstances; but through it all he remained fixed, and at last the pleader fell silent in exasperation and despair. The King was leaving Raschadt in the morning—that was certain, and no pleading could alter it. A youth's mingled obstinacy, resentment, mortification, and spirit of dare-devilment had built up a rampart which no ordinary man could pass. And the lieutenant was quite ordinary. His silence was the acknowledgment of defeat.

'And now,' said Conrad, with an air of great patience, 'if you have finished, I will take the money and go. I have been pestered by one of Rubin's plaguy spies at the "Silver Heart," and he may be searching for me now. If he finds me here, lieutenant, you may be compromised. Let me get away quickly.'

Then the lieutenant seemed to acknowledge

his defeat, and submitted to the inevitable. His sign of submission was the removal of his sword, which he unbuckled and placed in a corner of the room. Then he turned to the window, drew down the blinds, and lighted the lamp that stood upon the sideboard.

'Your Majesty has heard me with much graciousness,' he said simply. 'I acknowledge that in my excess of feeling I did not give sufficient weight to the difficulties of your task during the past three years. Now I hasten to admit that I was wrong, and that your Majesty is entirely justified in the course you are taking.'

'Now we're coming to the light,' cried Conrad, greatly relieved. 'I knew I should make you see it. Well, now, the money; there is no time to lose.'

'Certainly not. I will serve your Majesty at once. I can let you have twenty crowns in gold, and my cheque for as much as three hundred more.'

'That will do splendidly. Thank you, lieutenant. You are the only gentleman in Zorne. I hope that the new King may give you rapid promotion. When everything is settled I will tell him what you did to get me out of Zorne; and he should be even more grateful than I am!'

Lieutenant Heldmann sat down at his bureau and proceeded to unlock it. He did things slowly at all times, and to-night he was slower than ever, because he lingered to ask questions.

'I am grateful to your Majesty. But may I ask your present plans? I shall be anxious.'

'Do not let yourself be torn by anxiety. I shall be quite safe.'

'There are, of course, amusements in plenty,' said the lieutenant, as he took up his pen. 'There is Paris.'

'Quite so. There is always Paris.'

'Or Monte Carlo, or Ostend. Or there is Africa and the big hunt, or America and the big heiress. Fortunately there are occupations many, and some of them interesting. And several kings are always following them.'

It was impossible to think of irony in connection with Heldmann—absolutely impossible. As a matter of fact, the King did think of it at that moment, but one glance at that wooden face reassured him. The old man was only trying in a clumsy way to be interesting and helpful.

'Quite so,' he said, concealing his impatience and suspicion very skilfully. 'I will consider what to do. In the meantime, lieutenant, make out your cheque to Peter Robinson of London. That name will afford you some protection if trouble should follow; but I will leave you to weave your own story around it.'

The lieutenant wrote a cheque, blotted it, and turned to his keys again. From an inner drawer he drew a small bag of gold, and as he loosened the strings he made another humble remark. It was so humble, so unpretentious, that no one

could have supposed it important. 'Obviously,' he said, 'Rubin has long been in the pay of the Central Empires. Discomfited in the great war, they must win their way by other means than force. Your removal and the substitution of Prince Max will be the scoring of a good point in their game. The other Governments will be very much annoyed.'

'A plague on both their houses!' said Conrad promptly. 'They must find some other pawn to play with.'

'Certainly!' said the lieutenant with heartiness. 'There is no reason why your Majesty should be victimised.'

He turned the gold out upon his blotter, and began to count. Now, indeed, the ordeal seemed nearly over, and the King began to look almost pleasant; but when he had counted five pieces the old man came to another pause. Obviously he could not talk and count at the same moment.

'Nevertheless,' he said, 'some trouble should be taken to lay the facts before the world. Your Majesty's supporters must see that this is done, otherwise the wrong story will be accepted; and that would give pain to your Majesty's many friends, pleasure to your few enemies. I am reminded at this moment of two persons who might be interested.'

'Indeed?' said Conrad impatiently.

'Yes, though it may seem absurd to mention them. Indeed, I only do it as an illustration. But I was thinking of the Margravine of Peden, in Thuramia, and her daughter, the little Countess Xenia. Your Majesty will recall, possibly, that they were present at your coronation, and had rooms at the Castle?'

Conrad rose on his elbow and stared. 'What about them?' he asked abruptly.

'Very little, your Majesty, except as an illustration. But they were sitting on the terrace on the night of the fireworks display, and I chanced to be very near them. It was entirely dark, and they did not know of my presence, so they spoke clearly, the Margravine having a peculiarly strident voice.'

'Rather!' said the King under his breath.

'She was, I regret to say, very uncomplimentary to your Majesty and to the prospects of Zorne. Evidently the little countess had spoken well of you—a child's hero-worship, your Majesty—she was then only fourteen—and her mother took occasion to correct her views. The experiment, she declared, would end in disaster. You were, she said, too young to be wise, and it was well known that the men of your family lacked certain essentials—stability, patience, persistence, sense of responsibility.'

'Absurd old woman!' said Conrad. 'You should have arrested her for high treason, lieutenant. But go on. What else did she say?'

'Little else, your Majesty, fortunately. But the little countess protested with quite an

amusing earnestness, and I stayed long enough to note her opinion. May I repeat her words?'

'As an antidote, I hope. That morning I had met her in the park, quite by accident, and had taken a long walk with her. So, of course, she knew all about me! What did she know, lieutenant?'

'I can only tell what she said,' answered the lieutenant, without a smile. 'She said she felt sure that you were different from the other men of your family, and that you would prove to be a king of surpassing excellence. She used the word "hero," your Majesty—actually she did. And she declared this—that you would be good to your people, loyal to your friends, and terrible but kind to your enemies. A large programme, your Majesty!'

'Large indeed!' said the King. 'Good heavens!'

Then there was silence for the space of several minutes. The lieutenant counted his money twice, and then brought it over to the couch. He gave it to the King, and returned to bring the cheque. Conrad concealed the gifts with some care, and then prepared to leave; but seemingly his impatience had now evaporated, and he was considering. It was in a very casual way that he showed the course of his thoughts.

'You know my plans, Heldmann,' he said, 'and I am glad that they merit your approval. But at the beginning of our interview you would have urged me to take some other course. What course were you going to suggest?'

The lieutenant did not seem surprised; he scarcely seemed interested. Surely, he had learnt discretion this evening! 'Oh, your Majesty, it is not for me to suggest a course! I wished rather to deprecate haste and to suggest delay, even if delay should mean a little risk. And it seemed to me'—

'Yes,' said the King with a yawn.

'I was about to ask you to remain in the capital another day—no more.'

'But for what purpose?' cried Conrad. 'Man, if everything could be made smooth at this moment I would not wish to stay. Can you not understand that I am sick to the heart? You cannot change my purpose now.'

Heldmann did not answer. He stood still, humbly and woodenly receptive, patient, waiting.

For a moment Conrad fumed and bubbled with impatience; but suddenly that meek, wooden aspect seemed to strike him, seemed to appeal to him. He laughed. 'Bah!' he said; 'you are dreaming, Heldmann. But you have earned the right to make a request, and I will agree to it. I will remain at the "Silver Heart" for another twenty-four hours—if Rubin permits! Will that do?'

The lieutenant bowed. His face certainly gave no indication of his feelings, for he had schooled it well during the last half-hour. But

ten minutes later, when he had seen Conrad off the premises without mishap, the first thing he did on returning to his room was to wipe the beads of sweat from his high, bare brows. 'I

am too old for this work,' he muttered wearily. 'And yet there is more to be done. Twenty-four hours!'

(Continued on page 533.)

IN CANNIBAL LANDS.

By JOHN D. LECKIE.

THE German Press has seen fit to sneer at our 'piebald army,' composed of men of all colours and races, and including, they say, many cannibals. This is probably a reference to the Maori contingent, though cannibalism has been extinct in New Zealand for many decades.

Cannibalism has existed in all times and in many countries. Cæsar describes the ancient Britons as a savage race, and Horace refers to them in a contemptuous manner in his odes. The ancient Greeks went further, and accused our ancestors of cannibalism; for Strabo asserts that some of the former Irish tribes were addicted to the consumption of human flesh. St Jerome has made the same charge against the Attacotti, who inhabited Argyllshire and Dumbartonshire. The fact, also, that human bones have been found among ancient 'kitchen-middens' in other parts of Great Britain has been held as evidence of cannibalism in former times. Sporadic cases of cannibalism, such as families who lived in caves and devoured the unfortunates who fell into their hands, have occurred even in modern times and in countries not classed as savage. The tales of ogres who ate human flesh, so abundant in the folklore of all countries, perhaps owe their origin to cases of this kind.

In modern times it may be noted that cannibalism has been far more prevalent in warm climates than in the temperate zone; in fact, almost the only countries in which the practice still exists, or has existed during the last century, are situated in the tropics. The most notorious of recent cases have been reported from the tropical islands of the Pacific, for cannibalism is still rampant in the Solomon Islands, New Guinea, and other islands which have been only partially brought under the influence of civilisation. Even as these lines are written we have news of a tribal battle in Papua (British New Guinea), followed by a cannibal repast. Cases of shipwrecked mariners in the Solomons and neighbouring islands who have been killed and eaten have been reported quite recently in the papers. In the case of the natives, such massacres, there is good reason to believe, have in many instances been due to a spirit of revenge, caused by outrages committed by other whites in the same neighbourhood.

In New Zealand man-eating ceased as a practice at least two generations ago; but in Fiji scarcely so long a period has elapsed since

cannibalism was rampant. Herman Melville, who lived for a while among the natives of the Marquesas group, records the fact that cannibalism was prevalent among them at that time (about 1841). Yet the cannibals treated him well; they petted him, gave him a wife and a valet, and did all they could to please him except giving him his liberty, for they kept him a close prisoner, though he was allowed to roam about their lovely valley of Typee, always under surveillance. It seems scarcely possible to believe that so kind, hospitable, and gentle a people as nearly all the Polynesians are could be guilty not only of cannibalism, but of the acts of cruelty which often accompanied the practice, victims being in many cases tortured in the most fiendish manner before being put to death. But the Polynesians, though very kind to their friends, could also be very cruel to their enemies, a combination of traits which marks many other savage peoples.

The prevalence of cannibalism has varied greatly in intensity in various groups and at various times. Thus we are told that the chief Nofosaefa revived the practice of cannibalism in Samoa about the end of the eighteenth century, after the practice had almost died out in that group. About the same time there was a recrudescence of cannibalism in Fiji, where, it is asserted, the practice was at one time unknown, and was introduced from other groups. Speaking generally, it may be said that cannibalism was not so prevalent among the fair-skinned islanders (Polynesians proper) as it was among the darker races (Melanesians) who inhabit Fiji and the more western part of the Pacific. The Polynesians were also of a much higher type, physically and morally.

In the Pacific, cannibalism may be explained, though not excused, by the fact that when they were discovered by Europeans there was almost a total absence of animal food in the islands which stud that ocean. The seas abounded with fish, and there were a few land birds; but on most of the islands there was no mammal larger than a rat, and even these rodents may have been introduced by ships. Early English navigators found pigs and dogs on some of the islands; but these had probably been introduced by the Spaniards, who were the first Europeans to explore the Pacific. This surmise is borne out by the fact that the Spanish names for pig and dog (*puerco* and *perro* respectively), or

corruptions thereof, are applied to these animals by the natives of some groups. As the Polynesians were skilful navigators, and there was frequent communication between various groups, animals introduced into one part of the Pacific would soon be disseminated throughout other islands. We are apt to forget that the Spaniards possessed settlements on both sides of the Pacific two hundred years before that ocean was explored by Captain Cook, the first English navigator of note who undertook a voyage of exploration to these seas. Spanish galleons crossed the Pacific regularly every year long before one of them was captured by Anson in his famous voyage of circumnavigation (1740-1743). Spanish expeditions, fitted out by the Viceroy of Peru, explored the great ocean. One of these expeditions passed through Torres Strait in 1606; but Australia is believed to have been sighted by Magellan's expedition in 1522, and another Spanish expedition is said to have passed through Torres Strait in 1545, more than fifty years before it was navigated by the captain whose name it bears.

The scarcity of animal food doubtless accounts for the partiality shown by the Polynesians for human flesh, which was regarded as a delicacy. This was looked on as food for warriors only, and in some of the islands at least was tabooed to women and children. The Maoris and other native races claimed the right to kill or enslave prisoners taken in battle, a right which has been exercised at times by more civilised nations. It is noteworthy that all Pacific cannibals agree in the assertion that the flesh of the white man is not so palatable as that of the native. The white man's flesh has a salty taste, due doubtless to the fact that he makes a liberal use of salt as a condiment.

At first the reports which reached Europe about cannibalism in the Pacific were looked on as exaggerated. Naval officers who had visited the various groups, and been hospitably entertained, saw nothing of the practice, and were disinclined to believe that the polished and courteous islanders who had shown them so much kindness were capable of indulging in it. But the Pacific natives, well aware of the abhorrence in which cannibalism is held among Europeans, would doubtless try to conceal any

evidence which could produce an unpleasant impression on their guests, just as Melville's islanders would not allow him to witness their cannibal repasts, the existence of which they denied, in spite of evidence to the contrary.

But cannibalism prevails in other lands besides the Pacific Islands—as, for example, in some parts of Central Africa and the interior of South America. In neither of these continents can it be excused by want of animal food, for game is abundant. Here it must be looked on simply as a depraved taste. It is on record that the aboriginal inhabitants of the West Indies were ferocious cannibals. These were the Caribs, from whom the very name cannibal is said to be derived. The ancient Mexicans also were addicted to cannibalism and human sacrifices.

The inhuman practice is still prevalent in parts of Western Africa which have been partially brought under white influence. The word 'partially' is used advisedly, for it cannot be expected that a handful of white men settled for the most part on the coast can exercise an effective moral control over millions of natives scattered over a vast area, many of whom have never even seen a white man. The writer has read of cases of human flesh being hawked about in the markets. The gruesome habit has been transplanted to those countries in which African negroes have been involuntary immigrants. Sir Spenser St John, formerly British Chargé d'Affaires in Hayti, in his work *The Black Republic*, refers to sporadic cases of cannibalism in the interior of that island, one of the cases having been publicly tried in court. Voodooism, a kind of negro necromancy, has also been carried from Western Africa to the West Indies and the Southern States of America, originally by slaves. Voodooism is said to include, among other rites, human sacrifice and cannibalism, though the reports we have in regard to it are vague and perhaps exaggerated. Among the Indian tribes in the remoter parts of South America cannibalism is still said to be practised to some extent. The writer, when in Brazil, remembers the case of a party shipwrecked in one of the inland rivers who were said to have been killed and eaten by the Indians. Such cases, however, are not common in that part of the world.

PINCHER MARTIN, O.D.

CHAPTER VIII.—continued.

II.

THE leave was all too short, though Pincher did succeed in attracting more attention than Tom Sellon, and was, after church on Christmas Day, the bashful recipient of a congratulatory speech and a golden sovereign from the squire.

Captain the Hon. James Lawson, J.P., the

lord of the manor and a good many other things besides, was an old naval officer himself. He knew all the villagers by name, and took more than a passing interest in any of the boys who joined either the navy or the army. Pincher was aware of this, and imagined that he had

received a pound, as against Tom Sellon's ten shillings the year before, because he happened to be a member of the senior service. As a matter of fact, it was due to nothing of the kind. It so happened that the squire had no smaller change in his waistcoat pocket.

But, at any rate, the news of Pincher's wind-fall was blurred far and wide, and his reputation rose accordingly. It was quite simple. If Thomas Sellon got ten shillings and William Martin a sovereign, obviously 1 Martin = 2 Sellons; ∴ the two families almost came to blows to settle which was the better. Sellon *père*, in fact, felt himself so bitterly offended that he nearly went to the squire to complain. It was lucky that he didn't, for that would have cost Captain Lawson another ten shillings to soothe his injured feelings.

The week flew by, and when Pincher returned to the ship and his Emmeline he soon settled down into the old routine. The girl, who seemed to have adopted him as her permanent 'young man,' now took it upon herself to correct the defects in his speech.

'Billy,' she said one day as they were walking arm-in-arm along the front at Weymouth, 'I don't like the way you talk.'

'You don't like my talk!' he returned, rather nettled. 'It's orl right, ain't it? Good enuf ter git on wi' aboard th' ship, any'ow!'

'There you go again!' she pointed out, smiling. 'You say "ain't" instead of "isn't," and "ter" instead of "to," and you drop your h's something horrid.'

'Wot's it matter if I do?' he demanded. 'I ain't—'aven't, I mean—'ad th' hadvantage o' a heddication same as you.'

The girl laughed outright. 'Don't get angry. I'm only telling you for your own good.'

'Orl right!' he retorted with asperity, disengaging his arm from hers; 'if I ain't good enuf for yer we'd best chuck the 'ole show, an' you can go back to yer Mister Parkin—'im wot smells o' 'air-oil!'

'Don't be silly, stupid!' she chided, slipping her arm through his again and squeezing it affectionately. 'You know I don't like him a little bit.'

'You can't like me, any'ow,' he remarked, bitterly offended. 'Leastways, if yer did yer wouldn't go talkin' the same as yer do.'

'Oh! don't I, indeed? Think I'd go walking out with you, and let you—er—behave as you do, if I wasn't fond of you?'

'Let's 'ave a kiss now,' Pincher suggested, drawing a little closer.

Emmeline pulled back. 'Go away, you naughty boy!' she laughed, blushing becomingly. 'Not in public, anyhow.'

'Yer knows I loves yer, Hemmeline, don't yer?' Pincher asked.

'Myes,' she answered softly. 'If you didn't I don't suppose you'd carry on the way you do. But plenty of boys have said the same thing

before, so you're not the only one—no, not by a long chalk.'

'D'you love me, Hemmeline?' Pincher wanted to know.

'Ah,' she said archly, 'now you're asking.'

'Come on, tell us if yer do.'

'Well,' she answered coyly, looking up at him through her long eyelashes, 'just a little, perhaps, when you're a good boy. That's why I want to tell you how to talk properly,' she went on to explain. 'I want you to get on—see?'

'Oh!' said Pincher, slightly mollified, but not knowing in the least how a correct pronunciation would make him rise in his profession. 'That's the lay, is it?'

Emmeline nodded.

III.

By the end of February Martin had passed his examination in gunnery without much difficulty, and was half-way through his seamanship course. Here, under the guidance of Petty Officer Bartlett, he and several others like him were taught the rudiments of boat-work under oars and sail, the use of the compass and the helm, the rule of the road at sea, heaving the lead, knotting and splicing, signalling, and a hundred and one other things. The practical boat-work Pincher enjoyed, and soon got into; while the knots and splices, thanks to private tuition in his spare time from Joshua Billings, were comparatively easy to master. The more theoretical part of the business, however, was a little more difficult to absorb.

'The compass,' Petty Officer Bartlett explained to the class, as they sat round on stools in the foremost bag-flat—'the compass is what we steers the ship with—see? It's supposed to point to the north pole, but it don't really. On the contrary, it points to wot we calls the north magnetic pole—see?'

The pupils looked rather puzzled.

'Owever,' the petty officer went on hurriedly, as one youth opened his mouth to ask what might have been an awkward question, 'we needn't worry our 'eads about that this arternoon, and you can take it from me that it does point pretty nearly to the north—see?'

'This,' he continued, drawing an irregular circle on the blackboard, 'represents our compass-card, and 'ere we 'ave wot we calls the four cardinal points—north, south, east, and west.' He divided the circle into four parts by means of a vertical and a horizontal line, and labelled their extremities. 'As anybody not got 'old o' that?'

Everybody appeared to have grasped it, for they all sucked their teeth and remained silent.

The explanation continued, but half-way through his lecture Bartlett had reason to suppose that certain members of the class were not paying attention.

'Udson!' he said, pausing, chalk in hand, and

addressing a freckle-faced youth, who had spent the afternoon surreptitiously eating apples and sticking pins into the most prominent portion of the anatomy of the man immediately in front of him, 'wot is the hopposite to west-nor-west?'

'Sou'-sou'-west,' the youngster replied glibly.

'Look 'ere, my son, you're not payin' hattention; that's wot's the matter wi' you. D'you think I'm standin' up 'ere 'longside a blackboard chawin' my fat* for the good o' my 'ealth, or wot? Try agen.'

'Sou'-sou'-east,' the ordinary seaman attempted.

'You thick-'eaded galoot!' Bartlett growled. 'Don't you want to learn nothin'? Cos, if you don't, you're goin' the right way about it. Didn't you 'ave no teachin' before you joined the navy? Think it's a 'ome for lost dogs, or wot? I asked you wot was hopposite to west-nor-west—see?'

'East-sou'-east,' said Hudson at last.

'Right! Why couldn't you 'ave said so before, 'stead o' wastin' my time like this 'ere, you lop-eared, razor-necked son o' a sea-cook? You perishin' O.D.'s don't seem to 'ave no common-sense, some'ow.'

And so, point by point, degree by degree, the petty officer gradually hammered the subject into their skulls until their brains whirled and their heads ached. Much of what he told them went in at one ear and out at the other; but something stuck, and at the end of a fortnight most of them could box the compass with a fair degree of accuracy, knew that its circumference was divided into thirty-two points and three hundred and sixty degrees, and were aware that each point was exactly eleven degrees fifteen minutes from the next. In short, they came to regard it as what it really is, an instrument whereby 'the mariner is able to guide a ship in any required direction,' and not merely as a complicated invention of the Evil One specially designed to involve the moribund brains of ordinary seamen in intricate mental gymnastics. What little wizard inside the compass-needle induced it to keep pointing towards the magnetic pole, a spot which most of them pictured as a desolate region of Esquimaux, icebergs, and polar bears, they did not know. They were quite content to take it for granted that it was so. The science of terrestrial magnetism, luckily for them, did not enter into their curriculum.

The learning of the marks and other details of the hand lead-line was quite a simple matter, and all the class—even Hudson, the fool of the party—could recite it all, poll-parrot fashion, at the end of the first day's instruction.

'Th' weight o' th' lead is ten ter fourteen pound, an' at th' bottom of 'im is a 'ole ter take a lump o' taller or soap ter hascertain th' nature o' th' bottom.' Here the reciter took a deep

breath, and gazed anxiously at the instructor to see if he was correct.

Bartlett nodded encouragingly.

'Th' line is one an' a heighth hitches in circumference, an' is twenty-five fadum long, an' one end is secoured ter an 'ide becket at th' top o' th' lead by means o' a heye-splice. Th' hother end is made fast to a stanchion in th' chains. Th' line is marked as follers: at two fadum, two strips o' leather; at three fadum, three strips; five an' fifteen, a piece o' white buntin'; seven an' seventeen, red buntin'; thirteen, blue buntin'; ten, a piece o' leather wi' a 'ole in 'im; twenty, two knots. These is orl known as marks, cos they are marked, an' orl th' fadums wot ain't marked is called deeps.'

Even Hudson knew all about the theoretical part of the business, so we need go no further.

But actually heaving the lead was a very different matter, for here the learner was forced to take up his stand in the chains, a small platform on a level with the fore-castle, projecting perilously out over the water. The victim rested his middle against the breast-rope, grasped the line about two fathoms from the lead with one hand, and coiled the rest of the line in the other. Then, very nervously, he proceeded to swing the lead like an ordinary pendulum over the side of the ship to obtain impetus, until, when the line was horizontal on its forward swing, he was supposed to—what Bartlett called—'swing it over the 'ead in a circle by bendin' the harm smartly in at the helbow as the lead is risin', an' then let the harm go hout agen w'en the lead 'as passed the perpendicular. Then, arter completin' two circles, slip the line from orf the 'and, just before the lead comes 'orizontal, let 'im fly for'ard into the water, release the coil o' line in the other 'and as 'e goes, gather up the slack w'en 'e reaches the bottom, an' call out the depth o' water w'en the ship passes over the spot w'ere the lead dropped—see?'

He then proceeded to demonstrate, and, stepping into the chains, whizzed the lead round his head with such ease and rapidity that his pupils were gulled into the belief that it was quite simple.

They all tried it in turn, but speedily found that a fourteen-pound weight on the end of twelve feet of thin line is not really a pleasant plaything. When they were at it by themselves the lead seemed horribly unwieldy and dangerous, and, as often as not, through sheer fright, they forgot to give the line at the right moment the vigorous twitch which brought the lead circling round in a beautiful curve. The consequence was that it would either descend perpendicularly from the air in close proximity to their heads, or else would fall with a jerk which nearly pulled their arms out of their sockets, neither of which alternatives was exactly pleasant. But they practised it steadily for half-an-hour daily, with the ship at sea and in

* 'Chawing the fat' = spinning a yarn.

harbour, and, notwithstanding a few misadventures like heaving the lead on to the forecastle in the midst of a group of men, or nearly braining themselves, they improved by degrees.

And so, in course of time, Pincher became rather less of a hobbledohoy and rather more of a seaman. Fresh air and regular exercise worked their usual wonders, for his pasty face became ruddy and his flabby muscles hard; while plenty of good beef, bread, and potatoes caused his spare figure to swell until he had to have his clothes let out by the ship's tailors. Moreover, he was no longer the meek and timid Pincher who had joined the ship a few months before. He was not behind-hand in using his fists, and had come to find his own level; and many of the youths who used to amuse themselves at his expense while he was still in the verdant stage now found their little attentions repaid with interest. Peter Flannagan, even, still an ordinary seaman, always in trouble, and rapidly going to the dogs, shunned him like the plague.

But Pincher, whatever his qualities, was no plaster saint. He did not drink to excess, and never became what is known as 'tin 'ats,'* but was not averse to visiting public-houses when he went ashore. There was really no reason why he shouldn't, provided he behaved himself.

Emmeline's influence, moreover, kept him straight in other ways; and on one occasion she saved him from getting into serious trouble for breaking his leave. It was rather a long story, involving an evening entertainment to which the girl had been invited, and to which Pincher dearly longed to accompany her. He would have done it, too, if he had been left to his own devices, quite regardless of the fact that all leave expired at seven o'clock that night, as the ship was due to go to sea at eight the next morning.

Now, breaking one's leave is a serious offence at all times; but doing it with the ship under sailing orders is far and away worse, and Emmeline knew this. So at six-forty p.m. precisely she sallied out with the unsuspecting Pincher on the pretext of going for a walk, took him towards the pier, and, before he could stop her, marched him straight up to a petty officer wearing a *Belligerent* cap-ribbon.

'D'you mind taking this young man off to the ship with you?' she asked. 'I'm afraid he's going to do something silly.'

'Ere!' Pincher exclaimed angrily, 'wot's up wi' you? Wot's it got ter do wi' you?'

The P.O. seemed rather surprised at the girl's request. 'Wot's 'e bin doin', miss?' he asked, touching his forelock.

'It's not what he's been doing,' Emmeline explained. 'It's what he's going to do. Says he's going to break his leave and get himself into trouble.'

Pincher looked round with the obvious in-

tention of breaking away; but the P.O. nodded and grabbed him by the arm. 'You come along o' me, my son,' he remarked gruffly. 'Come on! Don't git kickin' up a shindy 'ere!'

'Interferin'!' Pincher blustered, wild with rage and struggling hard to get free. 'Interferin'—that's wot I calls it! Wot's it got ter do wi' you? Think becoss you've got a killick* on yer arm yer can do wot yer likes, I suppose!—Has fur you, Miss Figgins, I'll'—

But the girl had discreetly turned her back, and was hurrying homewards.

'Come on!' growled the P.O., dragging him along. 'I reckons you ought to be jolly thankful to the gal for takin' such a hinterest in you. None o' that, now!' as Pincher began to struggle again. 'If you don't come quiet like I'll call the patrol an' have you harrested. S'welp me, I will! Come on! We've not got too much time on our 'ands!'

Pincher, very chastened, saw that further resistance was useless, and suffered himself to be conducted on board the boat without more trouble.

The ship was at sea for only a few days; and a week later, when he went to see Emmeline again, he arrived in a very repentant mood, carrying a bunch of violets as a peace-offering.

'Well,' she said severely, as he entered the shop, 'I didn't think you'd dare to come here again after what happened last Monday night.'

Pincher hung his head and got very red. 'Wouldn't dare!' he repeated. 'Why not?'

'You know very well why not,' she said, eyeing him. 'What's that you've got in your hand?'

'Wilets,' he said.

'Who for?'

'I got 'em fur you,' he stammered. 'Thought p'raps you'd like 'em.'

Emmeline's heart softened. 'Bill,' she said kindly, 'you know I didn't want to make a fool of you, don't you?'

No answer.

'I only did it to save you getting into trouble,' she continued, emerging from behind the counter and coming very close to him. 'It's very kind of you to bring me the violets, dear Bill; I'll wear 'em in my dress. You're not angry with me, are you?'

Pincher looked up at her with a slow smile hovering round his lips. She had called him 'dear,' a thing she had never done before, and that showed he was forgiven.

'Angry!' he said, tucking his offering clumsily into the front of her blouse. 'Course I ain't. I was a bit rattled at th' time, but I shouldn't 'a bin 'ere if I 'ad broke me leaf. I reckons you done me a good turn, Hemmeline.' He

* 'Tin 'ats' = drunk.

* A 'killick' is an anchor, and a petty officer wears crossed anchors as his distinctive badge.

gulped, and gazed wistfully at a little strand of golden hair which curled tantalisingly behind her left ear. 'Give us a kiss, ole gal!' he pleaded softly. 'I've bin longin' ter see yer agen.' He put his arm round her waist, drew her towards him, and touched her face with his lips.

Emmeline squeaked, pushed him away, and darted behind the counter with a flutter of a white petticoat and a momentary glimpse of a pair of well-shaped ankles clad in black silk stockings. 'You're a naughty boy!' she scolded, safe in her refuge—'a very naughty boy, to behave like that when customers may come in at

any minute! You've rumpled my new blouse, too,' she added, patting herself and rearranging the violets. 'My, they do smell nice!' She bent her head and buried the tip of a very fascinating and somewhat *retroussé* nose in the flowers.

Pincher laughed happily. He felt he was very lucky.

'You go through into the sitting-room, Mister Martin,' she went on, with a mischievous wink and a jerk of her thumb. 'I'll be along in a minute, and—and mother's out!'

(Continued on page 538.)

TWO OLD NATURE MYSTERIES.

By E. D. CUMING.

AMONG the numerous points in natural history which exercised the minds of our ancestors two were conspicuous: (1) What became of the swallow and the cuckoo in winter? (2) How did toads found in holes in rocks and trees dwell there without visible means of support?

Take the case of the swallow and the cuckoo first. The writers of the Middle Ages passed the mystery by; they were far more concerned with the uses to which birds and animals, or various parts of their anatomy, might be put in what then passed for medicine than with habit and the like.

The first writer on birds to deal with the subject in something like a modern spirit was Dr William Turner, who wrote in 1544 his *De Historia Avium*. His remarks on the swallow, for the most part, are sound. His assertion that 'the *Hirundo* feeds on flesh' may be regarded as a picturesque reference to an insect diet; but when he comes to the matter of autumn disappearance he 'shies,' if the expression may be used. 'For the whole winter it lies hid,' he says, and passes hurriedly on to facts in swallow domestic economy which he does understand. Dealing with the cuculus, or cuckoo, he is bolder. He argues at some length the probability of its changing into a hawk in winter, but clearly leans to the belief that this change did not take place. 'Yet on occasion both have been seen at once. The cuckoo, moreover, has been known to be struck down by the hawk, which thing no bird is ever wont to do to one of its own kind.' He leaves it at that, and it remains at that unto this day in the minds of some good people. Ancient beliefs die hard, and you will find not a few who still hold that cuckoos become hawks in the winter.

For light on this point of swallow disappearance in the seventeenth century we naturally turn to Sir Thomas Browne. The eminent Norwich physician was a man far in advance of his age; he was keenly interested in bird and beast, and

he made at one time a specialty of putting his neighbours right. How sadly they wanted some assistance of the kind witnesseth Sir Thomas's *Vulgar Errors*. But neither his *Notes and Letters* on natural history topics nor his *Vulgar Errors* sheds a ray of light on this vexed question.

Robert Lovell, a naturalist of minor rank, who in 1661 courted fame with a book entitled *Panzootologico-Mineralogia*, also evades the topic. True, he says of the cuckoo, 'Their feathers come off in winter, and they are scabbed,' by which he means shabby or naked; and this has significance as implying that the bird retired into some hole to spend the winter and moult; a belief which found support among naturalists of a later age. Concerning the swallow he preserves a too masterly silence.

Francis Willughby, the ornithologist who, with his friend John Ray, undertook the gigantic task of compiling a systematic description of the whole organic world, was not afraid to deal with the subject. He treats (1678) of migration, as becomes one of scientific mind, cautiously: 'What becomes of the swallows in winter time, whether they fly into other countries or lie torpid in hollow trees and the like places, neither are natural historians agreed, nor indeed can we certainly determine. To us it seems more probable that they fly away into hot countries—namely, Egypt and Ethiopia—than that they lurk in hollow trees or holes of rocks and ancient buildings, or lie in water under the ice in northern countries, as Olaus Magnus reports. . . . "I am assured of my own knowledge," said Peter Martyr, "the swallows, kites, and other fowl fly over sea out of Europe to Alexandria to winter." Similarly, as regarded the cuckoo, whether 'hiding herself in hollow trees or other holes and caverns, she lies torpid, and at the return of spring revives again, or rather at the approach of winter, being impatient of cold, shifts place and departs into hot countries, is not as yet to me certainly known.' Willughby had heard stories of the cuckoo hiding away in England for the

winter, but had never met any credible person who dared affirm that he himself had found one.

The most curious theory concerning the abiding-place of the swallow in winter was that which had its origin in Norway; and it is a singular thing that the most extravagant idea, fortified by the most detailed misstatement, should have come from the most truthful people in Europe. That high dignitaries of the Church should have been the instruments of its perpetuation is not surprising; they would be slow to think that men they knew to be honest would tell such strange fairy tales as facts of which they had personal knowledge. Olaus Magnus, Archbishop of Upsala, who died in 1558, seems to have been the first to give currency to the subaqueous theory of hibernation; and it enjoyed vigorous vitality two hundred years later, when Erik Pontopiddan, Bishop of Bergen, wrote his magnificent work on the *Natural History of Norway*, of which an English translation appeared in 1755.

In Queen Anne's time subaqueous hibernation was engaging the attention of science. The Royal Society took it up, and on 12th February 1713 Dr Colas, 'a person very curious in these matters,' addressed a meeting on the subject, adducing fresh evidence from his own personal knowledge. Dr Colas had been in Scandinavia, and he said he himself had seen sixteen swallows drawn out of the Lake of Samrodt, and thirty more from the king's great pond at Rosineilen. Nor was subaqueous hibernation peculiar to the north of Europe; he cited the evidence of a personal friend who had seen a mass of swallows drawn out of the sea under the Cornish cliffs.

Some years later Mr George Edwards, F.R.S., a naturalist whose writings are less well remembered than they deserve, dealt with the matter in the preface to his *Natural History of Some Uncommon Birds* (1743). Mr Edwards scouted the subaqueous hibernation theory; he was a resolute migrationist, and had built up his convictions on reasonable grounds. Having ascertained that certain species of birds—the swallow among them—were as well known in Bengal as in England, he urged that some responsible person should be commissioned to note the season at which such birds were seen in Bengal, to the end that it might be discovered whether their presence there coincided with their absence from England. It will be noticed that Mr Edwards was on the right track; and though he contemplated the possibility of migration in cold weather, from west to east, instead of from north to south, he had grasped the main principle—that birds in winter seek a warmer clime. But the subaqueous theory was still held tenaciously by many, and its opponents had recourse to a new method of disproof. The famous surgeon and anatomist John Hunter made a series of dissections of swallows with the view of discovering whether their lungs differed in any respect from those of other birds; whether

they were so devised that life under water was physically possible. His report that he 'found nothing in them different from other birds as to the organs of respiration' was hailed as a final answer to the holders of the subaqueous hibernation theory. Dr Hunter 'esteemed it a very wild opinion' that swallows could survive under water. Whether Hunter's dictum was known to Bishop Pontopiddan does not appear. He was acquainted with Mr Edwards's views on the subject, and makes a remark which shows him to have been rather hurt; he complains that Mr Edwards, without the least foundation, contradicts 'this incontestible truth.'

About the time Pontopiddan's work appeared the ardent among English inquirers were seeking means to test the truth of the belief that the swallow kind slept in holes the winter through, surviving in virtue of their 'stored fat'; an idea that was regarded with more favour by British naturalists than the subaqueous theory. Dr Colinson, F.R.S., in the autumn of 1757, obtained the assistance of a clerical friend in Surrey. When they had satisfied themselves that the sand-martins had disappeared, the clergyman procured a number of men, and supervised their labours while they carefully dug out a large number of the holes in which the birds had nested. Perhaps it is unnecessary to remind the reader that sand-martins nest at the end of holes, two or three feet long, excavated by themselves in the face of some sand-cliff or in a bank of soft earth. The failure to find any sleeping martins was disappointing; but, after all, it was negative evidence, and so did little to advance the matter. The most thoughtful and level-minded of naturalists during the latter half of the eighteenth century did not wholly discredit the idea that the swallow kind might thus lie torpid in holes during the winter. Even George Edwards admitted that swallows, if surprised by a very cold, wet autumn, might 'lose their passage,' and, constrained through weakness to seek shelter in holes, might there be found; but he held that they would perish. This was rather in the nature of a concession to a school of thought he felt bound to treat with respect.

Thomas Pennant, Gilbert White of Selborne, and the Hon. Daines Barrington, all of them men of lasting celebrity as naturalists, 'divided their belief,' to use Pennant's expression. White, writing to Pennant in 1767, says, *à propos* of swallows lying torpid, that he never heard any such account worth attending to. In the same year he 'entirely acquiesces in Pennant's opinion that though most of the swallow kind may migrate, yet that some do stay behind and hide with us during the winter.' Writing in 1771 to Mr Barrington, 'no great friend to migration,' he admits the possibility of swallows lying up in a torpid state, but, citing the evidence of a brother resident in Spain, says we must not

deny migration in general. White's brother had seen myriads of swallows flying south in autumn and north in spring—facts that brought conviction to the mind of the Selborne naturalist. Nevertheless he kept an open mind. Ten years later we find him writing to Barrington that no house-martins having appeared by the 11th April, he had acted on his suspicions that some of these birds remained in hiding throughout the winter, and had engaged men to search the shrubs and cavities of the south-east end of the hill near the village. It was a strange coincidence, and one of which a man with a theory to prove might have taken undue advantage, that while the search was actually in progress the first house-martin of the year appeared in the village of Selborne.

The observations of more modern ornithologists have established the fact that though the vast majority of swallows leave our shores in October, laggards may remain longer in mild seasons. There are many records of birds being seen up to the end of December, a few in January, and one case of a swallow remaining throughout the winter at Masham, in Yorkshire. It was the exceptionally mild winter of 1895-96. Two birds stayed, but one disappeared. Whether it died or took flight south cannot be said.

How did these ideas that the swallow kind hibernate or disappear under water for the winter come to take birth?

In the first place, we have to bear in mind that the idea of migration was entirely wanting in the minds of the old naturalists. The birds were with us in summer, and were not to be seen in the winter; and, misapplying the analogy of dormice and bats, fathers of the science came to the conclusion that birds did the same. It only required that a late brood should be found in the nest (and young swallows have been found as late as 23rd October) to furnish basis for the theory that hibernation in a state of torpidity was the rule. The Scandinavian idea is more difficult to fathom, but it may have arisen in this way. Birds have sometimes fallen victims to untimely frosts. I have record of a case in which a number of wood-pigeons fell helpless from their perches in the morning, after rain had given place to frost during the night; and in severe weather it is not uncommon to find birds dead, their heads under their wings as they went to sleep overnight. Now, assume such a very possible case as this: a mob of swallows roosting in reeds on an autumn night—as we all know, birds on migration bent gather in flocks; after they have gone to bed comes rain, followed by untimely frost; when the swallows wake in the morning their wings are stiff, and in their struggles they fall into the water below, and, struggling in the water, lay hold upon one another, and, entangled in the water-weeds and trash, drown. An ignorant peasant finding a number of swallows in such case might well

imagine that they had sought refuge in the water. The Norwegian, being the most kind-hearted of men, would take the birds home that warmth should revive them; and, if he found the victims of frost in time, warmth might restore them. In this supposititious case we have a possible basis for the Scandinavian theory.

The notion that the cuckoo goes into winter hiding and loses all its feathers seems to have some similar foundation in fact. Thomas Bewick, an ornithologist of repute, whose *British Birds* appeared in 1797, affirms that a young cuckoo was found naked in the thicket of a gorse-bush, and, being carefully tended and fed, recovered its plumage, to survive the winter and escape in the following spring. In the *Field* of 8th December 1860 a correspondent related a case which had come under his notice some years previously. Certain farm servants were celebrating Old Christmas (6th January) at Eastwood, in Herefordshire. They were about to place a fresh Yule log on the fire, when they found it to be inconveniently large. It was a great billet, decayed in the centre; so they split it with an axe, and in the cavity found a cuckoo, naked as a nestling, in a bed of its own feathers. It survived only a very short time.

In this connection it is to be noted that caged cuckoos have been kept throughout the winter in England; but, needless to say, they moult in summer, as do other birds. Birds of the year remain with us till later than the old cuckoos; young ones have been seen in October; and it is possible that a bird incapable of flight has been found in late autumn in a state of weakness that caused greater or less loss of plumage. Hence the theory. As for that tale from Eastwood, Herefordshire, we shall perhaps be right if we conclude that the narrator mistook a story inspired by the sight of the Yule log for an incident. Such might easily happen at a convivial gathering.

Turn we to the toad in a hole.

The belief that this, 'the most noble kind of Frogge, most venomous and remarkable for courage and strength,' as old Topsell puts it in his *Historie of Serpents* (1608), could live for years together hermetically sealed in wood or stone is not quite dead yet. Among our ancestors it was an article of faith that toads were superior to the needs of other living creatures, and the thing that really bothered them was the question, 'How did the toad get in?' Spontaneous generation was held sufficient to account for the presence of toads in holes, where no toads should be, for many centuries; but during the seventeenth century the more inquiring minds began to look into the mystery. Dr Robert Plot, whose *Natural History of Staffordshire* appeared in 1686, reviewed the whole question as it was then understood. He found it easy to apprehend how toads creep into the clefts and hollows of rocks and trees to

preserve themselves in the winter; and it was clear to him that during their hibernation they might grow, so that the crack through which they entered might not be large enough for their exit in the spring. He adduced as an additional detaining factor the circumstance that both rocks and trees grow. The fact that rocks do not grow may be passed over as not necessarily vitiating an argument otherwise sound. So far Dr Plot was within the bounds of accuracy; toads do seek refuge in clefts of rocks and holes in trees for their five months' retreat in winter, and it is certain that their own development might prevent escape through the crevice which was only just large enough to permit entry. As regarded their accepted ability to do without food—the fact that toads breathe did not enter into and complicate Dr Plot's argument—he points out that they are at rest, do not perspire, and thus find enough sustenance in the 'salts of stones and juices of trees, together with the transcolation of such fine dews as may very well support an animal of so slender a dyet.' Salts of stones and juices of trees, with the 'transcolation of fine dews,' seem a poor substitute for worms and insects, but it satisfied Dr Plot. So far the thing seemed simple enough; but how were they to account for such cases as that at Lapley, where a toad was found in a hole in a tree twelve or fourteen feet up? He was equal to the occasion. Either we must suppose that it was produced from wind-borne spawn which lodged in the hole (which assumption argues fogginess concerning the breeding habit of toads), or the animal was 'drawn up by the sun into the clouds and so discharged thence in a shower and lodged in the hole of this tree while young, whence, fearing to leap in the summer, it had to stay.' To the seventeenth-century mind there was nothing strange about descent from the clouds. Olaus Magnus had settled that point for the enlightenment of science more than a hundred years before, in connection with the lemming plagues he knew in Norway. It still happens periodically that a Norwegian valley is invaded by hordes of lemmings (*Myodes lemmus*) which come down from the high grounds and wreak havoc among the crops and herbage. The Norwegians of the sixteenth century were sore put to it for explanation of these plagues of mouse-like rodents, until the then Bishop of Trondhjem came to the rescue with the theory that they fell from the clouds. That was about 1522. Archbishop Olaus adopted the explanation, and thus gave it currency. He was a benefactor: his approval of the cloud origin of such living things as might not otherwise be satisfactorily accounted for was a boon to science for many generations. Dr Plot's method of getting the toad high up in a tree is, it will be observed, a slight improvement; he translated the young toad to cloudland by sun-power as a preliminary step.

And yet there were brought to the notice of

good Dr Plot toad-stories that seem to have given him pause—that one about the Statfold toad, for example. The steeple of Statfold church was very old, and in a condition so dangerous that it was decided to take it down; and in the topmost stone of that very old steeple was found—a live toad. 'If,' says Dr Plot with becoming caution, 'the story of the toad in the top stone of the steeple of Statfold may be allowed to be true, we must allow them [the power of existing without tangible food] some hundreds of years.' The very fact that there existed a practical joker to conceive the brilliant idea of a toad prisoned in the topmost stone of a steeple which had stood for hundreds of years indicates that there were some who did not believe in the toad-in-a-hole even in those days; but they must have been few. Belief in the power of toads to survive long years of imprisonment totally cut off from food and air is by no means dead yet.

The old idea has its origin in the vitality of the creature, which is undoubtedly very great—so great as to have astonished Dean Buckland when, in 1825–27, he made his series of experiments to demonstrate its falsity. Dean Buckland prepared two blocks of stone, one of limestone, which is porous, and one of sandstone, which is very compact, by making in each twelve holes about five inches in diameter, and so cut at the mouth that a plate of glass with a slate to protect it could be slid into place. In each of these cells, on 28th November 1825, he put a live toad, and cemented down the glass and slate cover with a luting of clay; and then he buried the stones three feet deep in his garden. On 10th December 1826 he dug up the stones and investigated. Every toad in the sandstone cells was dead, and it was evident that some had been dead for months. The majority of those in the cells of limestone, which is so porous as to be easily permeable by water and probably also by air, were alive; two had actually increased in weight, a circumstance attributed to the probability that small insects had gained access through a cracked glass in one case and defective clay luting in the other. The surviving toads were kept in their prisons, and before the end of the second year all were dead. Toads imprisoned in wood blocks, the cells being closed by close-fitting plugs, died within a year.

The Buckland experiment dissipated for all time the toad-in-a-hole fiction, so far as educated people are concerned. It was the means of proving that these creatures can exist for an extraordinarily long period without food, provided only they have air to breathe; wherein they resemble the snake tribe. But there remain those who will have it that the toad brought to light in the coal-cellar has been released from some solid block in which it has had its abiding since the coal was made—some geological ages.

SEVENTH SERIES

THE ROCK OF QUARTO. AN ECHO OF THE GARIBALDIAN CAMPAIGN.

By A. COMYNS CARR.

CHAPTER I.

IN the barely furnished ground-floor room of an old villa on the Eastern Riviera a woman sat alone beside a shaded lamp. It was a dignified, if somewhat gloomy, room, telling of a sober past, far, in appearance at least, from the clamour and stress of the present; a home well befitting the grave, grand old lady who owned it; but the garden beyond was soft and seductive with all the perfumed seductiveness of a hot Italian night.

The night was very still, still and sultry, and the wash of the waves on the rocks below seemed to soothe the waiting woman; for the heavy eyelids drooped as if in sleep, perhaps only in a day-dream—a dream of fifty-five years ago.

For this was June 1915, and she may have been thinking of May 1860. And the Marchesa remembered that year only too well!

Suddenly she raised her eyes to a more modern portrait among the dark old family portraits that hung above the Empire consoles: the portrait of Giuseppe Garibaldi.

In this very room the great Deliverer had sat with the husband of her youth, the husband whom she had given to his country. As they had fought together in 1859 upon her Lombard plains, so, in 1860, they had sailed together for Sicily, and her man had fallen at the memorable battle of Calatafimi.

From the road that ran along the shore a chorus of strident boys' voices broke the silence of the night.

*'Si scopran le tombe; si levan i morti,
I martiri nostri son tutti risorti,'*

they sang lustily. And, as the hymn of Garibaldi rose upon the breeze, she seemed to see her own dead arise, her own beloved 'martyr' appear before her longing eyes.

What had he come to do?

Ah, she knew well enough! He was beckoning—beckoning to his grandson, the son of a son who had had the misfortune to squander his manhood in days of peace, the ill-luck to die before the great tradition was destined to be carried forward once more. But the younger generation was not going to fail them; the good

No. 295.—VOL. VI.

blood was there; it was going to carry that tradition forward exultantly.

The old woman sighed, but unconsciously; for there was no drooping of the courage within her; she too knew how to be exultant. As she had flung her girlish arms about the neck of her hero in a last embrace that 5th of May fifty-five years ago, so she was prepared to lay them more soberly, but none the less exultantly, around the neck of her grandson now; she only asked that he should be worthy.

The crazy bell at the upper garden gate sounded, and the woman started, then folded her gnarled hands resolutely in her lap again.

A shuffling step sounded on the marble terrace without, and an old servant, reminiscent—as everything here was reminiscent—of the past, put his head in at the door.

'Does *Vossignoria* receive?' asked he curtly.

'It will be the Marchese, my grandson. Do you not remember, *figlio mio*, that the regiment leaves Genoa to-night?'

The old man, whom the mistress still addressed after the friendly fashion of her youth, lifted his hand and rapped with his knuckles on his brow as in chastisement of his failing memory; then he nodded, and hastened to pull the wire which lifted the latch of the garden gate; it slammed, and a quick, firm step sounded on the bricked walk beneath the pergola.

'*Riverita!*' said the man in respectful salutation, as a well-knit, alert figure in the uniform of the Bersagliere Regiment filled the window in the moonlight.

'*Ciad*, Battista,' answered the master cheerfully in Milanese dialect, as he flung down his stiff black hat with its well-known plume of drooping cock's feathers, and stepped up to salute his grandmother. 'You will have enough to do now—eh? The young ones leave you for more difficult work than cleaning the plate—what?'

'*Dio santo!*' ejaculated the old fellow. 'But *Vossignoria* can joke! I understand! I would I could follow where they go! But what would you have?'

'Ah, you have done your work. You too

[All Rights Reserved.]

JULY 22, 1916.

have fought for Italy, my friend; you can be content! Look well after my grandmother; it is all I require of you now. The rest will be for another time.'

The master nodded, and the servant sighed and withdrew as the old lady signed to the lad to sit beside her.

He obeyed, laying his sword aside first, and took her hand and respectfully kissed it.

'Well, we are all ready,' said he in a business-like tone. 'The train leaves at ten-fifty. It is good to be off at last.'

'Yes, it is good!' echoed she quietly. 'Very good!'

'Ah, it is not you whom one has to teach how to bid a soldier farewell, *nonna mia*,' cried he with sudden *élan*. 'You have learned your lesson. It was harder then.'

'No, not harder,' she said in the same even voice; 'only different. Then I was young; I had more ardour perhaps; anyhow, I had more illusions. Now I have no illusions.'

He laughed. 'Oh, do not be too sure that I shall leave my skin down there!' said he merrily. 'I can assure you I have no such intention; and, as for illusions, they are not such bad things, do you know? And then, why call them by that name? We are going to win; I am going to come back; the world is not finished; oh no! There will be beautiful days again for the world, you will see!'

He bounded to his feet and stood facing her—the energetic shock of curly black hair thrust back on his forehead, the falcon eyes flashing, the hook nose of his Ligurian race defiant, the firm lips parted in a smile. He was not a tall man, but he looked it at that moment; strength and determination were in every line of him, and the grandmother smiled too.

'Son of thy race!' murmured she proudly. 'God prosper thee! Ah, do not fear! I have not lost my faith because I am old. I too know that we shall win! For our cause is just, and God is with a good cause. And this will be the crown—the crown of which he has been dreaming there in his Sicilian grave—he, who rises now to call thee!'

The quiet tones had strengthened till they became a claron; she lifted her arm, pointing to a dark painting hanging above the young man's head, and he bowed beneath the portrait of his grandsire.

For a moment there was silence.

Then, 'Have no doubts!' he swore with a merry oath. 'We will drive them from our soil, rest assured! And after that'—and had she not been so preoccupied she might have wondered at his laugh—'perhaps we may forgive them a little.'

'Never!' cried she, tossing her fierce old head. 'So, come that I may bless thee!'

The young man came forward and knelt before her. He was a modern, and many things to

her sacred were perhaps now insignificant to him; but this woman was one of those whom to belong to was to revere—and to obey. So he bent his head as she laid her hands on his hair and murmured her invocation.

'I can say I give thee to thy country with a good heart,' said she as he rose to his feet; 'though I confess it would have been with a better still hadst thou left me a sprig of the old tree to carry on our name.'

He started and lowered his eyes.

'I had my hopes,' she continued; 'there was an alliance that thou knowest of ready for thee, and worthy of thy race. But nowadays the men will not marry! It is a craze. The good families die out; and for what? Self-indulgence! egotism! Our youth of to-day'—

'Ah, let our youth of to-day alone, *nonna*,' interrupted the young man quickly. 'They are not doing so badly—our youth of to-day! We have been egotists—yes, and I have done as others do. But, I say it, to-day we will show that there is another side to us. To-day there is no more self-indulgence. We go, laughing, shouting, singing, but willing to suffer and to die for our king and our country, for wife and child!'

He threw up his hands, his voice shook; and she gazed at him with parted lips, amazed and suddenly rigid.

'Thy country is wife and child to thee! Thou sayest well, since thou hast no other.'

There was a pause.

'*Nonna mia*,' said he at last, 'you mistake! When I came to-night to receive thy blessing I came also to confess to thee.'

'To confess to me?' she said sternly. 'Make thy confession to God!'

'No! It is to thee that I must confess, since it is thee whom I have deceived. I have wife and child.'

'I had my suspicions,' muttered she, after an ominous silence. 'But I imagined it was only an affair like another.' Her voice was cold; her keen eyes had grown hard; but so had his. 'Didst thou hide it from me because thou wert afraid?' sneered she. 'Well, I tell thee that if it is some disgrace thou dost well to be afraid. *Dio santo*! Disgrace—for us? God be thanked that thy grandfather died without knowing thee!'

The young man squared himself; there came a quick, fierce ejaculation from him. 'Ah, take care, *nonna mia*!' muttered he between clenched teeth. 'Not even thou dardest use such words in connection with my wife! Of our women of to-day she is the noblest, the bravest whom I have known. She sends me forth gladly to fight the accursed race whom thou hatest. And yet—he paused—'she is a De' Maricis.'

The woman started. 'A Venetian! Of which branch?' hissed she.

'Of the elder branch.'

'Then her mother is an Austrian!'

'Yes! And her father an Italian, son of a patriot who died as my grandfather died.'

The words had come in a quick volley from one to the other.

But at the lad's last reply the old woman clenched her hands; slowly her head fell forward on them. 'Oh, my God!' she groaned, like some dangerous animal at bay. Then presently, 'Didst thou say there was a child?'

'Yes, *nonna mia*! A boy! That sprig of the old tree whom thou askedst of me!'

'A boy! Thy son. And he has Austrian blood in his veins!'

'He has the blood of two ancestors who gave theirs for Italy. My wife's grandfather fell at Varese.'

'In my Lombardy! Well! well! well! But, no! Austrian blood! It will out! There is no trusting it. I should never forget it. Never! Mother of God, that this should befall me!'

She was muttering to herself; but the heavy Empire clock on one of the consoles struck the hour in slow, warning notes, and the young man looked at his watch.

'Time presses, *nonna mia*!' said he. 'I must leave thee.'

Then she rose heavily—a towering figure—and laying her wrinkled old hands on his shoulders, gazed straight into his eyes. 'Gigio mio, I have suffered much in my long life. But it has remained for thee to deal me the worst blow of all.'

'*Povera nonna*!' murmured he; but added half-whimsically, 'Yet what is to be done?'

'Thy son shall be as my son—because of his father—because of his name,' said she slowly. 'But his mother'—

He put his hand quickly over her mouth. 'Do not say it,' he cried. 'Mother and son are one.'

She drew back, lifting her hands above her head in a slow, hopeless gesture. 'Let her choose!' said she; 'let her choose! God forgive me, I can say no more!'

'Then there will be no more to be said,' he answered with a sigh. 'Could I ask it of her? Not I!' He advanced quickly to the table, and, buckling on his sword, took his plumed hat. 'Hast thou the key of the garden gate?' asked he in a matter-of-fact voice. 'It will save me a few minutes.'

She took it from a drawer, and, passing before him out of the French window, led the way with a firm though measured stride across the moonlit garden.

As they stepped into the shadows of the black cypresses near the boundary wall a shrill railway whistle sounded in the near distance.

'Hasten, *nonna mia*!' cried the young fellow; and, snatching the key from her hand, he put it in the lock of a small door, opened it, and slipped the key hurriedly into his pocket.

'*Addio*!' called he from outside, lifting the plumed hat. And, 'God keep thee!' she answered, and then he was gone.

She stepped out on to the road and watched him running—running as if for his life.

On the flat rocks to her right above that little bay of Quarto, dear to the hearts of all Italians, stood the well-known monument to 'The Thousand,' white in the moonlight; and white, too, glistened the path down which Garibaldi and his staff had walked to the landing on that memorable night fifty-five years ago. Again she saw the boats swaying on the swell of the Mediterranean, the dark figures tumbling into them on the dark night—starlit only; again she felt a loved hand press hers as she linked her arm within that of the husband to whom she was bidding a hopeful, but, alas! a last, farewell.

All her mind had been set then upon being brave as a soldier's wife must be brave, and upon sending him forth without a qualm or a memory that was not soothing or inspiring. Could she say as much to-night?

A second whistle sounded below, and she heard the train steam out of the little station.

It was too late—too late to retract! The waves that lapped restlessly on the arid shore said so pitilessly.

The clock in the campanile on the hill struck the hour.

She turned back to the little door beneath the cypresses. Then only did she notice that the key was not in the lock. The boy must have taken it with him by mistake. Was it a good omen? Was he to bring it back? God grant it! But, as she walked up the moon-streaked paths to her empty *palazzo*, she seemed suddenly to be aware of the full weight of her seventy-five years.

(Continued on page 554.)

N A B L O U S.

By Lord CHARLES FREDERICK BRUDENELL-BRUCE.

SEVERAL years ago we, a party of four travelling through Palestine, made our way by Bethel and Omrah to Nablous, the ancient Shechem or Sychar.

Approaching the city, which lies up a valley,

we came first to Jacob's Well, which has been from time to time mended and excavated by the Greeks, so that it is now possible to go to the edge, probably to the very spot where our Lord talked with the woman of Samaria.

Shechem has from the earliest times been a place of great importance, chiefly owing to its beautiful climate and its unique position in the midst of a series of abundant springs, twenty-two in number. These springs burst up and flow down the valley between Mounts Ebal and Gerizim, irrigating the fields in their course, and so producing a fertility rarely met with in the arid region of Palestine. In early summer flowers of every description and hue abound on all sides, intermingled with fig and olive trees, as well as the orange, lemon, and pomegranate.

When we entered the city we were met by a Syrian gentleman, who had been appointed Baptist minister of the district, and he invited us to take our midday meal at his house. Being born and bred there, he was able to give us much information respecting the local traditions, of which so many are preserved in Palestine. Among other places of interest to which he conducted us was the Samaritan synagogue, situated at the end of some very slippery and evil-smelling cobbled streets.

As we picked our way along he informed us that a few years back it was unsafe for any Christian to pass this way unattended; and this I could well believe, judging from the dark looks with which we were greeted by the natives who passed us on the road.

Arriving at the synagogue, we were courteously received by the high priest and his son, both fine-featured men, with long beards. Here we were shown an ancient roll of the Pentateuch, dating from about 423 B.C.; another roll, said to be the oldest of all, was preserved there, but our guide told us that this was rarely seen, and only after several days of backsheesh and diplomacy. This precious roll, it is asserted, was written by Abisha, the great-grandson of Moses, in the thirteenth year after the conquest of Canaan, as recorded by an inscription said to be inserted in the manuscript itself. The manuscript is written in letters of gold, and is rolled on silver rollers, the whole being composed of three columns all written in the Samaritan or old Hebrew characters, which represent the type of writing in which the books of the Old Testament were originally written down. The story of the origin of the Samaritan Scriptures is curious and interesting, and is probably detailed to most of the travellers who make this a halting-place.

The Samaritan Bible was written in the old Hebrew characters, and took its rise from the incidents mentioned in Nehemiah xiii. 23-30—namely, the expulsion of those Jews who had intermarried with the heathen. Among those expelled was Manasseh, a grandson of the high priest Eliashib. He thereupon took refuge with the Samaritans, and set up a rival worship to that at Jerusalem.

The Samaritans were originally foreigners imported into the country of the Ten Tribes by the king of Assyria, and there they mixed with the

Israelites. They at first incorporated the worship of Jehovah as the God of the land into the worship of their own gods, and when the Jews returned from captivity offered to assist in the rebuilding of the temple at Jerusalem, but their offer was not accepted.

From that time they became bitter enemies of the Jews, and after Manasseh was expelled and came to Shechem with his Moabite wife, and set up a rival religion, the quarrel became more acute. He obtained leave from Darius Nothos, king of Persia, to erect a temple on Mount Gerizim, which became the headquarters of the new sect in opposition to Jerusalem. He commenced his ministry by an exposition of Genesis; but the process was so lengthy that he died before he completed Deuteronomy. His successor in the priesthood did likewise; and, commencing with Genesis, he also died when he had finished the expounding of Deuteronomy. A third priest took up the thread of the discourse bequeathed by his predecessors; but the people refused to hear anything more after the last book of the Pentateuch, being convinced that the death of the first two priests at that particular point was a sign that Providence meant them to be the only canonical books.

In many instances where the Samaritan text differs from the Hebrew, the Greek Septuagint version agrees with the former, and so increases its value as a reference. For instance, the Samaritan and Hebrew books differ very often as to the ages of the patriarchs mentioned in the early chapters of Genesis.

The minister also told us that he had seen the archives kept by the high priests from the earliest times, with a record of the principal events that occurred during the tenure of each. No record appeared of our Lord's visit to Sychar; but there are two occasions on which mention of Him was made by name, the first being that of His birth at Bethlehem, with the date; while a succeeding high priest says that 'Jesus the impostor was crucified in the accursed city of Jerusalem.' The records of these archives, coming as they do from the most bitter opponents of both Jews and Christians, are an additional and independent proof of the authenticity of our gospel history.

The Samaritan sect is slowly dying out in Nablous. In 1894 only about one hundred and fifty survived, and these, combined with Jews and Christians, numbered about three hundred, the rest of the population being fanatical Mohammedans.

Referring back to the aridity of the climate of Palestine at the time of this visit in 1894, it is interesting to note that the prophet Joel foretold that before the second coming of Christ the children of Zion should rejoice because God would give their land two rainy seasons—'the former and the latter rain'—so that the land might be fruitful and yield her increase. Until

twenty years ago, for many hundreds of years, the latter rains have been withheld, and so nothing grew to perfection. Twenty years ago only half-an-inch of latter rain was recorded in Palestine; but since then there has been a gradual increase, so that for the past four years there has been a supply sufficient for the cultivation of the vine and other fruit-trees. There are now forty colonies as against two or three

twenty years ago, thanks to the rain and the great Zionist Movement; so that during the past eight years there have been imported from America and elsewhere fourteen million new fruit-trees to replenish the waiting land. Wine from the vine-slips that have been planted (predicted by the prophet Isaiah, xvii. 10) by these colonists during the last few years in Galilee is already being sold in London for sacramental purposes.

THE KING-MAKERS.

CHAPTER IV.—THE PRISONER.

THE island called the Orphan stood at the entrance to the bay, some twelve miles from the coast, and its lighthouse stood on its eastern and seaward extremity. The Orphan had no inhabitants save the lightkeepers; and since the crown had claimed and used it for lighthouse purposes, it had been forbidden ground even to occasional fishers and holiday-makers. It measured only half a mile across, and was a barren rock from end to end.

It was just after dawn that two persons landed on the western beach of the Orphan with every mark of secrecy and caution. As a matter of fact they had no permits from the Lights Department of the Coastguard Service, and there were other reasons for secrecy. They beached their small but serviceable motor-skiff on a tiny belt of sand at the entrance to the great ravine that traversed the rock from west to east, and the younger man sprang lightly out. He was evidently accustomed to the management of a boat. His companion, who joined him on the beach with much less agility, proved to be Lieutenant Heldmann, shorn of the glory of his uniform, and somewhat stiff and cold from the night voyage.

'Here we are!' said the younger man cheerfully. 'It is just as it was on my last visit three years ago. And now for the breakfast—and the wait.'

With some difficulty he drew the boat to such a position that it was concealed from the direction of the sea should some idle traveller in a passing vessel turn his glass upon them. Even more safely concealed was the spot he selected for their temporary camp, and it was here that they enjoyed a long and leisurely breakfast. The making of a fire was out of the question, but a couple of thermos flasks supplied all that they needed; and, as for solid provisions, the young man had evidently given considerable thought to these matters. After the meal had been disposed of, and the remains carefully cleared away, they decided that, although a fire was impossible, there would be no harm in smoking; so a case of cigars was produced, and over the cigars they discussed, in an irregular fashion, the possi-

bilities of their expedition. It was the younger man that talked.

'Fenckener is a surly savage,' he said, 'just the man for a piece of work like this. The lighthouse-keepers only visit the mainland once a week, and, of course, they would be entirely under his thumb. Besides, they probably would not know the King by sight.'

'But when the prisoner found his tongue?' cried the lieutenant.

'As the prisoner was not the King, that problem did not actually arise! But, even if it had been the King, I do not think it would have proved a difficult question. The man who formed the plot would not fail to deal with it in advance.'

There was a brief silence. It almost seemed that the shadow of Rubin fell between them as they talked.

But even that austere shadow could not suppress Bernard Heldmann for more than a moment. 'As for the mistake itself,' he continued, 'it came about in a very simple way, through the plotters' excess of caution. Fenckener did not actually see the capture, for he was outside the summer-house all the time. His subordinates placed a sack over the captive's head, and then rolled him in a rug. That sack, probably, was not removed until the director of the affair was safely out of sight. That was simple caution, yet you see how it worked. Moral: Don't be cautious! Oh, I see yards of copy in this incident, and any number of morals. The Premier has been very hard on us lately; but a time is coming when we shall issue a *Gazette* which his calf-headed censor has not seen! No, I am not here for the adventure, or because you want to serve the Little King. I am here on behalf of the liberty of the Press, the greatest bulwark of the nation. Eh?'

The lieutenant smiled grimly, and his son's eyes twinkled in response. The two men understood each other perfectly.

'What would Rubin have done with his prisoner afterwards?' asked the lieutenant—'I mean, if it had been the King?'

'He would have found some way out. There would have been no special danger even in

setting him free. The fear of ridicule is a good silencer. As for the instruments, they would be sufficiently silent. It is no light thing to kidnap a king—even a little king. Whatever you do, worshipful father, never embark on such an enterprise as that. You are doing some risky things in your years of discretion, but please let there be a limit!

The lieutenant smoked and smiled; but it was evident that even his son's cheerful badinage could not make him forget the seriousness of his undertaking. So a silence fell again, while the sun rose higher over the dark ridge of the mainland. A gray splash that was Château Rombard looked at them from the distant cliff, as if watching the development of the story.

At last the lieutenant looked at his watch. It was nearly eight o'clock. 'We have probably six hours,' he said; 'then the boy will go, according to his word. I must confess that I am dispirited, Bernard. The whole affair is so full of irony. There was Rubin's excellent plan, the crowning plan of a man who never leaves anything to chance. It seems to have been splendidly conceived, perfectly timed; and yet some trifling accident leaves it a ridiculous comedy! Then the boy himself. I reason and implore in the name of all that is counted valuable, but he is adamant. "A plague," he cries, "on both your houses!" and "the crown may go to the devil!" Yet when he hears that a child of fourteen has hoped well of him he suddenly surrenders. What *are* the things that really matter?'

'That is a riddle,' said Bernard. 'As I said, this business is full of morals; and the answer to a riddle is often a moral. But he was very human, and it seems that we prefer a very foolish boy to a very wise man. But have you any more reflections, most worshipful? If not, we will get things moving.'

Lieutenant Heldmann frowned, but his son twinkled all the more. He was a journalist, and therefore irrepressible; but, besides, he was resolved to hide the sterner side of their adventure as long as possible.

'Now,' said Bernard, 'my plan is simply this. Keeping under shelter of this ravine, I will make my way towards the lighthouse. My object will be to get a sight of our man and to communicate with him. If I succeed, we will come back here. It may be that we shall come in a hurry, with guns behind us; so you will remain by the boat, ready to shove off at a moment's notice, ready also to cover us with your revolver if it should be necessary. Is it all clear?'

'Quite,' said the lieutenant. 'I have simply to wait.'

'With one foot in the boat and the other on the rock. And now I'll be off.'

With that he turned away up the ravine. For a little while he had the sand, but presently

this gave place to an uneven track strewn with loose rocks. In some places his journey was a rough scramble, in others a climb; always, however, he went as silently as possible, his eyes continually scanning the cliff-brows above, and his revolver ready to his hand.

In this way he drew near his goal, and at last caught a glimpse of the gray shaft of the Orphan Lighthouse. To go farther up the ravine would serve no good purpose now, and he must try the upper earth. After a careful scrutiny of the cliff, therefore, he began to make his way upwards, and at last gained a ledge within a few yards of the summit.

It was then that a calm voice spoke somewhere above him: 'If you come up higher, my friend, you will be shot!'

Bernard was sufficiently astonished, but it seemed to him that the voice did not suggest violence. 'I am obliged to you for the warning,' he said. 'May I turn and look at my new friend?'

'He will be charmed. But please don't come any higher.'

Bernard accordingly turned, and stood with one hand resting against the rock. Then he found that the person who possessed the voice was lying on the top of the cliff ten feet above him, looking over the edge. He saw a young man's face, with regular features, somewhat lazy blue eyes, and bronzed skin. The lower part of the face had a beard of a month's growth.

They surveyed each other calmly.

Bernard's wits were spurred to their keenest. This was almost certainly the man he had come to find. 'I believe,' he said pleasantly, 'that you are the person I have come to visit.'

'With such infinite pains?' suggested the other. 'That was my impression too. My argument was that since you were so evidently shy of the lighthouse-keepers, you must be amiably disposed towards their prisoner. And yet I could not jump to conclusions. I made a serious mistake in that way only a short time ago, and this is the first chance I've had since of making another.'

From the first Bernard admired the man's *sang-froid*. True, those lazy eyes were a little trying in their supreme assurance, and he missed any signs of a grateful recognition of the risks he had run. But he had certainly found his man.

'Our boat is at the end of this ravine,' he said quickly. 'I have a friend waiting by it. Can you come at once?'

The prisoner nodded. 'I can, but it must be quietly. One of those ruffians is always looking after me. Of course, they know I cannot leave the rock; but if they saw you there would soon be several devils to pay.'

As he spoke he glanced towards the lighthouse with such a look of hate that Bernard was startled. This man would certainly be a useful witness when the time came!

'What a month it has been!' the prisoner went on with feeling. 'I did not suppose that there were such wooden brutes on the face of the earth. They have fed me like a pig, and shouted at me as if I were a dog. I have been locked up at night like a criminal, and only let loose in the daytime like an animal turned out to graze. I dared not signal a passing ship—that would be instant death. When I speak they answer nothing; and I have failed to sleep at night lest I should fail to wake in the morning. When my turn comes! But how was it that you did not come earlier?'

Bernard seldom spoke in a hurry, however clear the path might seem. 'Of course,' he said, 'no one knew exactly what had happened. It was only after careful reasoning that we decided to try the Orphan. The whole thing was so well planned.'

The prisoner uttered an oath. 'Yes,' he said; 'and I thought him a fool. I mocked him—I sat and mocked him even while his ruffians were creeping up the cliff! Well, I have certainly more respect for him now; but I cannot say that I have any more affection!'

Bernard naturally failed to gather the purport of these remarks; but the words he had intended to say, 'Why, man, it was not the King that did it,' were choked back from his lips. When a man is talking it is always well to let him talk.

'Of course, I never dreamt that he knew me,' proceeded the prisoner, especially garrulous, perhaps, after his enforced silence. 'We had never met, and I—well, I was sufficiently disguised. His information must have been very complete. What has happened since? Rubin is still in power, or he would not have been able to send you for me.'

'The Premier,' said Bernard impressively—seeing that some answer was necessary—'the Premier is still the Premier!'

'Then he has only had to postpone the *coup*. I suppose he waited until he should get in touch with me again. But is everything else right?'

'I believe, everything,' said Bernard, whose brain was spinning with questions he could not utter.

'Then the King, though he had disposed of me, was still afraid to tackle Rubin?'

'He had some reason to be afraid. But—but may I ask exactly how this thing happened? So far we have only been able to conjecture.'

The young man smiled slightly. 'That must have been a trying occupation for the Premier. But it is simple enough—as simple as all such follies are. After our interview, you know, when everything was settled, I thought I would like to have a look round. So Rubin gave me a pass to go wherever I pleased; and just the first thing I did proved to be my last also. I was so self-confident that I must needs walk into the lion's den, and sit down there, believing

the lion to be an ass. And I have paid for the mistake.'

To Bernard much of this was still a riddle, because he had failed to see the key. Nor was there time to consider, for if he did that the prisoner would take his turn at asking questions. So he sought to gain time. 'But the boat,' he said—'can we gain it without being stopped?'

'I believe so. But I will walk quietly along here, so that they may not be rendered suspicious. You keep to the ravine. If they come out we must run for it, that's all.'

'Good!' said Bernard. 'Let us start, then.'

The prisoner agreed, and in a few minutes Bernard was again at the foot of the cliff. There, looking up, he could see the prisoner keeping pace with him at the top, but walking in a lazy, purposeless manner that was admirably designed to conceal his eagerness. Then he turned his face towards the boat, his mind struggling with its problem.

Bernard's theory had been all through that Rubin's secret agent might be, and must be, bought for the King's service. He had calculated upon a keen resentment in the man, a deep anger possibly, at the absurd mistake which had been made by his own employer and his other instrument; and he had come to the island with the object not only of seeing the fellow, and so confirming his own idea as to what had taken place, but also of bringing him away and placing him in the King's hands as an invaluable witness. This man was no doubt the repository of many secrets, and to secure him might well render the Premier powerless.

It was difficult to describe the difference, but certainly things were not turning out in that way. The man was evidently an able man, and there was also something about him which discouraged the idea that he might be easily bought. Then there was his hatred of the King, which seemed to suggest some old grievance which no gold might be able to remove. There were other points also in need of elucidation, and the young man turned them over in vain; but he knew that all his instincts were now against his original programme. At the same time, he saw the danger of allowing instinct to lead him from a well-planned scheme; and when he reached the beach he was in a perspiration of doubt and indecision.

The lieutenant watched his approach with tremulous interest, standing by the boat, his revolver hidden under his cloak. The tide was now rising, and the little craft was resting with her stern in the water. Looking back, Bernard saw the prisoner descending the cliff-path only a hundred yards behind.

'Is that the man?' asked the lieutenant.

'Yes. I found him. I hope I sha'n't be sorry for it,' said Bernard savagely, as he stepped into the boat to make ready for departure. In a few minutes, finding the engine in order, he looked

up to watch the approach of the prisoner, who was now coming rapidly over the last fifty yards. What on earth was he to do? He felt a wild desire to put all his doubts at rest by a question or two before they embarked, and with that vague idea in his mind he stepped out of the boat and walked a few paces to meet the prisoner.

'The boat is all ready,' said Bernard, as calmly as possible. 'But look! look!'

Two men, armed with rifles, had appeared suddenly on the crest of the hill, and were pausing there to survey the tableau. The prisoner looked, and swore; then he turned towards the boat; but Bernard had turned first, and reached it a moment before him. The pursuers were now coming over the hill with clumsy haste, and shouting loudly. Heldmann had already rushed to the boat and got her into the water, wading to his knees. But there was sufficient depth in the middle of the ravine, and he immediately got aboard. Bernard sprang in to take his place in the stern.

The prisoner, with one glance behind, hastened to join them. But as he raised his foot over the gunwale Bernard's doubts were resolved in violent action. Memory and instinct had rushed together to the conclusion he had failed to reach before, and he knew the truth. So he seized the intruding foot, and with one quick jerk sent its owner headlong backwards. He was plunged into the surf and sand, and in that moment the boat sped out into the stream, and was under way.

When the prisoner recovered himself he sat up, spluttering oaths and his face streaming with water. And his mouth foamed as he saw that somehow, somewhere, he had made another mistake.

Once past the dangerous rocks and out of sight of the little creek, the lieutenant allowed his sentiments to find expression in his face. Angry and bewildered, he glared at his incomprehensible son, to find that young man rocking with irrepressible laughter!

(Continued on page 548.)

COAL ECONOMY.

WITH prices of commodities of all sorts rising to heights unprecedented in our time, householders and public bodies are anxiously looking about for possible methods of economy; and with the growing scarcity of labour it is impossible to go on in the same old easy way of doing things.

One hears of various suggestions for economy; but a method that is not brought before the public in a sufficiently aggressive way, and one that would help to increase the supply of two very important products—namely, toluol and benzol—is the more liberal use of gaseous fuel.

Attention has been drawn year after year to our present wasteful methods of using one of our great national assets—coal; but perhaps not enough stress is laid on what would be the effect of getting rid of that pall of smoke which almost continually hangs over our large cities and towns, especially the industrial towns of Lancashire and Yorkshire.

It is not only factory chimneys and works generally, however, that are sinners; the domestic hearth contributes a large share of this undesirable poison-cloud; for it is no less! It is interesting to look at some of the figures relating to the consumption of coal, and see what would be the result in better health, apart from mere saving in money, if the smoke nuisance could be abolished.

The quantity of coal raised in the United Kingdom is, in normal times, about two hundred and seventy million tons; and of this total the gasworks carbonise the insignificant amount of fifteen million tons, producing some one hundred

and seventy thousand million cubic feet of gas—less than four thousand cubic feet per head of the population!

Still, even this comparatively small quantity of coal yields important by-products. These include one hundred and sixty thousand tons of sulphate of ammonia, a valuable fertiliser, which at current rates is worth, say, two million five hundred thousand pounds; tar, from which is obtained a host of subsidiary products, to the extent of nearly a million tons, worth about one million two hundred thousand pounds; and some forty-six thousand tons of sulphur, which is converted into sulphuric acid, the basis of so many of our commercial processes. Two substances which were urgently needed when war broke out in 1914 were toluol and benzol, as it was found that high explosives such as trinitrotoluene, of which toluol is the basis, were absolutely essential if we were to cope with the enemy on anything like equal terms.

As toluol can only be produced by the destructive distillation of coal, the Government turned to the gasworks and asked for their help, and in various ways that help is being given by the gasworks up and down the country, either by recovering the toluol and benzol direct from the gas as it is made, or by distillation of the tar produced.

If the whole of the gas made in the United Kingdom were stripped of its toluol and benzol, we should get about one thousand five hundred tons of toluol and nine thousand tons of benzol, with, of course, a considerable decrease in luminosity and calorific power in the gas.

Summing up, then, we can say that by converting this comparatively small quantity of coal into gas, which can be so conveniently used for lighting, heating, and motive-power, we gain products worth at least four million pounds, and the resultant coke, which is insufficiently used in domestic hearths, will amount to about six million tons, of a value of from five to six million pounds sterling.

Let us now look at the household fires, and see what economies could be effected there if gaseous fuel were substituted for our present crude method of obtaining heat. In round figures, forty million tons of coal are used in this way each year, and, of course, all the valuable products are, practically speaking, lost—for example, a potential five hundred thousand tons of sulphate of ammonia, worth seven million pounds, is wasted; two and a half million tons of tar, worth three million pounds, follows suit; as does some four thousand tons of toluol and twenty-five thousand tons of benzol!

And what of the loss in health, not only directly, but indirectly, due to less sunshine in our big towns; the damage to buildings due to sulphur acids slowly corroding the stone, brick, and iron of which they are composed; the filthy air our town-dwellers are compelled to breathe; the extra work that is caused in the household in washing and scrubbing; the rotting of curtains, book-bindings, &c.?

Take any of our large towns—Manchester, Leeds, Glasgow, Sheffield—and try to conceive what a difference it would make in the winter months to be free from fogs and those everlasting gray skies, and to have bright sunny days such as one so often gets in the country in winter. Ask any one who has his business in Manchester, but lives, perhaps, at Buxton, or Knutsford, or St Anne's—any place a dozen or more miles away—how often he finds a miserable, drizzly, foggy day in town, with greasy pavements and all the various inconveniences of typical winter weather, while when he left home after breakfast the sun was shining from a cloudless sky, and the fields and hedges were sparkling with frost.

Then go up one of the hills surrounding Sheffield—Wincobank, perhaps, overlooking Brightside and Tinsley—and peer down into the valley where the dense black smoke pours out of hundreds of chimneys belonging to the steel-works, and you wonder that human beings can exist in such vile surroundings! Ask the medical officer of health what the infantile mortality is in those districts, especially among the poor little mites in the more crowded areas, and then try to imagine how many could be saved if they were born in clean, bright towns where the air was pure and the sun could shine on them. In Manchester alone it is estimated that in various ways the smoke nuisance costs

a million a year, and that in material damage, not taking into account the loss the country suffers due to the workers being less efficient through being constantly below par and feeling 'out of sorts.' The effects are so far-reaching that it is almost impossible to over-emphasise the ills that can be laid at the door of this terrible scourge.

Factories and works of one sort and another consume some seventy million tons of coal each year, and the products from this huge quantity of coal are not only being wasted, but are helping to undermine the people's health, impair their efficiency, and generally make life a good deal less worth living. Surely it is due to us, as a nation that prides itself on being in the van of scientific progress, to 'do something' in this matter!

A little, but only a little, is being done in houses by the use of gas-fires, cookers, &c.; but it is to be hoped that the shortage of servants will tend to make gaseous fuel more universal in the future, and the use of coal in the raw state will not be tolerated. In industrial centres also, by means of forced draught, coke and breeze can easily be burnt in the boilers for power purposes, thus doing away with that black cloud belching forth night and day from our factory chimneys. If the burning of raw coal were prohibited, gas could be supplied at not more than a shilling per thousand feet, and we should have at our disposal a cheap, clean, and efficient source of heat that would banish for ever the ridiculous spectacle of carts laden with coal going along our streets to unload their contents into cellars, whence long-suffering mortals have to haul it up again to feed the insatiable maw of our domestic hearths.

Many people look upon gas as too costly to use for heating rooms; but used on common-sense lines it is as cheap as coal if the price is at all reasonable—two shillings to two shillings and sixpence per thousand feet. During the summer months the quantity of gas required for cooking, heating water, &c. in a house rented at twenty-eight or thirty pounds a year need not exceed five hundred feet per week, which at two shillings and sixpence per thousand feet would cost one shilling and threepence, a sum that would be almost saved in cleaning materials alone. In larger houses the mistress could easily manage with one maid instead of two by installing gaseous heating in all bed and living rooms, and using a gas cooker instead of the usual wasteful kitchen-range, and a geyser for heating water, &c.

Much more might be written on this subject, but perhaps enough has been said to give some little food for reflection; and one may conclude by hoping that Britain will really 'wake up' in this particular instance, and not be content to endure any longer the soot and smoke she has put up with in the past.

PINCHER MARTIN, O.D.

CHAPTER VIII.—*continued.*

IV.

SOON afterwards, when the bleak and stormy winter was nearly over, the *Belligerent* and the other vessels of the squadron started off on their first real cruise since Pincher had joined. They had had plenty of time at sea before this, of course; for gunnery, gunnery, *toujours* gunnery—unless it was torpedo-running, steam tactics, or P.Z. Exercises*—was carried on throughout the year, winter, spring, summer, and autumn alike. They were always at it; and though the frequent south-westerly gales made the winter work very unpleasant and trying, though officers and men bemoaned their fate and swore 'twas a 'mug's game,' it did them all the good in the world. So, at the end of February, the squadron left the short, choppy seas of the Channel and the familiar hump of Portland behind them, and waddled south, for all the world like a family of turtles migrating to a sunnier sea. It was then, for the first time, that Pincher knew what it was to be really seasick.

Their first port of call was Arosa Bay, in Spain, just to the southward of Cape Finisterre, and for once the much maligned Bay of Biscay upheld its reputation by providing a very fair sample of a south-westerly blow for Pincher's especial benefit. He was by no means the only sufferer.

It was a snorter of a gale, a regular snorter, and the short, snappy little seas of the Channel were nothing to these long, gigantic, foam-crested mountains of water rolling in with all the might of the Atlantic behind them. The battleships wallowed and plunged about to their hearts' content. Their movements were slow, deliberate, and very stately; but how they rolled! One could feel their enormous weight smashing through the seas instead of riding over them. Water came over the fore-castle in solid gray-green masses, until the deck was buried and the fore-turret, with its pair of twelve-inch guns, looked like a half-tide rock. Sheets of spray drove over the bridges. The quarter-decks were untenable; and at times gigantic, white-capped billows would blot out every vestige of the next ship astern—only five hundred yards away—except her topmasts.

The *Belligerent* was battened down, but even then a considerable amount of water found its way below. The atmosphere on the mess-decks, well impregnated with the mingled odours of cooking, damp clothes, and crowded humanity, was nauseating. Tables and other fittings had

carried away from their fastenings, and a horrible kedgerie of sea-water, hats, caps, boots, food, broken crockery, pickle-jars, tins of condensed milk, and pots of jam swished to and fro across the deck every time the ship heeled over. Each roll added something fresh to the collection.

On one particularly heavy lurch the door of the officers' galley shot open, and the wardroom cook slid gracefully out on to the mess-deck, accompanied by an avalanche of frying-pans and saucepans, the stock-pot, and a large receptacle full of Irish stew for the officers' lunch.

'If this ain't the ruddy limit!' he observed dismally, picking himself up and gazing at the débris with disgust written on his pea-green face. 'They'll git nothin' 'ot fur lunch ter-day, that I'm bloomin' well certain!' Nobody listened to what he said; and, after surveying the scene for another instant, he yawned twice, and then bolted hastily towards the upper deck. He got there just in time, poor man!

Most of the younger men were past caring whether it was Christmas or Easter. They merely became as limp and as pale as pocket-handkerchiefs, wedged themselves in convenient corners, unconscious of the water and rubbish washing round them, and wished that they might die. Some of them nearly did. It was only the old staggers like Billings who were not affected, and they, instead of offering consolation to their suffering shipmates, went about casting rude gibes at the poor wretches.

'Ullo!' remarked Joshua, strolling aft to his mess at dinner-time, and coming to a halt opposite a miserable little party sitting with their backs up against the ship's side. 'Ullo! 'ere we 'ave Mister Pincher Martin, Rile Navy! 'Ow are we, ole son? Feelin' a bit squeamish—wot?'

The 'ole son,' whose face was a ghastly yellow, whose eyes were closed, and whose head rested carelessly on the shoulder of his next-door neighbour, a man whose name he didn't even know, looked up with a sickly grin, and then relapsed into torpidity.

Billings, swaying easily to the violent rolling of the ship, looked at him with amusement. 'Ave a bit o' somethin' t' eat?' he suggested, with horrible cheeriness. 'Nice little bit o' corned beef or a drop o' pea-soup? Pea-soup's fine scran fur blokes wot's seasick.' He smacked his lips appreciatively.

Pincher shook his head.

'Then 'ave a nice bit o' fat 'am?' suggested his tormentor. 'Slips down nice an' easy like,

* 'P.Z. Exercises'—that is, mock actions, fought between two opposing squadrons; so called from the two-flag signal directing the fleet to carry out these manoeuvres.

an' don't rest 'eavy on th' stummick, fat 'am don't.'

Pincher groaned at the idea.

'Strewth! you ain't 'arf a sailor, you ain't!' the elder man snorted contemptuously, moving off.

Pincher expressed no emotion at all. The very sight of Billings's rubicund countenance made him feel worse than ever, while a man who could mention food at such a time was surely beyond the pale. Moreover, a sailor's life was the very last thing that he took any interest in at that particular time.

Even some of the officers were unwell. The *padre* retired to his bunk, and was fed by his marine servant on soda-water and Bath Oliver biscuits; while Cutting, the young surgeon, Hannibal Chance, the captain of Marines, and the fleet paymaster refused nourishment of any kind whatsoever. Nearly all the others made some attempt to eat their meals; but all except the most hardened sea-dogs bolted a few mouthfuls, and then beat a hasty retreat to their cabins. The only person who did really enjoy it was Harry Derrick, the Royal Naval Reserve lieutenant, or 'Cargo Bill,' as his messmates invariably called him. He always had an insatiable appetite, whatever the weather, and a 'little bit of a sea like this' did not incommode him in the slightest. It was nothing to what he had experienced off Cape Horn in the wind-jammer days he never tired of talking about when he could persuade any one to listen.

But all things come to an end in time; and, after thirty-six hours of absolute misery, Pincher revived to find the squadron steaming into Arosa Bay.

So this was Spain! he thought to himself, looking round with interest as they passed into the sheltered anchorage. He had imagined it to be rather a wonderful country, but if this was a fair sample, he didn't go much on it. A large indented bay; a few blue hills in the distance; a low-lying, dried-up-looking country, dotted here and there with wooded clumps and patches of cultivated ground; a few small white houses and a gray stone church or two; a straggling town and a long pier at the head of the bay; and many fishing-boats with strangely cut sails. There was a peculiar tang in the air which he could not at first determine. It was neither the sweet odour of freshly turned earth, new-mown hay, or heather, nor yet the honest salty smell of the open sea. It was something far more pungent and overpowering. He found out afterwards that it emanated from various sardine-preserving factories, and the discovery put him off canteen 'sharks' for quite a week. There are sardines and sardines; let us be thankful they are not all Spanish sardines!

No, Pincher's impressions of the first foreign country he had ever visited were not exactly enthralling. Spain looked a very ordinary place

from the water, and it did not improve on further acquaintance when he went ashore with Billings the same afternoon.

The town, Villagarçia, was not a delectable spot. It smelt of garlic and ancient fish. Its streets, badly paved and odoriferous with heaps of nameless garbage, seemed to provide a happy hunting-ground for many lean, fierce dogs, perambulating pigs and goats accompanied by their families, and prowling poultry. The people, too, looked dirty and ill-favoured, and the better-class men all smoked cigarettes and wore long black cloaks and wideawake hats, like clergymen at home in England. Numbers of barefooted boys and girls of all ages between three and seventeen followed Pincher and Billings about wherever they went. 'I say! On' penni!' they demanded persistently, holding out their grubby hands. 'I say, Jack! Damn you! I say, on' penni!' There was no getting rid of them until the pennies were forthcoming; and their stock phrases—all the English they knew—seemed to have been handed down from generation to generation, ever since British men-of-war first started to visit the place in the year one. It was a paying game, for the bluejacket is always free with his hard-earned money.

No, Villagarçia was not attractive. There was nothing to do except to drink vinegary *vino blanco* in the taverns, and to buy picture post-cards, silk shawls, paper fans showing fierce and bloodthirsty bullfights, and hideous tambourines depicting plump, gaily dressed ladies in short skirts dancing the *mattiche*. On the whole, Pincher was not sorry to get back to the ship, and he did not trouble to go ashore again.

A fortnight later they arrived at Gibraltar, where the ships went alongside the Mole in the inner harbour to take in coal. But here the operation was quite gentlemanly compared with coaling from a collier, for the fuel was carried on board in small baskets on the backs of non-descript, garlic-scented aliens known as 'rock scorpions,' and all the ship's company had to do was to stow it in the bunkers as it came on board. There was none of the back-breaking work of shovelling.

Coaling completed, the ships went out almost daily for aiming rifle practice; and then came the annual 'gunlayers' test' with the twelve-inch, six-inch, and lighter guns.

'Wot is this 'ere gunlayers' test they talks abart?' Pincher, rather mystified, asked Billings.

'Gunlayers' test!' the A.B. returned, staring at him very much surprised. 'You've bin in this 'ere ship nigh on six months, an' yer don't know wot a gunlayers' test is!'

'Ow can I know wot it is?' Martin sniffed. 'I ain't see'd it, 'ave I?'

'Ain't see'd it, ain't yer?' Joshua snorted. 'Ignorance, that's wot it is! 'Owever, I'll larn yer. Gunlayers' test is wot we carries art

every year wi' orl th' guns in th' ship—see? Th' ship steams parst a targit at fairly close range, an' orl th' gunlayers fires in turn. It's a bit o' a competition like, an' they orl 'as a certain number o' rounds ter fire in a certain time—see? It's just ter see if'—

'Ow fur orf is th' targit?' Pincher wanted to know, for even he could understand that this was rather a vital point.

'Don't yer git interruptin' w'en I'm spinnin' a yarn!' Joshua remonstrated. 'I loses th' thread o' wot I'm sayin'.' It was fairly early in the morning, and he was still feeling cantankerous.

The ordinary seaman apologised. 'Sorry,' he said. 'I didn't mean no 'arm.'

'Course yer didn't; but if yer gits arakin' stoopid questions, 'ow kin a bloke remember wot 'e's sayin'? Wot wus it yer wanted ter know?'

'Ow fur orf th' targit wus.'

'Not werry fur,' Joshua explained. 'Leastways, it ain't exac'ly fur, an' it ain't exac'ly close. You oughter know wot I means; I can't remember th' exac' distance. Any'ow, gunlayers' test ain't th' same as battle practice, 'cos then we fires orl th' guns at once, same as we do in haction, likewise at long range—see? Gunlayers' test is simply a competition like, ter see if th' blokes kin shoot strite—see?'

'An' wot 'appens then?' Pincher asked, still rather hazy as to what really did take place.

'Wot 'appens? Orficers comes aboard from other ships as humpires, an' they takes th' time each bloke takes ter fire 'is rounds, an' counts th' number o' rounds 'e gits orf; likewise th' number o' 'its an' misses on th' targit. The results is then packed up an' sent ter th' Admiralty, an' them blokes wot's done extry well gits medals an' money prizes, an' them wot ain't 'as a court o' hinqury on 'em, an' probably gits disarted from bein' gunlayers—see?'

'An' kin I git a medal fur this 'ere?' Martin eagerly asked, for he, also, was a humble member of one of the twelve-pounder guns' crews.

Joshua was amused. 'Kin you git a medal?' he laughed. 'A little cock-sparrer like you! 'Course yer bloomin' well can't! They only whacks 'em art ter them gunlayers wot's done extry well, an' there's werry few on 'em given. You ain't a gunlayer, an' ain't likely to be one neither. Gunlayers 'as brains.'

'But 'oo gives these 'ere medals?' Pincher asked, ignoring the insult. 'The admiral?'

'No; th' King gives 'em. Leastways they 'as 'is likeness on 'em, so I reckons they comes from 'im. Nutty Buttolph, th' gunlayer o' my gun, 'ad one larst year. 'E wears it Sundays wi' 'is No. 1's. I reckons I oughter got it too, 'cos I'm th' loadin' number wot shoves in th' projectile, an' each six-inch projectile weighs a 'undred pounds. We got orf eight rounds an' got eight 'its on th' targit, an' I reckons it wus

me wot done it just as well as 'im.' Billings's chest swelled with pride at the recollection.

'Ard luck!' Pincher murmured.

'Ard luck?' remarked Joshua. 'Course it wus 'ard luck! 'Owver, I took ten bob orf my opposite number in th' flagship, an' fifteen bob orf another bloke wot thought 'is gun could shoot strite. We were top o' th' 'ole bloomin' squadron larst year,' he added; 'precious near top o' th' 'ole navy, an' don't yer bloomin' well forgit it. Our ship's company made a bit o' a pay-day over it.'

'Pay-day! 'Ow d'yer mean?'

Joshua grinned and winked one eye. 'Bettin'!' he said in a hoarse whisper.

'But I thought bettin' wusn't allowed?' Martin remonstrated, remembering the regulations.

'No more it is, me son; but th' skipper won 'is ten quid from th' flagship's skipper, 'oo said 'is ship 'u'd beat us; an' w'en 'e won it 'e whacked it art among th' guns' crews, 'e did. Proper gennelman, 'e is. Th' Bloke, an' Jimmy the One,* an' most o' th' other orficers made a bit too. We're wot we calls 'ot stuff in th' shootin' line, I kin tell yer.'

Billings was quite right. There was certainly no lack of rivalry, for the officers and men of the squadron were as keen on the results obtained by their respective ships as they possibly could be. The gunlayers' test was treated in much the same way as a regatta or a race-meeting, for sweepstakes were got up and bets were freely offered and taken on the performances of individual gunlayers. Strictly against the regulations, of course, but nobody seemed to mind, and the favourites themselves became very important personages for the time being.

To the ship's company of any man-of-war, 'our ship' is invariably the best shooting and the smartest ship not only in the whole squadron, but also in the entire British navy. Disputes as to the merits of two crack vessels have been known to lead to regrettable incidents ashore. Pewter beer-mugs are handy missiles, and black eyes and contusions, though rare, are by no means unheard of. Moreover, if a smart ship which fancies herself is beaten at gunnery by some dark horse, the obvious inference, from her men's point of view, is: (1) that the umpires have been bribed; (2) that the ammunition was bad, and it therefore affected the shooting; (3) that the sea was much rougher and the ship had far more motion than when H.M.S. So-and-so fired; (4) that the sun was in the wrong place, and that the light was bad; (5) that the weather was misty; and so on, *ad infinitum*, all the excuses being equally futile.

But rivalry between ships, despite occasional bickerings ashore when their respective partisans

* 'The Bloke' = the commander. 'Jimmy the One' = the first lieutenant.

wax argumentative, does no harm. On the contrary, it is a good sign. It shows there is *esprit de corps*.

On this occasion, however, the *Belligerent's* guns were possessed of a devil. She did very well, it is true, and came out second in the squadron, but was just beaten by the *Tremendous*. The defeat came as a severe blow, particularly as a treasured silver challenge cup, presented by the admiral and awarded annually to the best ship, now left its resting-place on the *Belligerent's* mess-deck and found its way to the flagship. It was carried off in triumph by the winners; but the *Belligerent's* gunlayers cursed long and loud, and swore by all their gods that it had been won by a fluke. So did some of the officers.

'This 'ere's th' ruddy limit!' Billings muttered fiercely. 'Ter think o' these 'ere Duffos* 'avin' th' imperence ter say they 'ave beaten us! They ain't done it fair! S'welp me, they ain't! It's enuf ter make a bloke take ter—ter anythin'!' He was going to say 'beer;' but, remembering Mrs Figgins and his new-found respectability, he wisely refrained.

After spending a month at Gibraltar, they returned to Portland to give four days' Easter leave, and then sailed off to Berehaven, where they did more gunnery. Then on to the west coast of Scotland for a cruise, and finally back to Portland again.

The time passed very rapidly. Spring gave way to summer, and in due course Pincher found himself passed out of the seamanship training-class and handed over to the tender mercies of a torpedo gunner's mate, who crammed his head with an astounding number of facts pertaining to electricity and torpedo work generally.

One Sunday in the early summer, however, the chaplain rather electrified his congregation. 'I publish the banns of marriage,' he read, 'between Able Seaman Joshua Billings, bachelor, of this ship, and Martha Ann Figgins, widow, of the parish of St Cuthbert's, Weymouth. If any of you know cause or just impediment why these two persons should not be joined together in holy matrimony, you are to declare it. This is for the first time of asking.'

The commander, and various other officers who knew Joshua intimately, could hardly restrain their mirth.

'The old devil!' Tickle exclaimed in the smoking-room after the service. 'To think of any woman wanting to marry him!'

'There are plenty of worse men than Billings,' the commander disagreed. 'He's not very attractive to look at, I'll admit; but, provided he keeps off beer, he and his Martha'll get on

all right. What he wants is a woman to rule him with a rod of iron.'

'You'd better give the lady a few tips, sir,' Tickle suggested.

'Not I!' laughed the commander. 'I shall merely present them with an ormolu timepiece—whatever that may be. It shall be suitably inscribed, too. You see,' he added, 'Billings, in spite of beer, is quite one of the best seamen in the ship, and I shall be very sorry to lose him when he takes his pension.'

There is no need to describe Joshua's wedding, or to tell how some of the officers and a goodly proportion of the ship's company attended the ceremony, how Pincher performed his duties as 'best man,' and how the commander himself was prevailed upon to make a speech and to drink the health of the happy couple in grocers' port wine. It all went off like a house on fire; but at the tea-party afterwards Pincher seemed rather distracted.

'Ullo, chum!' the beaming bridegroom asked him, 'wot's up wi' yer? You've got a face on yer like a sea-boot.'

'I'm just thinkin' somethin',' Pincher explained.

'Thinkin' wot?' Joshua wanted to know.

'Wot an 'appy hoccasion this is, or wot?'

'No, 'ardly that.'

'Wot is it, then?'

'I wus thinkin' that now you've gorn an' married Missis Figgins you are Hemmeline's farther, ain't yer?'

'S'pose I am,' Billings assented, scratching his head, for the question had not occurred to him before. 'Leastways, 'er step-farther.'

'An' s'pose I marries Hemmeline, wot relation are yer ter me?'

'You ain't arsked my leaf to court 'er,' Joshua pointed out. 'An' s'pose yer does, I don't know as 'ow I shall give my consent. These haffairs is important—see. I'll 'ave ter hinqwire as ter yer prospex, an' suchlike. Supposin' yer wusn't respeccable?'

'Respeccable!' Pincher retorted. 'Don't talk so wet! If I ain't good enuf ter marry Hemmeline, you ain't good enuf fur Missis Figgins—see. She's 'er mother, ain't she?'

'Don't go an' git dizzy on this 'appy day,' Joshua went on with mock gravity. 'Don't go gittin' rattled! Carn't you see w'en a bloke's 'avin' a joke like?'

'It ain't no subjec' ter make fun o',' Pincher answered, rather mollified. 'But, any'ow, s'posin' I does marry 'er, wot relation would you be ter me? That's wot I wants ter know.'

'I reckons I'd be yer step-farther-in-lor,' Joshua answered after due consideration. 'Leastways, that's 'ow I looks at it. I'll arsk th' missis, though. Come an' 'ave a wet?'

Pincher, nothing loath, acquiesced. They went off arm-in-arm.

(Continued on page 565).

* The ship's company of a ship hailing from Devonport are known as 'Duffos' to the men of ships with Portsmouth and Chatham crews. A 'duff' is a pudding, and the term probably originated on account of the west-countrymen's supposed liking for the same.

GUM-DIGGING IN NEW ZEALAND.

A VERY valuable mineral product exported from New Zealand is kauri-gum, of which article about nine thousand tons, worth over half-a-million pounds sterling, were shipped in 1913. Next to gold and coal, kauri-gum has contributed more to the revenue of New Zealand than any other mineral; from 1853 to 1913 this contribution came to sixteen million seven hundred and fifty-nine thousand five hundred and sixty-three pounds. Kauri-gum is really a misnomer, for the gum is a true resin, being the solidified turpentine of the kauri-pine, occurring in great abundance in the Auckland Province.

Dry fern hills and muddy swamps are alike worked successfully by the digger. The gum is also found in the forks of living trees; but this is of low grade. In the fossil state the gum is in lumps varying from walnut size to that of a man's head. Pieces weighing one hundred pounds have been found. In tint the gum varies from the rich brown of the best specimens to the dark, almost black, colour of the resin dug up in the swamps. Occasionally transparent chunks of gum are unearthed, enclosing leaves, insects, and so on. This transparent gum has a high value as a substitute for amber. But the great bulk of the kauri-gum is used for oil varnishes, in the making of which it holds the highest place.

The market price for the gum varies considerably; the best grade, of which there is but a small quantity, sells up to three hundred pounds per ton; the average price is well over fifty pounds. The trade in kauri-gum began about 1847. Up to 1853 its price was about five pounds per ton. Since then the price has gradually risen as the demand increased and the labour of digging became greater. The chief factor influencing sales and prices of kauri-gum in recent years has been the request for the poorer qualities, called 'chips' and 'dust.' Up to the outbreak of the war these grades were sent to Germany for linoleum-making.

Manual labour has been the sole means of producing kauri-gum up to quite lately; but now mechanical means are employed to get the swamp gum, and the latest plan is the introduction of dredging. A gold-dredger is being adapted for the purpose in North Auckland.

A peculiar point is the discovery of two, three, and sometimes four layers of gum in many places, betokening the existence of several kauri forests, which, on being destroyed by fire in years past, left a legacy of gum on the ground.

In the early days of gum-digging, large pieces of gum, called in trade circles 'bold' gum, were found on the surface of the ground, or just embedded, reminding one of the beginnings of gold-getting, when nuggets were picked up. Later the gum-digger had to search with a spear, and get the gum at a depth of about ten to twelve inches. Then a second or third layer of gum was found in fields thought to be exhausted. A large gum-spear, eight to twelve feet long, was used as a probe, and a hook brought up gum in the swamps which a few years ago were not thought worth exploration.

Three classes take a hand in the business: the professional gum-diggers; the settlers who occasionally work on the fields when agriculture is dull; and the native Maoris and half-castes, who dig only when their crops fail and their food-supplies give out. Gum-digging is about the last employment to which Britons would turn if they were given their choice. The work is very hard, and the result is nothing more than a bare living. Some seven thousand persons are engaged in the New Zealand gum-getting business. Included are about fifteen hundred Austrians—that is, natives of Dalmatia, Istria, Croatia, and the Balkan States. These people, whose earnings come to from twenty to twenty-five shillings a week, are hardy, sober, and industrious. No clear evidence exists explaining why these Austrians went to New Zealand and took up gum-digging. But two Austrian sailors some years ago sent home very favourable accounts of New Zealand to their friends. This, and the excitement caused by some lucky Austrian gum-diggers winning and taking home nine thousand pounds drawn in one of Tattersall's racing sweeps, induced these aliens to pour into New Zealand. They speak a Slavonic dialect, not German. Unlike the British gum-diggers, who work individually, these Austrians are gregarious, camping in parties of twenty or thirty, and digging in the swamps in summer and on the hills in winter.

THE FRIGHTFULNESS OF DIVER PERKINS.

By 'ÆSCULAPIUS.'

I.

SHORTLY after midnight on 16th August 1915, H.M.S. *Alcibiades*, while proceeding to join a squadron to bombard Zeebrugge, ran aground on one of the numerous shoals off the

Belgian coast. The cruiser began to make water. The few watertight doors that remained open were immediately closed, and everything was done to confine the flooding to the region involved.

It was still three hours from high-water. The ship must be got seaworthy during that time, because it was known that enemy submarines rose to the surface at dawn for a preliminary look round.

The captain wished to repair the ship without calling for assistance. A wireless message would be intercepted, and, although in code, would tell the enemy of the presence of British ships in the vicinity. If a collision-mat could be got over the hole the ship would be able to go ahead.

Meanwhile the cruiser rested gently on the shoal.

II.

Several officers, chiefly non-executive, were in the ward-room awaiting developments. In spite of the uncanniness of the hour and the occasion, Staff-Surgeon Michael O'Brien was engrossed in drinking cocoa and perusing the enlivening pages of *La Vie Parisienne*. He failed to observe the approach of a boyish figure.

'The divers are mustered in the sick-quarters, sir,' the midshipman said.

'Why the devil can't they go down at a reasonable hour?' the staff-surgeon answered, gulping down the remainder of his cocoa.

The midshipman grinned as he made his exit.

The staff-surgeon's remarks were greeted with shrieks of derision from his messmates.

'The next time we bump we'll time the accident so as not to disturb your serene highness,' the staff-paymaster remarked.

'Why waste energy,' the chaplain suggested, 'when you can listen to the diver's heart over the telephone?'

'Would you like me to go for'ard and look them over, doc?' the gunnery-lieutenant blandly inquired.

'It'll take you all your time adjusting your gun-sights, from what I saw of your last firing,' the staff-surgeon retorted as he put on his cap and stalked solemnly out of the ward-room.

III.

A good part of the ship's company were at night defence stations. Others were getting out the collision-mat. Many were still on the mess-deck. They were lounging about in easy attitudes, talking and laughing boisterously. One youth fingered a mandoline; another eagerly exclaimed, 'This will probably mean leave.'

'It may mean the "Last Call" instead, my lad,' the staff-surgeon muttered somewhat wistfully as he made his way to the sick-quarters. 'Gangway!' he called out sharply to two irrepressible spirits who were wrestling, and impeding his progress.

'Off flannels,' the sick-berth steward ordered as soon as the staff-surgeon entered the examining-room.

'Divers Perkins and Crawford for medical examination, sir,' the sick-berth steward said, handing the staff-surgeon his stethoscope.

The divers were both medium-sized men. Perkins had good-humoured eyes and a jet-black beard that gave him the appearance of a well-fed buccaneer. Crawford, on the other hand, was leaner, and had ginger-coloured hair and brown eyes that showed up dark against his pink skin, and gave him a somewhat melancholy look.

'Are you all right?' the staff-surgeon asked severely.

'Yes, sir,' they answered in unison.

'I don't believe it,' he said emphatically.

The divers grinned. Admiralty regulations subjected them to physical scrutiny about once a week, and they were familiar with the staff-surgeon's pleasantries.

He put the stethoscope to each chest in turn. 'Take a deep breath.' He applied the instrument to different parts. 'Don't burst yourself,' he warned Perkins. — 'Stop your grunting, Crawford,' he said as he listened over the heart area. — 'You're all right, after all,' he assured them, as he signed the book. 'You're now free to earn half-a-crown extra by risking your life at this outrageous hour,' the staff-surgeon said as he left them adjusting their garments.

IV.

'Well, you have a fine morning for it, No. 1,' the staff-surgeon said, as he ran into the first-lieutenant at the head of the gangway.

'Have you got your swimming-waistcoat on, doc?' the first-lieutenant asked.

'Yes, and my flask filled with brandy too, if that's any comfort to you,' he replied. 'I make no bones about being a coward in these chilly waters.' He looked about him with interest.

The illusive light made the figures on deck seem unreal and ghostly. Water spouted several feet high from an ejector, and its semi-phosphorescence gave it the appearance of an unnatural geyser.

By means of the chains which are always in position under a warship's keel, an attempt was made to haul a collision-mat over the hole. There was, however, some unknown obstruction. The compartment being flooded, and there being now no further inrush of water, the divers were preparing to descend in order to investigate the cause of the trouble.

The captain spoke to the gunnery-lieutenant. 'Tell the divers to see what the obstruction is, and let us know if they can remove it.'

The gunnery-lieutenant gave the desired orders to them through the open face-piece of their helmets.

'Ay, ay, sir,' responded Perkins.

The face-discs were then screwed into the helmets. Men began to heave round the wheels of

the air-pumps. The electric lamps and the telephones were tested. The *Alcibiades* being cleared for action, the rail was already unshipped. The divers stepped in their ponderous way to the wire ladder that hung over the ship's side. A number of men craned their necks in the endeavour to watch them disappear.

Soon there was a tinkle from the bell of one of the telephones.

'Hello!' answered the gunner in attendance; 'is that Perkins?'

'Yes. It's a jagged hole, and a projecting plate prevents the mat from going over it.'

The gunner repeated the message to the captain.

'Ask him what tools he needs,' the latter ordered.

The gunner made the request.

'The electric chisel,' Perkins answered, 'and a couple of heavy hammers.'

These were lowered in bags.

Perkins reported progress from time to time. Occasionally Crawford asked that the air-pump be stopped in order that he might hear Perkins better through the telephone. Once or twice they requested the gunner to have the men pump a bit faster, or perhaps a little slower. The work took a long time, as the movements of a diver under water are necessarily slow.

Light was beginning to creep over the sea when Perkins finally informed the gunner that the mat was properly in position.

At the same time the carpenter reported that water was being rapidly forced out of the flooded compartment.

'We may bombard Zeebrugge, after all,' the captain murmured.

The telephone-bell tinkled again.

'I'm going to walk along the bottom a bit so as to make sure there's no further damage,' Perkins advised. 'Ease away on the air-pipe and life-line.'

Several minutes later there was a tremendous tugging at the lines.

The captain spoke. 'Find out what's wrong. They'd better come up. It's getting high-water, and we shall float presently.'

The gunner began to transmit the message. Suddenly he stopped short, and exclaimed in a tense sort of voice, 'What's that—what's that?' Then he paused to listen, and turning round, said excitedly, 'He says, "Go to the devil," sir, "and ease away." There's a submarine down there, and he's going to try to chisel holes in her.'

The lines were let out to their utmost limit.

The sun was rising in a cloudless sky, and there was scarcely any motion of the sea. The group on deck looked haggard and worn as the result of their long vigil. Suddenly they saw one of the most extraordinary sights that have ever been seen at sea. The long steel form of a submarine appeared about ten yards away. Its

sides glistened, and the U — seemed to leer at them in a sinister way. The bow of the under-water boat dipped toward the sea. The stern was high, and the propeller above the surface.

It was not so much the submarine that made the group cry out with astonishment. It was the fantastic figures upon it, and the reverberating *b-r-r-r* that fell upon their ears. Sitting on top of the slanting bow was one of the divers, probably Perkins. With his electric chisel *br-r-ing* ominously, he was rapidly perforating different parts of the thin shell of the submarine. No doubt the awful and unusual noise had made it come to the surface. The dipping bows indicated that Perkins's efforts were meeting with some success.

The second diver was sitting on the stern with his back turned toward the bow, smashing the blades of the propeller with his hammer. He had evidently broken the periscope, because it joined the deck of the submarine at a rakish angle.

The spell was broken by the gunnery-lieutenant giving orders to open fire with the four-pounders. 'Be careful to aim amidships so as not to hit the divers,' he commanded.

The captain spoke through one telephone, the torpedo-lieutenant through another. 'Close your air-escape valve, and jump for your lives,' they commanded; 'we're about to fire the four-pounders.'

The two divers left the submarine about the same time as the guns began to roar. The men hauled them in frantically. A tremendous cheering rose from the decks of the *Alcibiades* as the submarine took a dip and went to the bottom with its stern high in the air. Bubbles of air and oil marked the place of its disappearance.

It was but a few moments before the divers, buoyant with the air in their dresses, were raised on deck. Their helmets, collars, weights, and leaded boots were quickly removed. Their diving-suits were also taken off. They were only slightly dazed, and opened their eyes in a few minutes. The staff-surgeon administered stimulants. A cordon of cheering men surrounded Perkins and Crawford.

'Away with you, you blithering idiots!' the staff-surgeon roared; 'do you think it's your hot air they want at the present moment?'

They retired to a discreet distance.

'My lads,' the staff-surgeon murmured, as he regarded the divers fondly, 'if you were in the army you'd get the V.C. and a purse of gold. Being in the King's navy,' he added *sotto voce*, 'you'll probably get cells for speaking disrespectfully to your captain.'

Perkins and Crawford smiled contentedly as a slight shiver went through the *Alcibiades*, and, with engines put astern, she slid gracefully off.

Chambers's Journal

SEVENTH SERIES

THE LOWLAND FUZZIES.

By R. W. CAMPBELL, Author of *Private Spud Tamson*, &c.

A THOUSAND Scots, brand new to the game,
Marched in the night to the scenes of fame;
Marched by the light of star-shells strange
And the flare of guns that knew the range.
Their tongues were tied, their hearts beat fast,
As they trekked and thought of how men passed.

Phut! came a bullet straight in the breast
Of poor Tam Green, and one of the best;
He fell with a shriek and curses fierce,
His blood was seen by the lights that pierce
From the star-shells weird and Seventy-fives
Which thunder death into Turkish hives.

'Pass on,' shouted 'Jock,' a C.O. we knew
Had the 'guts' and nerve of an old Rugger Blue.
The column then dipped into pools and clay,
Where many had died for a 'bob' a day.
Gad! how the bullets pinged and cracked,
And the star-shells showed how we crawled and
tacked!

Then came the dawn in a gully that's famed
For blood and gangrene, crosses and maimed;
And the mouldy dead made a grim salute
To the thinking Scots who'd come out to shoot
The deluded Turks befooled to the game
By a Pasha made rich by the cult of shame.

Lancashire lads, mourning leaders and pals,
Were living in holes like pirates in kraals;
Some grunted a welcome, some gave a salute
To the tramping 'Jocks' now itching to boot
The children of Allah, and fine fellows too,
Fooled by a Turk with the blood of a Jew.

They filed to the zigzagged Plain of Tears,
They saw the hill of slaughtering fears,
And moaned for the riddled dead that lay
On parapets, wires, and in stinking clay;
The sight made them men, their philosophy
changed,
Jaws became set, and their rifles ranged.

The thousand 'Jocks' then started to pray
To use their steel in the Lowland way;
It was answered too, for the Turks came down
Like flies from out of a stinking town.
'Allah! Allah!' they cried as on they ran;
'Rapid fire!' yelled 'Jock' of the Lowland clan.

They fell with shrieks that still haunt the brain,
But others charged on, charged on, in vain;
For out of the earth leaped Lowland braves,
To gouge out the hearts of those Enver slaves;
Some cried for mercy, some called on their gods
As their blood streamed out to the weltering soda.

But death's half the price of all success,
Men mangled and maimed are part of the mess;
The thousand Scots at that muster-call
Answered to 'Jock' but eight hundred in all.
Bloody and wise, with death-haunted eyes,
They mustered and mourned at the price of the
prize.

So, off with your hats, you 'civvies' that skunk,
Salute the diced bonnets that never know funk;
Let their bravery stab, and stab in the shame,
That you are a fool while they play that game
Not measured in gold, if measured in tears,
But tears that shall blot out the cunning of years.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

SOME are reflecting it is time they knew
more of England now, and Scotland too,
and Wales. In summer days we should look
widely on the homeland. There is so much of
it we never knew, and the little we have seen
was so fine. The vastness of Dartmoor, solemn,
mysterious; the midland vales; the hills of
Wales; the rich romance of Westmorland, with
its mountains and its waters; and the grandeur
of rough, majestic Scotland. There are many
who, having forsaken England and Scotland

in the past, or having made scant effort to
know them, come now to the discovery of their
own land. The hunger of the road works upon
them. They see a whitened track twisting its
way to north and south, east and west. There
is a call from our own country in her summer
beauty, the sweet homeland, and a beautiful
pathos on it all this year. Seek the bosom of
England in the way of the simple wanderer and
the honest lover; not in the jogging dusty train
or in the scurrying motor-car, but with a little
pack for your own supply, go leisurely along

white roads and shaded lanes, and over the brows of hills down to peaceful vales. Is not the call of those white and winding roads of Britain heard in our hearts this year? Come along the sunlit roads.

* * *

The handy fellow who is master of a small cycle-store in the country village where the writer sometimes bides made a rare excuse this morning, and a true one. Last night a wheel of mine went wrong; and, with a whole day's adventure through the summer lanes and the glowing hills in prospect, it was to be delivered in running soundness at the door by the pretended hour of nine as fixed by Lords and Commons with the King's Assent. But not until nearly the sun's immutable nine did the boy arrive with our metal moke; and, if you please, there were then the compliments and the apologies of his master and the veracious statement that, to the wonder and excitement of the community, the great Lord N. had sent down from his Hall that very morning so early that the housetops still dripped with dew, demanding that three new cycles of the best Coventry manufacture, two for daughters and one for a boy too young for soldiering, should be delivered to him immediately. Peers at times have fine notions of the resources of the humbler commoners, and maybe they reflect that these are the days of a higher efficiency. If a conquering army of five millions can be formed instantaneously from plain civilian stuff, there might seem to be no sufficient reason why three new cycles, with their virgin tires in full odorous whiteness upon them, should not be produced from the lumber of an old repairing-shop. And Lord N. was right, as the swift course of events fully proved; for while he still pecked at his breakfast toast it was announced to him that the machines were on his premises, and that in truth the young ladies and the boy were already scratching and bruising themselves through their enthralling agency. How, by means of telephones and motor-cars and a scouring of depots over half the county, Richard the repairer did this magical thing, and earned a compliment from Lord N., would be a full history in itself, an epic of achievement. But some other thoughts and speculations were summoned up. Was it not odd that the Earl of N. and his happy family should thus suddenly find themselves with hot enthusiasm for an old pastime that has for nearly a generation now seemed but the habit of the lowly and those of simple tastes, while rank and wealth laid a thick gray cloud on the countryside with their motor-cars? Could there be some special meaning in this course? Now we seemed to be carried back in memory to the summer days of twenty years ago, when the 'safety' cycle, as they would always call it then, was a novelty, and a wondrous and delightful thing; when high

society bestowed upon it considerable advertising patronage; when the Park on a morning of May would be thronged with the smartest ladies and most gallant gentlemen awheel, and Rotten Row was shocked. So in the days of old, when Victoria still was queen, the cycle was a splendid thing, and upon the pedals then were pressed the toes of peers and princesses. But as fickle as a pretty girl with a flighty mind is that section of society. Victorianism passed, novelty fled still faster, and the automobile came to give a finer scope for great display. The bicycles were laid up in the gardeners' sheds. And now? Before we go further, let us assure ourselves that in the case of this noble lord, hard hit as he may have been through the ruthless war, it is not mere economy, as prescribed so urgently by our parliamentary counsellors, that leads him and his kin back to the cycle again. He still has means in plenty; his lands are not unyielding. It is a revival from the past, stirred by the great upheaval. Yet some of the old instincts of cycling—for we may call them instincts—were beginning to assert themselves even before the war. Let us point you to a curious circumstance.

* * *

Even so far away as when George III. was king, gentlemen, wearing high hats and coats with tails, set themselves astride between two wheels and spun themselves along by pushing with their feet upon the ground. There were no cranks or pedals to this contrivance, which was called the hobby-horse, or the dandy horse, or, if a better-looking name were needed, the draisene. The comic artists made rude pictures of these things, and the writers of the time penned skittish articles upon them, and so the draisene was laughed away. But it was the first manifestation of this new instinct for cycling. From the early bicycle the tricycle was evolved; that fell out of favour; improvements came in a steady progression until we arrived at the safety machine; and then, later, tired of leg-work, and discovering a faster and more expensive means of locomotion, part of the people took to motoring, while for many of the others the bicycle became a mere machine of utility, and only a faithful few held to it for its special charm. Now, mark. For two or three years past the children have been gliding upon the pavements with what have been called for them *skacycles*, a new-fangled name that suggests a cross between a roller-skate and a cycle. There are two very small wheels, one behind the other, joined by a board upon which a foot may rest, and there is a pillar leading up to the hands for the control and steadying of the contrivance. One foot is planted on the board, and the whole arrangement, including the body of the happy child, is sent flying along by the propulsion from the other leg working directly against the ground. This, you will perceive, is in effect

exactly the same principle as that employed in the dandy horse of nearly a hundred years ago, and it is the first time it has been revived in the interval. It takes advantage of the sublime attribute of the wheel in gathering and preserving momentum, with no shocks to break its full career.

* * *

Now for the most perfect application of human physical energy to the needs of locomotion and the preservation of momentum the cycle is clearly the thing. It is so simple that it is a constant mystery to me how humanity missed it until more than eighteen centuries of Christianity had been lived away. I hardly understand why they had no cycles in ancient Rome, in Carthage, in Athens. The principle is so clear, its application so inviting, it seems almost an axiom of living and working. Yet thousands of years went by, and the waiting wheels were unapplied save in the crudest way. When I have wandered among the ruins of Pompeii, and seen in the museum there how the people who lived in that fair but always threatened place were keen in their ingenuity to make useful things for life's convenience and contentment, and especially how in the way of kitchen appliances for the preparation of foods for their stomach's delight they were seemingly fully as advanced as we are to-day, I have almost wondered to see no signs of any cycle. For all their games and their athletics and their fine military marches, I feel that in the main these old Romans and Greeks, and the races that went before them and came after them, were rather lazy fellows. In Spain of to-day I have found that cycles are only just coming into a full popularity with the grand awakening of the country. They did not like them in Madrid at first, because, unless action were continued and persistent, the contrivances would stop and their proprietors would fall. Through all these ages of European history that we read of the cycle was never approached. Then when it came, at a time when people were in a whimsical mood, its full advantage was not realised. It was made the toy, the craze, of a season or two, and then 'society,' as it is called, gave it up, and it fell to a mere convenience and a useful thing for the butcher's boy. A friend assures me that this young person and his colleagues at other stores have been largely responsible for the decline of the cycle from its place as the acknowledged yielder of the best delights. Such is our inherent snobbishness. This, and the domination of the highway by the motor-car, which shoves the cyclist to one side. But, reflecting, we perceive the superior wisdom of the common people, as we call them, and the advantage of being poor; for, though we speak of the decline of the cycle, meaning its fall from the favour of noblemen and gentry, this splendid instrument never lost its hold upon the masses, but rather

continually increased it, as it was made cheaper and ever more efficient.

* * *

Now, like prodigal children, the others, deserters, come back to the wheel again. They feel a little ashamed. The other day we noted on this page the startling apparition of a man cycling along Whitehall, on the first sunny Sunday morning of this year, on one of the high bone-shakers of thirty or forty years ago. What strange awakening of an old sense led him to do this seemingly freakish thing, what strange attachment to an old beloved occupation had made him store the old contrivance, one may but guess at. But there was a clear significance in it. Here was the emblem of a fine return. In the mind of one beholder at least it awakened a thousand glorious memories, and aroused a longing. Not many days after that vision in Westminster, one who lived there was far away, speeding through country lanes and feeling youth come back in the full flood again, with proof of it at every thrust. Here are already indicated two of the special advantages of the cycle. You may have the maximum speed that is desirable for pleasure purposes in the country, and it is home-made. A motor-car or motor-cycle may be made to travel much faster than any cycle, and by some minds that has been considered a recommendation. But why? There is a limit at which speed and distance become emotionally ineffective. There is a delight in speed, it is true; there is a human instinct for it. Man seems to crave for it. But the good effect is lost when fifty miles are covered in an hour, or even thirty, and that is because the mind cannot absorb the passing scene; it has only a blurred sense of the country being traversed; the full joy of the open air is ruined. Speed in the abstract is a poor thing; it is almost nothing. It needs the country and a proper appreciation of it for its complement. To motor at sixty miles an hour over a country that seems little more than a streak of green is hardly better than to travel at that speed in a train. At sixty miles an hour, too, motorists realise that, after all, such speed is but a paltry thing; for, all speed being relative, what is this to the whiz of a bullet or to the glance of light? And, again, it is the speed of machinery, whereas the cyclist has the ineffable satisfaction of making his speed for himself, feels infinite joy in making with his own limbs ten miles or more in the hour, a joy the motorist knows nothing of. In cycling at a proper and moderate pace there is effort, there is independence, there is time for thought and contemplation of the world and all that is about, and the cyclist seems complete with the powers of far movement that are at his service. There is nothing like it.

* * *

There is now, to come back to the main point, an undoubted revival of cycling; but it is wrong to suggest that this revival comes from

mere economy, and it is an offence against the splendour of a magnificent pastime. Let us believe instead that it is through the shock of war we are brought back in our minds from false standards. Cycle manufacturers everywhere tell us that never before have they been so busy; that many people are buying cycles and determining to go into the country with them, making their own movement at the most desirable pace through any part of our beautiful country that entices them. The cycle yields all Britain to each Briton who rides it. Let us be glad of it; this is a sane and most commendable revival. In this little piece of machinery there are unlimited resources of happiness and pleasure. There is about it just enough of the really mechanical to satisfy a hankering in the rider. All of us have a somewhat secret liking for simple mechanics. An old and bookish philosopher feels himself exalted to the practical man as he potters about with cogs and chains, or screws a bolt, or tightens a bearing. Behold! he is of the race of engineers, the builders of railways and bridges. This piece of machinery, too, is dependent upon his control, and he upon it. There is a sentiment of independence, of self-reliance and completeness, attaching to cycling, and especially when the full kit of simple human requirements is attached, and the rider goes on distant tours, sleeping in strange places, feeding at wayside inns, stopping to stretch for a while on the grass of a shaded wayside on a sunny afternoon, and smoke a pipe or read a little from the book he carries. In a way, it provokes that sense of efficiency and ability to fend for one's self that seems everything in these times. And, indeed, your cyclist, philosopher or not, must be a fellow of some resource, for how knows he what may confront

him when he turns the sudden corner? And how sternly practical he must be when a thorn pricks through the cover of his inflated tire and the imprisoned air spurts free again! Every sport has its own peculiar thrill. A full drive to the boundary at cricket, or a run the length of the field at rugger, is a glorious thing. A perfect drive at golf, right from the middle of the club-face, with every physical movement properly carried out and in full harmony with the whole—a long low drive with perhaps the smallest suspicion of pull, and the ball rising a little near the end of its flight—that is emotionally an excellent thing. There are other emotional riches in sport; yet I know none of them that is superior to the magnificent thrill of letting the cycle run at full speed on its free wheels down a long hill of a mile or two, gathering more and more momentum all the time, and perhaps, if the rider feels that way, taking a risk at a bend here and there. Here is the sense of speed and of glorious freedom that nothing in the world except this pair of wheels can give, combined with adventure, the little risk that is spice to sport, the roar of beaten air, and the view in its full wonder changing every minute. So, with freedom and independence, we may roam awheel through England and Scotland and Wales, and through Ireland too, in these summer days, and come close to the bosom of our own fair country and get to know her better. For the pleasure of relief, for the good of the mind and heart, for solace and peace, for the appreciation of the love of God and of the simple and lovely things He had made, for meditation, and to arouse a new determination, you cannot do better, be you man or woman, old or young, than go buy a bicycle now and see our Britain at her best.

THE KING-MAKERS.

CHAPTER V.—THE MAN.

THE Premier's official residence was on the western side of the city, on the slope which was crowned by the citadel and the palace. His cabinet was a spacious room overlooking the garden; but from its windows he could also enjoy a view of one of the towers of the citadel flying the national flag to indicate that the Senate was in session. Yesterday the Executive had laid its decision before the members, who had accepted it by a vigorous majority; to-day they would meet after adjournment to give effect to that decision, and to offer the crown of Zorne to a new king. The Premier was engaged at this moment on the concluding sentences of his speech. He had been induced to bring forward the formal resolution, and he was giving the matter that thorough preparation characteristic of all his work.

'Let us confess,' he wrote carefully, 'that our beloved state has made an unhappy beginning; but a beginning, after all, is only a beginning. Circumstances, however regrettable, must be made subservient to statesmanship, and statesmanship is capable of correcting the initial error into which we fell. In that spirit we must seek to clean the slate, to expunge the record of misfortune. Gentlemen, it is yours to-day to decree a new beginning, to resolve that our kingdom shall rise resplendent out of its troubles, and by its dignity and forbearance, its inflexible pursuit of its high destiny, rebuke the laughter of Europe.'

He laid down his pen to read the paragraph. Every faculty was intent, and the heavily moulded and powerful face was that of a man who saw in vision the faces of the people he

addressed, and studied every shade of thought upon those faces. Yet a sound at the door roused him instantly.

'Inspector Fenckener,' said a footman softly.

'Let him come in.'

The inspector entered at once, and the door was closed behind him. He was a muscular-looking man of early middle age, clad in a semi-naval uniform. His face was one in which dogged resolution was a prevailing characteristic, and in this regard it was possible to trace some resemblance to his august relative; but his eye lacked the gleam of genius, and it was this lack that made him so excellent a servant. He bowed stiffly as he entered, and then stood in silence to deliver his business.

'Good-morning, Fenckener. You have a report?'

'My usual report, your Excellency.'

The Premier's ear, however, was quick to catch something unusual. 'Yes?' he said questioningly.

'I have to report, your Excellency, that things are unchanged on the Orphan Rock. But the lighthouse-keepers, when they came to make their weekly report at the Broken Tooth this morning, declared that their prisoner had made an attempt to escape. It appears that early on Wednesday he attracted the attention of a small boat which was passing the island, and by his signals prevailed upon the occupants to approach. His warders, however, came upon the scene in time. The prisoner had actually entered the water with the intention of swimming out, when the strangers were warned off and retreated.'

The Premier was evidently disturbed. 'Who were they?' he asked thoughtfully.

'It is impossible to say, your Excellency. They did not come in close enough; the approaches are exceedingly dangerous. Undoubtedly a couple of young men on a fishing expedition.'

'But did they see?'

'They could not have seen at such a distance. Besides, recognition would have been difficult at even five paces. A month without a valet'—

'Yes, yes; just so. But this must not occur again, Fenckener.'

'I took the liberty, Excellency, of ordering greater care. The prisoner must be confined more to the lighthouse; but if he is allowed abroad one of the men must be always with him.'

The Premier nodded. 'And always armed. That will be discreet, Fenckener. I need not say that I wish him to be treated with every kindness nevertheless. Very soon—in a day or two—when the troubles of this unhappy country have been settled, we may be able to arrange for his restoration to liberty. For the present he must not be allowed to trouble the state.'

Fenckener made no remark, but he evidently understood. He was in every way trustworthy, and he had repeated exactly the story which had been told him by the alarmed lighthouse-keepers. The Premier dismissed him briefly, but with some of that charm of manner which had contributed so largely to his success. It was a considerable time since it had been exercised toward the King except when others were present.

'Very good, Fenckener. I know that the state has a faithful and capable servant in you. It shall not be forgotten.'

Fenckener saluted and departed.

For a little while the Premier considered. 'After all,' he said, 'even if they had seen him, there would be little danger now. It is too late.' For the moment, however, he did not return to his speech. Instead, he opened a drawer and took out a document which had reached him the previous morning from the head of his secret police. It was a report so terse and so concise that its reader must have approved its form with all heartiness. He re-read it now with a slight smile, for Fenckener's visit had given its pointed sentences a grim tinge of humour.

'Obedient to instructions, we have watched the tourist at the "Silver Heart" who was said to resemble the ex-king. He had registered as Peter Robinson, London. His papers were examined in his absence. His name is Charles Segel of Belgrade. I have to express to your Excellency my regret that one of our officers should have failed in observation and judgment. The person in question has now left the "Silver Heart." We did not inquire as to his further movements.'

The Premier returned the paper to its drawer with visible satisfaction. An incident whose first phase had given him a distinct shock and some hours of uneasiness had now been straightened out in a very entertaining fashion. 'But "Charles Segel" is a little too reckless in his movements. I must speak to him seriously a little later!' he said to himself; and then he turned to his manuscript and completed his speech.

'I move, gentlemen,' he wrote, 'that Prince Max of Swarzfeld be invited to assume the crown of Zorne, confident that this action of the Senate will be endorsed with enthusiasm by our united people; confident, too, that the integrity and stability of his Highness's character offer the best guarantees of a new era, distinguished, prosperous, and untroubled.'

He read the sentences with visible satisfaction, and then re-read them aloud; but as he concluded the reading a voice behind his chair made comment in a subdued tone: 'It is very happily expressed, Premier. But it will need some revision!'

The paper sank to the Minister's knee. For a moment he sat rigid, recognising the voice, yet

unable to realise what that recognition involved; numbed, yet alive to the sense of impending disaster.

And Conrad, coming round from behind the chair, stood looking down upon him from the side of his table, a smile upon his lips. 'It will need some revision!' he repeated calmly.

The Premier strove to recover himself. There was no fear in his nature. He felt sure that he was in imminent peril of his life, for he read the boy's coolness as the coolness of a desperate resolve. Yet, though the movement might mean instant death, he leaned forward and struck the silver gong upon his table.

It was the call for his servant, who always waited in the hall. The sound rang loud, but Conrad did not move; and, eyeing him warily and closely, the Minister realised his self-command with an uneasy sense of discovery. That pale composure, that steadiness of voice and eye, were something so new in him! He leaned back in his chair, watching the youthful face from under half-closed lids like a crouching lion.

Half-a-minute passed. There were soft foot-falls without, and some unusual stir and movement, but no one came to answer the call of the gong. Perhaps for the first time in his life Rubin was conscious of the helplessness of one who rings or calls in vain when he has the right to a swift reply. In those moments, too, he noticed the open window by which the intruder must have entered, and the tall screen which had sheltered him. But how had he gained access to the garden? The next house was that of Admiral Moyr. Had Conrad been in the room during the Fenckener interview? But when Rubin thought of Fenckener he thought also of the 'Silver Heart,' and he ceased to question himself. He recoiled from the contact of some amazing mystery; and all the while he struggled against an impression which was rapidly becoming a conviction—the conviction of irrevocable disaster.

And Conrad spoke gravely. 'Try again, Premier. Or you are free to go to the door to call; but you cannot leave the room without my permission. There is a guard at the threshold.'

Without a word, Rubin rose and went to the door. With a certain dignity he opened it, looked out, and closed it again. He came back, and slowly crossed to the open window. There one glance was enough, and he returned to his chair. Then they looked one another in the eye, the old man and the young, for a long, anxious minute.

'Perhaps you will explain,' said the Premier. 'I am a little at a loss.'

'With pleasure,' replied Conrad, with perfect self-possession. 'The house is occupied by a guard. The citadel is also occupied on my behalf by several companies of the Fifth Regi-

ment. The particulars of your plot against me were laid last night before Admiral Moyr and General Rampner, with sufficient evidence. Acting for the army and the fleet, they have taken these steps and such others as we thought necessary and prudent. It was arranged, however, that I should deal with the Premier personally.'

With the habit of decision natural to himself, Rubin at that point laid aside every doubt and every hope. The bayonets at the threshold and in the garden were strong evidence, but they were not decisive; it might be within his power to make a good fight against such arguments as those. But he found more convincing proof in Conrad's voice and manner. There must be more against him than he could see; and, having come to a conclusion on the subject, he wasted no time in a hopeless conflict with overwhelming circumstances, but instantly turned his thoughts in another direction. A moment before he had been vitally interested for his own plans and his own safety, but now the centre of interest had shifted. He began to study his enemy, seeking to give a definition to the curious change observable in his bearing. He was convinced that this was not the petulant lad whom he had first crowned and then uncrowned for the betterment of Zorne—and the interests of the Central Empires! 'I am honoured in this arrangement,' he said ironically. 'I am entirely at your service. But perhaps a little further explanation first'—

Conrad smiled. He was aware of the strength of this chained lion; he was also aware of an anxiety to prove fully worthy of the task he had taken upon himself for reasons known only to himself and guessed only by Lieutenant Heldmann. 'Of course,' he said, 'an explanation is due to the great excellence of your plans, Premier. The simple fact is that through a trifling accident those excellent plans miscarried. Another man was kidnapped in my place, and is still your prisoner upon the Orphan Rock. As for me, I have had a brief vacation, and as a mere spectator have greatly admired and enjoyed your programme.'

'Indeed!' said the Premier.

'It is entirely true. I have been free in the streets of the city all the while, and a diligent reader of your efforts in the Press. But you have not asked me the name of the man who was kidnapped instead of me. I have been at some pains to ascertain it.'

Rubin kept himself well in hand. He had no need to agitate himself. It was too late. But he was also interested in the story and the story-teller. It occurred to him that the King had spent his vacation in some more useful way than he had yet indicated. As for the prisoner on the Rock, what did it matter who the fool was? Yet this interview demanded all that he had of self-control, and he continued to be cere-

moniously and ironically polite. 'I shall be glad to hear,' he said.

'Not exactly glad,' corrected Conrad; 'that would be too much to expect. Say, rather, interested. Let me explain that this man has been described under your own hand and seal as Charles Segel of Belgrade.'

There was a pause. Then the Premier turned. Master of his countenance he might be; but that word swept over every guard and transfixed him. Instantly his half-closed eyes became wide, his cheeks livid. He half-rose as if in wild, instinctive protest; but as the King completed his relentless message he sank helplessly back again.

'Otherwise known,' said Conrad gently, 'as his Serene Highness Prince Max of Swarzfeld!'

When the Premier came to himself, a little dazed, a little inclined to be hysterical—for the first shock had been followed by a singular burst of laughter—he found the King standing at the window with his back to the room. But in a moment or two he turned to speak, with no change in the serene suavity of his manner. 'And now to business,' he said. 'Prince Max can wait a little longer. At this juncture your Excellency's help will be useful.'

Rubin would never be the same man again. The stroke had shattered him in a way impossible to describe. No man can ever be the same again when he has seen some small item go awry in his perfectly prepared plan, and the whole edifice come toppling to destruction. In his case perfection of detail had been a delight, and painstaking a pride and pleasure. But the note in Conrad's voice called all his faculties to attention, and he looked up mutely.

'I am extremely anxious to avoid confusion and, above all things, violence,' said Conrad slowly. 'For this reason the Executive must be prepared; they must not be taken by surprise by the new situation. Moreover, they must be ready to explain it to the Senate in an hour or so. Therefore, they have been summoned here this morning; they are even now gathered in your dining-room, waiting for an explanation of the summons, which they believe to have been sent by you. There is one man who can make things smooth with them, and his co-operation is necessary. That man is yourself.'

Again the Premier's face changed, against his will. Perhaps some wild hope leapt into being against all reason and all evidence. He was wise enough to abandon it at once, though not before he had given vague expression to it.

'But if all that you have told me is true,' he said, 'you do not need my help.'

'No,' said Conrad deliberately; 'that was a polite fiction.' It was the last thrust of that

long battle. The Premier flushed as he acknowledged it. Yet in the next moment Conrad helped him to forget it in his incredulous amazement. 'Frankly, Premier,' he said slowly, 'I am anxious to have your co-operation, though it is not indispensable. You will deal with the Executive to-day, and later you must deal with Prince Max. These things must fall to you, and in any case they are only as difficult as you have made them. After that you will decide, no doubt, to retire to your estate. But I may say also that only four persons besides myself know the whole story, and it is not necessary that others should learn it.'

Controlling his surprise, Rubin sat and considered. Then he looked up to read the boy's face, and met there some vague signal that stirred him tremendously. He could have defied the conqueror, disdained the mercy; and a smaller man would have done so; but he was not a small man, and he rose to the last act of his premiership with all his natural courage strung to its highest point. 'I will go,' he said, 'and I will return in five minutes.'

The King bowed. Rubin went to the door, and the guard, at a sign from Conrad, allowed him to pass. He went in to join the Executive, and was in the room for some five minutes. The thing that occurred there has been variously reported; but we need not believe that the Premier was really the author of the romantic stories of the King's adventures and return published that night in the Raschadt Press, to the great relief and delight of his people. I prefer to believe the alternative story: that he astonished his colleagues by giving them the naked truth. In any case, the result was satisfactory, for he returned to his study with everything done.

'Will your Majesty come?' he said respectfully.

The King had spent the interval in mixed reflection. He had really no sense of personal triumph; nor had he cause for it. Out of his reflection, indeed, had grown two curiously connected conclusions: one, that he had been an awful fool; and, two, that he would spend his next holiday in Thuramia; and he was still blushing over these—one or both—when the Premier returned. He followed him without a word.

The old man led the way across the hall and threw open the door of the dining-room. As it swung back Conrad saw the members of the Executive rise in their seats about the table, all faces turning towards him with tense interest and vivid expectancy. And the Premier spoke, simply, coldly, but decisively, stating an indubitable fact:

'Gentlemen—the King!'

THE END.

A MIXED LUNCH AT SALONIKA.

By G. TREVOR ROLLER.

THE other day, in Salonika, I had a mixed lunch. I do not mean by 'mixed lunch' that I had a mixed grill for lunch, or that the menu was mixed. A menu can't call itself a menu unless it is mixed. No; I mean that the company was mixed—mixed in nationality, sex, and thought; but wonderfully unmixed in purpose: 'Hun strafing.' We were Allies. And because it was so mixed, and was interesting to me, I shall try to tell you about it, for I hope it may interest you.

Well, first let us catalogue the company. As all the allied nations are equal in a common cause, I will not mention them in any order of precedence, but in the order in which they sat round the table. It was a round table, so the talk went each way and every way at once.

First an English lieutenant from a yeomanry regiment attached out here to the French aerial service for observing; a man of some importance in private life, cheery, big-hearted, with a face that has been known to break hearts. He was my host. Next a French flying officer who had flown in France, been in Greece for some months, and bombed — badly twice! On his left sat a Serbian officer who spoke perfect English; his family were ruined, his part of his native land laid waste, and he was bearing up well under it, cheerful and confident; in fact, he seemed to have made up his mind to 'keep smiling.' Then came a Russian officer, attached also to the French for flying. We couldn't get much out of him. He was in love; he had only met the adored one the day before, and he was but nineteen. He had a proud record behind him; but until the 'blast of war' again rang in his ears he was not worrying about it; though he was worrying a whole lot about the girl. Next came a British subject in civilian clothes who had lived all his life in the Levant. Had you been able to make him talk he could have opened your eyes, for he was Secret Service, and particularly secret. He had lots to say about other things, things that don't matter. Then came the only lady of the party, a Scotch nursing Sister, a splendid little person, who had been with the Serbian army in the big retreat; capable, cheerful, and perfectly at home among a crowd of men, several of whom she had never met before. But then war equalises the sexes; and we, the inferior, rise to the level of the superior sex, and we fraternise. There are friendships made in war-time that accentuate the old adage, 'It's an ill wind that blows nobody any good.' Next to the Sister came a perfectly unimportant person, a pawn in the war-game—myself.

The conversation, to begin with, was general,

and also futile, everybody trying to keep off 'shop;' but I felt they would not for long. The old order has changed; it is war now, everybody dying to hear what the other fellow has been doing, also perhaps willing to tell of his own adventures.

I myself essayed to break the ice. 'It's a long way to Tipperary,' I said. 'How long before the war is over?'

This was greeted with a roar of laughter. The question has been asked so often that it has become funny.

'I'm asking,' I said, 'because I want to know. I thought a consensus of opinion might'——

'When we have utterly crushed the Boches,' cut in France.

'And we get our own back,' said Serbia.

The Russian lover sighed. 'I'm afraid,' he said, 'that it will be over very soon now—soon, and I shall have to leave Salonika and return to my own country.'

'Is she so very lovable?' asked the Sister.

The boy's eyes fairly flashed; he half rose from his chair. 'Mademoiselle,' he cried, 'let me'——

But the Intelligence man pinned him down. 'My son,' he said quietly, 'don't do it; go and tell *her* how beautiful *she* is—not us. It bores.'

The love-light faded from Russia's eyes. 'You English are so unsympathetic!' he grumbled. 'Now, were you to tell *me* about some adorable one of your own I should listen with the greatest sympathy.'

'I will,' said the Intelligence Department, and proceeded to do so. The boy was soon struggling not to yawn.

'Tell me,' whispered the Sister, 'who is Russia's lady-love?'

'Heaven knows,' I answered. 'But never mind him; tell me about yourself, about Serbia.'

'Oh, there's not much to tell,' she answered.

Ye gods! not much to tell, and she had been through one of the most tragic and terrible retreats in the history of war! But I saw how it was with her; it's the same with many of us. Some big thing happens, and the horror remains in your mind; you really don't want to talk about the detail, so there is little left to tell. After a while the memory of horrors fades, the last cry of a comrade no longer rings in your ears, and you remember many things, and you can talk over the battle again. That's after months have passed. However, with tact and a few questions, the Sister told me many things. Serbia was a beautiful country, and Serbians splendid people. She told me of how she nursed a soldier with his *ninth* separate wound. 'And

he was only a boy,' she added. She told me how the First British Field Hospital for Serbia, for which she worked, came into action—or, rather, one should say, 'attended an action'—in early October, at Pirot. Then came a month of close fighting. The hospital had mostly bullet-wounds to attend to at that time. At the end of October the retirement began, and, 'We got shelled,' she remarked.

'Did you? And how did you like it?' I asked.

'Not a little bit,' she said with a smile, for which I liked her the more. I can never quite trust people who tell you they 'don't mind' shelling.

Then she told of how the Serbians would fight a desperate rearguard action, disperse all over the country so as not to block the roads, rally the next day at some prearranged place, and offer another line of resistance. This is an old game that the Boers under De Wet played frequently. She told of how the Austrian prisoners were friendly and good-natured, wishing the British nurses good-luck on the road. She told of the kindness of the wounded Serbian soldiers, the surprise they showed at the nurses waiting on them, making their beds, &c. And they never could get over the amount of work a British woman can do.

Then she mentioned some of the personal hardships that the nurses underwent: black bread and hard-boiled eggs, fried bacon on bread for a plate, heavy endless walking over terrible roads, and sleep when possible and where possible.

'Why,' she said, 'the first night we got here from Monastir I slept in a bed the first time for four weeks, and I didn't get up till seven-thirty.'

I squirmed inwardly, for I remembered that that very morning I had not got up till nine.

Then I asked her a question. The answer I knew before I asked it; I merely wanted again to prove my theory. 'What,' I asked, 'were your chief thoughts during all this time?'

Without a moment's hesitation she replied, 'Food.'

We both laughed, for all the army over it's the same: 'What and when are we going to eat?' And I was quite certain that the Sisters differed not at all from their brothers in the fighting-line.

Then something happened which took my breath away. The door opened at the end of the crowded room, and down the centre of it marched a Serbian soldier in khaki, breeches, and puttees, who passed our table, saluting the Serbian officer. A cheery word from him, and a cheery reply in a *female* voice.

'A woman!' I gasped.

'Oh yes,' the Serbian quietly replied. 'Why not? There are many of them in our army.'

I gasped again; it was a shock to me. I had read about these things—romantic, they seemed, and only half-true; but here I had seen it—a woman in a man's dress, and serving as a man serves.

'Tell me about it,' I said.

The Serbian was smoking between the courses. He blew a cloud of smoke in the air, and told.

'In England,' he said, 'you are not overrun by the enemy; the life of your country goes on peacefully. To you the war is across the water. You soldiers, British soldiers, are fighting on other people's land, and perhaps you don't realise the inconvenience to the owners. Therefore it must be a shock to you when you see the owners' womenfolk entering into the general rough-and-tumble. To us, nowadays, it seems quite natural. It started like this. Women whose husbands fell at the beginning of the campaign formed a band and went fighting on their own with such effect that the army drafted them, and we have never regretted it.'

This made me furiously to think. What a sacrifice for a country to make! What women! And—well, is it wonderful how Serbia has 'stuck it' when they can boast such mothers?

I went on thinking for some time, until through my thoughts penetrated the voice of the French aviator. 'You see,' he was saying, 'we fly so much lower than the Boche; that is why our bombing is so much better. We see; we wait; we drop the bomb so!' and he dropped a piece of bread neatly into the centre of his plate. 'Now, two days ago,' he continued, 'the Boche he visit us; he goes for one special place so high he cannot see; he drop ten, fifteen, twenty bombs all around, and not one hit. *Ah, c'est drôle.*'

'Dashed droll,' I grumbled, 'when you happen to be in a camp next door to the special place, ain't it?'

The Frenchman loved this, and he sat back chuckling. 'Ah,' he said, 'you have, how you say, "had some," *n'est ce pas?* Oh monsieur, the safest thing in war is to fly.' Then he went on to tell us how he was going to fly over the sea next day and drop some new bombs that he wished to try.

'If you monkey about like that,' said my host, 'the fleet will certainly *strafe* you.'

'Ah, what matter? I shall be very high, and when the first two, three shells come I nose dive; they think me hit, and stop the *strafe*; then I fly back to the aerodrome.' Then, bowing to me, he continued: 'Would monsieur care to accompany me? I could easily arrange.'

I, bowing also, said, 'A thousand thanks, *monsieur le capitaine*, but urgent military affairs will hold me to my unit to-morrow and for many days to come.'

'You like not aviation,' he laughed.

'No,' I answered; 'my line is cavalry—horses!' 'Nasty, dangerous things horses,' he cried; 'they make the false step, and then—*mon Dieu!*'

Which remark showed the difference of temperament. From this conversation arose reminiscences of Gallipoli and its artillery *strafes*; sad regrets for those we had left behind; admiration of the big-gun shooting of the Turk, who had to compete with bad ammunition and worn guns; how the same worn, tired gun would drop a shell on our front-line trench, creating uncomfortableness, when it was meant for our reserve or even supply depots.

And so it went on, this 'shop,' this war-talk, until the waiters (mostly Turks or Bulgars) swept away the crumbs and coffee-cups, and we had to break up.

'*Au revoir,*' said the Sister. 'We'll win in the end, and come out top somehow, in spite of the muddling.'

Everybody laughed, and some of us thought a bit, and also thanked our stars for the jolly Allies—France, Russia, Serbia, & Co.—and felt very pleased to be mixed up in such good company in the universal trouble.

And so we parted after the most cosmopolitan lunch I ever had.

THE ROCK OF QUARTO

CHAPTER II.

THE weeks went slowly, slowly by. The opulence of the early summer flowers had fallen, and now there was nothing left but the cactus and the magnolia against the terrace, and the heliotrope climbing the pergolas, with the verbenas and geranium all drooping with the heat.

The ancient manservant, lazily cleaning copper beneath the shade of the ilex in the back-court, grumbled at having to put on his thin alpaca jacket to answer the bell which tinkled suddenly behind the high wall, with its crown of spiked and dusty aloes. But when he had pulled the wire that opened the gate he stood open-mouthed at sight of a beautiful lady, who walked with a quick, undulating gait up the brick walk beneath the vines.

He had opened the door to many great names in his day, but not to many elegant women. His mistress mistrusted such nowadays; they smacked of that 'self-indulgence of youth' which she had so severely criticised. And, *Dio buono*, but this woman was truly elegant! Old Battista had an eye—as all Italians have—for beauty of form and grace of movement; this woman was 'well made'; she walked like a princess, and, simple as her clothes were, she dressed like one. Battista knew a thing or two.

'Is thy mistress at home?' asked she, not without some proper pride, which he did not dislike.

Now that she was close to him, his old eyes could see her beautiful glossy gold hair, her lovely skin, which he most admired. Who could she be? Stories came into his mind. 'I will see,' said he. 'Will *Vossignoria* give herself the trouble to enter? Whom shall I announce?'

'Do not announce at all,' said the visitor. 'Simply say some one is here who has news of the Marchese Casamarina.'

The old man shuffled hastily across the hall and opened the door of the room where his

mistress sat, as she always sat, alone among the dingy portraits, her Book of Hours and a cup of chocolate beside her on the ormolu table.

'There is a lady,' said he, 'but a real one, who asks to see the Excellency.'

'Didst thou not deny me?' snapped the Marchesa.

'Yes! yes!' lied he shamelessly. 'But she said she had news of the young *padrone*.'

The old lady closed her book sharply, and exchanged her spectacles for a pince-nez, through which she keenly examined her ancient retainer. 'She gave no name?'

'No name, *Vossignoria*.'

'And she has a good presence?'

'Oh, I believe you!' And the old fellow raised eyes and hands to heaven. 'One of race. And a blonde.'

There was an instant's pause.

'Then show her in,' said the old lady calmly.

'It may be the wife of my grandson arrived from Venice.'

Gian Battista stared, and—as he expressed it later in the kitchen, using an idiom of the Genoese vernacular expressive of his befuddled condition—'remained a beast!' He had had suspicions, but not that one.

'Up, pumpkin-head!' snapped his mistress, momentarily losing her temper with this intimate of years' standing. 'One does not keep a Casamarina waiting in the vestibule! Whatever she be!' added she to herself as the man positively leapt to her bidding.

But by the time the tall lady was in the room and the door unwillingly closed behind her all the great dame's dignity was back again. She bowed her head grandly, but without rising. If this were her granddaughter, it was not her place to rise.

'Pray be seated,' she said, waving a withered hand toward the other Louis XV. *fauteuil* which Gian Battista had placed ready on the far side of the ormolu table. 'They tell me you have

news of my grandson who is at the front. Is he wounded? Or perhaps killed?'

The girl before her—she was scarcely more—shivered. She had expected to be ill-received herself, but she had not expected this coldness as to the heir whom she supposed to be adored.

'God forbid!' murmured she. 'He was well when I received this letter,' drawing it from her dress. 'He asked me to come and tell you so. Otherwise—well'—She laughed a little, but quickly sobered as she added, 'In truth, I could not speak so quietly if misfortune had overtaken him. I love him. I am his wife.'

'I imagined it to myself,' replied the grandmother, still without moving a muscle. 'Three months ago I did not know of your existence. But when your husband came to bid me farewell he told me that he was married'—She paused; then, forming the words stiffly with her thin lips, added, 'To an Austrian.'

There was no reply.

The young woman had not taken the offered seat. She stood, gracefully bending a little, her daintily gloved, slender finger-tips lightly resting on the table, and the slanting rays of the sun touching her golden hair to brilliance.

'He had not asked my consent,' continued the old lady, 'though I am still the head of the Casamarina. In our family we do not love the Austrians.'

'And in ours there is not absolute love of the Italians,' responded the young wife with spirit. 'Therefore, neither did I ask the consent of my mother.'

'You did ill, then.'

'I did what love bade me; so did my husband. I shall never repent; and—I think—neither will he.'

'I am sure of it,' admitted the grandmother; but when the words had slipped out she frowned and sighed as well.

And at the sight the girl's face softened. 'A great love excuses something. Do you not think so?' said she very gently.

'How does one know that it is a great love?'

'Perhaps by the sacrifices that it is willing to make: *he* of your goodwill; *I* of that of my widowed mother, who will neither see nor remember me.'

'And she is a rich woman!' sniffed the Marchesa with acidity.

The girl drew herself up. 'My husband will never touch Austrian gold. Could you think it? No, nor I! Were it ever offered we should refuse. We would rather starve—we and our son.'

The red lips trembled. The old woman guessed it; but she had dropped her eyes hastily, and did not see. 'Our son!' she echoed to herself.

'But what does all that matter now?' said the breaking young voice with something between a sob and a laugh which should have melted the hardest. 'All that matters is that God should restore him to me—with honour. I would not withhold him; but, oh, I have the heavy heart! Ah! believe me, *signora*, it is not a bad love that makes one find the necessary courage somewhere.'

A tiny square of cambric came out, and when its use was over, 'But to whom do I say it?' added the girl with a quick, charming motion of her hands. 'Do I not know the story of 1860? Do I not know the part acted by the Casamarina? Ah, *nonna mia*—if I may so permit myself to address you?—do I not know that you too have well loved?'

There was silence; but the old heart would not show itself.

'And do not forget that, if on one side I am Austrian, my father was the son of a patriot—of a Venetian who died for Italy. *He* may have forgotten it when he married German gold; but I do not forget it. I am proud that the blood of an Italian patriot runs in my veins; and I am proud to be the wife and the mother of a Casamarina. I shall not betray my trust. Do not fear.'

At the name of 'mother' that tremor had run again through the old woman's frame; but she would not let herself go.

There was a long wait; then the young woman gathered herself together, disappointed—even outraged. She had shot her last bolt, and with no avail; she had heard of Genoese pride, but this—well!

'I will not inconvenience you further, Signora Marchesa,' said she haughtily. 'I have performed the duty with which I came charged, which was to tell you that, God be praised, your grandson is well. If you should wish at any time to see his son you have only to let me know. Here is my address.'

She took a card from her gold wrist-bag and laid it on the table.

'Ah! You are staying in Genoa?'

'Yes.' Then quietly: 'I had chosen to be near the relatives of my husband. But'—

'Well, well, I will let you know,' interrupted the old lady hurriedly, still without rising.

She had stretched out her hand to touch the hand-bell beside her, when the cracked one at the bottom of the pergola sounded again sharply, and they heard old Gian Battista, with much more than his usual alacrity, shuffling across the hall to answer it.

Truth to tell, he had been at the open window in the room of the Marchesa's maid overhead, trying to catch some echo of the conversation, and he had seen the unwonted figure of a bedizened foster-nurse with an infant in her arms hastily approaching down the lonely lane.

It was she who had rung that bell so impatiently; there was something in it.

But before he could bring the frightened message which he received into the *salone*, the door of it was hastily opened by the tall lady, who had her head in the air. She was angry, it seemed, for her eyes flashed; but at sight of the nurse and child she gave a cry and snatched at a letter in the woman's hand.

'For the love of Heaven, do not read it—you!' wailed the nurse with the kindly stupidity of her class. 'Let some one else read it, *signora*. It is bad news, believe me.'

The young wife had staggered blindly back into the room; her face was ashen; her hands shook so that she could not have opened the letter if she would.

But the old lady was on her feet. All her coldness had vanished; her eyes were anxious, but—yes!—full of sympathy. She crossed to the other side of the table, pushed Gigio's wife peremptorily into her chair, and took the letter from her. 'I will read it,' she said with authority.

There was an awful instant's silence; only an instant, for the letter was not long. Three fateful words—no more; but, oh God! enough to put out the sun.

The old lady laid her gnarled hand on the crisp golden-red hair, perhaps unconsciously. 'My child, it is the moment now for your courage. You said it; we both said it! We would not have withheld him from his country, and his country has required his life of him. The will of God be done!'

'It is not true! It can't be true!' stammered the girl. 'Ah, no! I cannot bear it!'

'Hush!' said the grandmother sternly. 'You will *have* to bear it, like all other wives! Come! Remember *him*; do not disgrace him!'

The poor young thing started as if stung. 'I disgrace him! Oh God, help me! not that!'

The nurse was in the doorway. 'I brought the boy,' whispered she. 'I thought perhaps'—

'You did well! Give him to me,' said the old lady.

And so it came to pass that the grandmother took in her arms the 'sprig of the old tree,' and kissed him, and forgot that he had Austrian blood in his veins. She kissed him and laid him in his mother's lap. The babe stirred in his sleep and whimpered, and then the healing tears fell, as the poor girl strained him to her beating heart.

'Yes, weep, my daughter!' said the old woman, tenderly enough, although her own old eyes were dry. 'God sends His tears lest our hearts break. Ah! have I not passed this way too? Do I not know?'

Impulsively the girl seized the old hand and laid it on the babe's head. 'Bless him!' faltered she.

If anything more was needed, this was it.

For the first time the old voice broke, as the head of the Casamarina blessed her great-grandson.

There was a long, deep silence, broken only by a noisy sob now and then from the nurse; the wife's tears flowed too painfully for sound.

Then a wonderful thing happened. There was a sudden faint distant sound. No one heard it but the old lady; no one could have recognised it but she, so it was natural that it should fall unheeded on other ears. But *she* knew it; it was the groaning of the old hinges in the little door that opened on to the sea-road beyond the garden. The door had been opened from the outside!

The Marchesa had not had the key replaced since her grandson had pocketed it in his hurried departure; it had not mattered, when there was no one left to come in and out.

Who had opened the door?

She made three steps to the window. It was not night now, as it had been when she had given the lad her last sorrowful blessing; the sun had but just set; the crimson glow touched the plumed heads of the cypresses; it lit another plume—the plume of a Bersagliere's hat; and it lit a face beneath it—bronzed and thin, but beaming with joy; the face of an officer, limping, but hastening up the garden path.

God of Miracle! It was Gigio!

She stepped out on to the terrace, lifting a warning hand. '*Adagio!*' she called out as the figure advanced. And she turned back to the room.

'Hast thou some more courage left, my daughter? The courage to hope?' she said in a strong voice.

The young wife leapt to her feet, the babe still in her arms; the strong voice was like a prophet's, and she too had now heard the step. Hope? Oh God! if there was hope, let it come quickly!

Then in an instant she knew that she had that courage, for Gigio's strong right hand was in hers, and his kisses on her face.

'Poor little heart!' whispered he. 'The maid told me at the flat in town that there had come bad news of me! I wish I could have spared thee that agony. But it is all past. It is not such bad news—eh?'

He was trying to laugh as he laid his brown face upon her pale one and against the soft cheek of his son; but there were tears in his eyes, though he did not know it.

'How did the thing happen?' asked the old lady with forced calm, and at her voice he held out his left hand to her with a deprecating gesture.

'Forgive me, *nonna mia!*' said he in greeting. 'I had eyes for none but her at first, you see! But how good to think that my wife was here,

with your great courage of experience to help her! I thank you for myself and for her.'

'Do not thank me!' said the old woman significantly. 'Thank God!' And then, resuming her matter-of-fact voice, 'But come, you do not tell us how the thing happened!'

'It was all a mistake. It was another Casamarina, one of my many cousins; I do not even know which.' And again he laughed, the laugh that was so near to tears.

'Thou art wounded; but no matter—it is an honour,' said the grandmother in her cool, even voice.

And at the words the young woman found hers. 'Wounded!'

The soldier laughed again; but this time it was a genuine merry laugh. 'Come! do not let us weep for that! Of course it is an honour; and if it were not for my wound I should not be here. But it is nothing—I shall soon return, I hope. So let us be happy while there is time.'

Closer still was the bronzed face to the white cheek; the black hair mingled with the golden red.

'Gigio!' murmured the young wife.

It was only one word, but it was like the bell of a church ringing in to prayer.

The old lady stepped forward. 'Give me the babe,' said she, taking him.

She made a sign to the nurse, and together they passed out into the garden. She was not wanted, but she was content to leave those two to that prayer. Something was happening that was changing all her preconceived notions, that was changing the world. She did not ask what

it was; she only knew that she was forced to bend her proud head to it.

She walked slowly, carrying the child out on to those arid rocks where she had for so many years taken all her sorrows, and sent them whither her youth's love had gone before her. She had lived a long life, but during the last weeks her youth's love had seemed very near to her—to-night nearer than ever; she had seen it once more as in a mirror. Just as the westering sun, setting in orange and gold behind the purple mountain, lit every little cloud that floated on the blue of the east with a rosy reflection of its glory, making a bed of beauty for the crescent moon, so did she see the passion of her girlhood reflected in the eyes of the 'youth of to-day.'

Gigio had said well; they were not doing so badly, 'the youth of to-day.' The heroes of her own time, beside whose monument she stood, had laid the foundation; but 'the youth of to-day' were finishing the building. Why deny them whatever reward they asked? And what reward so sweet and so worthy as to win the freedom of one's country for wife and for child?

Gigio had said—she found herself once more quoting 'the youth of to-day!'—that perhaps when one had driven the stranger from the last corner of the land one might even feel differently towards him. Perhaps!

Anyhow, the mellowing light of the afterglow fell softly on her as she stood, with 'the sprig of the old tree' in her arms, beside the memorial of her martyrdom and of her glory; and she was content to look to the sun that would rise to-morrow for 'the youth of to-day.'

THE END.

THE MONTH: SCIENCE AND ARTS.

PROSTHETIC APPARATUS FOR THE CRIPPLED IN WAR.

HITHERTO, so far as Great Britain is concerned, the manufacture of artificial limbs has been conducted upon a very limited scale, a result due, no doubt, to the comparatively slender demand for such articles, owing to the elaborate precautions which are observed to ensure the welfare of our workmen. In the United States, on the other hand, this peculiar industry has attained considerable proportions, having been fostered by the reckless disregard of limb which has ever been characteristic of American industry. The outcome is that, at the moment, we are largely dependent upon American ingenuity, knowledge, and craftsmanship to provide adequate substitutes for the limbs which our heroes have lost in battle. The American specialists in this field are generally considered to be the best, and it is significant that even the Germans are copying American methods very

closely. The artificial limb of to-day differs radically from its predecessor of two decades ago. The earlier article was virtually a crude stump, utterly deficient in any mechanical features capable of reproducing the movements of nature. Its present-day representative is a highly ingenious piece of workmanship, with which the patient, after a little experience in accustoming himself to the devices, is able to carry out almost any operation, often with truly marvellous dexterity. The modern artificial limb is often spoken of as 'prosthetic apparatus' (sometimes, though erroneously, as 'prothetic apparatus'), to differentiate it from the primitive makeshift of a few years ago. One of the most remarkable instances of how excellent a substitute it may be has been recorded in a German scientific paper. Some years ago a German mechanic who went to the United States met with an accident which resulted in the loss of the lower portion of both arms and both legs. Five months after the amputations he was fitted

with a remarkable set of prosthetic apparatus which cost about fifty pounds. Within an hour of donning the artificial feet he was able to walk without the aid of a stick, and in less than a week he was strolling about the streets revealing no sign of the contrivances fitted to his legs save that he had a somewhat longer stride than formerly. With the apparatus fitted in place of his amputated hands he can carry out practically any task, being even able to write. The apparatus, while substantially made—it has been in use for eight years—is extremely simple in its design, and the patient himself carries out some of the minor necessary repairs. He is able to climb ladders, to walk long distances, to run, to ride a bicycle, and to dress and undress himself. Just now he is earning a higher wage than ever before. Upon his return to Germany he started in business, but has now been taken in hand by one of the foremost Austrian surgeons to give demonstrations of his dexterity in the use of his wonderful limbs in an Austrian hospital devoted to soldiers crippled in war. He instructs the broken and battered in the use of artificial limbs, and proves by example that the loss of even both legs and arms does not necessarily condemn the patient to permanent incapacity. With the prosthetic apparatus now available it is possible to perform practically any task. Naturally, the more there is left of the original limb the easier it is to make the substitute efficient; but it has been found, from practical experience, that even the loss of both arms by amputation at the shoulder does not condemn the patient to utter helplessness, because of the power and adaptability developed by the shoulders. Several American firms, realising the demand for artificial limbs, which is rapidly attaining imposing proportions, have despatched specialists in this novel profession to these islands. The expert fashioning of prosthetic apparatus demands years of experience and unremitting attention to minute details, and it is interesting to learn that the majority of the American masters in this craft are themselves minus a limb. They are probably better able than a workman sound in every limb to appreciate the needs of a mutilated comrade, and to translate their sympathy into the practical shape of providing a comfortable and well-fitting substitute.

AN AIR-BED FOR THE FIELD.

In order to maintain that physical soundness which is imperative upon the battlefield, comfort in sleeping at night is vital. Perfect relaxation of the limbs is essential, as well as protection against cold and damp. Many attempts to achieve these highly desired ends have been made with air-beds, which are inflated as required; but the majority of these extemporised pneumatic couches suffer from the serious disadvantage of being too bulky and cumbersome

for use upon active service. An improved contrivance of this character, which appears to fulfil every requirement, has recently appeared upon the market. It consists of a mattress and bolster made in one piece, which, when rolled up in its deflated condition, has an over-all length of eighteen inches, with a diameter of four inches, and thus, being light in weight, is easy to carry. It is readily inflated by the mouth; and, because of the material employed in its manufacture, a ground sheet is not required. In its inflated condition it offers a raised pillow for the head, while the mat is sufficiently long to receive the body down to the knees. Owing to its small dimensions it can be used practically anywhere—in the trench, in a dugout, or in camp; and as it can be packed into such small space, it is no obstruction during the day. Mouth inflation imparts sufficient resiliency to the couch to afford the body all the rest and comfort needed, the result being that the sleeper does not suffer from cramp or stiffness, while damp is completely avoided. The soldier, upon waking, is fresh and fit for instant duty. This novel air-bed is the invention of a well-known engineer whose profession has taken him into remote corners of the world where he had to depend entirely upon his own individual efforts and ingenuity. He has used one of these beds continuously for three years, which affords adequate testimony to its value.

RADIO-ACTIVE ORES AND PLANT-LIFE.

During the year 1914 a series of interesting experiments to determine the effects of radio-active ores and residues on plant-life was carried out by Mr Martin H. F. Sutton, F.L.S., the results of which were described briefly in 'The Month' (May 1915). Although it was not possible to arrive at any final conclusions from these experiments, the subject was sufficiently important to induce Mr Sutton to resume his investigations on a much more extensive scale during the year 1915, and the results of these have recently been communicated. During the 1915 trials experiments were made with nine radio-active materials, as compared with only three during the previous year. Moreover, the forms of plant-life experimented upon were of greater variety, and consisted of fruit, roots, foliage, and bulbs. They included tomatoes, potatoes, radishes, lettuces, onions, carrots, vegetable-marrows, and spinach-beets. For purposes of comparison, the trial plots fertilised by radio-active ores were ranged beside other plots in which ordinary fertilisers were employed—farmyard manure, artificial fertiliser, coal dust, and chemical mixture. Mr Sutton has set forth the results of his investigations in a comprehensive yet succinctly written bulletin, which sheds considerable light upon a subject which is a matter of keen controversy in agricultural circles. A perusal of this report

will serve to establish the incontrovertible fact that the fertilising properties of radium, if not mythical, are certainly considerably exaggerated. Indeed, the trials not only proved to the hilt that radium cannot assist the farmer in any way, but that now, as ever, farmyard manure and complete artificial fertilisers are far more useful than one is apt to imagine. The radio-plant-stimulating enthusiasts may perhaps be disposed to dissent from the results achieved by Mr Sutton; but the facts which he has collected as a result of patient investigations and trial cannot be gainsaid. They serve to establish the conclusions of Dr Cyril Hopkins, who carried out similar experiments at the agricultural experimental station attached to the University of Illinois, U.S.A., and who reported results quite as barren as those recorded by his British contemporary. There was one factor, it should be noted, for which Mr Sutton was careful to allow—namely, the susceptibility of the ores from which radium is extracted to ‘contamination’ by other chemicals or agents, such as arsenic and copper sulphide, which in themselves are inimical to plant-life, and which might possibly nullify all the hypothetical benefits bestowed by the radium itself. Although negative results have been achieved so far, the influence of radioactive ores upon plant-life offers a quest which should be pursued even if the ultimate issue is only of scientific value. In this manner it may be possible to strangle very effectively one manifestation of quackery, as applied to horticulture, much in evidence at the present moment.

COAL HAULAGE BY ELECTRIC TRACTION.

While the electrical operation of passenger trains has undergone tardy and belated adoption in these islands, the haulage of freight trains by electricity has up to now been ignored completely, even in the congested industrial centres and on the coalfields. The North-Eastern Railway Company, however, is proving the pioneer in this direction, as it did in the provision of electrically propelled passenger trains to compete with the electric tramways. The first section to be adapted to this system of goods haulage is that between Shildon and Newport, a distance of eighteen miles. The overhead conductor has been adopted, the three-phase alternating current supplied at one thousand five hundred volts being converted into direct current and ‘stepped down’ to the working pressure of the line at the sub-stations. The locomotives weigh seventy-four tons, are equipped with four motors giving an aggregate output of two hundred and seventy-five horse-power, and are capable of exerting a tractive effort of twenty-eight thousand pounds at the tread of the wheels when starting under normal conditions. Each locomotive is designed to haul a train weighing one thousand four hundred tons at a speed of twenty-five miles an hour upon the level, and to start a train of this weight upon a gradient of

one in three hundred. The electrical operation of trains, both passenger and freight, is capable of considerable development in these islands, especially in territories like those on the north-east coast. In such districts the power should be obtainable at a low figure from electric generating centres erected where cheap fuel is obtainable in unlimited quantities. It is the cost of power which constitutes the governing factor. Doubtless many decades will pass before the whole of the British railway systems are converted wholly from steam to electric operation; but it will be brought within the sphere of practicability as we appreciate the advantages accruing from the installation of enormous electric generating stations in the heart of the coalfields, transmitting far and wide the power thus obtained by overhead conductors such as are to be found in the districts contiguous to the Falls of Niagara.

COPING WITH THE PETROL FAMINE.

One of the most disturbing factors in the commercial world at the present time is the petrol famine. In many quarters the existing situation is considered to be merely temporary, and to be directly attributable to the war. But this is far from being the case. As a matter of fact, the world's supplies of petrol are decreasing at an alarming rate, and if the present consumption should be maintained and further developments of its use should continue at the pace which has recently prevailed, this volatile petroleum fuel will virtually become exhausted, at all events for ordinary commercial purposes. In these islands the average price of over three shillings per gallon has been reached; while even in the United States, which produces more petrol than any other country, it is rapidly rising to a corresponding figure. The oil-producing companies are spending vast sums of money in defraying the cost of elaborate experiments, and are laying down plant to effect the extraction of the last drop of the volatile spirit from the prime product. It is the increasing cost of extracting the fuel, coupled with the difficulties of the process, which is responsible for its high price. The specific gravity of what we generically describe as petrol has been steadily rising for some years, the spirit which is at present known under this name, and the gravity of which has risen to .750, corresponding with the paraffin of twelve years ago. The situation can be met only by the utilisation of other volatile fuels, such as benzol from coal, and alcohol, which can be produced in vast quantities at a nominal figure. Doubtless alcohol would have been placed upon the market long since had an effective denaturant been discovered. However, there is every indication that alcohol will come to be regarded as the volatile fuel of the future. The alternative is in the hands of the engineer. If he can produce an apparatus which will volatilise the heavier oil as easily and as effectively as the present carburetter volatilises

petrol, the difficulty will be completely overcome, but such an invention will revolutionise the high-speed internal combustion engine altogether. This has long since been brought to a point of perfection beyond which, at the moment, it appears to be impossible to proceed. If the manufacture of alcohol for industrial purposes receives official sanction, the vogue of the petrol motor is assured. But should the engineer solve what at present appears to be a hopeless problem, a far-reaching revolution will be wrought. The motor itself will undergo such a remarkable transition as to convert the automobile engine of to-day into a curiosity comparable with the mail-coach of a hundred years ago. The engineer recognises the baffling complexities attending his quest, but it is a line of research which is being actively pursued in all countries where the gravity of the present situation is fully appreciated.

IS THUNDER HEARD AT SEA?

The audibility of thunder at sea, a question which has so far baffled scientific inquiry, was the subject of a prolonged and interesting discussion at a meeting of one of the scientific societies a few months ago. It was pointed out by several learned men that frequently the most vivid lightning discharges at sea have failed to be accompanied by the slightest sound of thunder. Others argued that thunder is just as characteristically attendant upon lightning-flashes at sea as upon land, but that the sound escapes detection because it is drowned by the noises produced on the ship herself. In order to provide authoritative data in this connection, the commander of the *Carnegie*, the ship built especially for the Carnegie Department of Terrestrial Magnetism, was instructed to study the conditions attending thunderstorms at sea during his voyage down the Pacific from Alaska to New Zealand. The journey occupied ninety-one days, and during this period twenty-two storms involving lightning discharges were observed. The attendant thunder was heard only upon six occasions, and on each it was 'streak' lightning that was observed. The theory that thunder at sea is not heard because of the 'ship's noises' appears to have been disproved, for on several occasions vivid lightning displays were seen, but although the ship's noises were as far as possible eliminated, no thunder whatever was heard. The proximity of land does not appear to affect the issue in any way; in one instance when thunder was heard after a lightning discharge, land was six hundred miles away. During one storm several peals were heard, and from investigation of the intervals between the flashes and the attendant peals, it was discovered that the thunder became inaudible when the disturbance occurred more than five miles from the ship. The subject is considered to be of such scientific interest and importance that investigation will be continued during the

remainder of the present lengthy cruise of the *Carnegie*, by the end of which it is hoped that sufficiently conclusive evidence will be furnished to decide the question.

KILLING TRENCH RATS BY ELECTRICITY.

The soldiers in the trenches upon the battle-fronts are suffering from another pest—rats. These animals have multiplied at such a rapid rate as to render totally inadequate the various plans for their extermination which have been tried hitherto. After testing nearly every feasible scheme, the French soldiers in one section, chagrined at the meagre results achieved, decided to try a most drastic method. This is electrocution. The rat-runs leading to the trenches are excavated slightly to form a narrow trough, and over each are stretched three parallel wires, spaced a few inches apart, and kept charged with electricity at a sufficient potential. The rats, in their stampede across the troughs, foul the wires and are instantly killed. In the section where this simple system is in operation the death-roll is stated to amount to several hundreds weekly. The process is certainly effectual, but unfortunately the necessity of having a supply of the 'juice' conveniently at hand militates against its general adoption.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

PEACE.

Is there no hope when clouds around thee falleth?
No bow of promise circling 'gainst the sky?
Yea, hush thy soul, the tender rain but calleth
The sunlight nigh.

Is there no joy to lift the blight of sorrow,
When leaden hours stretch forth their shadows long?
Lift up thy heart, it cometh with the morrow,
A bird's glad song.

Is there no love to calm the storm of weeping?
Ah! yes, dear one, it leaneth on thy breast.
God gave a child into thy gracious keeping,
And this is rest.

Thus hallowed joy, with hope, shall leave thee never,
Soft hands clasp thine till all of passion cease;
And to thy soul the love of heaven for ever
Shall whisper—peace.

GILBERT RAE.

* * * TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL*.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

THE THIRD KEEPER.

By ARTHUR O. COOKE.

PART I.

THERE were just two of us that August afternoon within the little lighthouse perched upon the mighty headland of red Devon sandstone jutting out into the sea—the lightkeeper, gray-headed, gray-eyed, middle-aged; and myself, a summer idler taking holiday. With pipe drawing steadily, I sat and watched the keeper while he gave a final polish here and there, touching with a caressing hand the spotless glass, the shining metal, of the splendid lens.

‘You see how sweet she runs,’ he said, with almost reverent admiration in his tone. ‘Just touch her with your little finger—that’s enough to set her going.’

I rose and pressed a finger lightly on the framing, and the great round drum of glass and metal, some two tons in weight, moved noiselessly and smoothly round, floating within its trough of quicksilver.

‘It’s a fine lens,’ the keeper went on musingly, ‘and so’s the Whirlstone too; but there’s no bath of mercury out there as yet; it runs upon steel wheels. This mercury’s the very latest dodge there is.’

‘How long were you upon the Whirlstone, keeper?’ I inquired.

‘Three years as second keeper,’ he replied.

‘Three men are always on a rock light now—not two, as on shore lights? Is that not so?’ I asked.

‘Yes. On a rock lighthouse there are four men in all: three on the rock together, while the fourth—each man in turn—takes four weeks on the shore. Two men were there alone together in past days, until there came a terrible affair. One keeper died, and his poor mate, thinking it might be said there had been foul play, lashed up the body on the gallery, and it hung there for weeks; for it was stormy weather, and the light was long in being relieved.’

‘Yes, it must be much safer to have three upon a rock,’ I hazarded.

The keeper did not answer for a minute, but looked through the open door across the down. ‘Well, yes,’ he said at last; ‘and yet there may come times when one would have been better off without the third.’

‘That so? But why?’

No. 297.—VOL. VI.

He looked down at me curiously as I sat smoking in the wooden elbow-chair. ‘I take it, then, you’ve never heard the tale of what took place upon the Whirlstone fifteen years ago,’ he said. ‘Oh, you were off in foreign parts for many years about that time; then that accounts for it. But it was in the papers, and it made a fine to-do, as well it might. It’s well known round this district, though it’s not much spoken of to-day.’

‘What tale?’ I asked.

The keeper gave a last touch to the lens, and then stood back admiring the effect. ‘I think that’s all,’ he said; ‘she’s ready now. Well, the sun’s out again, and we’d be just as well outside.’

He led the way across the turf to the cliff’s edge, whence we could see the brown-sailed trawlers beating seaward from the bay. Then, seated beside me in a sun-warmed nook, well sheltered from the bluster of the north-west wind, he told the tale of the third lighthouse-keeper whom his fellows would so willingly have been without. Here is that story, told, so far as I remember, in the keeper’s very words.

‘His name was Charlie Wilson; my own name you know—Tom Prout; while the third man mixed up in it was William Harding. Yes, it was on the Whirlstone that the job took place. The principal was on his turn ashore. I was the second keeper, Charlie third, and Harding fourth. I was just forty-five, Wilson perhaps ten years younger, while young Harding was a lad—not more than twenty-two.

‘A better chap than Charlie Wilson never lived, quiet and inoffensive as could be. He was a fair-haired, blue-eyed, kind-faced man; the very last man you’d have thought— Well, well! He had been married some eight years, and there were two small children, boy and girl. Things had gone well with him at first. His wife was a nice woman, a fresh country girl from the East Coast, where he had met her when he had a shore post out that way. After a time he was sent to the Whirlstone; it was his first rock station since he was a married man.

‘Well, I don’t say that it was all her fault, poor thing! Coming straight from the country,

AUGUST 5, 1918.

[All Rights Reserved.]

where her husband had been with her for four hours out of eight—coming from the country to a big port town like Wellmouth kind of turned her head. Charlie would be at home with her for one month out of three; then for eight mortal weeks she never saw his face. She felt her loneliness, and got drawn in with women whose men earned big money at the dockyards, and they took her out to music-halls and restaurants, and helped her to spend Charlie's wages at the shops. We soon began to see that Wilson came back from his month ashore upset and worried, and then tales began to get about. Soon it was common talk that the house and children were neglected, while she would be gadding here and there about the town with friends.

'Then Wilson had a talk with our old principal one night while I was in the lantern upon duty, and they two were in the lighthouse kitchen by themselves. Our principal was a real good sort. He advised Charlie to apply to the Board for a remove; to ask for a shore station, if it might be, where he would be more at home.

'The next time Wilson came from shore he was more upset than ever. He had talked to his wife about this plan of moving, and she had refused to go. She was not going to bury herself in some out-of-the-way place, she said; he could go where he liked, but she would stay. She would get a situation—plenty to be had in Wellmouth—and would keep herself.

'That was all nonsense, of course; but still it worried Charlie terribly to think that, from being so miserable and lonely when she was without him, she was now so taken up with her gay friends that she could talk of parting from him if he went elsewhere. Things went on as they were for some time longer. Charlie was off on shore in May; then, in the first few days of June, he came back to the lighthouse, and the principal went home. Charlie and Harding and myself were on the rock.

'Well, I saw from his face that he had found things pretty bad at home. But, different from what was usual with him, he said not a word to me, but went about his work and sat at meals with a queer look, as though his eyes were set on something far away.

'Still, except for his silence, things went just as usual for the first two days from the relief. It was the evening of the third day that the smash occurred, and a fine smash it was. It was enough to last me all my life; when you have heard it you won't wonder that I had no nerve for a rock light again.

'I've told you it was June when all this happened, just at the beginning of the month. Well, the sun sets just then a few minutes past eight. On the third night it was my turn for duty in the lantern during the first watch—the watch from eight o'clock to midnight. A little before eight—a quarter to, maybe—I went up to the lantern to be ready to light up. Harding

had gone down to the set-off, fishing; Wilson was, therefore, in the kitchen all alone. He and I had had supper together; he would lie down for a few hours before coming up at midnight for the middle watch.

'But stop; you've never been inside the Whirlstone? No; you've only seen it from the sea. Well, then, to make things clear, I must describe the place a bit. The lighthouse stands upon a ridge of rock which is above water even at high tide. All round the bottom of the tower runs a ledge, or set-off, built of masonry, and four feet broad, which forms the landing-place. At dead-low water of spring-tides an active man can scramble down on a few yards of rock; but it is difficult. So all the exercise the keepers get outside the lighthouse is upon this set-off or upon the gallery outside the lantern.

'The entrance-door is thirty feet above the set-off, and is reached by ladder-rungs of gun-metal. The folding-doors are gun-metal, and of enormous weight. They open inwards, and, when shut, can be secured not only by bolts at top and bottom, but by heavy arms of gun-metal hinged to the walls inside and falling forward into rings fixed on the inside of the doors.

'From the small space inside the entrance-door a stair leads to the lower oil-store, and there is a second oil-store above that. Then come two store-rooms, one above the other; in the lower one there is a winch for hauling stores up from the steamer's boat. Above the upper store-room is the kitchen; then a sort of sitting-room known as the engineer's apartment. Over that there is the keepers' bedroom, with the lantern at the top of all.

'There is a little window on each staircase-landing, and a door, with glass panes in the upper panels, at the top and foot of nearly every stair. But the stair leading from outside the keepers' bedroom to the lantern is a very steep one, like a ladder, with a trap-door at the top. On that trap-door there is a bolt below, but none above; so a man could be fastened in the lantern, but not out of it.

'Well, Harding, as I said, had gone down to the set-off with his rod and line. There are both bass and pollack off the Whirlstone, and the dusk is a good time to catch the latter fish. Harding was very fond of fishing, and was constantly down there at dusk when not on duty with the light.

'Sunset had come, and I had lit the lamp. As soon as it was burning steadily, the winding-gear going well, and everything in order, I lit my pipe and strolled out on the gallery outside the lantern. It was a lovely evening, clear and bright. I leaned upon the railing and watched Harding fishing, better than a hundred feet below.

'He was having good sport that night. Time after time I saw the glitter of a pollack as he drew it in and took it off the hook. We should

have fish for breakfast the next morning, that was clear. I watched till it had grown quite dark, and I could hardly see him; then I went inside.

'Keepers are not allowed to read while on their watches, for, you see, it might make them forget the winding, or perhaps even go to sleep. They generally busy themselves with some bit of cleaning, and I now took out a rag and set to polishing up the brass ventilator covers in the lantern walls. I can remember that I whistled to myself the while. A lonely four-hours' night watch is all right so long as you have nothing in the way of worry on your mind; but when you've trouble, and brood on it—why, it's very apt to lead to something worse.

'There was a breeze sprung up with sunset, blowing pretty fresh from the south-west. What with a breeze, and the waves breaking on the reef, you cannot hear much else outside the tower; but I did at last hear something like a shout. At first I thought it was my fancy, but when again I heard it I went out.

'There were no boats in sight; only a liner making in for port. I walked all round the gallery, looking down on the set-off; there was no one on it. Harding must have come inside. And then, quite clear, I heard the shout again—just the beginning of it like; the rest went down the wind.

'Had Harding fallen in? It was just possible, but hardly likely. Still, I looked well at the rocks that rose up here and there all round. And then I heard the shout again, louder this time, and, as it seemed, immediately below. I looked once more all round the set-off; then, dim against the tower, at about the height of the top ladder-rung, I saw a fluttering of something white. Looking more closely, I could see the figure of a man, and saw that he waved something in his hand. He saw me looking over, and he shouted once again.

'It was young Harding, standing on the top-most ladder-rung outside the entrance-doors. By why on earth, I wondered, was he standing there, instead of coming in? And then it struck me that the doors were surely shut.

'But who had shut them, and what for? During fine summer weather they were always left wide open night and day. There was but Wilson in the tower with me; somehow that thought gave me a nasty jar. Why should he shut them? He was not the man to play a silly joke, especially just now. Nor would he do so out of any spite. Though there was no great friendship between him and Harding, who, as I have said, was a much younger man, yet there was certainly no bad feeling between them. It was a mystery to me, and one I did not like.

'According to strict rule I could not leave the lantern, or at least go farther from it than the gallery, until I was relieved at twelve o'clock.

But I could not leave Harding standing for three hours there; I must go down to Wilson, ask him what was up, and tell him to let Harding in. Perhaps, after all, the doors might not be shut; Harding might possibly have hurt himself. At any rate I must go down.

'I went in to the lantern by the small low doorway, not two yards from which was the trap-door. There, in the trap-door opening, with his shoulders on the level of the lantern floor, was Wilson, on the point of coming in.

'My God! one look at him was quite enough for me. Though I had never seen a madman in my life before that moment, I well knew that I was looking at one then. It was his eyes! Don't ask me what they looked like; sometimes, when I am by myself and quiet, I can see them still.

'In his right hand he held a narrow-bladed and sharp-pointed knife, one of those used by shoemakers. There had been no such knife upon the lighthouse, and he must have brought it back with him from shore.

'Two seconds more and he would have been inside the lantern. But there are times upon a lighthouse when one has to do a lot in two short seconds, and I did it then. If he were once inside it was all over with me, and most likely with poor Harding too. Wilson was quite as tall and strong as I was; he was younger, armed, and would have all a madman's strength.

'I just took one step forward and let fly my right foot full into his face. Even as I let out I hated myself, but you'll agree that there was no time to be nice about it. My boot-toe caught him fairly on the jaw and sent him backward, but not down the ladder—his left hand still clutched the edge of the square opening in the floor. I stamped upon his hand with all my might, the while I pulled the trap-door downwards from the wall. His hand gave way at last; I banged the door down, and then stood on it.

'I am a pretty well-built man, and was much stouter then than now; and yet his shoulders made that door dance up and down—so strong he was. But he could not force it open long enough to get his hand inside; so, for the moment, I was safe.

'But for how long? As I have told you, there was no bolt upon my side of the door. I must stand where I was or let the madman in. Put something heavy on it? What? There was one chair up there; that wouldn't be much good. Nor was the writing-desk, at which we sat to fill in the log every watch, much heavier.

'I looked round the lantern in despair. There was nothing which was both heavy and movable. There was the metal container holding the two days' supply of oil, and connected with it by a small brass pipe was the similar container in which was the compressed air which forced the oil up to the lamp. Both these were

very heavy; but, even had I made up my mind to use them, both were fixed down firmly to the floor. No, I must just keep where I was till I thought out some other plan.

'Just then the gong connected with the machinery by which the lens is kept revolving struck; it was a warning to the keeper to wind up the weight. Well, that was a call of duty I could still obey. The handle of the winch hung ready in its place, easily reached from where I stood on the trap-door. So I began to wind.

'Seemingly Wilson had been standing all this while—which indeed was not very long—upon the stair below. As soon as he heard the winch at work he tried again to force the door, battering it with his shoulders, even with his head. But I kept squarely on it; and, although it bounced and shook and trembled, yet it did not yield. I did not greatly fear its breaking, for they put good stuff in lighthouse-work. And, while I made the full three hundred revolutions of the winch, a notion came to me.

'At intervals all round the lantern, just below the upper portion of the walls, which is, of course, of glass, there are placed oblong ventilators to let in air during stormy weather when the door that opens on the gallery must be kept shut. I had thought, by the way, of that door; it was of gun-metal and a great weight. Could I have got it off its hinges I should have been right; but that was quite impossible.

'But to go back to the ventilators. Three of them were within my reach as I stood on the door. They opened and closed by means of brass sliding covers, and these covers moved in brass frames which could be unscrewed from the wall when they required a thorough cleaning. Each frame was held by four screws. If I could get these twelve screws and screw them through the trap-door and its framing, they might hold, and I should be comparatively safe; just safe enough at any rate to go again on to the gallery, communicate with Harding, and perhaps make some signal to a passing ship or to the shore for help.

'But I hadn't got the screws yet. However, that was soon done, for the screwdriver was in

a cupboard in the wall a yard away. I got it out, and soon had drawn one screw.

'As bad luck had it, all of them were little better than an inch in length. If screwed straight down they would not reach the ledge on which the trap-door rested; but I might perhaps screw them obliquely into the side-framing. At all events I meant to try.

'But I had neither nail-passer nor bradawl handy. Happily I had my knife. The job took me two hours, and each time the gong struck I left off to wind the weight; it was slow work making a hole for each screw with the knife-blade. But it was done at last, and was, so far as I could judge, a decent job. The proof of that would be when Wilson made his next attack upon the door. He had been quiet now for some two hours and more; whether he still stood on the stair below me or had gone into some other portion of the tower I was wholly ignorant. I took the chair and sat on the trap-door awaiting him.

'While I sat there I wrote a note to Harding, telling him that Wilson had gone mad, and that I thought we could do nothing until daylight; we must just hold on. This note I twisted round a little piece of metal taken from the tool-box, and then wrapped the metal in my handkerchief, making it less likely to bound off the set-off with the fall. Then, going on to the gallery, I managed to attract Harding's attention by striking a match, and dropped my message down. I could not get an answer, for there was not, as there sometimes was, a fishing-line upon the gallery by which I might have hauled up a reply.

'Then I went back and sat upon my chair to think. I was sorry for Harding, who for three mortal hours had been quite in ignorance of what was happening, and only knew that something had gone wrong. But somehow for his actual safety I had not much fear. I knew that madmen often turned against their greatest friends; and, of his fellow-keepers, I was certainly best chum in Wilson's eyes. It was, I guessed, on me that his mad sudden hate had turned; he had shut out Harding on the set-off to be free to deal with me.

T O B R U K.*

By T. W. EYRE, Royal College, Mauritius.

WE descended upon Tobruk as if dropped from the skies. Our party consisted of the captain, officers, and Chinese crew of the s.s. *Helmsmuir*, together with myself, the only passenger, not one of whom until the previous

day had ever heard of Tobruk. 'Sweet are the uses of adversity;' and if the *Helmsmuir* had not been shelled and sunk by an enemy submarine, and we ourselves brought on to Tobruk by an Italian armed yacht, we should probably never have heard of the place unto this day. Tobruk itself we might, perhaps, have been content to miss; but to experience the

* Tobruk is an Italian naval base in eastern Tripolitania, about one hundred miles from Solum, on the western frontier of Egypt.

courteous hospitality of Italian naval officers it is almost worth while to be submarined.

We landed at about eight-thirty P.M. at a small jetty, and saw nothing of Tobruk that evening except the harbour lights and the dim outline of the houses clustered about the summit of the low cliff that faces the quay. Our arrival had been heralded by wireless, and a large and interested crowd pressed about us as we made our way along the little pier to the shore. Here two large motor-lorries awaited us; we took our seats, and were whirled away to the naval mess, shouting 'Tipperary,' in lusty chorus, to the wondering amusement of our Italian audience. We were most hospitably welcomed by the officers of the mess; and the note struck that evening was sustained with the utmost kindness throughout our long enforced stay of four weeks' duration.

Our skipper, the chief engineer, and myself were housed in the officers' quarters near the mess, the rest of the late *Helmismuir's* officers in hospital buildings about a mile away; and the Chinese crew found rougher but quite comfortable accommodation in the naval barracks.

Next morning we were all up early for our first view of Tobruk by daylight. The day at Tobruk officially begins at eight o'clock with the hoisting of the Italian flag on the flagstaff near the mess. A guard of bluejackets marches up under the command of a petty officer, a bugle blows, and up goes the flag, the guard presenting arms. Similar pomp and circumstance attend the hauling down of the flag at sunset; and we came to look forward to these little ceremonies as breaks in the monotony of the day.

Daylight revealed the naval mess as a low wooden building roofed with galvanised iron, and having a veranda running round three of its sides. It faces a high signal station and the harbour, and consists of the usual anteroom, with dining-room behind, the former containing a piano and the officers' library, well stocked with Italian, French, and even some English novels. On its right are workshops and timber-yards and the town; on its left the officers' quarters, a concrete tennis-court and a skittle-ground, the flagstaff surrounded by a few green shrubs (the object of tender solicitude), and the official dispensary; and, farther away, shut off by a wall and a gate, the military barracks and forage stores—the *parco foragio*. Behind the mess, on the arid sandy plain, the lines of the naval barracks stretch up to a boundary wall, with sentry-guarded gate, beyond which rises the wireless installation; and to the left rear lies the cemetery.

If you walk across the stony, dusty plain past the cemetery and the big cattle-pen beyond, keeping the *parco foragio* with its zealous sentries on your right, you reach a marshy tract covered with coarse hardy scrub resembling heather at first sight, and bordered with 'many a mouldering heap' of the squalid jetsam of

civilisation—broken bottles, empty tins, and dilapidated boots; and here—oh, wonder!—is a pond, which on Tobruk's thirsty plains assumes almost the dignity of a lake. Here, too, a few flowering plants are to be seen; and hither in their hours of leisure sporting bluejackets are wont to resort with shot-guns in keen pursuit of the various small birds that haunt the place. To right and left of the marsh is a battery, and between the two lies the one little beauty-spot of Tobruk. But that I will keep for the last of my sketches.

Animal life in Tobruk presents little to interest the casual observer. Besides the small birds already mentioned, large crows are usually to be seen in the neighbourhood of the barracks and the *macello*, or shambles, on the lookout for anything edible; and their harsh croak startlingly resembles sinister human laughter. Every evening at sunset they used to pass over Tobruk in great troops like homing rooks, whither bound I know not. During our last week at the mess somebody deposited one of these birds—a dejected specimen with clipped wings—in the flagstaff enclosure. It moped sullenly during the day; but at nightfall I observed it making desperate efforts to hop to the top of the low wire fencing that kept it prisoner. It had all my sympathy in the attempt. I noticed also two varieties of lizards on the sandy plain, and a long-legged rodent like a dwarf kangaroo. These, with a few beetles of moderate size, and some enormous black ants, were all the wild life to be seen by such an amateur naturalist as myself.

The domestic animals included a large number of horses and mules kept for military purposes, and cattle for the food-supply of the garrison; and I saw several flocks of goats herded by picturesque Arabs. Large cats abounded in the military barracks, but sedulously avoided the vicinity of the naval mess. This feline boycott was not arbitrary, but based on the presence of a formidable pack of miscellaneous mongrels of every shape and size, maintained as watch-dogs to guard the naval barracks against night attacks. As the dogs fraternised with all sailors, they at once recognised the status of the *Helmismuir's* officers, and formally welcomed them to the mess, and even tolerated me as being one of their party. But against soldiers they waged a truceless war; and any Italian Tommy who passed near the naval mess did so at his own risk. The dogs at sight of the hated uniform at once raised the hue and cry, and dashed upon him in a threatening mass; the soldier cursed and swore, hitting and kicking right and left like a madman; and sailors, running to the rescue, would drive off the yelping curs with a volley of stones. This was one of the minor diversions of life at Tobruk. Puppies were naturally in evidence in the naval barracks, and were, of course, made much of by the sailors. I once watched a tall, black-bearded petty officer

patiently training a fat white puppy to sit up; and, when the pup acquitted itself well, it was pleasant to see the big man lift the little dog and lovingly kiss its fat round head.

At the mess we used all to assemble four times daily—for our early breakfast of *café au lait* and rolls at eight-thirty, for *déjeuner* between eleven and twelve, for afternoon tea about four, and for dinner at seven. We were very well 'done,' all things considered. Macaroni, of course, played a large part in our bill of fare, and our vegetables—beans, chillies, tomatoes—came out of tins; but we had fresh beef and fruit almost daily, and the *chianti* and bread were excellent. We had no poultry during our stay, and eggs only twice; for to our table Tobruk contributed nothing beyond an occasional large fish and one small salad raised with infinite care and toil, and exhibited proudly as the triumph of art over reluctant nature. Everything else was imported from Italy, down to the water we drank and the hay for the cattle.

For the first fortnight or so our meals were enlivened by the presence at the dining-room window of Mina, an engaging monkey, the particular pet of one of our hosts. Mina became a general favourite with all our party; and her premature death after one day's illness threw a gloom over the whole mess.

Tobruk's one valuable asset is the harbour, which has made it an important naval base; and there its natural advantages begin and end. All the building materials for the town and the barracks had to be imported, for Tobruk's coast is rich in sand and stone alone. Besides its fine harbour and quay furnished with several small jetties, Tobruk possesses a mosque, whose white tower dominates the town and quite eclipses the Catholic church, a few fancy shops and grocery stores, several taverns, a hotel, a cinematograph theatre, the officers' club, the courthouse, Civil Status Office, and other buildings of the civil Government, and the barracks for the soldiers and sailors of the garrison. Tobruk, when I was there, contained over three thousand men and about a dozen women, all told, some six being the wives or daughters of the Italian shopkeepers, and the rest native women from the Arab camp, which lies within the walls, but outside the town. For Tobruk stands on a peninsula, across the neck of which runs a high wall, loopholed for rifles, and furnished with parapets and lookout posts. You enter and leave the town by two gates, guarded night and day by armed sentries; and no one can come or go without a pass. Outside the walls at some six or seven miles distance runs a line of forts and outposts with high lookout stations commanding a wide expanse of desert. At night it is thought dangerous to venture outside the walls; and on the one occasion on which I walked out to visit a fort about six miles away I was escorted by two armed sailors, although

we started at two-thirty P.M. and returned before sunset.

The fort was interesting. It had a battery of Seventy-fives, and also some lighter guns and a Maxim; but its walls of sandbags and earth would have been useless against modern artillery, which happily it has not hitherto had to face. The soldiers were much interested to see an Englishman in the fort, and eagerly crowded about me. The lieutenant in command was summoned; but as he spoke no English, and replied to my '*Parlez-vous français, monsieur?*' by the single word '*Poco!*' our conversation ended where it began. However, with his permission, I ascended the lookout post, a wooden erection about a hundred feet high, whence I had a good view of Tobruk and the harbour, with its lighthouse and two batteries on one side, and of an outlying post and the desert on the other. On my return to *terra firma* I met a gunner who spoke English fluently and well, and who showed me everything worth seeing in the fort in the most obliging manner. Such politeness was the rule in Tobruk with all the inhabitants, sailors, soldiers, and civilians alike. I will quote some instances of this pleasing trait of Italian character, and, as in duty bound, will begin with the officers of the naval mess.

Captain the Marquis Giulio Santasilia gave us on at least three different occasions a package of one thousand cigarettes, supplied afternoon tea for us daily at his own expense, and very frequently treated us to *asti spumante* and to liqueurs with our coffee after breakfast or dinner; and on Christmas Eve the naval officers provided us with a Christmas-tree. This in itself was a *tour de force*, for there are no trees of any kind in Tobruk, which produces nothing bigger than a little scanty scrub; but, undaunted by this natural deficiency, our kind hosts proceeded to make the tree first and to decorate it afterwards. The *modus operandi* was as follows: a broom-handle was planted upright in a pot of sand, and to this pole bunches of the scrub aforesaid were attached with most realistic effect. The product of these labours looked every inch a fir-tree; and when it was hung with presents and lit up with electric lamps the result was what the French call *féerique*, and delighted all beholders. The gifts were varied, and adapted to the needs of the recipients. For instance, our skipper received a silver cigarette-case, as his own had gone down in the *Helmismuir*; one of his officers was given a wrist-watch to replace the one he had lost; and a razor and a stick of shaving-soap fell to my share—a most appropriate present, as I had contemplated growing a beard in default of the necessary shaving-tackle.

The skipper and myself were also invited by the colonel commandant to dine at the officers' club, the finest building in Tobruk, possessing the only billiard-table in the colony, and a flat roof that must have afforded a pleasant

lounge on summer nights. Here we had an excellent dinner, and good music afterwards, two officers playing operatic selections on piano and violin. Captain Como, too, invited us to breakfast on board the armed yacht *Mizurata*, where he entertained us most hospitably.

As an instance of the same kindly spirit amongst the townsfolk, I may mention that the proprietor of a store and picture-house, Signor Nicola Spino, several times gave us afternoon tea, and also refused payment for a handkerchief I wished to buy, compelling me to accept it as a gift. Again, an Arab seller of hot chestnuts insisted on filling my pockets with his wares, free, gratis, and for nothing; and those sailors and soldiers who could speak English were always ready to enter into conversation with us victims of German piracy, to show us all the lions of the place, and to assist us in our bargaining at the stores. Most of these men had learnt their English, like the barber, in the United States, and hence spoke with a strong American accent.

One of the naval officers rode a good deal, and was often accompanied by our skipper on a borrowed mount. They saw a fox one day in the course of their ride, whereon the Italian expressed a wish for a gun to shoot it; so perhaps fox-shooting should be included among local sports. Even with this concession, to say that Tobruk is deadly dull vastly understates the case; it is the very abomination of desolation, like nothing on earth that I have seen except Pointe des Galets, in Réunion—a mere expanse of sandy, stony desert, with no sign of vegetation save about the two marshes that lie on either side of the town, and serve as mosquito-beds in summer. Still, I saw nothing but cheery good temper on the faces of the sailors.

Men who can enjoy life at Tobruk must indeed be disciples of Mark Tapley. And yet we English saw the place in the best possible conditions; for it was winter-time, and the climate was delightfully fine and bright—it rained for one day only out of the four weeks we spent there; there were no mosquitoes, or sand-storms, or oppressive heat; and the Italians did all in their power to make our stay pleasant by their extraordinary kindness and courtesy.

Our ship's officers played several games of football against a Tobruk military team; and very good and closely contested games they were, if rather rough at times. The *Helmsmuir* team was usually a man or two short, but our complement was made up by sailors from the naval barracks. I must add that the home team always provided refreshments for the English players after the game—unlimited coffee, vermouth, cakes, and cigarettes—and fraternised with them in the most genial manner. Mandolines were produced, songs sung, and our skipper had usually to oblige the company with 'Tipperary' by special request, every one joining heartily in the chorus.

When not playing football, tennis, or skittles, the *Helmsmuir's* officers amused themselves by boat-sailing, reading novels, playing cards, chess, or draughts, and by strumming on the piano; and the sea-lawyers of the party engaged in endless arguments. But being for the most part men of action, unused to protracted leisure and with few personal resources, they found time hang heavy on their hands; and the belief that we were always to leave Tobruk 'next week' made us all restless and unsettled. We daily received a little news from the outer world by wireless, but it was usually confined to details of 'our war,' as the Italians emphatically term the struggle against Austria, their secular enemy, and told us little of what the British troops were doing. I walked a good deal; but sailors are rarely good walkers, and I did most of my exploring alone.

While we were at Tobruk an Italian soldier was badly wounded by an Arab, who fired point-blank at him at short range; and when the poor fellow died, after lingering for a day or two in hospital, we English thought it right to attend the funeral, which proved strikingly different from such ceremonies at home. It was badly stage-managed. A shockingly tawdry hearse had been provided by the dead man's friends, but the colonel of the regiment declined to allow it to be used; and a very long wait ensued while an Italian flag was being hunted out from the hospital to place over the coffin, which was finally carried to the cemetery on a bier by soldiers. There was no formal marching off of troops; all the assistants went as they pleased in no sort of order, except that the senior officers, naval and military, walked next to the bier. The priest, a burly, bearded man in spectacles, was strangely unimpressive, and sprinkled the water and swung the censer and mumbled his prayers as if eager to get through an irksome task. There was no firing-party and no 'last post;' and the best part of the ceremony, to my mind, was the funeral oration spoken by a young officer, the captain of the dead man's company. He was an Italian of the handsome classical type, with wax-like complexion and jet-black hair; and, standing bare-headed beside the grave, he spoke without the least hesitation or apparent self-consciousness, very fluently, and yet so clearly that I could understand a good deal of what he said. His speech was full of ardent patriotism and of that desire for national expansion and aggrandisement that seems to fill every nation but our own. He spoke with lively action; and at the close he clicked his heels together as he saluted, and then quietly joined a group of officers with the easiest and most natural air imaginable. The Italians possess the secret of doing such things gracefully and well.

The trial of the Arab responsible for this death was typical of Italian colonial methods. The court, presided over by the Marquis Santasilia,

sat from eight till past two without a break, for by Italian law a court-martial must conclude its business at one sitting, and no adjournment is allowed for any reason, not even for lunch; and when the prisoner was acquitted on the charge of murder he was obviously very grateful and a good deal surprised. He prostrated himself before the president and fervently kissed his hands, calling Allah to witness the justice of the court in acquitting an innocent man. Whether the Arab was really so innocent as he made out I am not quite sure; but at least he received a fair trial, and was very leniently dealt with.

This conciliatory treatment, well exemplified in the building of the Tobruk mosque as a bid for Mohammedan sympathy, is part of the Italian colonial policy, and must in time triumph over the hostility and suspicion of the native tribes.

I heard another example of Italian forbearance from the master-gunner of the battery that defends the harbour-mouth. He told me that one day he noticed a band of armed natives on the opposite side of the harbour, evidently reconnoitring the ground; and that he at once telephoned to his superior officer asking if he should not open fire on them. In reply he was

told not to fire unless they first began hostilities; and so, after completing their reconnaissance, the Arabs were allowed to retire unharmed.

This policy is probably the right one in existing circumstances; but whether the lenient Italian code should be applied *en bloc* to barbarians is more doubtful. When convicted of stealing a goat, for example, it merely puzzles an Arab to escape punishment as a first offender, even after admitting his guilt. Capital punishment, too, as unrecognised by the penal code of Italy, cannot be applied in Tripolitania. Such immunities for the uncivilised natives were condemned as legal blunders by officers who spoke to me on the subject.

I have kept the *bonne-bouche* to the last.

Between the two batteries, beyond the coarse vegetation of the marsh, lies the beauty-spot of Tobruk, a place of haunting charm, to which I walked almost daily with ever new delight. Imagine a beach most 'excellently white,' on which the clearest sea always breaks in creaming ripples; overhead a bright sun in a blue sky; and on the shore side, shutting out all the arid ugliness of Tobruk, a quaint little range of snow-white sandhills like tiny Alps sloping to the sea.

I will end my sketches of Tobruk with that pretty picture.

PINCHER MARTIN, O.D.

A REALISTIC STORY OF THE INNER LIFE OF THE ROYAL NAVY.

By TAFFRAIL, Author of *The Bad Hat*, *The Decoy*, *An Eye for an Eye*, &c.

CHAPTER IX.—THE CLOUD.

I.

[The reader is cautioned against accepting this story as an official narrative of the great war. The incidents described have actually happened; but, for obvious reasons, it has been necessary to give them fictitious colouring.]

IT all happened very suddenly. The fleet had been reviewed by his Majesty the King at Spithead in the middle of July, and after this certain exercises were carried out in lieu of the usual summer manoeuvres. They did not last very long, however, for on Friday, 24th July, the *Belligerent* arrived at her home port to effect some necessary repairs, and, incidentally, to give four days' leave to her men; so the next morning half the ship's company, including Pincher, left for their homes.

Now the Martin family, being country-people, did not worry their heads with newspapers on weekdays. For one thing, the papers cost money and were difficult to get; and, for another, they had little time to read them. Mr Martin usually bought *Reynolds's Weekly* on Sunday; but on that particular Sunday, 26th July, there was nothing in it to give rise to any anxiety. He did notice that there was some sort of trouble between Austria and Serbia; but that could not

possibly affect his weekly wages, and beyond remarking casually to his wife that 'them there Balkan nations is 'oly 'orrsors for gettin' up rows,' he paid no further attention to it.

On the following Tuesday, 28th July, at ten-forty-three A.M. precisely, Pincher left the cottage to buy a packet of cigarettes at the village shop. Albert, his youngest brother, aged five, clutching a penny with which he proposed to purchase two sticks of glutinous but very succulent pink nougat, accompanied him. They were away exactly fourteen minutes, and on their return found Mrs Martin, fresh from her wash-tub and with her arms covered in soapsuds to the elbows, bubbling over with suppressed excitement. She was gazing in a perturbed manner at a telegram; for, to the Martin *ménage*, the arrival of an orange envelope was a matter of some importance. It generally spelt trouble. The last one had arrived over a year before to announce that Mrs Martin's sister had been run over by an omnibus.

'Ullo, ma!' Pincher exclaimed, noticing his parent's agitated condition; 'wot's th' racket?' 'This 'ere's just come,' she said excitedly,

handing the telegram across with very damp fingers. 'For you, it is. You've got to go back to the ship at once!'

'Go back!' he echoed indignantly, taking the offending missive. 'My leaf ain't up till fu'st train ter-morrer mornin'!'

'Ye'd best read it, son,' remarked the lady, wiping her arms on her apron. 'See for yerself.'

Pincher did so. 'Gosh!' he exclaimed with a whistle of surprise, 'there ain't no bloomin' error abart this 'ere.'

There was not. It was addressed to him personally, and was signed, 'Commanding Officer.' 'Leave cancelled,' it said abruptly, almost brutally. 'Rejoin ship immediately.'

'Strewth! Wot's th' buzz, I wonder?' he murmured, very much puzzled, and looking at the back of the paper as if to find the answer to his question there. 'Wot's it mean?'

'That's wot I'm wonderin',' said his mother. 'Wot does it mean? Ye're not in trouble, are yer?' She had a vague suspicion at the back of her mind that Pincher might have absented himself without leave.

'Trouble! Course I ain't. It ain't that. There's somethin' else in th' wind. One o' these 'ere bloomin' war buzzes, I reckons.' He spoke as if wars and rumours of wars were of everyday occurrence.

Mrs Martin seemed rather alarmed. 'War!' she gasped, looking up with a horrified expression. 'Wot d'you mean, Bill? Surely we're not goin' to war?'

'Course we ain't, ma,' he replied, laughing, and patting her consolingly on the shoulder. 'This 'ere don't mean nothin'; only a bit o' a buzz round like. Yer see,' he pointed out with pride, 'we—th' navy, that is—always 'as ter be ready fur these 'ere shows, 'cos if anythin' did 'appen an' we wasn't ready things 'u'd be in a pretty hot mess. S'pose I'd best be makin' a move, though,' he added ruefully. 'Bit orf, I calls it!'

'Goin' now?'

'Fu'st train,' he said, nodding. 'This 'ere telegraph says rejoin immediate. I expect th' ship's goin' ter sea in an 'urry like, an' they wants me back perticular.'

Mrs Martin gazed at her son with motherly pride. She did not like the idea of his leaving so soon; but it was very consoling to think that he was a person of such importance on board the *Belligerent* that the ship could not go to sea without him. He must be a very valuable person, otherwise they would not have telegraphed.

Albert, who had already assimilated half a piece of nougat, and had covered his face with pink stickiness, looked up inquiringly. 'Bill goin'?' he queried fretfully.

'Yes, ducky,' answered his mother. 'Called back to 'is ship. 'E's goin' now.'

The information was too much for Albert. He withdrew the sweetmeat from his mouth,

screwed up his face, and suddenly burst into a howl. 'Ow!' he bellowed; 'Bill's goin' back to 'is ship! Bill's goin' back!' It was a matter of some importance to him, for the presence of his elder brother meant an occasional honorarium of one penny, and one penny meant a plentiful supply of nougat. His little soul delighted in nougat. His mother never gave him pennies.

'Stop yer 'owlin', Albert!' Mrs Martin ordered severely. 'Has if I 'adn't enough to think about without listenin' to yer noise!—Bill,' she went on, glancing at the clock, 'you'd best be off. The Lunnon train stops at the station at eleven-forty-four, same one yer uncle Charles come by yesterday. There's not another till the arternoon. The clock's a bit fast, but it's about quarter-past eleven now, an' the station's a good couple o' miles.'

'Strewth!' muttered Pincher, darting from the room, 'I'll 'ave ter run.' He went to his bedroom, collected his few belongings, and presently reappeared with an oilskin over his shoulder and a small blue bundle in his hand.

Albert, with his mouth wide open, gazed at him tearfully.

'S'long, ma,' Pincher said, putting his arm round his mother's neck and kissing her gently. 'Say good-bye ter farther w'en 'e comes 'ome, an' th' kids w'en they gits back from school.'

'Good-bye, son. Good-luck to yer,' she answered, drawing his head down and embracing him, with the tears in her eyes. 'I do 'ope it's not nothin' serious. Write an' let me know 'ow yer gets on.'

'Right you are, ma.—S'long, Halbert,' he went on cheerfully, bending down and kissing his small brother. 'Be a good boy, now, an' don't git worritin' ma, now I'm goin'.'

The tears streamed down the youngster's cheeks. He began to whimper loudly.

'Be a good boy, I tells yer,' Pincher went on, patting him. 'If ma writes an' tells me you've be'aved yerself I'll send yer another penny nex' week—see? If yer don't, yer won't get no penny—see? Gosh!' he added hastily, 'it's 'igh time I wus orf.' He gave his mother another hurried kiss, and a second later was out of the cottage and racing down the road as fast as his legs would carry him. The shrieks of the inconsolable Albert pursued him.

Mrs Martin watched him till he gave a final wave before disappearing round a bend in the lane, and then returned to admonish her small son. 'Ye're a naughty boy, ye are!' she scolded shrilly. 'If yer don't stop it I'll put yer across my knee an' give yer wot for; straight, I will! Stop it. D'you 'ear wot I say?'

Albert's howls gradually died away into sobs.

Mrs Martin returned to her wash-tub with disinal forebodings in her heart. Telegrams always meant trouble.

II.

'Bless yer 'eart an' soul!' exclaimed Billings, with a loud snort, 'e ain't goin' ter fight. Orl this 'ere racket's only a bit o' bounce like. Same as wot 'e did in that 'ere show in nineteen eleven.' He rammed the tobacco down into his pipe and relit it, with one watchful eye on his companion.

'I presooms ye're talkin' abart that there Meroccer bizness,' said Tubby M'Sweeny, producing a cigarette from the lining of his cap. 'Aggie-dear wus wot they called it.' He seemed rather proud of his superior knowledge.

'Yus, that's it,' Joshua agreed with a nod. 'I knowed it wus Aggie somethin'. But, any-ow, look wot this 'ere Kayser Bill does then! Directly 'e see'd we meant bizness 'e piped down smart, an' sed 'e wus sorry for wot 'e'd done. That's wot 'e'll do this time, I reckons.'

'I dunno so much abart that,' M'Sweeny disagreed. 'Look 'ow them Germans downed France an' done th' dirty on them! I reckons they thinks they kin do the same wi' us—s'welp me, I do.'

'Garn!' jeered the other. 'They've got ter reckon wi' our bloomin' navy, an' it's more'n double as good as theirs. I'm not sayin' they doesn't mean ter fight us later on,' he added, wagging a finger; 'but I says they won't try it on now. 'Sides, they ain't sailors!' To show his contempt he expectorated violently, and with deadly precision, into an adjacent spitkid.

M'Sweeny seemed sceptical. 'Maybe they ain't sailors,' he pointed out solemnly; 'but we ain't see'd nothin' of 'em. We knows nothin' of 'em, either. I've 'eard tell, too, that that there Kayser bloke o' theirs 'as gingered 'em up somethin' crool, an' a navy wot's been gingered up must be on th' top line same as us, mustn't it?'

Joshua shook his head. 'I tell yer they ain't goin' ter fight yet awhile,' he persisted. 'Orl this 'ere racket's only a bit o' bounce. D'you think they doesn't know wot our navy's like? Ain't they bloomin' well scared o' it?' Billings, a staunch and very insular Briton, still held to the belief that his own countrymen were the only really good seamen in the world. Those of other nationalities were either 'Dagoes' or 'niggers,' and which of the two terms was the more opprobrious was rather a moot point.

'An' wot abart our army?' came an irrelevant remark from Pincher, who happened to be listening. 'I knows a bloke wot's in th' Black Watch—lance-corporal 'e is—an' 'e reckons our army's bin properly gingered up an' is properly on th' top line.'

'Th' men is orl right,' said M'Sweeny mournfully, 'an' so is the officers; but we ain't got enuf o' 'em. We ain't got a million men in th' army, nor yet 'arf that number, an' that there Kayser's got millions an' millions!' He

waved a hand vaguely to give some idea of the Teuton hordes.

'But if we goes ter war our army 'as a slap at somethin', I suppose?' Pincher queried.

'Course they does, fat'eard,' Joshua replied with fatherly condescension. 'They goes an' 'elps th' Frenchies ter take Berlin, while we—th' navy, that is—as a desprit battle in th' North Sea, an' wipes th' deck with their bloomin' 'Igh Sea Fleet. The army blokes 'll be at Berlin in a month or six weeks, an' we 'll 'ave done our job in 'arf th' time. W'en we've done it we orl goes 'ome on leaf wi' our medals an' V.C.'s, an' becomes public 'eroes wot saved the country. But you mark my words, the 'ole bloomin' war 'll be over in three months w'en it comes. 'Ow-ever, they ain't goin' ter fight now, so wot's the use o' yarnin' abart it? This 'ere racket's only a spasm like. It don't mean nothin'.'

But M'Sweeny, obviously a pessimist, shook his head. 'I dunno so much,' he answered sadly. 'I've bin 'avin' feelin's in me 'ead that somethin' 's goin' ter 'appen soon, an' me feelin's allus comes true. W'en you wus made a leadin' seaman, Josh, I 'ad a feelin' that you'd be an A.B. agen afore long; an' w'en'—

'Wot! d'yer mean yer 'ad a feelin' abart me?' Billings interrupted, rather annoyed. 'Ow dare yer?'

'I 'as feelin's in me 'ead abart lots o' people,' Tubby reiterated solemnly. 'They allus comes true.'

Joshua lifted up his head and laughed. 'Feelin's in yer 'ead!' he jeered. 'Feelin's in yer stum-mick, more like. It's beer wot's done it, Tubby; an' if it ain't beer, it wus them canteen termarters yer 'ad fur supper larst night!'

'Termarters be damned!' retorted M'Sweeny.

Now this conversation took place during the dinner-hour of Thursday, 30th July, two days after the watch on leave had been hurriedly recalled, and all further shore-going had been cancelled.

Neither Billings, M'Sweeny, nor Pincher—nor, for that matter, any other member of the ship's company—knew exactly how they could become embroiled. They were all painfully aware that there was trouble in Eastern Europe, and that, in some remote sort of way, this trouble transmitted itself to them. But beyond anathematising the 'spasm,' as they called it, on somebody's part which had caused their leave to be stopped, and extra work in the way of coaling and embarking ammunition to be carried out, they regarded the affair as of no more importance than the annual summer manoeuvres. War was utterly unthinkable.

But by this time, if they had only known it, practically the whole of the British fleet was on a war footing, and ready for instant action. The newspapers had remained discreetly silent, and the whereabouts of squadrons, flotillas, and individual ships was unknown to the public.

They had vanished into the air; but, except in isolated cases, every vessel in the navy was already at her war station or on her way there. Dockyards were working night and day. Naval reservists and pensioners were flocking to their depots; retired officers were coming forward in dozens to volunteer their services. Colliers, oil-fuel ships, ammunition ships, and a thousand-and-one other fleet auxiliaries had been chartered, and the Admiralty had taken their 'precautionary measures' so rapidly and so unostentatiously that hardly a soul in the country realised that anything untoward was happening.

The fleet was ready, and well it was for Britain that it was so. Germany, relying perhaps on a surprise attack at some 'selected moment' before an actual declaration of war, and while our fleets and squadrons were still dispersed, had bungled badly. She may not have expected us to join in the war; may have imagined that Britain, fettered with the possibility of complications in Ireland, preferred to keep out of a Continental struggle at all costs. But she had made a grievous mistake, an error which, combined with the wisest forethought on the part of the British Admiralty, made it practically impossible for the trident of Britannia ever to pass into the hands of the Teutonic Michael.

Early the next morning, 31st July, the *Belligerent* left her home port, and steamed to her base in the English Channel to rejoin the rest of the squadron. It was quite a short trip, but it was on the passage that the eyes of the ship's company were opened to the fact that something serious really was in the wind. For one thing, the ammunition for all the six-inch and lighter guns was brought up from the magazines and shell-rooms and distributed to the casemates and batteries; while certain of the weapons were kept constantly manned—what for, exactly, none of the men quite knew. The captain and the commander looked graver than usual; and Chase, the gunnery lieutenant-commander, rather worried, held hurried consultations with the gunner about shell and cartridges, and had a party of armourers constantly at work throughout the day testing and adjusting the mechanism of his weapons.

The commander and the carpenter, too, the latter armed with a large piece of chalk and a note-book, made a solemn peregrination of the ship, decorating various wooden fittings with cabalistic signs as they went. Pincher, who happened to be working on the boat-deck at the time, heard part of their conversation. It rather frightened him.

'All this wood of yours will have to be landed or slung overboard, Mr Chipping,' the senior officer remarked, coming to a halt beside a pile of spars and planks on the boat-deck, and eyeing it with evident disfavour. 'If a shell burst in the middle of this little lot we'd have a bonfire in a couple of seconds.'

Pincher pricked up his ears.

'It's all on charge, sir,' the carpenter answered ruefully, with horrible visions of subsequent discrepancies in his store-books. 'I've got to account for every inch of it.'

The commander laughed. 'You storekeeping officers are born obstructionists, Mr Chipping,' he exclaimed. 'If we go to war your store-books will go to the devil, anyhow, so what on earth does it matter? I'm always greeted with the same remark when I'm trying to make the ship a little less like a bonfire. They're invariably "on charge," dammit!'

'And so they are, sir,' put in the carpenter. 'I have to account for 'em.'

'Can't help that. You'd better send in your bill to the Kaiser. Anyhow, we can't have all this lumber up here; it's a regular death-trap.'

Mr Chipping scratched his grizzled head. 'I'll land all what I can't strike below, sir,' he grudgingly assented at last.

'Yes, see to it at once, please. If this pile of wood catches fire it'll play Old Harry on the upper deck with the twelve-pounders and their ammunition.'

Pincher listened open-mouthed, for it was quite obvious from the way they talked that things were far more serious than Joshua had led him to believe. Moreover, he, Martin, was in full agreement with the commander as to the expediency of removing the pile of wood from the boat-deck. His station in action was at one of the upper-deck twelve-pounder guns, and he had no wish to emulate Shadrach, Meshach, and Abed-nego of the Old Testament in their blazing, fiery furnace.

The carpenter got busy with his chalk, and before long the whole pile of lumber was ornamented with little noughts and crosses. The noughts, Pincher assumed, meant that the articles so marked were to be retained, and the crosses that those bearing this mark were to be thrown overboard or landed; and when, a little later, he had occasion to go on to the upper deck he found many other things decorated with the same mystic signs. Certain of the smaller boats, spare spars, cabin doors, accommodation ladders, gratings, lockers, anything and everything wooden, inflammable, or likely to make splinters, were apparently to go by the board. It gave him furiously to think.

The ship arrived at her base during the afternoon, and Captain Spencer went on board the flagship to report his arrival. He was away for an hour and a half, and came back with what the officer of the watch called 'a face like a sea-boot,' and the information that the situation was very serious. Beyond that he professed to know nothing, but every one noticed that the commander was closeted with him in his cabin for fully three-quarters of an hour on his return from the flagship. Petty Officer Finnigan, moreover, the captain's coxswain and a great friend

of the admiral's cook on board the flagship *Tremendous*, told his messmates with much gusto that the cook had informed him that the admiral's steward had told him (the cook) that war with Germany was only a matter of hours.

We have heard of yarns emanating from ships' cooks generally being treated with derision, but presumably admirals' cooks are above suspicion in this respect, for the news spread rapidly, and the 'Belligerents,' believing it implicitly, were flung into a state of ill-suppressed excitement in consequence. Most of them had never seen a shot fired in anger; but the prospect of war—the awful prospect of the unknown—did not seem to alarm them. On the contrary, officers and men went about their business with light hearts and smiles on their faces, for, as Tickle had once pointed out when referring to the same subject, 'it's a bit thick if we're doomed to fire our guns at a canvas target all our lives.' Most of them longed for a run for their money, and to all appearances they were going to have it. The graver possibilities of war did not intrude themselves upon their minds until long afterwards. They all felt cocksure that they, individually, were not fated to die violent deaths by the enemy's shell, torpedoes, mines, bombs, or by drowning. If any one was to be killed, it was not they. They merely pictured to themselves a short and triumphant struggle, at the conclusion of which—in six months at the very most—they, having sunk the enemy's navy, and with medals on their manly bosoms, would go home on leave, to be hailed as the saviours of their country. Alas for their dreams!

The squadron was in a state of feverish activity. Some ships were taking in final supplies of coal and ammunition, working night and day; while others were landing all their superfluous wooden or inflammable fittings and non-necessary stores. The 'Belligerents' themselves started on the job early the next morning. Such a collection there was! Many tons of paint and varnish; some of the smaller boats; quantities of timber for building targets; wooden accommodation ladders; baulks, spars, and planks; chests of drawers from the officers' cabins, and tin cases and trunks containing their personal effects and more treasured possessions; the midshipmen's and chief petty officers' chests; doors of cabins; gratings; even the wardroom pianola, an instrument which was being paid for on the instalment system, were taken ashore and lodged in a place of security. The work took them a full forty-eight hours.

The *Belligerent*, being a pre-Dreadnought battleship, had to have more done to her to make her ready for battle than a similar vessel of a later class, and Sunday, 2nd August, brought no cessation of labour. If anything, it was a more strenuous day than the previous one, for except for a brief service on the quarterdeck, lasting exactly ten minutes, officers and men

alike were hard at work preparing the ship for war. There was plenty to be done. Extra lifts and tackles were put upon the yards on the foremast to prevent them crashing down from aloft if struck by a shell, the rigging was snaked down with hawsers to stop it flying away if severed, and extra protection, in the shape of tightly rolled-up canvas awnings, thick enough to stop a substantial shell-splinter, was improvised round the bridge and fire-control positions up aloft.

Fire, first-aid, and stretcher parties were told off and organised, and everything was done, beyond the final wetting of decks, to make the ship ready for immediate action, and to lessen the chances of damage to vessel or men through fire or fragments of flying débris almost as dangerous as the shell-splinters themselves.

Surgical bags containing bandages, dressings, splints, and tourniquets were placed ready to hand in all the gun positions in case men were wounded; morphia tabloids were served out to all the officers of quarters for administration to badly injured men; while the fleet surgeon and Cutting, the 'young doctor,' saw to the gruesome implements of their profession, and caused the operating-table to be transferred from the sick-bay to a convenient site behind armour on the lower deck.

Tickle's cabin was next to the 'young doc's' in Rogues' Alley, as it was called; and, happening to go below during the forenoon, he noticed Cutting through the half-drawn curtain busy with a chamois leather and an array of murderous-looking knives, probes, and forceps laid out on his bunk.

'Hallo, Sawbones!' he remarked, putting his head inside; 'I see you've got all your ironmongery out. Think you're going to have something to do, at last—eh?'

'Hallo, Toby! That you? Come inside and have a look. I've an excellent line in cutlery, guaranteed to kill or cure while you wait. What d'you think of that?' He held out a horrible-looking knife with a thin curved blade.

'Ugh!' shuddered Tickle. 'Take the beastly thing away! What d'you do with it?'

'Cut, my dear chap,' the doctor gloated. 'One sharp snick like that'—and he gave the blade a downward jerk, and clicked suggestively with his tongue—'and then we get to work and remove—er—anything you like. Ripping little thing, isn't it?' he laughed. 'This,' the medico continued, laying the knife down and picking up a probe and a pair of forceps, 'is what we use for feeling for a bit of shell inside a chap, and this is what we fish it out with. Quite simply done. Topping little operation to watch.'

'You bloodthirsty little blighter!' Tickle ejaculated.

'Bloodthirsty! Why, it's my job, isn't it? We hardly ever get a chance of doing any decent operations in peace, worse luck!' he added

regretfully. 'Your sailors are so disgustingly healthy; and if they do get really ill and promise to be interesting cases, they're packed straight off to hospital. Sickening, I call it!'

'M'yes, that's true, I suppose,' Tickle agreed, smiling. 'Look here, though, doc; if you ever have to—er—extract a bit of shell or other foreign substance from my anatomy, look out

you don't chuck it away. I want to keep it as a relic.'

Cutting grinned. 'Right-o, Toby; I'll see to it. Now you'd better clear out of here, young fellow, and get on with your work. I'm busy, and I'm sure you ought to be.'

Tickle departed.

(Continued on page 578.)

SOME SENSATIONAL DISAPPEARANCES.

PEOPLE WHO HAVE VANISHED.

By JOHN G. ROWE.

THE mystery still surrounding the disappearance of Mr Joseph Wilberforce Martin, the Memphis (Tennessee) millionaire, recalls the remarkable case of Mr William Robertson Lidderdale, the bank manager of Ilminster, Somerset, who vanished on the eve of his marriage in 1892, and has never been heard of since, although more than one attempt has been made to presume his death in the probate courts. His affairs at the bank were quite in order; he had just completely furnished a house for his bride-to-be, and there was nothing whatever in his private life to suggest that he had gone away of his own accord. An anonymous communication, however, reached his friends, alleging that he had met his death from an accident on board a Miss Vining's yacht, the *Foresight*; and a reward of twenty-five pounds was thereupon offered for an authentic certificate of his decease. The remarkable tale was then told that he had been kidnapped by a wealthy, middle-aged spinster, an American admirer, who had vowed that he should marry no other woman but herself. She owned a yacht, and, so it was said, had contrived to entice him aboard in some way, and had run off with him. This story has been related soberly in our law-courts from time to time, and it is now over twenty years since he thus vanished from human ken, and apparently nothing really authentic has been heard of him.

People disappear every day. Our newspapers have often cases of parents or other relations advertising the disappearance of some member of their family, and concernedly asking for news of the lost one, who is now a boy, now a girl, now a grown-up. One of the most celebrated and heart-rending cases of a child's disappearance was that of little Charlie Ross, in 1874. He was a child of four years of age, and the son of a well-to-do business man of Philadelphia. One day, while he was playing with his elder brother, aged six, near his home, two men offered to take them for a ride in a wagon. It would seem from the elder boy's evidence later that the boys had often seen these men driving by in the wagon, and were in the habit of recognising them by a word or a wave of the hand. On this particular occasion the men sent the elder boy into a shop to buy some

biscuits, and when he came out they had disappeared with his little brother. An anonymous letter reached the heart-broken father stating that the child was all right, and demanding a heavy ransom for him—no less than twenty thousand dollars. Mr Ross advertised, as the letter desired, that he 'would come to terms,' and the Philadelphia police left no stone unturned to find the two men, whose names were eventually discovered to be William Mosher and Joseph Douglas. But the pair could not be traced, nor the little boy recovered, although the father would readily have paid the ransom. Six months afterwards Mr Van Brunt, with his son and men-servants, cornered two armed burglars in the house of his brother, Judge Van Brunt, on Long Island. The burglars and their would-be captors exchanged shots, and one of the former was killed outright and the other mortally wounded. The dying burglar then confessed that his name was Douglas and his dead companion was Mosher, and that they had both kidnapped little Charlie Ross, but that only Mosher knew where the child was. The dead scoundrels were identified by the missing boy's brother, and Mosher's wife was traced, and admitted that Charlie had been placed with an old man and woman, but she did not know them or where they were. The affair created a tremendous sensation even in Britain, and all the papers rang with it; but although within ten days four thousand dollars were offered for any news of little Charlie, his fate is still shrouded in impenetrable mystery. He was never heard of more, notwithstanding that several confederates of Mosher and Douglas were arrested, and one got seven years.

An historic disappearance was that of Mr Benjamin Bathurst, a kinsman of Earl Bathurst, the British Minister for Foreign Affairs in 1809, and a son of the Bishop of Norwich. He was sent in that year to Vienna on an important secret mission, and mysteriously disappeared between Berlin and Hamburg when on his way home with important despatches for the Foreign Office. The story has been related here in an article, 'The Mystery of the Murdered Ambassador' (1911).

Then there is the case of the missing Austrian Archduke Johann Salvator, or, as he is more often referred to, Johann Orth. Over twenty-five years ago he resigned his rank and title, although one of the most popular of the imperial princes, on account of differences with his family about his marriage and other affairs. When thirty-eight years of age, in 1890, he married in London an opera singer named Milly Stubel; and then, accompanied by his wife, sailed in a ship of his own with a cargo of cement to the Argentine. There he discharged the captain and mates, with whom he had quarrelled, and, taking command of the vessel himself, he set sail from Buenos Ayres for Valparaiso. The ship was named the *Santa Marghereta*, and since she left Buenos Ayres no word has ever been received of her, of Orth, his wife, or of a single member of the crew. Ship and all within her simply vanished. It is believed that she sank with all hands in a great storm off Cape Trespuntas. But all manner of rumours became rife: one, that Orth was a farmer in South America; another, that he was a leader of Chilean insurgents; and yet a third, that he was identical with the Japanese general Yamagata. His nephew, the Archduke Joseph Ferdinand, applied in 1910, twenty years after his disappearance, for formal declaration of his death, and the Austrian Imperial Court of Justice decided that should no news be received of him within six months he should be declared dead, so that his property, estimated at between eight hundred thousand and one million pounds, might be distributed.

In 1898 Sir Arthur Curtis, an English baronet, accompanied an expedition in British Columbia under the leadership of Mr Roger Pocock. He disappeared from his companions, and all investigations of the British Columbia police on behalf of the Curtis family for traces of him resulted in nothing save the circulation of sensational stories, such as that he was living as a trapper and hermit in the Ashcroft district, or that he was being held to ransom by a gang of Indians.

A Mr Hedley Green, of Bishop-Stortford, where he was a magistrate and a member of the Board of Guardians and District Council, mysteriously disappeared in 1909 on Dartmoor, and bands of men, mounted and on foot, searched the neighbourhood in vain for him. He had gone to Devonshire on the recommendation of a specialist for a complete rest and change, as he was suffering from overwork, and had left the Dartmoor inn to walk on the moor and search for some rare insects that might be found near the bogs and the river Lyd. From that time nothing has been seen or heard of him, and it is supposed that he stumbled into some bog and was engulfed, like Carver Doone in the famous Devonshire romance of *Lorna Doone*.

Benjamin Davis, a colliery fireman, went down the Fishley Pit, near Walsall, on August Bank Holiday 1903, to perform his round of it as usual.

Two fellow-colliers, a pumper and another fireman, saw him at the bottom of the shaft, but he vanished from that moment. As many as a hundred men searched the pit for over a week, but the only trace of him ever discovered was his jacket near the bottom of the shaft. The Government Inspector of Mines for the district declared that everything was done to find him, and his disappearance was pronounced unparalleled in the history of the Black Country mining enterprise. If my memory serves me rightly, a funeral service was subsequently performed by a clergyman at the pitmouth, in presumption of his death in some unknown way.

The weird case of the crew of the American brig *Marie Celeste* is almost too well known to need mention, and was discussed in these pages in 1904 in an article entitled 'The Case of the *Marie Celeste*,' but readers who have not heard of it may like the facts recapitulated for their benefit. On 4th December 1887 the vessel was sighted in mid-Atlantic by the captain of a ship named the *Highlander*, and she reported 'All well.' Two days later another vessel found her derelict, yet with all sails set and everything apparently in order aboard. She was perfectly seaworthy, the cargo had not shifted, and in the saloon a cold luncheon was set ready for the captain and his wife and child, while in the forecabin was a half-eaten meal. Yet there was no one aboard, dead or alive, although not a boat was missing—all were still hanging at the davits! A small phial of medicine even stood upright on the captain's table, and this must surely have been upset if rough weather had been encountered. On the forecabin-head hung the sailors' weekly washing. She had carried a crew of seventeen hands. There was no blood anywhere, or sign of any struggle; the only suspicious sign found was a deep cut as though made by an axe on the bulwarks. The mystery created a great sensation, and the American Government instructed their consuls everywhere to make diligent inquiries for the missing people; but nothing transpired to elucidate the strange affair until about two years ago, when the *Wide World Magazine* published the story of a man who claimed to have been a seaman on the vessel. His tale was that the captain went mad, and insisted on swimming round the ship in mid-ocean. The wife persuaded two others of the crew to join him in the swim. A loose wooden gangway had been fitted up across the deck, and the rest of the crew, with the wife and her child, were on this, when it tipped over and flung them all into the sea. The narrator of this extraordinary explanation was the only one saved. He stated that another ship picked him up.

In April 1864 a boat left the lonely little island of St Kilda, off the north-west coast of Scotland, beyond the Outer Hebrides, for Stornoway, with a woman and seven men on board, all natives of the island. The weather was

calm. A month later three smacks from London arrived at the island, and one of the smack skippers told the islanders that the boat that had left the month before had been lost near Lewis, with all on board. But when the St Kildans gave way to grief at this news the smacksmen jeered at them, and the story was disbelieved. One of the smacksmen spoke Gaelic—a rather curious thing, it was afterwards thought. The islanders did not take the names of the smacks. Some time after the departure of these three craft, some lads searching for seabirds' eggs at Lewis, the chief island of the Outer Hebrides, found in a cave, hidden under some seaweed and brushwood, a quantity of men's clothing, all blood-stained and torn as if in a scuffle. The garments were St Kildan homespun, and when taken to the island were recognised as belonging to some of those who sailed in the lost boat. The islanders at once believed that the crews of the three smacks were concerned in the mystery, and search was made for them, but without success; and the matter remained wrapped in mystery until 1876, twelve years later, when, if anything, the mystery was added to. In that year a firm in the Transvaal wrote stating that Donald M'Kinnon, one of the men who were supposed to have been murdered, had died out there, leaving thirty-seven pounds to his relations in St Kilda! Why M'Kinnon had gone to South Africa, and why he had never written to his father and friends in St Kilda informing them of his fate, was never explained, any more than where and when he parted from his companions in the boat. The whole affair to this day is an impenetrable mystery.

In 1891, during the great strike of dockers and coal-heavers in Sydney, Australia, a Dr Lale, who had volunteered as an amateur coal-heaver, was observed to pass through a crowd of strikers who were jeering at him, and was never seen again. He had a Gladstone bag with him containing a bank-draft for two hundred and fifty pounds, and his gold watch and chain, as well as some loose gold and silver. The strikers swore that not one of their number had raised a hand against him, but had suffered him to pass through their midst untouched. A month or two later Mr James Beer, a wealthy contractor and builder, was about to be married. He parted from his fiancée to walk home, having about eighty pounds in his possession. He never reached home, and was never seen again. His bride waited in vain at the altar-rails for him next morning. Two months after that a third gentleman, Mr Baker, the chief officer of the Orient Royal Mail steamer *Lusitania*, who had won seven hundred pounds at the Randwick Races the previous day, vanished from a small boat he was known to have taken. The three mysterious disappearances filled Sydney with horror, and a special committee of citizens was appointed to act as vigilantes. But no solution of any one of the

three mysteries was ever found. After the stir they made, however, disappearances in Sydney ceased for a time.

The disappearance of Miss Sophia Frances Hickman, a lady doctor, created a tremendous sensation in 1903. She was connected with the Royal Free Hospital in Gray's Inn Road, London, and left there on the afternoon of 15th August, informing certain other members of the staff that she would be back to tea. She vanished, and the most outrageous theories were advanced in the Press and elsewhere to account for her disappearance. Of athletic and even powerful build, she was nearly thirty, and of decided character. It was alleged at one time that she had been decoyed into 'Little Italy,' as the Saffron Hill district of London is sometimes called, on account of the predominance of Italians—it is the Italian quarter of London. The tale was that she had been induced by a woman to go to some house there, and had then been seen struggling with two or three Italian men. The priest of the district and the police quickly disposed of this cock-and-bull story, exposing it for what it was worth. Next, the Jesuits were supposed to have kidnapped her. Of course, too, there were not wanting the usual number of persons who were sure they had met her; she was said to have been seen in Kendal, on Clapham Common, and in Coventry. More than two months passed without any real clue being discovered as to her whereabouts; and then, one Sunday afternoon, some boys who were after chestnuts, climbing over a fence of barbed wire in Richmond Park, found the body of a woman within the shrubbery. This was the 18th October. The remains were almost unrecognisable, but by the clothing they were identified as those of Miss Hickman. The cause of death could not be specified by the doctors, as the body was in such a decomposed condition. A surgeon's scalpel was found close by the spot, however, and the head was detached from the trunk. Not the least remarkable fact that transpired in connection with this case was that exactly thirty-seven years before another Miss Sophia Hickman—no relation, apparently—had vanished from her home, and had never been seen or heard of again.

The 'Newquay Mystery,' as it was called, is still fresh in everybody's mind. On Saturday, 23rd November 1912, Mrs Nowill, the wife of a Sheffield merchant staying at the Atlantic Hotel, Newquay, in Cornwall, mysteriously disappeared, and a Mr James Arthur Delay, a retired solicitor, also a guest at the hotel, and a great friend of the lady, committed suicide after aiding the police and coastguards in the search for her. The lady was thirty-four years of age, and very handsome; and after the suicide of Mr Delay it was learnt that that gentleman had left her thirty thousand pounds in his will. Mr Sidney Nowill, the husband of the missing lady, offered fifty pounds to any one who should

find his wife alive, and twenty pounds for the recovery of her body if dead. Eventually Mrs Nowill's body was found floating in the sea at the foot of the Cornish cliffs, and was only recovered with great difficulty by means of ropes. Whether she was murdered, committed suicide, or fell over the cliffs accidentally it was impossible to tell.

One of the saddest cases was that of Mr John Davidson, the well-known poet and dramatist, who suddenly disappeared, and was missing for months before his body was found in the sea at Mousehole, Cornwall.

A Miss Uish disappeared from a house in Euston Square, London, about the middle of October 1878, and in the following May a woman's dead body was found in a cellar belonging to the premises. The cellar was under the pavement, separated by the area from the house. It was shown that the victim was an elderly lady who wore her hair in old-fashioned ringlets, and had a slight curvature of the spine, a description that tallied with that of Miss Uish. And now a Mr Edward Hacker came forward and stated that he believed Miss Uish was none other than his sister, Matilda Hacker, an eccentric lady of property in Canterbury. She had been missing for some time, and had not collected her rents for fully a year. A watch and chain belonging to Miss Uish, which the police had found, were identified as his sister's by Mr Hacker. It now further transpired that Miss Hacker had also passed under the name of Miss Sycamore at an address in Mornington Crescent, Hampstead Road. The people of the house in Euston Square stated that she had given them notice and apparently left when she disappeared. A young woman who had been a servant at the house was arrested and tried for the old lady's supposed murder, but was acquitted; and the case is still often referred to as the 'Euston Square Mystery.'

About three years ago we had the disappearance of Dr Diesel, the inventor of the oil-engine, from the packet-steamer *Dresden* during her voyage from Antwerp to Harwich. He vanished from the ship on the night of Monday, 29th September 1913. He was coming to England to a meeting of the shareholders of the company in which he was so largely interested, and the melancholy tidings of his supposed loss at sea came like a thunderbolt to all. It was the annual meeting of the shareholders, who had assembled at Cannon Street Hotel. Dr Diesel was on his way *viâ* the Ipswich Works, and should have been at the meeting. The chairman, in stating the facts to the gathering, said: 'Dr Diesel will be a loss not only to this company, but to the whole world. Though Dr Diesel did not take a prominent and active part in the management of your company, he was always ready when we wanted him or his advice. We can hardly hope to see him again, and I am sure that his wife and friends have your deep

sympathy.' Captain Thorn of the *Dresden* could throw no light on the mystery, but declared there was no foundation for a story that an employé of the G. E. R. Company had seen the doctor leave the vessel at Antwerp. The doctor was seen with two friends on the ship during the passage down the river Scheldt. The pilot also asserted that no passenger left the *Dresden* at Flushing in his boat. The story the captain referred to was to the effect that Dr Diesel came on board at five P.M.; but, on being informed that the vessel would not leave until seven-thirty P.M., he went ashore, and did not return; and it was alleged in confirmation of this story that his name did not occur in the steward's list of cabin passengers. Dr Diesel's son and his son-in-law, Baron Schmidt, instituted every inquiry, but in vain. The mystery of Dr Diesel's disappearance from the Harwich steamer must be relegated to the great number of others that have never been solved.

A ward in Chancery and heiress to a fortune—the young lady's name was not allowed to transpire—disappeared about the same time from London with a gentleman—also nameless—and was searched for by Messrs Withers, Bensons, Birkett, & Davies, solicitors, a reward of twenty-five pounds being offered for information as to her whereabouts. They were traced to Leicester, and lost sight of; but eventually the young ward was found in Paris, brought back to England, and handed over to the care of her friends.

This does not by any manner of means exhaust our bag of such cases. We could continue to a much greater length, but our space is limited, and we must conclude. The fate of many a fine ship, like the *Waratah* and the White Star liner *Naronic*, that sailed from port and were never heard of again, has still to be solved. In 1903 the New York police received a letter purporting to come from the notorious Italian or Sicilian secret society, the Mafia, which led to the discovery of an infernal machine and a box of dynamite aboard the steamer *Umbria*; and it was generally believed that ten years earlier the *Naronic* had been blown up with dynamite by some vengeful gang of miscreants.

A PARTING WORD.

CHILD of the radiant heart, three years ago
The loving God unlocked for me the room
Of His best gifts; it was as when the womb
Of kindly Heaven first gave to those below
The glorious treasure of the morning glow,
To tell of coming joys, to speak the doom
Of every shadowy dread and hopeless gloom;
Indeed thy coming here was even so.

And now, each time we needs must say good-bye,
My Father's favour seems to be withdrawn,
And I would be as one compelled to grope
In awful night beneath a cruel sky,
But that thy smile of sunset bids me hope
There soon shall come a yet more splendid dawn.

SEVENTH SERIES

THE ORATORY AMONG THE ROCKS.

AT one time our British shores were engirdled by posts of prayer. Pious men spent the hours of day and night in spray-dashed towers, so that no ship, either large or small, left the harbours or passed the rocky headlands without some humble petition being offered for the safety of the busy souls she carried. One sits within the mouldering walls of such an oratory, looking out over a great bay of the north, and muses regretfully, and yet in some ways thankfully, of the days that are gone. Times may have changed greatly, but the witness of the little oratory is still eloquent, not least in these days of dreadful war.

In the old days, as now, the existence of this realm, this England, depended on her full dominion of the sea. From many a wind-swept oratory the hermit or votary or priest looked down and out on the shipping of his nation. He saw the light craft of the fisherfolk gliding along and scarce marking the moving plain of water. He watched in its proper time the many-oared galley tracing its way in silver and in foam through the tide-stream. He saw later the high-pooped ships shaking out their broad sails, outward bound for trade, for exploration, for war. And on the souls in each and every one he humbly asked the blessing of the Most High.

But gone are these days and men; and, as my fingers idly pick at fragments of crushed-shell mortar, there passes before my eyes a modern pageant of the sea, of Britain's trade and seapower, twice more wonderful than anything seen by the monk of old. The spirit has not changed from the last day of his pious vigil, but the equipment of our navies for peace and for war is strangely different. The day of 'wooden walls' has come and gone, and everywhere there is vision of iron. Even the trawler of the fisherfolk is clothed in metal. Man has withdrawn his shipbuilding industry from the neighbourhood of the great oak-forests, and gains his materials from fume levels and waterlogged galleries a mile beneath the hills. He has removed his oratory from the storm-battered headlands to the level holms where the sound of the sea comes faint, and where the sea-birds rarely soar and scream. The sun of the white sail has set as utterly as that of the bending blades of the sweeps, and progress against wind and tide is made to the belching of coal-smoke and the white plumes of steam. Power again has disap-

peared from sight, but the grim energy in these hulls is multiplied a thousandfold.

My ancient monk from his narrow window would see nothing but peace in the spreading sands, the level channels, the fields golden with harvest or green in smiling pasture; would see the vast forests which clothed the lower hills, and away in the distance a tumbled line of blue mountains. But to-day most is changed. Heavy clouds of smoke hang over the channel where great warships are built, and at night the red flame of furnaces springs and jerks along the near line of the hills. There is railway smoke along the levels, and busy villages where formerly were but the cottages of fishermen and farmers. At dawn one sees a huge floating fort pass along the horizon, or the lean, sinister form of a destroyer—Britain in arms—going out to guard the marches of our Empire. Yes, modern industry is great; in and out of the narrow bays and estuaries pass mighty ships laden with timber, with ores, with wheat from lands scarce known by name to the ancient watcher in prayer; and the sound of the unloading winches at the nearest port comes up idly on the soft breeze.

But more dear than the shipping, the hollow sands, or the peaceful vales would the religious man find the sight of the watch-tower which marked to him the shady ghyll where a great abbey reposed, the knot of trees in mid-channel beneath which an altar had long been set up, and priests prayed for the safety of those who were compelled to cross the dangerous fords of the estuary, the little priory on the last sound land across the river. To-day one sees the spires and towers of many a village church; but the great abbey, the altar on the island, the little priory by the shifting sands, have gone to ruin. The sentinel has been called hence from his watch-tower, the votary from his cell among the rocks. But the spirit of religion is still as strong and powerful as before; it is more indestructible than the daring which for a thousand years has inspired the navy of Britain, more lasting than the blue peace of the far-off mountains which even the roaring, bustling generation of to-day can only revere, cannot disturb the serene majesty of. And the spirit of religion halts not, but with every generation is advancing slowly but surely toward the pure Light of Lights.

Roofless the oratory, ruined these narrow slit-

like windows, small and low the crumbling walls ; but just behind is a church—the smaller has merged into the larger building, just as the narrow faith of constant supplication by men sanctified to do the service of the Most High has given way to the broader feeling, the more generous, personal spirit, which calls every man to worship in spirit and in truth, and to make his daily task a real service of love to God and man.

The spirit of man is really slow to change. The oratory among the rocks may be roofless, unoccupied, but the essential faiths remain ; and who can measure the changes of nature ? Stupendous, startling, are the truths of the rocks ; but the tides flowed and ebbcd, the seasons marched from spring to winter, just the same when the oratory was built as they do to-day.

So it falls out that as I stand here between the mouldering walls I listen to the sob and the song of the sea as it pushes and rushes among the skerries ; I watch the sea-birds hover and float, and I hear their wild screams and calls ; I watch the golden sunlight gleam along the wet sandbanks, the glimmer of distant and still more distant waters in and beyond the islands. There is no change in the shadows of purple and blue and green which delighted the first one who

prayed at the oratory as they delight me to-day. He, too, saw the sea rise up in storm, heard the heavy shock of the waters beneath, and drew in with every breath the water-fog which encompassed and entered his rude dwelling. And when the fogs of winter clung along the tide, and hid even the breakers from his ken, he would give his strongest cry to God for help to those mariners who might be groping nearer and ever nearer the rock-bound coast. Perhaps he tinkled his little bell incessantly in warning, just as the great fog-horn now rings from the distant port-head to preserve our keels from sandbank and rock-reef.

One cannot but admire the men who held this outer guard of prayer, this oratory among the rocks, during days of storm and darkness, through nights of snow and sleet and hail ; who pitted their voices in prayer against the majestic roar of the breakers, against the rumbling thunder of the hurricanes ; and one likes to feel that there were men of action as well as of prayer among them, men who would lead forlorn hopes to rescue at least one soul from the shattered wreck, who counted their personal danger but small when service was offered. Living in such narrow bounds as this rock-girt oratory, they could not be lovers of great fame, but they might be very brothers to those in distress and need.

PINCHER MARTIN, O.D.

CHAPTER IX.—*continued.*

III.

THE marine postman, who should have been off at eight o'clock, was delayed, and did not come on board with the mails and Sunday papers for the ship's company until nearly noon. But when he did finally turn up he was nearly carried off his feet by the rush of men.

'Ere, posty !' shouted some one, 'got my *Dispatch* ?'

'Wot abart my *Lloyd's* and *People* ?' roared another man, elbowing his way through the throng.

'Ain't ye got my *Reynolds's* ?' from somebody else.

'Oh, go to 'ell !' retorted the exasperated marine, vainly endeavouring to make his way forward through the crowd with a large leather satchel slung over his shoulder and three bulbous mail-bags on his back. 'Oh, go to 'ell, the 'ole boilin' lot o' you ! Orl in good time ! 'Aven't none of you blokes got no patience ?' He was annoyed, poor man, and had every right to be, for he had gone breakfastless, and the mail, arriving late, had delayed him many hours.

'Well, tell us th' noos !' some one bellowed above the uproar.

'Noos !' he replied. 'Germany's declared war on Russia, an' all the naval reserves an' pensioners is called out ! Wot more d'you want ?'

It was quite sufficient ; enough, indeed, to reduce a good many of them to a state of excited incoherence. It seemed practically impossible that Great Britain could keep out of the conflict ; and, though throughout the ship the general feeling was one of warlike joy, it was tempered here and there by a touch of subdued solemnity. The mail despatched the same evening constituted a 'bloomin' record,' as the long-suffering postman put it, for every officer and man on board had spent the afternoon in writing letters.

'I know'd my feelin's 'u'd come true,' remarked M'Sweeny in his mess during supper. 'I know'd this 'ere wus comin' orl along. I know'd yer wus wrong, Josh.' He wagged his head wisely, and looked at Billings, who was sitting opposite.

'Don't start chawin' yer fat, Tubby,' Joshua retorted. 'Things is quite bad enuf without yer makin' o' 'em worse.' He was feeling rather peevish and irritable. He was thinking of his wife, and wondered vaguely when he was likely to see her again.

'Owever,' he added, putting down his fork with a throaty sigh, 'I don't much care wot 'appens now so long as we 'as a decent smack at them blighters. I owes 'em one fur gettin'

me bloomin' leaf stopped, an', by gum, they'll git it w'en I runs acrost 'em!' He glared savagely at the man opposite as if he, too, was a potential enemy.

'Ear! ear!' shouted another man, banging heavily on the table. 'Them's my feelin's.'

'There, there, me boy-o!' snapped M'Sweeny. 'W'en ye've finished upsettin' me tea, Mister Jones, I'll git along wi' me supper, thankin' yer orl the same. Them bloomin' Germans can wait. Supper carn't.'

'Ark at 'im,' jeered 'Mister Jones.' 'Just 'ark at him! Allus worryin' abart 'is vittles!'

'An' why shouldn't 'e?' suddenly demanded Billings, veering round and taking M'Sweeny's part. 'Better ter be a well-covered bloke like 'im than a lop-eared, spindle-shanked son o' a perishin' light'ouse like you. It makes me feel 'ungry ter look at yer.'

Both M'Sweeny and Jones promptly became covered in confusion; for, whereas the former's adiposity was his sore point, Jones was as touchy on the subject of his excessive leanness.

That same night, or, rather, early the next morning, they had their first alarm. The immaculate Aubrey Plantagenet FitzJohnson happened to be the officer of the middle watch—midnight till four A.M.—and at two-thirty, having absorbed two large cups of hot cocoa and half-a-dozen tongue sandwiches, he was sauntering up and down the silent quarterdeck, pipe in mouth, and longing for his bunk. It was chilly for the time of year. There was no moon, and though here and there stars peeped out between rifts in the clouds moving down from windward on the gentle breeze, the sky generally was overcast and the night was dark.

Quite suddenly the silence was broken by the sound of footsteps running along the boat-deck. Next came the clattering of a ladder and a muffled exclamation as some one fell down the last few steps and landed painfully on the deck, and then the footsteps advanced on to the quarterdeck. Whoever it was was evidently in great haste. FitzJohnson turned round.

'I wants th' oficer o' th' watch,' he heard an agitated voice telling the quartermaster. 'Where is 'e?'

'Here I am. What's the matter? Who's that?'

'It's me, sir. Grimes, ord'nary signalman,' the man panted breathlessly. 'Please, sir, th' yeoman o' th' watch on th' bridge told me to tell you there's a Zeppeling comin' over th' 'ill!'

'A Zeppelin coming over the hill!' the officer echoed, in astonishment, half-suspecting that some one was pulling his leg. 'What the devil d'you mean, my man?'

'It's gawspul truth, sir. 'E's burnin' lights, an' me an' th' yeoman saw 'im quite plain.'

Grimes was obviously in earnest, and the

lieutenant did not wait to hear any more. He crammed his cap firmly on his head, darted from the quarterdeck, ran up the ladder leading to the after shelter-deck, sped along the boat-deck, barking both shins badly as he went, and finally clambered up the ladder leading to the fore-bridge, breathless and limp with excitement. 'Where is it?' he gasped.

'Over there on the port bow, sir!' answered an equally agitated yeoman of signals, busy with a pair of binoculars. 'D'ye see where that 'ump sticks up on top of the 'ill, sir?'

'Yes!'

'There's a bit o' dark cloud on top of it, and just to the left, sir. 'E's be'ind that now. We'll see 'im agen in a minute w'en the cloud passes.'

They both gazed at it anxiously, and presently the mass of vapour thinned and drifted away on the light breeze.

'There, sir!' exclaimed the yeoman, triumphantly waving an arm. 'See 'im now, sir? 'E seems to 'ave altered course to port a bit since I see'd 'im first; but 'e's there all right. See 'is lights, sir!'

The man was quite right; for, looking in the direction indicated, the lieutenant distinctly saw in the sky a bright white light, with, just below and to the left of it, a green light. They both seemed to be moving rapidly in a north-easterly direction, and looked for all the world like the steaming and starboard bow lights of a ship suspended in mid-air. He snatched the glasses from the yeoman's hand and looked intently through them. Yes, the white and green lights were quite distinct. They seemed to twinkle as he watched them, and behind them there appeared to be a dark phantom shape rushing through the sky. A Zeppelin, without a shadow of doubt.

Dashing down the glasses with an exclamation, he fled from the bridge as if Satan himself was after him, and running aft, hastily told the marine corporal of the watch to turn out twenty marines with their rifles and ball ammunition, and then to inform Captain Hannibal Chance, R.M.L.I., that a Zeppelin was in sight.

Aubrey P. FitzJohnson was no fool. Not he. He knew that hostilities had not started, but he had read enough history to be aware that hostile acts had frequently been committed before actual declaration of war. Moreover, he was officer of the watch, and as such was responsible for the safety of the ship, and it would never do if he were to be caught napping by a bomb-dropping dirigible. Therefore he must take precautions. There were no anti-aircraft guns mounted in the *Belligerent*, so the next best thing which occurred to him was twenty marines with their rifles. He might just as well have paraded five thousand schoolboys armed with catapults or pea-shooters, for all the good they could do.

A few seconds later he was knocking franti-

cally on the door of the commander's upper-deck sleeping-cabin.

'Who's making that infernal din?' growled the sleepy occupant, waking up with a start. 'What the devil d'you want?' The commander, poor man, had had a long and busy day, and was inclined to be irritable.

'It's me, sir—FitzJohnson,' the lieutenant exclaimed, putting his head inside the curtain. 'There's a Zeppelin in sight!'

'A *what!*' ejaculated Commander Travers, sitting up in his bunk and switching on the electric light.

'A Zeppelin, sir. I saw her quite distinctly. She's on our port bow, steering to the north-east'ard, and travelling pretty fast. You can see her from the fore-bridge. I've turned out twenty marines with their rifles!'

The commander glared at him for an instant, and seeing he was in earnest, hopped out of his bunk, crammed his feet into a pair of rubber sea-boots, flung on a purple dressing-gown, and dashed out of his cabin. 'You'd better go and call the captain,' he called back over his shoulder.

Captain Spencer, who had been sleeping soundly, was at first inclined to be sceptical and annoyed; but, convinced from FitzJohnson's manner that an airship really was in sight, he too left his bunk, and, arrayed in a suit of green-striped pyjamas and a uniform cap, joined the commander on the forebridge.

The marines meanwhile, in various stages of deshabille, were mustering on the quarterdeck under the orders of their imperturbable sergeant-major.

'Have you served out ball ammunition?' FitzJohnson demanded.

'Yessir; five rounds a man.'

'Well, double your men on to the forecastle, load your rifles, and stand by to open fire as soon as you get orders.'

'Party! 'shon! Trail arms! Left turn! Double marrch!'

At that moment Captain Chance appeared up one of the quarterdeck ladders. He was wearing a uniform tunic, pink pyjama trousers, dancing-pumps, and a monocle. 'What the dooce is happenin'?' he wanted to know. 'That damfool of a corporal came down to my cabin; but the silly ass was so bally excited, I couldn't make head or tail of what he was talkin' about. For the Lord's sake, old man, what the devil is the matter?'

'There's a Zeppelin in sight,' FitzJohnson told him. 'I've just sent the marines on to the forecastle.'

'Great Cæsar's aunt!' gasped the marine officer, running forward after his men.

The quartermaster, boatswain's mate, corporal of the watch, and Ordinary Signalman Grimes, meanwhile, had spread the news far and wide. Officers in scanty raiment, armed with binoculars,

came up the after-hatches and congregated on the quarterdeck; and most of the ship's company, determined not to miss the fun, seemed to have left their hammocks and repaired to the upper deck. It was literally crowded with excited men, who were all talking at the top of their voices.

'There 'e is!' FitzJohnson heard a shrill voice saying as he retraced his footsteps to the bridge.

'See 'im?'

'Where?'

'There!'

'No, that ain't 'im. That's one o' them lights ashore.'

'No, it ain't; not wot I'm lookin' at!'

'I tells yer it is!'

'It ain't, I sez. Ye're lookin' at th' wrong one!'

FitzJohnson eventually arrived on the bridge, to find the captain, the commander, and the first lieutenant already there. The last-named seemed to be rather amused.

'You can fall your men out, Captain Chance,' Captain Spencer called out to the forecastle. 'I'm afraid there's nothing for you to shoot at to-night.'

'I beg your pardon, sir,' said FitzJohnson, coming forward. 'Did you see the Zeppelin? There, sir,' he added, waving an arm; 'you can still see her green and white lights; and when I looked through the glasses just now I distinctly saw her shape.' He was rather afraid that the marines were being sent away prematurely.

Chase, the first lieutenant, unable to bottle himself up any longer, burst out into a hoarse chuckle.

The captain turned round. 'Is that you, Mr FitzJohnson?' he snapped.

'Yes, sir. I—'

'Are you trying to make damfools of the commander and myself?' demanded Captain Spencer. He seemed very much put out about something.

'I beg your pardon, sir,' stuttered the lieutenant. 'I don't quite understand what you mean.'

The commander suddenly flung back his head, and went off into a roar of laughter. 'Oh,' he gasped, 'this is the limit!'

FitzJohnson stared. Had they all taken leave of their senses?

'Did you really see a Zeppelin,' the skipper asked sarcastically, 'or did you merely get me up here in these garments so that I should catch my death of cold?'

'Yes, sir, I really did see it,' the lieutenant faltered, beginning to realise that he had made some horrible mistake.

'What! showing its white and green lights?'

'Yes, sir.'

The captain glowered. 'I believe you're a zealous officer, Mr FitzJohnson,' he said grimly;

'otherwise I should believe that you were treating me with unseemly levity.'

'I'm afraid I don't understand what you mean, sir.'

'You don't understand—eh? Well, next time you report a Zeppelin, kindly make quite certain that it is a Zeppelin. This time you've dragged us all out of our beds to look at a couple of rather bright stars.'

'Stars, sir! But I saw the shape behind the lights!'

The captain shook his head. 'Merely a cloud,' he explained. 'If you look at your so-called lights now, you'll see they haven't moved a fraction of an inch since you first saw them. The nearer clouds travelling across them gave you the impression that they were moving. One of 'em does look rather like a green light, I'll admit, but that's merely the dampness in the air.'

'I'm awfully sorry, sir,' FitzJohnson stammered, covered with confusion. 'I had no idea'—

'Of course you hadn't,' Captain Spencer interrupted. 'Nobody realises he's made a fool of

himself until afterwards. However,' he added with a chuckle of amusement, 'I'm not really angry; but nobody, except perhaps the Astronomer-Royal, likes being dragged out of bed to look at celestial bodies. Good-night.'

'Good-night, sir,' said the culprit sheepishly.

The captain and the commander left the bridge together. They both seemed amused.

Chase came across to FitzJohnson. 'Dook, old man,' he laughed, digging him in the ribs, 'you've made a bally ass of yourself. The least you can do, after digging me out of my cabin at this unearthly hour, is to give me a cup of your cocoa. Grr, it's beastly cold!'

'Of course I will, No. 1. Come along.'

They left the bridge chuckling.

'Well,' remarked the yeoman of signals when they disappeared, 'I could 'a swore I'd seen 'im!'

Perhaps he could; but he, the cause of all the trouble in the first instance, had taken very good care to maintain a discreet position in the background during the captain's presence.

GIBRALTAR IN WAR-TIME.

PICTURESQUE NOTES.

By AUGUSTUS MUIR.

IT was early morning. The great liner was throbbing her way eastward to meet the rising sun. To port and to starboard gray cliffs reared themselves above a dull, clay-coloured sea; the boat was nosing her course through a faint white fog; and we were standing on the fore-deck, shivering slightly, waiting for the sunrise. As we lingered, the mist was banished as by some warm and unseen hand; the monochrome cliffs were suffused with continually changing tints of light; and the chill, lifeless sea seemed suddenly touched with the vivid joy of morning. All things woke to rich, warm life; the placid wavelets gleamed and sparkled in a thousand hues of flowing gold; and to our delighted eyes it seemed as if a countless multitude of sun-fairies had descended to leap and dance on the quivering surface of the sea. Sunrise on the Mediterranean!

The subtle aroma of romance hung over everything as we steamed in to Gibraltar. Fourteen hundred feet of dark rock jutted out of the sea, cutting the blue heavens like a ragged knife-edge. It dominated that scene of sea and sky and coast. As we drew in it swelled in stature; and we could discern the tiers of white buildings round the harbour, the military barracks, the covered market-places, and the little white-and-yellow walled town that lay in the shadow of the Rock, and crept upwards, clinging in the crevices, perched on narrow ledges, hid in

gulleys, and snatching meagre positions from the burly, gnarled rock-face. Here and there loomed a precipice which was pierced by black holes, and was reputed to be the sites of guns. Toward the bottom they were large and clear-cut, but upwards toward the top they were concealed with the utmost subtlety, and were scarce to be discerned by the naked eye. And beyond Gibraltar, stretching east and running west, swept the golden sands of Spain.

The liner drew in to the wharf, which is called the Mole. Here the authorities would not allow us to land; for to proceed to the town we should have to pass through the dockyard, and in war-time that is holy ground, immune from the prying eye. In due course a steam-tender drew in, and took us by a circuitous route to the town wharf, where we stepped ashore and received our first impressions. It is said that first impressions are the most acute and durable, and indeed with Gibraltar I find it so. From a distance one is awe-inspired; but on stepping ashore it is a sensation of exceeding quaintness which is most clear-cut and compelling.

At every ten yards you are besieged by a Spaniard from the dickey of a strange contrivance called a 'garry.' He offers to drive you round the place for an old song. That is the comedy of Gibraltar—everything is offered to you for an old song. For fourpence you may procure sufficient grapes to last for many meals; and

four shillings would procure cigars which would cost upwards of a pound in Britain. A silken shawl which you would be fortunate to acquire at home under eighteen shillings is here proffered to you for three. But the main point in this street-barter is that one is foolish to give the vender the sum he demands. I discovered a safe, though amusing, rule-of-thumb. If the coffee-coloured merchant asks for three shillings, offer him one. He will hotly assure you that it is out of the question; it would ruin him. Then offer him one-and-threepence. At this concession he will probably drop his price to two-and-sixpence. Offer him one-and-six. He will then haggle with you, argue with you, brow-beat you, storm at you, weep, shout, whisper, smile, fume, and shriek in turn; but he will bring down his price to two shillings. You have him now in the hollow of your hand. Offer to split the difference, and produce your one-and-ninepence. He will look at the money, then at you, then back at the money. The sight will be too much for him. He will hand you the piece of merchandise, and push out a grimy paw. The bargain is closed, and he will have a shilling clear profit.

We walked up the quaint, narrow, little main street. It resembles one of the better-class Paris slums, with its white-painted houses, shuttered windows, and strange foreign names above the doors. Every Britisher you meet is an official of some sort, and every second man is a Britisher. But the street is also thronged with Spaniards, Moors, white ladies, dark-skinned girls with sunny black eyes and gay costumes, bare-legged messengers, priests, and heavy-looking labourers who smoke cigars. The Gibraltar navvy is a queer customer. I have never seen him do any work. He stands with the stub of a cigar in his mouth, his tools in his hands, and a dazed, vacant stare upon his features. He is a living, breathing symbol of the curse of Spain—indolence.

'That is an old Moorish castle,' said my friend, who for years had lived on Gibraltar as an army officer. I looked at the jumbled mass of buildings half-way up the rock-face, and saw an old, gray, square castle. 'Gibraltar,' continued my friend, 'was once in the hands of the Moors. In the fifteenth century it was taken from them by Spain, and the Moors were driven across the fifteen miles of sea to Africa. About the year seventeen hundred it was taken from the Spaniards by Britain. We have held it ever since. But eighty years after it came into our possession,' he proceeded on observing my interest, 'it was the scene of one of the world's greatest sieges. The Spaniards and the French brought against it the greatest force of armaments that has ever in the world's history been brought against any fortress—excluding, of course, the present war. But in one single night the whole attacking force was destroyed.

The British, from the seclusion of the Rock, sent red-hot balls into their floating batteries, and at the same time their whole line of works was wiped out by a sudden sortie. That night's work meant a loss to the enemy of over two million pounds. To a student of naval and military history,' added my friend, 'these almost incredible facts are of absorbing interest.'

'Did that finish the siege?' I inquired.

'On the contrary,' he assured me, 'it was a three years' siege. Arrayed against us was the Duke of Crillon, in command of twelve thousand of the best troops of France. A thousand pieces of artillery played on the fortress. There were forty-seven battleships of the great three-decker type, and ten mighty floating batteries which had been considered invincible, and which carried over two hundred guns. In addition, there were innumerable frigates, xebecs, bomb-ketches, cutters, gunboats, mortar-boats, and small craft for disembarking the troops. For weeks together, six thousand shells per day were thrown into the town. I mention this so that you can understand me when I say that Gibraltar, even in the light of recent events, is impregnable. It is the unbreakable key to the Mediterranean, and Britain should send up a psalm of praise that at the present hour it is in her hands—rugged, stern, invincible!'

We presently succumbed to the clamours of a native charioteer, and entered his carriage with feelings of distinct novelty. He whipped up his sturdy little pony, and we clattered out of the town toward the eastern base of the Rock. Interspersed between the buildings that clustered above us was an interminable growth of green scrub. This runs up the rock-face, wresting a scanty existence from the sun-parched earth that clings in crevices and reaches to a spot called St Michael's Cave. Here thrive gigantic ferns; and rumour has it that the cave continues downwards through the rock, and has an exit to the sea by some subterranean cavern. Here, too, thrives that well-known animal the Gibraltar monkey. My military friend told me that they emerge from their dwelling-place at night, creep down by the scrub to the barracks, and reap a rich reward in the shape of handkerchiefs, shirts, tins, and any portable article upon which they can lay their little black paws.

At length we reached Catakin Bay, which is the habitation of a tiny tribe. Generations ago a fleet of Genoese fishing-boats put into the bay for shelter. There were many women in the boats, and they were so enamoured of the spot that huts were built, and they remained. Hundreds of years have passed, and the little tribe still lingers on. The Government has given them a grant of land, and a village now clusters in the shelter of the bay. The population dare not increase, in case it oversteps its boundary, and marriage is only allowed in rotation. Indeed,

no marriage may take place in the village until way has been made for it by a death. The people are squat and ugly, and look amazingly like each other. It is a little colony of cousins, dwelling apart in the shadow of a great rock, and going down to the sea in ships to earn a hard-won livelihood.

Gibraltar is a little colony shut off from Spain by a strip of land which is strictly neutral ground. By arrangement between the two Governments, this ribbon which ripples round the contours of Gibraltar is a veritable No Man's Land, and is immune from the foot of Britisher and Spaniard alike. Only on the pain of imprisonment dare you venture on this sacred margin of drab, parched, rolling sandhills; and the inviolable ground is pierced by a frontier road for passage to and fro. At either extremity British and Spanish sentries stand guard; no merchandise may cross the frontier without previous examination by the Customs officer; and great Spanish cavalymen, in magnificent uniforms of red and blue, are there to enforce the law. But in spite of all precautions, smuggling—that picturesque

old practice beloved of the romancer—is carried on. Tobacco, for example, is strapped to swift dogs, who at night-time race across the neutral ground. A cry in the darkness, a sudden gunshot, and the Spanish and British guards turn out on the *qui vive*, with eyes piercing the night to descry the flying figure of some laden mastiff. Often dogs have been shot; sometimes they have been adroitly captured and the cargo confiscated; but search has never revealed a trace of the wily Spanish trafficker whose lithe fingers, agile in the dusk, had strapped on the fragrant burden.

We drove back. Night drew down while we wandered through the quaint lamp-lit streets. The fog-horn of the tender warned us that it was the hour to return. Aboard the liner we paced the rear-deck. The boat drew away from the quay. The setting sun crimsoned the roofs of the town, and struck with a strange light on the summit of the Rock. Minutes passed, the throbbing of the engines alone breaking the silence; and we watched Gibraltar dropping in the west till it had faded to a speck in the declining splendour of the day.

THE THIRD KEEPER.

PART II.

'HARDING was certainly in a very uncomfortable position—even a dangerous one if Wilson took it into his head to go down and attack him. If that should happen, one or both would, in all likelihood, be thrown into the sea. Otherwise Harding was less badly off than I. It was calm weather, and a fine, warm night. Then, too, he had not my responsibility. I was the second keeper, and was in command in absence of the principal; it was my duty to make plans and act.

'What worried me was how to draw attention to our danger. There were no mackerel-fishing boats at hand. Often these were off the reef for days together; but the fish were scarce, and no boats had been near us for a fortnight past. The tower had recently been fitted with the present fog-signalling apparatus—an explosive cartridge fired from a jib upon the gallery. The firing of several cartridges on a fine summer morning would soon have attracted notice on the shore; but the cartridges were in the engineer's apartment down below. So, as ill-luck would have it, was the lighthouse flag, which I might otherwise have run up to the mast. It seemed impossible for me to go down for them; Wilson might be lurking close at hand. Not only did I feel it right to do my best for my own skin; if Wilson overpowered me and got into the lantern, he might do a terrible amount of damage to the lens.

'There was another way in which I might attract attention to our desperate state; I might

put out the light. It would be the work of a moment. I had only to step across the lantern, turn a valve connected with the oil-container, and so check the flow of oil. Or I might stop the revolution of the lens; that would be noticed and reported mighty quickly by some passing ship.

'But I could not bring myself to do this—not at present; for it might mean shipwreck to some vessel on the sea. You can't well be a lightkeeper for five-and-twenty years, as I had been, without its being fixed firmly in your mind that duty to the light comes first—that you must keep it burning at all costs. I could not say what I might have to do in time, if things came to the worst; but for the present I determined to maintain the light.

'I could, if I chose, keep it burning that night and the following one. The oil-container held about five gallons; it was filled daily in the winter, every other day in summer-time, oil being brought up by hand from the oil-store. Now it so chanced that the container had been filled that morning, so that there was enough oil to last two nights. Farther ahead than that I did not care to look.

'I must make something happen soon; that was quite clear. To begin with, there was the question of food. I was not badly off as yet, for I had had my supper before going on duty; Harding had not. But, on the other hand, he need not starve; he had the pollack, and must eat them raw. We were about quits there.

'Slowly the hours of that night went on; at last I saw the first gray streak of dawn. Soon came the sunrise, and I stepped across the lantern and put out the light. Then I went on to the gallery, and, as I did so, heard the sound of a sharp crash upon the set-off down below.

'Wilson had left me undisturbed for several hours, and, wondering what he might now be up to, I looked down over the railing in alarm. You may well think that I was in no mood for laughing; yet I could almost have laughed at what I saw.

'There was poor Harding on the set-off, skipping to and fro to dodge the things that Wilson, who was leaning from the kitchen window, hurled at him. There were two windows in the kitchen, and a third upon the little landing just outside the door; so that Wilson commanded, as you may say, nearly the whole of the ledge. As fast as Harding could get out of range at one place, Wilson was at another window, pelting him hard with everything he could lay hold of.

'What I had heard was the crash of our largest kitchen saucepan. While I looked, the kettle followed it. Then came a shower of plates and cups and saucers, knives and forks. Out went our ham; out went a piece of beef; then loaves of bread. I wished that he could throw these last at me! Presently came books from the kitchen bookcase, then the telescope we kept downstairs. At last the volley ceased; the madman must have thrown out everything the kitchen held.

'Then there was quiet for a little. What, I wondered, was he up to now? I went back to my seat on the trap-door and listened, but could hear no sound. So I went out upon the gallery again.

'Harding looked up at me with a scared face and waved his hand. Then, in two bounds, he had slipped round to the far side of the set-off. He was only just in time; for from the double-doors of what we called the winch-room there flew out a heavy bucket, aimed straight at his head. Then followed tools, then lumps of coal. And when the coal began to fly my heart leaped, for I saw a way out of the mess.

'There was a large supply of coal, brought by the steamer at the last relief. If Wilson meant to fling it all at Harding's head the job would take him several minutes—ten or even perhaps fifteen. The winch-room was two floors below the kitchen, three below the engineer's apartment, where the cartridges and flag were kept.

'Now was my time. I seized the screwdriver and worked with all my might at drawing the screws from the trap-door. In some five minutes I had out the lot, the trap-door open, and was listening on the stair below. No sound. Then I ran out on to the gallery. Coal was still flying from the winch-room, but I saw that I must hurry, for the lumps were getting smaller; Wilson was

nearly through that job. Taking my boots off, I descended swiftly in my stocking feet.

'My word, but I can tell you I was nervous; for, you see, poor Wilson was the first madman I had ever met. Shaking, I reached the engineer's apartment, snatched the flag out of its drawer, and then turned to the cartridge cupboard—only to find I had not got the key! The key was one of several on a bunch kept in the kitchen bookcase, and by now was doubtless in the sea.

'I looked all round the room for anything with which to force the cupboard door, but could see nothing; and the door, though not a very strong one, closed quite tightly, so that I could not get my fingers in to wrench it open. No; I must go up to the lantern for the screwdriver.

'Taking the flag, I was up and down again in twenty seconds, wrenched the door open with a crash, and seized the nearest cardboard box, which held a dozen cartridges. I was about to take a second, when I heard a stealthy step upon the stair below. In just one bound I reached the door. Wilson was on the topmost step, within two yards of me.

'There was a glass-panelled door at the top of the stair leading down to the kitchen, and I slammed it in his face. Then, for dear life, I bounded up the upper stair, with Wilson, whom the door had hardly checked, close at my heels. When half-way up the second staircase I was conscious of a sudden sharp pain in my leg. Wilson had stabbed me; but I still dashed upwards, reached the lantern, slammed down the trap-door, and sank upon it at full length.

'The blood was flowing freely from my leg, but I knew well that it was death for me if I did not succeed in keeping the door down; and, lying on it while it shook and bounded with the blows from Wilson's shoulders, I pressed one hand tightly on my wound. Then I felt in my pocket for the screwdriver, only to find that it had fallen as I raced upstairs.

'Well, I got all these screws in somehow with the point of my penknife, though there was little point, or blade either, left to it when once the job was done. But done it was; that was the main thing. And then, just as I was driving the last screw, a thought occurred to me.

'I had brought up one dozen cartridges; there were at least another hundred dozen left downstairs. One cartridge is fired every five minutes in time of fog, so that a good supply is always kept in the tower. Suppose—and there were many things less likely—that the madman got hold of these cartridges and exploded them! Why, he might put them in the kitchen fire by a handful at a time! Henceforth that dreadful fear was ever on me till help came.

'It was not till long after the whole thing was over that I came to think why he did not. The kitchen fire, not being tended since the previous evening, had gone out. Wilson had

thrown at Harding from the kitchen everything, including matches, upon which he could lay hands. Curiously, for a keeper, he was not a smoker, and he had no matches of his own.

'Wilson had left the staircase long before I drove home the last screw. All was now clear for me to fire the signal; but before doing so I took the flag out to the gallery, attached it to the line, and ran it up the mast—to half-mast high. The news of death in the tower would not fail to bring us prompt relief.

'I fixed a cartridge to the jib, swung up the latter clear above the lantern, and then pressed the handle of the small electric battery inside the door. I think the crash of the explosion was the sweetest sound I ever heard. I swung the jib down, fixed another cartridge, fired it, and finally a third. Taking the lantern telescope, I went back to my post on the trap-door.

'It was full time, for Wilson was soon battering at it, and kept doing so for a quarter of an hour; and although the screws held firmly, yet I did not care to trust to them too far. Presently he was quiet; then, through the gallery door, I trained the telescope upon the land.

'It was a fine fresh summer morning, and the land, though ten miles off, was very clear. Thank God! I could see people running and groups gathering here and there upon the cliffs and harbour quays; and presently I saw the flag float out above the lighthouse station, which was in full view. My signals had been heard, the half-mast flag was seen, and help would not be long in coming.

'But it was full two hours before, amid the crowd of vessels in the harbour, I could see the lighthouse steamer coming out. Of course, they had to get the crew together, and to get up steam. So great had been my joy at having made the signals that I had not given much thought to what was next to come. Now I began to see that we weren't anything like out of the wood yet.

'The steamer was coming out, doubtless with the station superintendent on board. He, of course, thought that one of us was dead, and could know nothing of the real state of things. First, I should have to make that known to him; then he would have to plan some means of coming to my rescue. Harding he could take off the set-off without much difficulty.

'How he would set about relieving me was more than I could tell. The only entrance to the tower was shut and barred; nothing short of powerful explosives could break in those doors. Entrance by any of the windows or the winch-room doorway was impossible without a rope. Besides, the madman would be waiting to repel attack.

'However, my old mother often used to tell me to "do the next thing," and not to mind about the next one after that till the time came. My first job was to give the news. That was

simple enough, for of course I understood semaphore signalling. So I sat waiting till the steamer had come alongside of the reef.

'Soon she slowed down within five hundred yards of us, and swung round with her bows against the ebbing tide. Then I went out, and, standing with my back against the white wall of the lighthouse, made the following signal with my arms: "Wilson gone mad and armed. Harding shut out upon the set-off. I have screwed down the trap-door."

'I was not long in getting a reply. From a seaman placed upon the steamer's bridge as signaller there came the question: "Have you a line up there that will let down to the set-off?"

'How I regretted that I had to answer "No"! It was a most unlucky chance, for usually we kept a fishing-line upon the gallery quite long enough to reach down to the ledge and farther still. We used it for bass-fishing, for the wind would drift it out to a distant rock which was much haunted by these fish. It had been taken downstairs a few days before.

'There was some consultation on board the steamer; then a second signal came: "Am going back to harbour for the rocket. I will take off Harding, and will leave two men."

'A boat was forthwith lowered and pulled in toward the ledge. One of those in it, I could see, was the principal. I saw poor Harding helped in from the set-off, while the principal and another man were left upon it in his place. At least I was not to remain entirely alone with Wilson; that was something to the good.

'But there were three long hours of waiting while the steamer went full speed to port and came back again; I was now getting faint and queer from the pain of my wound, as well as from the want of sleep and food. I sent no messages to those upon the ledge below, and they could send none up to me. I just sat quietly upon the trap-door and waited. There was no sign of Wilson.

'It was the afternoon before the steamer was alongside of the reef again. This time I saw that she had a large force on board. I could make out several of the police and some coastguards, as well as one or two gentlemen. These latter were magistrates, as I afterwards heard.

'I had already guessed what they were going to do—fire a rocket and a line across the lantern. I was to catch the line, and by it haul up a strong rope. By this rope, when made fast, there would come up to me a force of men sufficient to make a rush and overpower Wilson. The whole thing was a difficult and dangerous business, but it was the only way.

'A seaman went up once more on to the steamer's bridge and waved his arm to me. Then came the signal: "We're going to send the rocket and a line. It will be fired ten seconds after you have heard our siren blow. Stand by to catch it and make fast."

'I stood ready. There came a puff of steam and the hoarse wail of the siren; a few seconds later, and the rocket soared up toward the summit of the tower.

'As it came up I had to watch and calculate on which side of the dome-shaped lantern-roof it would fall, for I must spring to catch it as it slipped down to the gallery. If I misjudged it by the fraction of a second it would fall into the sea.

'Straight as an arrow I could see it coming—for I will say for the coastguards that they do know how to send a line. I don't believe it missed the very centre of the roof by half a foot, and it was hard to judge which side the line would fall. But I saw it drop across the roof, hang for a second, and then slip down toward the west. Quick as a cat I sprang and clutched it as it fell. That was all right so far. I heard the fellows on the steamer cheer—no doubt to hearten me.

'I wanted cheering, I can tell you; any minute I might hear Wilson battering at the door. And now, if help were to reach me, I must be out on the gallery.

'I could see rope being coiled into the steamer's boat, and soon she put off for the rock. When she was close in to the set-off a signal came for me to draw in the line.

'I did so. To the far end had been fastened a rope fit to bear a man. I passed this rope once round an upright of the gallery railing, then sent both ends down. Thus they had got a running line by which to haul up several helpers, one by one.

'The boat cast anchor at a few yards' distance from the ledge. I saw a coastguard getting ready to come up, while a policeman and another coastguard seemed to stand by waiting for their turn. I saw the boat's crew scan the windows of the tower, as if in search of Wilson. Seemingly they could not see him; but he could see them, as we were soon to know.

'The coastguard set his foot in the loop at one end of the rope, the boat's crew hauled upon the other end, and in some seconds he was rising steadily toward me. He was kept steady by a line passed round him and held by some one in the boat. At first he came obliquely, for the boat was some yards distant from the tower; but the higher he rose the nearer he came to the wall. When he was perhaps some forty feet below me he was practically perpendicular. They had not raised him straight up from the set-off, and I guessed the reason; he would have had to pass close by the winch-room's open door.

'Why not have set him on the tower there? Ah, but, you see, only one man could go up at a time; and he, while waiting for the others, would have been at Wilson's mercy. Several could muster with me on the gallery without the danger of attack.

'I had just turned to give a glance behind me at the lantern, when there came a sudden cry from the boat's crew; and, looking down, I saw a sight that froze my blood. Wilson was leaning from the kitchen window, knife in hand. His madman's plan was to reach out and cut the rope, letting the coastguard fall upon the set-off sixty feet below.

'The boat's crew paid out the rope with a will, letting the man drop down till he was out of Wilson's reach; but, from his weight, the rope still hung within reach of the lighthouse wall. I could see Wilson leaning farther from the window, see his knife just reach the rope. I shut my eyes. There came another cry from the men down below, an awful yell from nearer me, and then a heavy thud upon the granite of the ledge.

'I looked again, shuddering to think what I must see—the coastguard lying there injured, even dead; all help again far off. But, when at last I did look, it was not the coastguard who lay in a huddled ghastly heap upon the set-off. It was the madman. He had reached too far, had overbalanced from the window, and had dashed his life out on the stones.

'Well, there is not much more to tell you. My hands were shaking as I tore the screws out, and went stumbling down the stairs to let my rescuers in. Once I had unbarred the door I fainted, and for hours after coming to I could do nothing but sit and tremble, while the tears ran down my cheeks. It was dark night before they could well move me to the steamer and ashore.

'For several weeks I was off duty, quite unfit for work. And even when I was myself again the doctor said that, though I was all right for a shore station, yet he would not, taking things into consideration, recommend my being placed again upon a rock.

'The Elder Brethren were uncommon nice; they always are. They found me a shore station, promising me due promotion, and that I should never go upon a rock again. I got a silver watch—it's at the watchmaker's for overhauling now; and Harding and myself got money too. And the next time the annual inspection took place one of the Elder Brethren shook me by the hand and congratulated me on what he called my "courage and steadfast attention to duty under circumstances more dreadful than any others he could well conceive."

'Poor Wilson's wife and children went to friends abroad. It came out later that there was insanity in Wilson's family; an aunt and a grandmother had both gone off their heads. I wished we'd happened to know that before. Well, sir, my wife and I will be glad if you will take a cup of tea. Oh, you must catch your train? Well, then, good-day. I'm glad you liked the tale; it's more than I did at the time!'

THE END.

THE HEADSHIP OF THE HERD.

By R. B. TOWNSHEND, Author of *Lone Pine*, *A Girl from Mexico*, &c.

WHEN animals live together in a herd there is usually a certain one among them exercising authority over the rest; or, more often, the herd may be composed of various groups, each with its own leader, but all keeping together for the sake of safety. How much authority the leaders wield depends primarily upon the species of animal of which the herd consists; and, secondarily, upon the vigour both of mind and body exhibited by the more masterful individuals.

Nearly half-a-century ago, in Colorado, before the days of barbed wire, when I started ranching with a herd of wild Texas cattle out on the then unfenced Great Plains, I used to watch the ways of my stock with a double interest, not only as the owner who had invested his money in them, but also as an observer of the varying characters of animals.

In the simplest sense of the word, the master of a herd of Texas cattle is bound to be the bravest and biggest of the bulls on the range. If I rode on a warm summer morning down the chain of water-holes that stretched nearly a mile along the gulch below the clear cold spring where I had taken up my ranch, I could always see a thousand head of cattle watering, some of them my own and some my neighbour's. They grazed during the night out on the hills two or three miles back; and daily, as the sun grew hot, they came in to drink. Out of the whole thousand about twenty were bulls—I mean big, grown-up bulls, not young calves or yearlings—and these gentlemen daily paraded up and down along the gulch, trumpeting their fierce challenges to one another. But the challenges seldom led to a pitched battle, for two reasons. One was that as all the twenty bulls had been ranging around there ever since the spring round-ups, they had already fought, and each bull knew exactly whom he could lick and who could lick him. They were like schoolboys in the old pugilistic days, when the acknowledged 'cock' of the school was the boy who had proved that he could lick every other one, while the boy whom every one could lick was the unfortunate 'hen.' This knowledge of his precise rank as a fighter tempered each warrior bull's fighting ardour with prudence. Moreover, as out of the thousand head of stock that watered by my ranch well over a half—say six hundred—were cows, there was small chance of any one of the twenty big bulls failing to find a lady-love for the day; and when he had found her, he devoted himself to her entirely for the time being, and had no particular desire to fight unless some rival audaciously sought to take her away from him.

Here was where man's interference had

modified natural selection; for, if these range cattle had really and truly been wild animals in the fullest sense of the word, nature would have provided something like six hundred bulls for the six hundred cows, and their battles would have been frequent and fierce in the extreme. When man, for his own purposes, upset the balance of nature by altering the proportion to one bull to thirty cows battles rarely took place, unless a new bull from another range was introduced on the gulch; then, indeed, the boss of the home range felt bound to take him on, and for 'an hour by Shrewsbury clock' you might see the fur fly.

All this, however, did but settle the question of who was master as regarded the possession of the cow of his choice for the time being. The conquering bull cared only for that, and it never entered his thick head to try to regulate the movements of the herd, and all he did was to attach himself for the day to the bunch with which his favourite happened to be running. The real leadership, the initiative which settled when each bunch should move in to water, and when and by which road it should move out again to graze, rested elsewhere; that was the special business of the boss cow in each bunch. For the herd of a thousand head scattered along the water below my ranch was made up of from fifty to a hundred separate bunches. They met daily at the water-holes, and intermingled freely enough there; but they travelled in and out to the grazing-grounds independently. Numerous old buffalo roads led down from the hill pastures to the water; and now that the buffalo had gone, and we pioneers had brought in stock to take their place, our cattle reopened the old roads of the buffalo, and always travelled by them.

Now comes the question, how does the boss cow come to be the boss of her bunch, and how is her authority exercised? In a very minor degree she does it as does the bull, by physical force. For, supposing that another cow tries to displace her, the boss cow will use her horns, and by a few pokes and pushes teach the intruder to keep her place. The fight between the two cows is a tame performance indeed beside that between warring bulls; but it is a fight of sorts, though of rare occurrence. Nevertheless, the ultimate sanction here is physical force, and if you knock the horns off a boss cow she will automatically relegate herself to the position of the last instead of the first of the lot. Instead of being the 'cock' of the school, she becomes the 'hen.'

But how did she attain the position at all? Mainly, as I think, through two things: gregari-

ous instinct and motherhood. A cow's calves naturally cleave to her even after they are weaned, and the deference which is naturally shown by the offspring to their parent often continues after the young heifer has grown up and has got a family of her own. Thus the filial affection merges in the gregarious instinct, which makes any member of the bunch hate to leave it unless absolutely compelled. If an individual happens to get separated from the bunch, either by accident or by man's intervention, not for a moment can she bear to be solitary; she makes haste to join another bunch, the first to which she can manage to introduce herself. At first the new-comer is looked on askance by her new friends, and is kept on the outskirts; but presently she finds her place as a full member of the herd. No gregarious female animal ever lives alone if she can possibly help it; a bull who has been whipped out by a rival may become a solitary, a rogue, as they call him in the case of an elephant, and a dangerous customer he is to tackle in the brush. I cannot imagine a cow doing this; she would find company of some sort or other at all hazards. In 1867 the big Hayden herd, almost the first Texas herd to reach Colorado, was turned loose on the outskirts of South Park, on Tarryall Creek. Here they got scattered in a very rough, timbered country, and one of the cows got lost, and, being unable to find the others, took up with a band of buffalo still surviving there. When I was there in 1870 she was even then with the buffalo, and had a half-breed calf by her side. Similarly I have known of a work-ox which got lost from a freight team out on the plains and took up with the buffalo for company. His gregarious instincts made him seek the security of the alien herd; and as, of course, he did not arouse the jealousy of the buffalo bulls, he was tolerated.

It is this gregarious instinct which keeps the individual true to his bunch, and it is so strong that nearly every member of it has no ambition except to stay with the others and go wherever they go. The mass are content to be followers, and very few ever show a wish for the first place. If none is willing to lead when by some chance the boss cow is lost or killed, the whole lot will probably join in with another bunch, and be adopted into it; but if there be one masterful individual among them she will at once take the place of the lost leader, and the bunch goes on as before. Thus it is that, on the move, it is always a cow that leads the bunch; and the bull, if he happens to be along, is merely a follower. But should an enemy appear on the scene the rôles are reversed. Then the courage of the bull and his masculine love of a fight bring him instantly into the front rank. Be it wolf or panther or grizzly, the bull comes to the front, and stands ready to take him on.

A young Blackfoot Indian was out one day in the Bad Lands up in Montana, trying to kill a buffalo for meat. The Bad Lands are full of rain-washed gulches with perpendicular clay walls, and the buffalo roads run down the bottom of the gulches. The Indian was lying above a trail on the terraced side of a gulch, waiting to get his shot. He saw a bunch of buffalo come down it in single file, and a fine young cow was in the lead. Suddenly from the terrace above her something shot out just as she was passing, and a huge grizzly reached down and seized her by the neck with his great forearms, and, flinging himself on her, bore her to the ground. The other cows fled, and their unhappy leader in vain tried to shake off the dreadful monster that was tearing her flesh. But there was a bull with the bunch which did not fly. Instead he charged down the trail and rushed on the bear. So fierce was his rush that he fairly knocked the beast off the stricken cow and rolled him over. The poor cow fled, but the furious bear got up and went for the bull. It was a ding-dong fight, the bull horning and thrusting at the bear, and the bear striking at the bull's head and shoulders so savagely that he almost scalped him. But the brave bull fought on till the bear had had enough, and tried to run; the bull was after him like a flash, bowled him over, and gored him to death. Even this did not satisfy his rage; he stood back a little to get his breath, and then charged the body again and again, fairly lifting it off the ground with his horns. Finally, having glutted his wrath, he left the dead body of the bear, and went off to find the herd, and, let us hope, recover from his dreadful wounds. The Indian was only too glad to see him go; for he feared lest, now his blood was up, the bull might find him, and destroy him too. Here was a typical instance of the organisation of the gregarious herd: a cow the leader, the fighting male as the warrior.

In Texas, however, later on, I came across certain wild animals living gregariously in a herd, but differently organised. These were the peccaries. Riding with Gonzalez, a Mexican herder, in the cane brakes, we came suddenly on a multitude of little pointed triangular tracks freshly made in the damp earth. For a moment I thought that they were those of the white-tailed deer; but I was wrong.

'*Javalin*!' ('Peccaries!') cried Gonzalez. 'Now we got to look out;' and I drew my 16-shot Winchester from its holster. 'Better not shoot,' he warned me, 'unless they come for us. Those *diablos* afraid of nothing, and never quit. They fight till they drop.' And he told me how once, when hunting, he fell foul of a drove of peccaries, and how they hunted him up a tree and kept him there for hours. 'I guess I bin up there yet,' he laughed, 'but at last I spot one big old boar who seem to boss the show. So I wait till I get good chance, and kill him dead with my

last cartridge. And then they all clear out, and leave me go home safe. That's the right trick with cruel beasts like that. Kill the boss.'

'That's so,' said I; 'and you might say just the same about men.'

As our business at the time was to track some horses from my herd that had stampeded in the brush, I was content to let the peccaries alone. But only the other day I got a confirmation of Gonzalez's account of them in a book called *The Two Americas*, by the late President of Colombia, General Rafael Reys. The General says of these South American peccaries that their leader is not one who fights in the forefront like the buffalo bull, but one who orders the battle by his skill, and is obeyed by his well-disciplined followers. Reys came across them in the forests of the Putumayo, a tributary of the Amazon, where he was hunting with four Indians. The Indians carried bows and arrows, while he had a Winchester repeating rifle. Suddenly they encountered a band of peccaries, and began to shoot at them, killing several. Thereupon the peccaries fled; and Reys, evidently much excited, followed them up, pumping lead into them from his Winchester, without noticing that the Indians had stopped behind. Of a sudden he found himself in the presence of what he describes as 'the commanding boar,' who gave a loud cry. At the cry the herd, which must have numbered hundreds, faced the hunter, roaring in unison, and formed a circle round him.

Realising that he was in a bad fix, Reys ran for the only tree handy; it had a slender trunk, which fortunately had one branch growing out of it about ten feet up, and this he succeeded in reaching, and flattered himself he was safe. He counted his cartridges, found he had only twenty left, and sincerely hoped that the wicked brutes, finding they could not get at him, would go away. Not a bit of it. Again he heard the commanding boar's loud cry, and saw this hero wisely taking shelter behind a fallen tree fifty yards away, from which secure post he calmly gave orders to the rest. At their commander's cry the whole peccary army gnashed their tusks till the forest echoed with the clashing, and advanced boldly to the foot of the tree, bristles up and eyes flashing fire. It seemed to Reys there on his branch as if he were in a scene

taken out of Dante's *Inferno*. The peccaries rushed at the tree with their tusks to cut it down; but, in their fury, they so pushed and hindered one another that they made little headway. The commanding boar gave another cry, and the mass of peccaries at once drew back, and only four remained to do the work unhindered. So effectively did they ply their tusks that Reys saw they must be stopped at once. To economise his cartridges, he aimed very carefully at the four in turn, and killed them in four shots. But he was by no means out of the wood yet.

Up came four more undaunted peccaries to cut through the tree-trunk, and they made the chips fly till four more careful shots disposed of them. Not a whit deterred by their fate, four others took their places and attacked the tree afresh. Four more shots disposed of them; but when four more fresh heroes took the place of these, Reys—who, as a military officer, was trained coolly to estimate chances—saw that, with only eight cartridges left, he could not kill off the whole peccary army one by one, and realised that the best hope of disposing of them lay in killing the general. But that astute warrior had his eye on the hunter, and ducked his head under cover whenever the Winchester was pointed toward him. At last, however, Reys got his chance. When the boar put his head up to observe, he lodged a lucky shot in his brain, and the peccary leader fell. At his fall the herd raised a great cry and fled away into the forest; and, finally, when they were all gone, Reys cautiously descended and went up to have a look at his fallen foe. He asserts that the peccary leader was not only larger than the others, but was also distinguished from them by a band of lighter colour running along his spine, 'which,' says he, 'evidently served as an emblem of his qualities of leadership.' 'Thus,' he concludes, 'it may be seen what a wonderful thing is nature and its teachings, proving that amongst the most savage of animals there are well-formed ideas of order, discipline, and work.'

With animals so intelligent as peccaries it is not alone bodily strength, with alert readiness to take the lead, but superior brain-power supported by both of these, that finally decides the headship of the herd.

HOIST WITH HIS OWN PETARD.

By Lieut.-Colonel Sir HENRY SMITH, K.C.B.

ONCE on a time, not so long ago, there lived in the breezy and bracing town of St Andrews a fondly attached couple—Richard Ramsay, and Edith, his wife, both on the sunny side of thirty; she a handsome woman, he a powerful young athlete who, in present times, would doubtless have been in the trenches at

the front, inhaling the poisonous gas of the enemy, and not on the links of St Andrews inhaling the invigorating and rejuvenating air which has restored to perfect health many a man run down from overwork, be he an Edinburgh writer, an advocate, or a Cabinet Minister. The couple, though, as I have said, fondly

attached to each other, were wide asunder as the Poles in their tastes, occupations, likes and dislikes—the wife being eminently domestic and devoted to her children, an accomplished pianist and violinist; the husband not knowing the difference between the ‘Dead March in Saul’ and ‘The Rat-Catcher’s Daughter.’ But the point on which the couple differed most acutely, on which they had come reluctantly, soon after marriage, to recognise that they never could agree, was—most unfortunately, seeing where they were domiciled—the game of golf. Richard thought of nothing but golf, and talked of nothing but golf. The daily routine was a round in the morning and a round in the afternoon; but occasionally a climax occurred compared to which the daily routine sank into insignificance, and was temporarily lost sight of.

Such a climax occurred a fortnight before the ‘autumn meeting,’ when Richard came home in a state of great excitement. ‘Did I tell you, dear,’ he exclaimed, ‘that Kirkcaldy are sending a team to play against our best team?’

‘No, you did not mention it to me.’

‘Well, such is the fact; and it is rumoured that Kirkcaldy have a dark horse whom they have kept bottled-up for months; and it is quite on the cards, so Bob Bunker says, that we may be beaten. You can imagine the sensation all this is creating, and the excitement at the club.’

Edith smiled, perhaps just a little superciliously.

The climax passed. Kirkcaldy won—thanks to the bottled-up one; but there was no bloodshed, and the ordinary daily routine was resumed.

‘Would you mind, dearest,’ Richard said one evening, ‘breakfasting at seven-thirty to-morrow morning? I must make an early start.’

‘Not a bit; but why the early start?’

‘Well, you see, Bob Bunker and I have put down our names for ten o’clock instead of our usual ten-thirty, and if we’re even half-a-minute late another couple are sent off. You should see Bob play! He’s a fine player, there’s no mistake about it; and he’s more cautious than I am—that’s how a lot of my half-crowns leave my pocket and make their way into his. Bob hasn’t driven into the stationmaster’s garden for quite a month, whereas I was in twice yesterday—twice in one day—both morning and afternoon.’

‘I am sure,’ his better half broke in, ‘that both you and Mr Bunker would be much more comfortable in the garden in this hot weather than on the sandy links. I noticed the gooseberries were almost ripe the last time I passed with the children. I wonder if the stationmaster sells them?’

No reply; he was deep in thought. Then, jumping to his legs, he put himself energetically into the position of ‘addressing’ the ball. ‘Mind you, dear,’ he said, ‘Bob has really a splendid swing.’

Edith looked up, evidently interested.

‘I don’t say it’s a better swing than mine, but I must admit it’s longer.’

‘I had no idea you had time for swinging. I thought you were at golf all day. The children doat on swinging. Are the swings far out on the links—farther than the stationmaster’s garden?’

‘Great Scott!’ he exclaimed testily, ‘will you never understand?’

‘No, my dear, I’ve told you many a time I don’t think I ever shall.’

‘Never mind, darling,’ apologetically, ‘I will write out a glossary, or concordance, or whatever they call it, and when you have mastered all the phrases we use on the green I am sure you will begin to take an interest in the game, and I shall induce you to come out and play a round with me.’

She shook her head. ‘No, I am not the “golfing girl” you see depicted at the railway station. I don’t start every morning with my golf-sticks (*sic*) in a bag slung over my shoulder, and stay out all day. I have my children to attend to.’

‘But,’ interrupted her husband, ‘what do we keep a nurse for? Surely Jemima can look after the children?’

‘Not as I can; but, independently of the children, if I were the golfing girl, who would sew on your buttons? Who would darn your stockings? Why, you are awfully hard on them. I suppose,’ archly, ‘it’s the way you stand when you are “addressing” the ball.’

‘I know, darling, you are the best wife man ever had, but I would risk buttons and stockings and everything else if I could only bring back the roses to your cheeks. You are positively as white as a ghost. Promise you will try the effect of the links, and come out with me.’

One morning, as he seemed so bent on it, she yielded.

‘Very well,’ she said, ‘let us start, and you will give me a lesson in the fascinating game.’

The first stroke Edith made was a good one, the second beat the first, and the third beat the second; and before she had time to realise it her ball disappeared in the hole.

‘Bravo!’ cried Richard; ‘if you go on like that you’ll be a scratch player, or possibly plus one.’

‘Scratch player sounds rather feline.’

‘Oh, but, my darling, here’s the glossary; I have carefully marked it against your first appearance as the golfing girl. Look at “scratch,” then at “plus;” now you understand it. You do not regret coming?’

‘No; it’s splendid. You’ll bring me to-morrow again, won’t you?’

‘Of course I will. No need for the rouge-pot now. The next thing for you to learn is how to address the ball properly.’

‘Address the ball! Make a speech to it? Is that necessary?’

'Find out from the glossary again, darling.'

Richard and Edith went home arm-in-arm, the happiest and most united couple in St Andrews.

Next morning Richard found Edith with her clubs, no longer 'sticks,' in the hall, waiting impatiently. She did better than ever.

'I shall be plus, Dick, you'll see,' she cried delightedly.

And the evening and the morning were the third day.

'Where's your mother?' he said to the children.

'We don't know,' they chorused, with tears in their eyes.

'Do you know, Jemima?'

'Well, sir, Mrs Ramsay ordered some sandwiches to be made last night. She said she and Miss Niblick must be out early this morning.'

Taking up a powerful glass and adjusting it to his focus, he turned his eyes on the links. Soon he discovered his wife wielding her club most vigorously, while Miss Niblick looked calmly on. 'She's in difficulties evidently,' he said to himself, and started off at his best pace.

Hearing some one approaching, Edith paused.

'My darling,' Richard exclaimed, 'have you forgotten the children's tea?'

Tossing back her beautiful hair from her lovely face, she regarded her lord and master contemptuously. 'If you had been twice in the whins and thrice in the cart-rut you wouldn't be thinking of the children's tea.'

An audible snigger from Miss Niblick.

He turned without a word, and went sorrowfully home. He comforted himself in thinking 'It will be all right to-morrow.'

But next morning things were worse. As he was wielding his autostrop he heard his wife's voice in the hall, and, looking down, saw her in full marching order, and whistling gaily to the dog, 'Come along, Stymie.'

'Stymie!' he ejaculated. 'The dog's name is Dick; he's called after me. Surely you haven't forgotten?'

'Oh,' she replied indifferently while opening the front-door, 'Nelly Niblick says Dick is a rotten name; but Stymie is rippin'. *Au revoir.*'

The widower* went up to the drawing-room again, and once more turned his glasses on the links. 'By Jupiter, what a swipe! Beats Freddy Tait's. But,' jubilantly, 'she's in "Hell," and I'm not sorry for it. No, the hard ground saved her; she's lying absolutely tee'd on the "Elysian Fields." She's lost to me for ever. Hoist with my own petard!' he said to himself. 'Hoist with my own petard!'

* Two inhabitants of 'Joappy' were strolling along the promenade one summer evening. 'Whae's that weeda wumman,' said one to the other, 'that sits on the roacks frae moarnin' ti' nicht knittin' stoackins?' 'Weeda wumman!' was the reply. 'She's no a weeda. Her man's a gowfer.'

HOIST THE SECOND.—THE HUNTING HOIST.

About twenty years ago there lived in the beautiful county of Berwickshire Robert Jardine and Helen, his wife, a couple similar to the couple at St Andrews, fondly attached to each other; but, like the hero and heroine of the links, wide asunder as the Polas on one subject—the subject of hunting. Though eminently Scotch, the husband, in common with the late Lord Scamperdale, had a contempt for hunting in Scotland. Lord Scamperdale's words, addressed to Mr Soapy Sponge, were: 'Rot ye, sir! hanging's too good for ye! You should be condemned to hunt in Berwickshire for the rest of your life.' Every year about the end of September he left his beautiful residence and emigrated to the neighbourhood of Rugby, where he rented a 'box' repleta with everything connected with the 'sport of kings,' and there he remained till the very last 'meet' of the season. His poor wife disliked going south intensely, where she heard nothing but 'shop'—that is, horses, hounds, huntsmen, and 'whips' all day long; but she bore her cross resignedly, while praying for the beautiful slopes of the Lammermoors and the deep blue sea which dashed itself against the Bass Rock.

'My darling,' her husband said to her one morning, 'you look awfully well in a side-saddle. Why not come out with me and have a day with the hounds?'

'No, I'm not a hunting woman; and how often have you told me that women were a nuisance, and you could not imagine how men could bring their wives and daughters where they knew they were not wanted? Besides, you would be so nervous lest I came to grief that your day's sport would be spoilt.'

'Not a bit of it. That Irish mare has carried a lady; she positively can't put a foot wrong.'

At last, by reason of much importunity, he gained his point, and one morning, with the proverbial southerly wind and cloudy sky,† they set off together. The sport was glorious. The mare carried the lady right up among the hardest men in the hunt, where she rode proudly alongside her husband. As she had held her own in the field, so she held it in the dining-room, discussing with the sterner sex the events of the day, and blushing becomingly at the loud encomiums on her horsemanship. No tabloids were required that night. Helen slept the sleep of the just.

When Die Fitzgibbon, a girl without a trace of jealousy in her composition, and the hardest little 'thruster' that ever galloped up the Wicklow Mountains, heard the news—stable misfor-

† Generally, though erroneously, believed to be the typical hunting-day; whereas, as far at least as my experience goes, far better sport may be expected, and faster runs as well, when the ground is dry as a bone, and showers of dust are driven by an east wind into the nostrils of hounds.

tunes had kept her at home on the eventful day—she drove over in her jaunting-car to congratulate Helen.

Now it so happened that within the next fortnight things were reversed. Helen had to stay at home, and drove over to get the news from Die. She, Helen, could not bear to think she might have missed a 'good thing.'

'You missed nothing, dear,' said Die. 'We spent an hour and a half over lunch. Nobody expects any sport in that beastly country.'

'But didn't the hounds find?'

'Oh yes, and we had a run, if it can be dignified by that name. The field was mostly composed of second horsemen out for exercise, and of course the three inseparables.'

'Oh,' interrupted Helen, with a merry laugh, 'I can see it all now. First the fox, then Mr Trotter,* then the hounds, then Shoolbred and Kennedy.'

'Bravo!' cried Die; 'Faugh-a-Ballagh himself couldn't have described it better.'

To those who make the pursuit of the fox the all-important object in life, Rugby is a paradise. There you can put in six days' hunting a week, and seven did the law permit of it. The country is studded with boxes where friends meet at dinner to compare notes and fight their battles o'er again. After three or four glasses of Dagonet or Geisler, it is instructive to see how the brooks increase in width and the fences in height. There are, moreover, two or three 'assemblies' a week—at least there were in my day—where every one of note, and sometimes Royalty, is in evidence. And thereby hangs a tale—of a tailor—a tailor who had his business premises situated within a stone's-throw of the top of the Burlington Arcade. It takes, so they say, nine tailors to make a man, and, even when made, he is not much to look at; but there are exceptions.

Many years ago this tailor lived at Rugby. Barring the fact that he had considerable difficulty with his aspirates, occasionally omitting one where it was wanted and inserting one where it was not, he was, as our gallant Allies say, *tout à fait convenable*. He kept ten or a dozen weight-carriers, and was pretty generally in the 'first flight.' Now it so happened that one evening there was an assembly to which 'Snip' went; but Royalty, though in the neighbourhood, stayed at home. Next morning Royalty and tradesman met at the covert side.

'Well, Mr Blank,' said the former, 'enjoyed yourself last night, I hope?'

'No, your Royal 'Ighness, I did not.'

* Jock Trotter, younger brother of Major-General Sir Henry Trotter of Morton Hall, Midlothian, afterwards Master of the Meath Hounds, the very hardest man I ever met. Shoolbred and Kennedy, also grand horsemen, and always 'there or thereabouts' whether they got 'well away' or not. I have seen men who, having been on the wrong side of a covert, or for some other reason were unable to get 'well away,' sulk and go home—not my idea of good sportsmen.

'What! Were there not some nice people there?'

'No, your Royal 'Ighness; a very mixed lot.'

'A mixed lot, were they? You didn't expect them all to be tailors?'

But to our tale.

The season progressed, and at last came to an end. The 'stinking violets' blossomed and faded. 'And now, Nell,' said Bob with great glee, 'we're off to Berwickshire.'

Instead of the joyous assent she used to give at such an announcement, Nell's heart was no longer in the north. 'We must not miss the cubbing, Bob,' she said.

Bob looked glum. 'Oh, Nell, won't Sandy be disappointed if we don't turn up on the 11th as usual? Never was such heather, he writes; the grouse are swarming, not a trace of disease, and the butts are just the right height and beautifully drained.'

'Of course I'll go with you, if you wish it, dear,' Nell replied; 'but I don't want that little beauty spoilt. Grooms have such heavy hands, most of them.'

'Well, Nell, there I agree with you. It would be a terrible pity if Kathleen's mouth was left to a man who hung on by the bridle. I gave Bob Chapman, no doubt you remember, two hundred and forty pounds for her.'

So the beautiful house remained vacant; the grouse called to each other in the early morning before the sun broke out and the mist cleared away; the blackcock strutted about and fought for the hens on the slopes of the Lammermoors; and the hill partridges twittered and cheeped among the grass-seeds on the fringe of the moor. The old housekeeper opened doors and windows, aired sheets and blankets, watched for the postman, and looked for the letter which never came.

Like unto Richard Ramsay at St Andrews, so was Robert Jardine at Rugby—Hoist with his own petard!

A LIFE ON THE LAND.

A LIFE on the land! Is there room for all?

Yes, room in the woodlands free,
Room on the hills, where the wild-flowers call
And the creeks wind down to the sea.

There is elbow-room on the open plain,
A field on the broad plateau,
Where the fallow thrills with the autumn rain,
And the upland breezes blow.

There is breathing-space where the rivers glide
Through the deep alluvial loam,
A footing left on the mountain-side
For a vine-enclustered home.

The waste lands wait for the men who dare
To trust to themselves alone,
Who long for a life in the bracing air,
And a freehold all their own.

NEVILLE BOSWORTH.

SEVENTH SERIES

THE LAUGH.

By RALPH STOCK.

PART I.

YATES mechanically gathered up a dirty knife and fork, a mug, and three enamel plates, which had accumulated from that day's breakfast, dinner, and tea, and slid them into the wash-pan. He then added hot water; and, producing a satisfying lather by stirring it with a perforated coffee-tin containing household soap, he proceeded to wash up.

This done, he 'dried' with equal precision, arranged each article in its appointed place on the shelf behind the stove, and spread the dish-rag over the inverted wash-pan to air. Then he lit his pipe and looked at the clock. It was twenty minutes past four, just ten minutes before he usually fed the calves. For the moment Yates seemed at a loss, as if those ten spare minutes should not have been. However, he occupied them by filling and trimming the hurricane lantern, and exactly at the half-hour set out for the corral.

Darkness had already descended on the prairie; but the level expanse of snow reflected the star-pricked sky, and far away on an invisible horizon the Northern Lights flickered and danced like wraiths at play.

Yates scrambled up a stack, and for the next half-hour pitched hay to the bawling, scampering calves. Range stock they were, Durhams and Herefords for the most part, and hefty as only five months' buffalo grass and mothers' milk could make them.

'Ought to winter all right,' mused Yates, standing in the middle of the corral for a final inspection with the hurricane lantern held above his head. He said this aloud almost every night. It was part of his life.

Half-way up the hard-trodden snow slope to the shack he paused. Something was gathering in the north-east, something that had put the playful wraiths to flight and was blotting out the stars. A faint, icy cold wind was borne out of the darkness, and down at the corrals the snow-birds twittered shrilly.

'Storm,' said Yates, again aloud, and trudged on to the shack.

He went to bed humming Gilbert and Sullivan, and awoke to the tapping of snow on the window-pane; not the soft patter of flakes, but

the peremptory rapping of a blizzard straight from the worst quarter. Yates knew it well, knew what it might mean for him; but it made no difference, as yet, to his curriculum. He lit the fire with shavings carefully prepared the previous evening, set the kettle on the stove, and, muffled to the eyes in a wombat coat, went out to feed the calves. They no longer scampered or bawled, but slunk out of the shed with hunched backs, ate as much as they could in as short a time as possible, and slunk back again to huddle in a corner for warmth.

Yates thawed out his moustache over the stove, and had breakfast, completing the early morning routine by spreading the dish-rag over the inverted wash-pan to air. He always washed up if there were any likelihood of his not having another meal at home that day, and as things were at present it looked very unlikely indeed.

He wasted an hour, two hours, sitting in the home-made rocker, smoking placidly, but the frozen flakes of the north-east blizzard still rapped at the window-pane.

Presently he got up and struggled into a pair of heavy Angora chaparejos, then a fur coat, stuffing into the pockets what food he could find, a flask of emergency brandy, and a pair of wire-cutters.

Down at the stables his favourite cow pony whinnied at his approach; but, before saddling up, Yates pulled down a panel of the hay corral so that the calves should have access to the stack while he was away.

Half-an-hour later he and his pinto pony were a white phantom moving slowly through a world of driving snow. It was necessary to ride round the main bunch. They might drift anywhere, and Yates must drift with them. It was part of his life.

With the wind in its present quarter he knew just where to find them, and presently came upon them huddled in the lee of Tea Kettle Butte, a thousand odd head of cattle, standing or lying motionless, with snow thick upon their hunched backs. They must be moved, kept moving, for to lie down was to die. Yates rode amongst them, shouting and swinging his quirt

until they began to move slowly, reluctantly into the open. The storm did the rest. They drifted before it, and Yates followed, humming Gilbert and Sullivan into his fur collar.

It must have been about noon that there came a check, the bunch spreading out, and finally coming to a standstill. Yates rode through their midst, and dismounted at a five-strand barbed-wire fence. It belonged to the Priest boys, and they were rather proud of it, but it had to be cut. Yates groped for the wire-cutters with numbed fingers, succeeded in extracting them from his pocket, and dropped them into the snow. Not a sound or sign of impatience escaped him; he merely hunted in vain for upwards of three minutes, and then kicked loose two frozen stones from a wind-cleared ridge and hammered the wires between them until they snapped, the cattle pouring through the gaps in a vain endeavour to escape the pursuing blast.

The fence on the far side of the field was dealt with in the same way, and Yates watched the cattle streaming through with a certain satisfaction. From here onward, if the wind held in its present quarter, there was nothing between them and the international boundary-line, a clean sweep of over eighty miles. The Priest boys' fence had always been a death-trap, Yates reflected. They could drift now until the blizzard died out—or the cattle—one of the two. He could do no more.

The pinto had already turned in the direction of home and stable, despite the blizzard, when Yates glanced over his shoulder. Something caused him to whip round, and for a moment he sat motionless, straining his frost-rimmed eyes into the mass of snow.

Through it he saw the cattle, a faint, moving mass, heading for the east. The east! And it looked as if some of them had broken into a run; the mass rose and fell unevenly like the waves of a choppy sea. They were running! And Yates was after them.

Only one thing will cause a bunch of cattle to change its course when drifting before a blizzard. Yates worked the pinto to a lather in his efforts to head them off, but one man was as a pebble against a tide; they lowered their heads and charged the slanting storm, bellowing as they ran. The run developed into a stampede, and Yates reined his sweating pony into a walk.

He knew just what had happened. They had sensed the presence of other cattle over there in a death-trap known as the War Lodge Coolie, and nothing would stop them from joining forces. Companionship in adversity is strong on the range. Yates knew also what it might easily mean—the loss of 20, 40, even 80 per cent. of his stock. He dismounted and filled and lit his pipe in the lee of his cow pony's heaving ribs, though he knew that after twenty puffs the tobacco-juice would freeze in the stem. Then

he mounted and rode at a slow walk toward the death-trap.

They were all there, and half the Priest boys' bunch as well, some fifteen hundred head of cattle bunched in the *cul-de-sac* of a deep valley, tails to the weather, waiting for the blizzard to abate or bury them where they stood.

Yates rode round them leisurely, looking for other riders. There were none. He wondered vaguely where the Priest boys might be at that moment; possibly roasting their toes at the stove in their cosy shack on Bear Creek. They were inclined to be slack. At any rate he could do nothing alone. He rather doubted if fifty riders would be able to do more. There is nothing quite so obstinate as a desperate cow.

Yates recognised a good many of his bunch. There was the blue three-year-old that should have been beef next spring. She was down, and the snow already covered her legs. A long-horned Texan steer, gaunt as a scaffold, stood placidly chewing an imaginary cud; he had seen many such storms, and in all probability would see many more, for he was of the breed that makes beef slowly, but can stand almost anything.

The heifers were dropping fast. Yates counted them aloud: 'One, two, three, four'— He had reached fifty, riding slowly round the bunch, when his quick eye was attracted to a hummock on the hillside. On a second inspection it proved to be more, and when he dismounted at close quarters it resolved itself into the snow-covered form of a woman—a woman with red hair, Yates took time to notice, before shaking her like a rag doll.

'Hi!' he bellowed. 'Hi, d'you hear!'

Apparently the woman with red hair did not. Yates poured brandy between her teeth—they were remarkably small and white—and fell on her afresh, pummelling and shaking her absurdly soft body until his arms ached from shoulder to wrist.

She cried out at last, a small, plaintive sound, and her eyes fluttered open. They were the brown of English wallflowers.

'Hi!' roared Yates, as the eyelids commenced to droop. 'We've got to get out of here. Can you feel that?'

'Feel what?' came a drowsy but not unpleasant voice.

'That,' said Yates, pinching the toe of her riding-boot with all his strength.

'What?' repeated the voice, faintly petulant, and the woman sat up.

Yates answered by whipping off her boots and rubbing her toes with snow until she cried out.

'Now,' he said at last, 'can you stand?'

The woman scrambled to her feet. 'Where's Ted?' she demanded. 'Good gracious, is the storm still on? I must have been asleep.'

'I don't know where Ted is,' said Yates.

'The storm *is* still on, and you've been asleep all right.'

The woman looked at him with her wallflower eyes, and shivered.

Yates stood over her with the flask. 'Take another pull,' he said—'a good one;' and, while she obeyed mechanically, he caught up the pony's trailing bridle-lines and mounted. 'Now take hold of the stirrup and walk,' he commanded. 'Stamp your feet whenever you get a chance, but keep going. Just stick it, and we shall get home all right.'

The woman, perforce, obeyed, and they moved out into the storm.

Yates fancied that it had died down a trifle, but it was just as cold, and this infernal woman with the red hair made it impossible to push on at any speed. Every now and then she looked up at him, and at last he took pity on her.

'Are you warm yet?' he shouted down at her.

'Yes,' she panted; 'quite—thanks.'

He dismounted, strapped his fur coat over hers, and hoisted her into the saddle. Yates had an idea that she was trying to say something, protesting in some feeble way, but it was really not worth bothering about. There was nothing to be said, everything to be done. The pinto knew his stable, if mere man did not. Yates had absolute faith in a horse's instinct; and once, when the woman dared to touch the bridle-lines, knotted and hanging loose on the animal's neck, he shouted a warning. She dropped them like a red-hot coal.

All night they fought their way against the storm, but it was slackening, and once the moon glimpsed through the cloud-wrack. The dawn broke fair, and the sun, when it had dispelled an icy mist, shone cold but clear on the illimitable snow plains, converting them into a sea of scintillating jewels.

Yates's movements had become entirely mechanical. His legs sank into and lifted themselves out of the snow of their own volition, and he knew that if the process were stopped he would fall, after the fashion of a spinning-

top. Also, he was aware that once or twice the woman spoke, but it was far too much effort to answer her, to explain anything; he needed every ounce of energy and will-power to keep going.

The sight of a lone pine-tree silhouetted against the sky on a terrace in the far distance registered itself on his mind, because he knew that it was close to his shack. From then onward he saw nothing but that lone pine-tree, heard nothing but the methodical crunch, crunch of the pony's hoofs in the snow. Could he last out? He rather fancied so. Yates was one of those men who have never known their own strength, because they have never taxed it to the utmost. He was doing so now. The force that kept him on his feet, plodding, plodding, was unconscious energy, stored up during five years of a clean, open-air life. The woman, muffled in furs, looked down on him and marvelled silently. She had found that words were of no comfort or assistance to this man. She fell to wondering.

Something troubled Yates. At first his mind, numbed with fatigue, refused to grapple with it; then, by sheer insistence, it forced itself into his consciousness. Of course, it was the blinding reflection of sun on snow. He groped in his pocket for the smoked glasses, but failed to find them. He must have forgotten them, for the first time in his well-regulated life. It became a positive nuisance, this glare of light, interfering with a clear view of the lone pine-tree, and causing the eyes to smart abominably. Then strange things happened: balls of fire floated before his vision, balls of red fire that leaped and swirled and finally burst, shutting out the world—which for Yates was the lone pine-tree—as completely as a red blind drawn down over a window. Thenceforth he plodded through a red pond, a pond of blood, with no other guidance than a grip of the wooden stirrup of his Mexican saddle and a firm faith in the instinct of his cow pony. Yates was snow-blind.

NEW YORK AND LONDON IN 1916: A CONTRAST.

By Mrs JOHN DALL, M.A.

THERE is perhaps no way in which one can get a more vivid impression of the contrast between a nation enjoying the blessings of peace and a nation sitting in the darkness of the shadow of war than by being suddenly transported from the crowded metropolis of a neutral country to the throbbing life-centre of a beligerent Power.

Such was our good fortune in this the second year of the European war, if New York and London be thus regarded. In British North

America everywhere is observable that military activity which has of late been extending in ever-widening circles from the centre of Empire; the eye is accustomed to the sight of khaki-clad men marching and drilling throughout the Dominion; but once we are across the border, a striking change becomes apparent. Here the spirit of war is dormant, or perhaps it is truer to say it is waking from sleep, for the United States, albeit unwillingly and maybe almost unconsciously, is showing the influence of the world

war at work within her own borders in an awakened interest in the question of national defence against possible hostile invasion, and in the advocacy of a policy of preparedness.

Of course, while as a nation America has mainly followed *laissez-faire* principles, individual Americans have chafed at inaction, and, maintaining that in such a war as this true neutrality is impossible, have definitely cast in their lot with one side or the other. We owe much to countless brave American citizens, who, whether from love of adventure or hatred of oppression, have chosen to fight for our flag; and there are others whose work is as useful, if less obvious. I know of at least one American-born professor in a Canadian university who has placed his skill at the service of the Allies, and in his five months' vacation will be employed making shell-cases, giving at the same time every cent he earns in this way to the Canadian Red Cross.

But it is the nation we consider now.

Near one of the towns in New York State there was a great training camp, where relays of men were to go on training during the summer months; everywhere were placards and posters advertising a military tournament and naval manoeuvres. New York itself, when we arrived, was gay with flags and bunting, in readiness for the Preparedness Parade, in which all branches of labour were to be represented. At every street-corner one could see such legends as the following, writ large, 'Your country is the greatest country in the world! Why not defend it?' while in Wall Street and Broadway street-venders were displaying patriotic buttons and miniature Stars and Stripes.

To a Britisher it comes with a sense of shock that among a people sharing our language there should be any doubt as to the righteousness of our cause, and discussion of the war after the fashion of an academic question strikes strangely on the ear. Strolling through Bowery and the Ghetto, the fiery Scot is even moved to wrath by seeing German and English newspapers side by side on the stalls, and hearing at every turn the guttural voice of some garrulous German.

A friend whose footgear required professional attention one day took his boot to the cobbler wrapped in an old piece of newspaper. The cobbler, who was undoubtedly of German origin, noticing the German script in the paper, asked if he knew German, and on getting an answer in the affirmative, began volubly to talk on all manner of things, till finally the *schlacht* came under discussion. As soon as our friend said he was English conversation ceased abruptly; nor was any effort made to resume it. New York, however, like Boston, is mainly pro-Ally, though every third store bears a name of decidedly Teutonic ring.

The temper of a nation is perhaps best gauged by what affords it amusement. In search of entertainment one evening we visited

the Hippodrome. There were some marvellous performances; but perhaps the most significant in the present situation was an item entitled 'The March of the States,' in which, to the music of Sousa's band, groups of girls appropriately garbed to represent each of the states of the Union marched on, and were finally gathered together under the Stars and Stripes. References to the strong Note which the President had just sent to Germany were hailed with an applause which left no doubt as to where the sympathies of the vast audience lay. Most striking of all was the great blaze of light at night-time in theatre-land. All along the Great White Way electric signs of the most dazzling brilliance and intricate design were blazing, and everywhere was abundant evidence of the golden stream that is pouring daily into the coffers of the States. A crowd would gather round a newspaper bulletin-board, and we would be borne along in the rush, only to find that where we had expected news of some vital victory or strategic move in the world conflict, pride of place was given to the report of the knock-out blow of some boxer or the scores in a baseball game.

But even far away here is the edge of the far-flung battle-line and a silent witness to the power of the British navy. A trip up the Hudson brings us close to the spot where, chafing in forced inaction, lies the *Vaterland*, that king of ships, with its surrounding satellites all held captive to the same supremacy. There they lie, steam up in trim to sail, but powerless to forsake their shelter. Even more significant of Britain's sea-power is the sign observable in the shipping quarter of the city. Here, where all the various transatlantic lines have their offices with notice-boards outside advertising the current sailings, hangs the board of the Nord-Deutscher-Lloyd Line a glorious magnificent blank—triumphant testimonial to the German navy keeping close to Kiel.

Of course, the contrast between New York and London is not confined to war-time. Everywhere in New York there is the spectacle of a city still in its growth, reaching out after the expression of its own individuality. The most characteristic difference is that which impresses itself first and last upon the visitor. In sharp distinction to the age-old architecture of the Old World comes the almost aggressive modernism of the New—that marvellous group of sky-scrapers which commands the harbour. To the Eastern mind these architectural efforts of the West are wont to appear fantastic, vulgar, and crude, and so the visitor is apt to approach them with a mind full of prejudice. Yet they have a beauty that is unique, but still is beauty. Seen dimly through the mists of the morning, the giant Woolworth building, shadowy and vague, with perhaps a glint of sunlight gilding the summit, or looming gaunt and sinister at nightfall, catches

the imagination with its almost unreal massiveness, and we fancy we have here a second Tower of Babel daringly reared to the skies, and destined to swift destruction. Looking at the pile of lofty buildings massed together, one feels something of the emotion evoked by a sudden sight of some vast mountain range, and realises something of the spirit that Pennell's pictures have so wonderfully expressed.

In little over a week pleasantly spent at sea without adventure, we set foot on English earth again, and about four o'clock on a Sunday afternoon found ourselves in London. Such a London! Our first realisation of the change wrought by war came with the difficulty we had in finding a taxi. Verily things *are* changed when one considers it a personal favour to be allowed to enter a cab! In the brief journey to our hotel we saw many different uniforms: here a husky, prairie-bred farmer would be hobnobbing with a bronzed Australian giant; South Africa would meet India's wondering eyes; while we got a glimpse of the terror of the time in the tired eyes and maimed limbs of some wounded Tommy. And then at nightfall! Could this be the London that we knew? Is it not hard to recognise the London of lights and laughter in this City of Dreadful Night? Here street lamps are darkened, and in the dimly gleaming asphalt streets run the usual taxi-cabs and buses, now tiny twinkling glow-worms shining in the surrounding dusk. Overhead the searchlights play, scanning the night sky for the dreadful Zeppelin. Yet in spite of it all London is typical of the entire nation in its dislike of the abnormal. Wearing the heart on the sleeve is not a national failing, and that is perhaps the explanation of why we remain such a perpetual enigma even to those allied with us.

I have never forgotten a letter which I read early last year. It was written to a Turkish-born Canadian in America by an American friend in Oxford. Von Tirpitz had just proclaimed his submarine blockade of the British Isles, and the writer, commenting on the situation in England, said something like this: 'It is dreadful, and I

fear worse will follow. Frankly, I am very much scared and apprehensive; but as I seem to be the only person here who takes it seriously, I do my best to hide my feelings.'

And so, despite the war, life in England is still fairly normal—too normal, as many will say. Step for a moment from the street into any of the parks in the centre of London, and who could dream that our people are at death-grips out yonder? For there is no trace here of the din and rush of panic-stricken Londoners so fondly gloated over by the German Press, but a picture of a people seeking their rest in familiar ways and places.

And, war or no war, the fact remains that for all its wealth and present plentiful supply of labour, New York has much to learn from the Londoner even in war-time in the cult and care of the people's pleasure-grounds. New York has not yet had time, perhaps, to turn her thoughts much in this direction; but it is an indisputable fact that the public parks and gardens in London are laid out and kept with a taste and care which those who are responsible for parks like the Central and the Bronx in New York would do well to imitate! It is a comfort to know that in these days of strain and sacrifice, when it is so difficult and so necessary to get what we can of brightness and happiness, there are such gardens of delight whose gates fly open at our touch. Of course, there are many throughout Britain to-day whose light-heartedness is neither a mask to conceal pain nor an attempt to be happy while recognising the seriousness of the time, but a stupid and heartless endeavour to deny the existence of a crisis while following their own pleasure at all costs; but in fairness to the nation it must be admitted that these are in the minority, and scarcely fair samples of the race. And, if a last contrast may be made, we see London to-day being purged in the furnace of affliction, and losing therein much accumulated dross; while New York, in her care for the things that perish, is, if she see not to it, not so much in danger of losing her own soul as of never coming to find it!

PINCHER MARTIN, O.D.

CHAPTER X.—WAR.

I.

[The reader is cautioned against accepting this story as an official narrative of the great war. The incidents described have actually happened; but, for obvious reasons, it has been necessary to give them fictitious colouring.]

DINNER in the wardroom had been over for some time, and the long table in the centre of the apartment was cleared. The mess, though it was close on ten o'clock, seemed very full of officers, far more crowded than on ordinary

evenings, and it was noticeable that all wore 'monkey jackets'—the ordinary eight-buttoned reefer coats usually seen in the daytime—instead of the customary mess-jackets, low waistcoats, and starched white shirts.

The unusual size of the gathering was accounted for partly by the fact that it happened to be the evening of 4th August 1914, when people were expecting things to happen, and partly because

a six-inch gun casemate, which ordinarily served as an officers' smoking-room, had been bereft of its furniture, supplied with a number of evil-looking shell, and had otherwise been converted to the grim legitimate function for which it had originally been intended—that is, as an armoured position for the gun and its crew.

Pipes and cigarettes were going full blast, and the air in the wardroom was blue with tobacco-smoke. A few of the occupants were seated in arm-chairs or on the sofas, re-reading the morning papers or assimilating the latest news from the early evening editions, which had arrived with the last post at eight o'clock. But by far the greater number were arguing and talking loudly, as was their habit.

The mess itself looked rather bare, for pictures had vanished from the bulkheads, and the carpet, the piano, and certain other not strictly necessary articles of furniture had disappeared. They had gone the way of a good many other things—ashore out of harm's way, where their presence could not be the cause of possible fires or splinters. Less than a fortnight later, however, the younger members of the mess were all clamouring for the return of the piano. They couldn't have their sing-songs without it, they explained—which was perfectly true. Moreover, they said, they were sick unto death of Peter Wooten's bagpipes, the *padre's* banjo, and Boyle's penny whistle, the only other musical instruments in the mess; and so, after some discussion, the piano came back, like the landlady's cat. The cabins, too, were practically gutted. Fitz-Johnson, who loved comfort, nearly wept when he entered his. His silk hangings and curtains, pictures, and photographs had been torn ruthlessly from their fastenings and sent ashore. They had filched his carpet and his chest of drawers. A score or so of exquisite striped shirts, many suits of plain clothes, his uniform full dress, frock-coats, and mess-jackets, which fitted his figure like a glove, and shore-going boots of all kinds, shapes, and colours, had been packed up in a box and sent to his long-suffering outfitter's for storage. Little had been left him beyond his shallow bath, the drawers under the bunk, a bookcase containing the King's Regulations and Admiralty Instructions, the Addenda thereto, and a washstand. Everything else seemed to have gone. He complained bitterly, poor fellow, for his exquisite soul rebelled at this wholesale desecration.

The general atmosphere in the wardroom was by no means gloomy or sad. On the contrary, every one seemed to be bubbling over with good spirits. In some cases, perhaps, the hilarity was a trifle forced, for when folk realise that war is practically inevitable they think they must appear to be cheerful whatever their personal feelings may be. As a consequence, they sometimes overdo it. But there were no signs of depression; neither did one see the

fierce aspect, tightly shut mouth, puckered brow, and general 'do or die' appearance usually associated with the eve of hostilities by sensational writers. They all knew that the chances were fully 100 to 1 that they were about to take part in the greatest struggle the world had ever known. Germany was already at war with Russia; Teuton troops had violated the neutrality of Luxemburg and Belgium, and had crossed the French frontier at various points; so it seemed impossible that Great Britain could refrain from joining in the conflict.

Ever since the early afternoon things had been humming. Urgent telegrams in cipher and wireless signals in code, the purport whereof were unknown to any but the senior officers, had been pouring in all day. Steam for full speed had been raised, and the ships were ready to move at an instant's notice; while Captain Spencer had been on board the flagship during the afternoon, and was away for a very long time. But not till afterwards did any of them know that the British ultimatum had already been handed to Germany.

Nobody was anything but cheerful. Their loyalty to their king, their anxiety to fight and overcome in a just cause, and, if need be, their readiness to die could not be expressed in mere words. There was no necessity for it. They took all that as a matter of course. They had been brought up to the idea ever since they had joined the service, so why talk about it?

'Peter, old son,' said the first lieutenant, rising with a yawn, and kicking the senior watch-keeper gently as he sprawled in an arm-chair, 'you're keeping the middle watch at the guns, aren't you?'

'I am, No. 1,' Wooten nodded. 'What of it?'

'Be a good chap, and have me called if war's declared, if any one fires a torpedo at us, or if you sight another Zeppelin.' He winked slyly at Fitz-Johnson. 'Also, at ten minutes to four; and tell the messenger to drag me out of bed. If you love me very much, Peter boy, you can have a nice cup of hot cocoa waiting for me when I come up.'

Peter rose from his chair and blinked sleepily. 'My love for you, No. 1,' he declared with great gravity, making a low bow with his hand on his heart, 'has long since passed its platonic stage. I will prepare your cocoa with mine own fair hands, and would even embrace your chaste cheek before you retire to your couch.' He stretched out his arms and advanced.

'Touch me if you dare, varlet!' Chase exclaimed, avoiding him neatly, and darting to the door.—'Well, s'long, all you chaps; sleep well.' He paused with the door open.—'I say, Dook, old man!'

Fitz-Johnson looked up.

'If you see another Zep, old bird, you might

take a photo of it. There's a camera in my cabin.' He vanished, chuckling.

Some time after eleven p.m., when the ward-room had been closed for the night and the officers had retired to their cabins, the sound of frantic cheering suddenly echoed out over the water. It came from the direction of the flag-ship; and Tickle, the officer of the watch in the *Belligerent*, paused in his perambulation. It could only mean one thing.

Ten minutes later he was reading his Majesty's message to Sir John Jellicoe, the Commander-in-Chief of the Home Fleet:

'At this grave moment in our national history, I send to you, and through you to the officers and men of the fleet of which you have assumed command, the assurance of my confidence that under your direction they will revive and renew the glories of the Royal Navy, and prove once again the sure shield of Britain and her Empire in her hour of trial.'

'And a jolly fine message, too,' Tickle muttered to himself. 'God bless him!'

Almost simultaneously came the official intimation that a state of war existed between Great Britain and Germany as from eleven p.m. on 4th August. The news spread like wildfire, and the 'Belligerents,' not to be outdone, left their hammocks *en masse*, crowded on the upper deck, and gave vent to their pent-up feelings and enthusiasm in volley after volley of cheers. They were quite irrepressible, and before very long the 'squeegie band,'* composed of two drums, a dozen fifes, many mouth-organs, and an unholy number of mess kettles and other noisy utensils, was marching round the deck making the night hideous. The noise did not cease till well after midnight.

War had come.

II.

Christmas came and went; but, though the ship's company made a point of keeping up the time-honoured traditions and customs, things were hardly the same as usual. They did not suffer from lack of seasonable fare, for volleys of plum-puddings and other comestibles from home had temporarily superseded the deluge of mufflers, mittens, and cigarettes; while the canteen did a roaring trade in turkeys, geese, boiled hams, fruit, holly, and chains of coloured paper for decorations.

On the morning of the 25th itself the squadron happened to be in harbour, and at daylight the *Belligerent* and every other ship appeared with the customary branches of fir and evergreen lashed to the mastheads and the yardarms.

At eight o'clock came a signal from the vice-

* Most ships, even those carrying proper musicians, have a home-made band formed by the men themselves. It always goes by the name of the 'squeegie band,' though why I cannot say.

admiral wishing all the officers and men under his command 'A Happy Christmas;' and at divisions at nine-thirty the officers took the opportunity of saying the same.

Then came church and the issue of Princess Mary's gifts; and if the donors to the fund could have seen the way these gilt boxes, with their cards, pipes, packets of tobacco, and cigarettes, were appreciated by their recipients they would have felt that their generosity had been repaid. A gift was always a gift and something to be appreciated, but a gift from a Royal Princess was to be treasured as an heirloom. As a consequence, the greater number of the men sent their boxes home by registered post without smoking the contents. They were far too valuable to be kept on board when there was a chance of the ship being torpedoed by a hostile submarine or sunk by a mine.

Shortly before noon the band assembled outside the captain's cabin, and as eight bells struck, Captain Spencer, preceded by the musicians playing 'The Roast Beef of Old England' and the 'funny party' with blackened faces and attired in a variety of strange costumes, and followed by a procession of all the officers, made the usual tour of the mess-deck. Some of the messes were embellished with festoons of paper chains, sprigs and bunches of holly and mistletoe, and home-made mottoes. Others were hardly decorated at all, but all the tables were well laden with food. At the foot of each mess stood a man with a plate of cake, pastry, or pudding, which he offered to all the officers in turn as they passed by. Every one of them took a small piece, wished the occupants of the mess 'A Happy Christmas,' nibbled the cake or whatever it was, and then hastily secreted the remains in his pocket. There were several dozen messes to be visited, and a few ounces of stodgy cake from each of them would provide more than enough for a schoolboy.

Opposite one of the chief petty officers' messes the procession came to a halt close to a black-board on which was chalked in large letters:

'The Ship's Company of H.M.S. *Belligerent* wish Captain Spencer and the officers a very happy Christmas and a bright and joyful New Year. They deeply regret that up to the present Captain Spencer has not had the opportunity of taking them into action, but are anxiously awaiting the time when he will.'

The captain smiled, took the proffered chalk, and made his reply.

'The same to you,' he wrote. 'Captain Spencer will be only too pleased to take the ship into action whenever the enemy give him the chance. When the time comes he and the officers know that they may rely on the "Belligerents" to give a good account of themselves. Let 'em all come!'

Loud and prolonged cheering before the procession moved on.

It took fully half-an-hour to do the whole round of the messes; but at last the officers disappeared to their own lunch, and left the men to go on with their meal. They acquitted themselves nobly.

Soon after lunch, when Tickle had retired to his cabin and was composing himself for his usual afternoon slumber, there came a knock at his door. 'Well, what is it?' he inquired lazily.

'It's me, sir,' said Petty Officer Casey, insinuating his head through the curtain. 'The foc's'lemen sends their compliments, sir, an' would yer be so kind as to visit 'em in their messes for a few minutes?'

Tickle yawned, hoisted himself out of his bunk, and stepped outside. Here he was promptly seized by four stalwart A.B.'s, hoisted shoulder-high, and, with a man in front playing triumphantly upon a mouth-organ, was carried off. Down ladders and up ladders they went, through cheering crowds on the mess-deck, until they finally allowed him to slide gracefully to earth among the men of his own fore-castle division.

They proceeded to drink his health in navy rum, a compliment which he was bound to return; but even then the ordeal was not over.

'They'd like yer to say a few words, sir,' Petty Officer Casey prompted him hoarsely.

Tickle cleared his throat nervously. 'I'm not much of a hand at making a speech,' he began; 'but I'm very glad to come here and wish you all a happy Christmas again. From what I can see—he looked round the tables—'you all seem to have been enjoying yourselves. My only regret—our only regret, I should say—is that we haven't had a chance of meeting the enemy yet; but that's a pleasure we all look forward to'—

Here he was interrupted by loud cheers and bangings on the tables.

'It's quite unnecessary for me to tell you that I know the *Belligerent* will do jolly well when the time comes, and that the men of the fore-castle division will do better than any one else'—

Loud cries of 'Hear, hear!' and more shouting.

'I've clean forgotten what I was going to say,' he went on, laughing. 'Oh yes. I'm sure the fore-castle men will do better than any one else when it comes to a scrap; but don't get down-hearted if we have to wait for some time before we get it. Other ships have had a run for their money, and we haven't; but we're all doing our bit for the country, and it's up to us to do our duty wherever the Admiralty choose to send us. At the same time, I hope the war will not be over before we have our look in. Well,' he concluded, 'I don't think there is anything else I can say, except to wish you all the best of luck.' He lifted the fanny* to his lips and sipped its contents.

'An' th' same to you, sir!' came a roar. 'Three cheers for Lieutenant Tickle!'

'One more, boys!' somebody yelled excitedly. 'Hip, hip, hip, HURRAH!'

Tickle, feeling very awkward and red in the face, bowed his acknowledgments. 'Thank you very much indeed,' he said quietly. He could not express his feelings in mere words.

The *Belligerent* was a happy ship, and the officers were popular with their men, and many of them, including the commander, the engineer-commander, all the officers of divisions, captain of marines, and most of the midshipmen and warrant-officers, were ruthlessly dragged from their afternoon slumber and carried forward to the mess-decks to make speeches. Christmas, the time of good-fellowship and goodwill, only came once a year, but it was one of the rare occasions when the men were able to show their officers what they really thought of them.

So, taking it all round, they managed to enjoy themselves, for bluejackets always succeed in being cheerful under any circumstances; but nobody could help having a feeling at the back of his mind that this particular Christmas was not quite the same as others, as indeed it was not. They were thinking of their homes and of what was happening there, and many of them, officers as well as men, had not set foot on shore for weeks—months, in some cases.

Boxing Day found the squadron at sea.

(Continued on page 617).

INVENTIONS OF THE DEVIL HOW THE MACHINE-GUN HAS REVOLUTIONISED WARFARE.

By FREDERICK A. TALBOT.

'INVENTIONS of the Devil!' Such was the terse, graphic description applied by General Sir Ian Hamilton to the death-dealing machine-guns which greeted our troops as they waded to the beach upon the invasion of the Gallipoli Peninsula. It is an opinion which is shared in many quarters, and by the enemy as much as by the Allies.

The Germans were undoubtedly the first to bring home to military science the deadly nature of this type of firearm, although they, too, blundered badly in its utilisation. The fact that Germany placed great reliance upon this weapon is not surprising. In the Franco-Prussian

* 'Fanny,' the receptacle from which a bluejacket drinks his rum.

war of 1870-71 the French virtually relied upon a quaint mechanical rifle, described as a mitrailleuse, which was an improved revival of the 'coffee-mill' used in the American Civil War. But the French made one great mistake. They thought that their possession of this weapon in sufficient quantities would completely counterbalance their weakness in heavy artillery, in which the Germans excelled.

That the French machine-gun was used with pronounced effect was borne out at the conclusion of the campaign by the Germans immediately setting to work to devise an improved arm similar to that which had been used against them by the French. They succeeded to such a degree that the weapon was distributed throughout the reorganised Teuton army. Moreover, the authorities carried out their work with all the secrecy they could command, so that other Powers were quite ignorant of the precise strength of the machine-gun elements in the German army.

Then came the momentous improvement evolved by Sir Hiram Maxim. His wonderful weapon rendered the German machine-gun obsolete. It could not compare in many respects with the latest development in this direction. The Maxim gun aroused world-wide interest, inasmuch as its principle of operation was completely new. The gun was automatic in the fullest sense of the word. The trigger was pressed to fire the first shot, and then the machine continued to fire upon its own account until the magazine, as represented by the belt, was exhausted. But this was not all. The military experts of the various Powers, when the occasion arrived for them to examine and test the gun, were astonished at its firing capacity. Never before had it been possible to discharge bullets in such a steady stream and at such a speed; and this from a weapon which weighed less than eighty pounds!

Considerable speculation prevailed as to the precise rôle the new gun would play in civilised warfare. The initial practical demonstration came during the South African war, and we were doomed to taste its real bitterness first. The Boers had acquired a certain number of these weapons from the German manufacturers, and they turned them upon our troops at the charge of Magersfontein, when eight hundred of the Black Watch were knocked over like skittles within three minutes! Incidentally this experience brought home the futility of frontal attack in massed formation. Unfortunately, however, although our troops were well equipped with Maxims, the fighting tactics adopted by the Boers precluded their effective use, so that at the conclusion of the war military experts were still somewhat undecided as to the exact functions they would fulfil in the game of war.

The Germans, however, cherished their own opinions. Massed frontal attacks were the alpha

and omega of Teuton military science. Consequently it was assumed that other nations would pursue the self-same principle. Moreover, the Teuton military advisers shrewdly surmised that a proper disposition of machine-guns in adequate force would be highly successful in both attack and defence, and thereupon two machine-guns became attached to each company of one hundred men. Although the Germans have adopted the Maxim whole-heartedly, it is by no means the only weapon of this type which is in their service. Other weapons working upon slightly different principles, more particularly the Austrian machine-gun, are distributed throughout the army in large numbers. Consequently, owing to the secrecy with which German military preparations were veiled, the Allies were far from knowing the precise machine-gun strength of the enemy, although it was known that at least forty-six thousand Maxims were in use, because the British firm holding the patents for the arm had received royalties up to this number.

The machine-gun strength of the Central Powers came somewhat as a surprise to all the Allies. It is estimated that in the advance upon Paris in the opening days of the war the Germans carried no fewer than fifty thousand of these weapons; and even then the workshops of the Empires were toiling feverishly to increase the numbers of this arm. The reliance of the enemy upon machine-gun fire was afterwards brought home to us very convincingly when he was thrown back to his present position upon the Western front, because the machine-gun strength played a prominent part in disputing the further advance of the Allies. Incidentally it contributed to the siege war which developed and has ever since been maintained.

Realising our insufficiency of these weapons, we speedily utilised our workshops to turn out unlimited quantities of this arm. The French were equally determined and energetic. Fortunately, in this instance we were not called upon to give France a helping hand to any great extent. Our Ally, although using the Maxim, is more impressed by an American machine-gun, the Hotchkiss, which has been persistently developed in that country, until now it stands as one of the finest arms of its type in the world. It is extremely light, and may be carried easily by two men, so that it fulfils all the requirements of portability, and assists the mobility of the army.

The Maxim gun has also been improved out of recognition. In its present form it is known as the Vickers rifle-calibre machine-gun, from the fact that it uses the self-same ammunition as the British service rifle. Weight has been pared down by the skilful employment of improved metals and alloys, until now it weighs only forty and a half pounds complete, so that it can be readily carried by two men. Its support has

also undergone considerable improvement, the present mounting being of a 'universal' character, enabling the gun to be adapted to any conceivable position with equal facility.

In addition to these improvements, the gun has been rendered more deadly. Its rapidity of fire has been increased until now it is possible to discharge up to seven hundred and fifty shots per minute, and with such accuracy that a complete belt of ammunition can be pumped into an area a foot square at a range of two thousand yards. In rapidity of fire, accuracy of aim, and range, the British Maxim, it may be mentioned, is superior to its Teuton brother of the same name, the German weapon having for the most part a lower rate of fire. On the other hand, the Germans have been every whit as enterprising in reducing the weight of the weapon so as to secure increased mobility.

The difference between the systems of operation in the Maxim and the French Hotchkiss is very marked. In the Maxim gun the cartridges are carried in a leather belt. The belt is slipped into position, and the trigger is pulled to fire the first shot. After that the machine continues to fire of its own accord until the trigger is released or the belt of cartridges is exhausted. The 'kick' of the gun is harnessed to eject the spent cartridge-case, insert the succeeding cartridge, reset the gun, and to fire again. This is done by causing the recoil set up by the discharge of the bullet to slide the breech-block and barrel backwards. The extent of this movement is controlled by a special (fuzee) spring, which in turn acts upon the mechanism of the gun in such a manner as to bring about the cycle of operations just mentioned.

The rapidity of the fire sets up intense heat; but the barrel is cooled by a water-jacket of special design, containing seven and a half pints of water, surrounding the barrel. The necessity of utilising water to overcome the heat set up by the combustion of the propelling charge constitutes, to a certain degree, an adverse feature of the Maxim; but this becomes pronounced only in extremely hot countries where adequate supplies of water may possibly be difficult to obtain. In the latest type, however, the cooling is assisted in a measure by the air. The use of the leather belt is considered also to constitute somewhat of an objection, owing to this material being liable to expansion and contraction under climatic vagaries, thereby conducing to jamming of the gun.

In the French Hotchkiss the functions performed in the Maxim by the forces of recoil are carried out by the blast set up by the burnt powder gases. These are passed into a tiny cylinder in which there is a piston. The gases move this piston, which in turn actuates the breech mechanism through a connecting-rod, thereby bringing about the ejection of the spent

cartridge, the introduction of the succeeding cartridge, and the resetting of the firing-pin. Another point in which the Hotchkiss differs from the Maxim is that it is air-cooled; while, furthermore, a rigid metal clip is used instead of a flexible leather belt to carry the cartridges.

The war has also served to bring to the front another and newer type of machine-gun which may be said to represent a decided forward step towards the realisation of what is known as the machine-gun rifle—a combined rifle and machine-gun. This is the Lewis weapon, the invention of Colonel Lewis of the United States Army, the rights to use which in the British army were promptly acquired upon the outbreak of war.

This weapon differs completely from any of its rivals. In general appearance it resembles the ordinary rifle, carrying on the top, near the breech, a flat disc or drum in which are placed some fifty cartridges set radially. This disc revolves, feeding the cartridges successively one by one into the breech after the spent cartridge has been ejected. The gun weighs only twenty-six pounds, so that it can be fired from the shoulder, although a strong, well-built soldier would be required for the purpose. Under these circumstances a small light mounting is recommended, and indeed is used. Owing to the character of the mechanism it is possible to discharge the weapon in the manner of the ordinary rifle—that is, one trigger-pull, one shot—or the fifty rounds may be discharged within four seconds, which is equivalent to seven hundred and fifty rounds per minute. The magazine, when emptied, can be exchanged for a charged drum, and firing resumed within two seconds. The Lewis weapon is operated by the gases of explosion, in which it resembles the Hotchkiss mitrailleuse; while the barrel is kept cooled by the aid of air, water thus being unnecessary. The bullet, as it travels towards the muzzle, creates a blast of cold air, which is utilised in such a manner as to cool the barrel immediately. The consequence is that, no matter how vigorously the weapon may be discharged, there is no risk whatever of its becoming overheated.

The machine-guns now in operation among all the belligerents are estimated to exceed one million in number. If these were concentrated into a single battery, and the whole were fired simultaneously, they would spit forth no fewer than five hundred million bullets every minute. It is the extraordinary voracity of the machine-gun which has made of the utmost importance the maintenance of an adequate stream of rifle-bullets from the small-arms ammunition factories of the world.

The vogue of the machine-gun has exercised a far-reaching influence upon the defence of trenches, which constitutes such a feature of the present campaign. It has solved the problem of the economical manning of field fortifications to

an extraordinary degree. A single machine-gun, with its crew of four men, is equivalent to forty infantry armed with the modern magazine-rifle, and is capable of throwing a hotter concentrated fire upon a given spot. Incidentally, it is this weapon which has rendered the taking of a few yards of trenches such a desperate and costly achievement, and which has invested such a capture with so much importance.

Nor is its application confined to any one phase of military operations. It is the only efficient weapon for the armoured car and the motor-bicycle. Its wonderful utility in this direction has been frequently revealed. The significance of the armoured motor-car equipped with an efficient machine-gun was first proved during the opening days of the war, especially upon the occasion of the German advance from Antwerp along the Flanders coast to Ostend. The British and the Belgians maintained a kind of guerilla warfare, and harassed the Germans sorely. All sorts and conditions of motor-propelled vehicles were impressed for this duty, the simplicity of the mitrailleuse and Maxim mountings facilitating these tactics. The Belgians, as well as some of our other Allies, have also requisitioned dogs for the hauling of these weapons, the guns being mounted upon light pneumatic-tired bicycle-wheels. The utility of the Maxim, as applied to the motor-cycle, was powerfully demonstrated on the occasion of the desperate German counter-attack upon Hill 60, which doubtless would have succeeded had not these fleet vehicles dashed up and assumed strategical positions, whence they were able to rake the onrushing massed ranks of the enemy through and through with fearful devastating effect.

There is one drawback attending the utilisation of the machine-gun, if it can be described as a drawback. Owing to its rapidity of fire and high consumption of cartridges it is imperative that adequate supplies of ammunition be carried. This constitutes the most critical phase of the whole problem, because the bullets are weighty. A box containing two hundred and fifty rounds represents a dead-weight of about twenty-seven pounds, and this supply is only adequate to keep the weapon going continuously for thirty seconds! Experience of the war has proved the necessity of at least twenty thousand rounds, which represent nearly a ton in weight, being within easy reach of a machine-gun.

But in the application of the Maxim to the motor-cycle considerable ingenuity has been displayed. A three-wheeled vehicle is favoured, the attachment, corresponding virtually to a side-car, being a small, compact, flat deck, on which the gun is mounted, with a seat for the gunner; while the ammunition is tucked away in boxes beneath the deck. Fortunately, owing to the extreme mobility and speed of the motor-

cycle, it is possible to recharge the ammunition-boxes from a conveniently adjacent centre, or vehicles can be delegated to the express duty of rushing to and fro, thereby providing the guns with an adequate supply of cartridges.

It must also be remembered that it is the machine-gun which has contributed most largely to aerial fighting; the magazine-rifle is only useful as a stand-by. With the machine-gun a steady hail of bullets can be kept trained upon an enemy aeroplane. Such a fire is severely demoralising, especially if the attacker has secured the superior position, inasmuch as the attacked cannot reply. It was the employment of the machine-gun in these tactics which enabled the Germans to secure an ephemeral triumph with the much-vaunted Fokker. The Teuton tactics were very simple. The Fokker rose to the attack. If the aviator discovered that he held the advantage in speed, he instantly rushed towards his antagonist, preferably from the rear, peppering him, once he had drawn within point-blank range, from the most advantageous position. Then, owing to superior speed, the Fokker could keep circling around the weaker aeroplane until the latter had been smashed or forced to descend. This circling method of attack was no doubt highly effective. It enabled the gunner in the Fokker to keep his weapon trained upon the enemy machine, which virtually represented the centre of the circle which the Fokker described. Consequently, once the range had been obtained, the gunner had only to keep it. On the other hand, the attacked plane could not retort effectively. Whereas the Fokker gunner had merely to keep his gun steady and in one position to produce a continuous discharge, the gunner in the attacked aeroplane having constantly to move his weapon, and being able to fire only through a limited arc, the discharge was spasmodic. The tactics of the Fokker, however, were partially overcome by a novel means of mounting a machine-gun in the aeroplane, which gave the craft acting on the defensive greater fighting-power, and to a certain extent deprived the speedier warplane of the advantages accruing from its high speed and ability to circle.

The machine-gun has also proved a highly efficient weapon for repelling aircraft attack so long as the aerial invader is within the range of the weapon. The mounting is such that the gun can be given a very pronounced degree of elevation. Indeed, it can be fired almost directly vertically. Machine-gun fire is extremely harassing to an aeroplane flying low. It can be picked up fairly easily, and its flight can be followed without undue effort. Meanwhile a steady stream of bullets is poured upon it, and this has a distinctly unnerving effect, more particularly as the aeroplane has no

efficient means of retaliating. As a rule, when the machine-gun fire from the ground commences to grow somewhat hot, and the gunner is perilously near the critical range, the aeroplane sheers off; the risk is considered to be too heavy. Whatever else the Germans may have achieved, they have certainly proved unable to combat anti-aircraft gun-fire from a Maxim or a mitrailleuse. The Teuton flier, while daring, is not inclined to take chances. He knows full well, once his antagonist on the ground gets the range, that his aeroplane is doomed to be riddled like a sieve.

Two weapons have proved practically invincible in this war. One is the famous French '75, and the other is the machine-gun.

The two acting in effective combination are irresistible. The '75, by rafale and curtain tactics, is able to isolate an attacking force by keeping the supports at bay. Then the machine-gun, faced only by the front attacking element, is able to mow it down like a motor-driven scythe cutting hay. The danger of the machine-gun defenders being rushed by sheer weight of numbers is removed by the support of the '75, and the combination of the two widely divergent arms, acting in perfect unison and with clock-like precision, is able to defeat the most determined attack, as the Germans in their desperate efforts to capture the defences of Verdun and to break through the British lines have found to their cost.

DEAR LADY OF THE STARLIGHT.

By M. F. HUTCHINSON.

THE guard closed the door of the first-class compartment with a decided thud. A woman who had been leaning out, trying with anxious eyes to pierce the shrouded darkness of the station, sat down with a sigh and glanced almost apologetically at the only other occupant of the carriage. 'My husband has missed the train. He thought he had time, instead of waiting here, to visit a wounded man in hospital. I ought to have got out!'

The train was moving out of the great station.

A gently sympathetic voice answered her. 'He may be in the back part of the train. You will be able to find out at the first stopping-place.'

Mrs Allerton sighed, and then did her best to laugh. 'Men will always count on the unexpected odd minute being in their favour!'

There was no use in feeling depressed; she disliked the idea of the long night-journey alone, and yet she was a great traveller. In these days of war there might be all kinds of unexpected and trying happenings. She was glad to have a companion; and yet when the other passenger had stepped into that compartment five minutes before the train started she had felt momentarily annoyed, because she had counted on being alone with her husband. But now the presence, an attractive presence, was comforting. The light in the carriage showed the figure of a tall, well-dressed woman, wearing a small travelling hat; the rather heavy veil obscured her features. Mrs Allerton tried to interest herself in deciding whether the owner of the voice with delicate intonations was dark or fair, but all the time her real self was occupied with the thought of her husband, and the dislike she felt at taking the long journey south alone. A soldier's wife should never listen to the whisperings of fear!

She was really foolish; at the first stopping-place, if he did not appear, she could leave the train and wire a message back to Edinburgh stating where she was.

Mrs Allerton glanced across at her companion and wished she would talk, then drew aside a blind and looked out into the dark. There were houses, many of them probably quite close at hand, but not a light could be detected. Great Britain in war-time! But she would not allow herself to think of the war, its deathless glories, its poignant tragedies, because she determined to be cheerful. She let the blind fall, and saw her travelling companion open a handbag and take out what looked like a mass of crumpled paper, glance irresolutely at the handful, crunch it up in one hand, only to smooth it out again and thrust the paper into the bag. The opening of the handbag seemed to fill the compartment with a very delicate scent, one unknown to Mrs Allerton, but it made her think of the lovely stretches of flower-filled meadows in southern France before the war. Anxious for forgetfulness, she made some tentative remark about the swift but easy rush of the great express, and was answered courteously but not expansively. The stranger wanted silence. Well, she would think of the end of the journey, the pleasant errand taking her husband—how she wished she knew him to be safely ensconced in a smoking-carriage!—and herself to London. Other people travelling in that express train might be on their way to see some sick, wounded, or even dying man.

Again her kind eyes, always bright with sympathy and interest, rested on the other woman. To what was she journeying? Though they were travelling alone together, she would never know; but at least she might hope, with all the strength of a kind heart, it was not

sorrow which had called her to make this night-journey.

Mrs Allerton closed her eyes and leaned back in her corner. She would sleep, since it was not easy to think of cheerful things. She believed they had a two hours' run before crossing the Border. Worry she would not. General Allerton always teased his wife about this habit, and said it brought a pucker to her forehead, and made her look a harassed woman, as if he were in the habit of ill-treating her in private! The wife suddenly smiled; she seemed to hear the bracing, cheery tones, and longed for his actual presence.

Two hours! The train swept on so steadily; after all, it was a very little time. Why was she so stupid as not to sleep? *Two hours!* The train rushed, but the minutes dragged; twice she looked at her watch, to feel positively angry with it. Surely the tiresome thing must have stopped; but, holding it to her ear, she heard its serene ticking.

Suddenly she sat erect with a start of joyful surprise; the train was stopping! Her hand went out eagerly to the window-strap. The train stopped. The blind, released, rolled up swiftly; Mrs Allerton let down the window, met the cold rush of night air, and saw nothing but a heavy darkness, not so much as one point of light.

She drew in her head and spoke to the other traveller. 'Can anything be wrong, or are we just outside a station?' The lady got up and moved down the carriage towards the open window. The light went out. Window after window was flung down; they heard a confused murmur of voices, and then came the sound of hurrying heavy feet on the metalled way, and words spoken hurriedly but with authority. 'No lights! Not so much as a match. No lights.'

'*Zeppelins!*' exclaimed Mrs Allerton. If only her husband were on the train! Surely he would find her somehow! She called to the guard; but he merely muttered his sharp order, and ran on intent on duty. She kept the window-strap in a firm clutch as she leaned forward to ask a question: 'Shall I shut the window?'

'Thank you; I like the air. Please leave it down if you are not cold. Everything seems very quiet; I hear nothing.'

'I fancy that I do hear many sounds, but I believe it is just the result of nervous imagination. How helpless we are, shut up in this train! I ought to have got out when I did not see my husband. He told me to make for a compartment in the middle of the train, and I did as he told me.' The wife sighed as she spoke.

'And I wrote telegram after telegram in the station to say that, after all, I would not take this journey, and here I am!'

Again Mrs Allerton detected the delicate fragrance of the unknown perfume; she guessed the handbag had been opened once more. The crumpled mass of paper was composed, then, of unsent telegraph-forms. She heard sounds as if the hands of the other traveller were endeavouring to smooth out the paper; then there followed a swift unmistakable noise of tearing, which ceased abruptly, and presently the sharp click of the catch of the handbag. Had the papers been returned to it? And then there was silence.

Mrs Allerton could not keep herself from shivering, but not with cold. She put up the window to within a couple of inches of the top, and drew down the blind. 'I have a small electric hand-lamp in my bag,' she said wistfully; 'but it would not be right to turn on the light even for a moment. One needs a disagreeable experience like this to make one realise the comfort in a safety-match, even the feeblest light.'

Mrs Allerton, always an impulsive person, wished she had not made this remark, because it sounded so prosy. The other passenger could not guess she had to make a tremendous effort to keep her self-control. If only her husband had been with her!

Her companion asked a question: 'May we have the blind up? The stars are shining so brightly!'

The blind went up swiftly; fingers found relief in the commonplace action.

'Stars! Do you know, I never even thought of them, and I have been sighing for light. How very bright they are!'

'I am so fond of stars.' There was a pause, and then the voice of delicate intonations went on speaking, to Mrs Allerton's relief. 'We are strangers, but I fancy you are in need of comfort. Shall you mind if I talk a little?'

'*Mind!* I shall be thankful. May I tell you who I am? My name is——'

'No, please don't tell me. It will be so much easier to talk, especially about stars, if our ordinary everyday names are not mentioned. We are two women alone in the dark, arrested suddenly in a journey south by a Zeppelin raid. I know one thing about you—a great thing—you are a devoted and very happy wife. I shall like to talk to you.'

'Ah,' was the quick response, 'are you married and not happy? That is so sad.'

'I am not married, but'—— There was a pause.

Mrs Allerton waited for the completion of the sentence, but waited in vain.

When the other passenger went on speaking it was of the stars. 'My love for the stars arises from a curious adventure. Six months ago I had a strange experience. I thought I was to know the meaning of terror and fear, but instead I spent the happiest hours of my life. I was going from London by car to a dear old aunt

taken suddenly ill, and it should not have been much more than an hour's run. The car, a hired one, as it happened, ran well. I was alone; I had no maid with me. Suddenly, startlingly, we were stopped by special constables, and the chauffeur was told to put out the lights. I got out; the car was drawn as close as possible to a dark mass of trees, and I stood there, not asking questions, but just shivering helplessly and realising that I was afraid.

'A Zeppelin raid! And now you have another experience of the same kind. That seems hard!'

'But to-night I am not afraid; then I was, until a voice spoke to me. I can hear it now, a wonderful voice. "This is a trying experience for you, but try not to feel alarmed. There happens to be a little hotel not more than a mile away; and as the special constables don't want help, I came through the plantation to offer mine. I am returning there; will you allow me to show you the way?" You see, I remember the actual words just like a child who has learned a lesson well. The stranger told me the Zepps were over London, and that it would probably be a long time before my car would be allowed to go on. He gave me his name and regiment, said he had been sent home on military business, and on its completion had been given forty-eight hours to himself.

'I accepted his suggestion at once. I wish I could explain the effect of his voice, that wonderfully inspiring voice heard first in the dark. I could understand its magnetic effect on fighting men. My driver would not leave his car; a policeman said that when things were safe he would guide him to the hotel. *When things were safe!* I forgot fear with the sound of the stranger's voice.' The speaker paused. 'Am I wearying you? Does it seem a long, tiresome story?'

'Tiresome?' Mrs Allerton spoke truthfully. 'I am deeply interested.'

'I do not know now whether the road to the hotel was long or short, easy or difficult; it seemed pleasant to me. When we reached the little place a kind woman was good to me. I sat for three hours, wrapped in rugs, on a small veranda, and listened to the voice of this officer. He talked of the stars. Other people listened too, but I felt all the time as if he were talking just to me. He said it was wonderful to look up from trenches and the openings into dug-outs at the stars. He repeated stories, legends, fables, which he said a brother-officer had collected from different nations. I liked one so much! Each of us has his or her own star, from which our spirits come for the experience of this earth, and to it we return when, early or late, we have learned that which is expected from us. He spoke of gradations of stars. Perhaps, for some of us, the earth experience will not be sufficient; there may be more schooling still until we reach our real star again. I wish I could repeat every-

thing as I heard it. But since then the stars are my friends.'

'I do not wonder!' Mrs Allerton moved closer to the window and looked up at the sky.

'The hours passed. The officer asked me to let him know if I reached my journey's end safely. From my doing this there sprang up a correspondence which—which—has meant a great deal to me.'

'You love this man,' exclaimed Mrs Allerton, 'and I do not wonder. You will meet again.'

'I have written to him two or three times a week, and I have heard constantly. His letters always begin, "Dear Lady of the Starlight!" Does it seem odd to confess, sitting here in the dark, that I do love to think of him? I wonder if you will understand or think me a strange creature! This man has said no word of love to me. I had a letter saying he was coming home on five days' leave, and that he might be going to Scotland. I wrote at once, impulsively, to France and to the London address he gave me, saying I should be going to town. But'—The speaker hesitated. 'But'—

A kind hand was stretched out and two words gently spoken: 'I understand!'

'I have lived a guarded, sheltered life; the war alters so many things. After my letters had gone I was wretched. If I went to London I had to acknowledge the truth to myself that it would be only to meet him, and I had no real right to go. His letters told me nothing of his family, his ties. He just sprang out of the darkness in the starlight to give help and comfort. And here, in the train, I experience another Zeppelin raid. But up above us are the stars he talked about. He spoke of the Star Gauge, and declared if we measured life's happenings by that things would be so different, because many of our troubles are the result of our own littleness. If I meet him, will he judge this action of mine by the Star Gauge?'

'I am sure he will, and that you are going to happiness.'

'When I wrote, it did not seem strange to say I should be staying at my club; but afterwards, and when I reached the station to-night, I wondered how I could have done it. I have heard nothing; perhaps silence will reveal the full measure of his disapproval.'

Mrs Allerton set herself to bestow comfort. 'I am sure it will not! I sympathise so much with you, and I do thank you for telling me. I know exactly what you mean by the influence of a voice. I fell in love with my husband's voice—Ah, *do you hear?* What is that?'

They heard the sound of feet on the metalled road. Did it mean the danger was over, and that the train would proceed on its way? A voice spoke—surely that of the guard who had done his duty so thoroughly? Yes, it was the guard's

voice. 'Keep close alongside me, sir. Don't show the scrape of a match. Middle coach is hereabouts.'

The two women sat in the darkness waiting. Mrs Allerton longed to hear an answering voice, that of her husband. She let down the window and thrust out her head and called three words: 'Is it you?'

If the gentleman piloted by the guard were her husband he would know her voice at once. She tried to speak calmly; but for the moment she forgot everything—the other passenger, the talk about the stars, and the words of comfort she had tried to speak—in the delicious possibility of his nearness and his safety.

She was promptly answered, 'Of course it is I! The guard refused to let me stir before. All right? I am coming in.—Thanks, guard, I don't expect to be under a better commanding officer.'

The door swung open, and a man scrambled in. At the sound of the voice the other woman had started, and then, unseen in the darkness, unheard, fell back in the corner with a moan of pain. As the door opened she nerved herself, and was able to creep down to the far end of the carriage.

Mrs Allerton, made momentarily forgetful by great joy and relief, remembered her companion. 'There is a lady here!' Her hands groped in the darkness. 'Ah, you have moved! I am sorry. Now my husband will take care of us both.'

'I am very glad you were not alone,' said the man in his inspiring voice. 'Poor worried wife! I hope the lady will not find me in the way.'

There was no answer.

He went on speaking. Of course, she was nervous. 'I believe we shall be on the move before long. We thought in our smoker we saw flashes and heard explosions. Were you very much worried? An ass of a porter gave me the wrong number of the platform, and I caught the train by the skin of my teeth. Well, here I am! What about the superior midnight supper we were to have on board? Have you ladies eaten all the good things?'

'I never remembered them! The flat hamper is in the rack just above here. Get it down, dear.'

The man laughed because his wife knocked against him. He put his arm round her, and very, very gently kissed her. He was sure the ears of the other lady could not have heard!

For a moment Mrs Allerton clung to her husband, and then she spoke, but not to him, in a light, caressing tone of voice: 'Please, dear and kind other passenger, where are you? Come back to this end of the carriage, and let us be cosy together.'

She was answered, but in a voice she would not have recognised, coldly icy in tone and

sharply metallic: 'Thank you, I prefer to remain here!'

A kind woman, momentarily baffled, sat down, while her genial husband wished ladies would not be disagreeable when Zepps were in the air. Probably this was an elderly person who had a horror for the scent of even a harmless cigarette, and who disliked men. Well, for once she must try to tolerate the presence of one, because he intended to stay with his wife. He knew, though he could not see the loved face, that the attitude of the other passenger distressed the kindest of women.

Mrs Allerton sat quite still, thinking desperately. Something had literally frozen the other woman at a moment when she was talking of intimate and tender things. What could it have been? *The sound of her husband's voice!* She forgot the possibility of danger from the air, and concentrated her mind on the problem. And then, swiftly, mental illumination came.

She sprang up, and drew a reproach on herself from her husband's lips. 'Now, Kitty, *why* try to upset the whole bag of tricks? Notwithstanding the dark, I am trying to set out this supper in the most workman-like, or, rather, waiter-like, manner!'

He was not even answered. His wife went to the far corner and sat down by a still figure. 'Please let me tell you that my husband and I are going to London to meet his brother, who is to have five days' leave. There are fifteen years between the two men, but their voices—I always say I fell in love first with a voice and not with a man—are exactly the same! One cannot tell the difference, and many times have they played tricks on me!'

General Allerton muttered to himself, 'Upon my word!' and reflected that women were undoubtedly the most curious creatures, doing utterly unexpected things. Here was his wife talking to a stranger in this rather absurd way. What was she saying now?

'Hugh, my brother-in-law—Hugh Allerton—is a bachelor, and, though he won't own it, superstitious. His mother was Scotch. He told me in a letter that he was deeply in love with a sweet woman, met unexpectedly; but even if she were dear enough to care for him, so many splendid fellows lucky in love had been unlucky in war!'

Curious and curiousest! General Allerton had certainly not tumbled through a looking-glass into another world, but the climb into a dark railway carriage had produced strange conversation and confidences. He heard, clearly, the sound of a kiss, and then realised that the other passenger was not disagreeable or elderly. Voices! He liked hers.

'How good you are to me! My name is Marjorie Dallas.'

Then his wife had made her strange little

confidences without even knowing the name of the other lady.

And then his name was called: 'Raymond, please come here and be introduced to Miss Dallas, who has met Hugh.'

So his brother was the link, the brother of whom he had always thought so much, and now admired and envied! General Allerton was serving his country at home, not like the younger men who were fortunate enough to be in the forefront of the battle. He had just completed some special work in Scotland.

Laughingly, he felt his way to the other end of the carriage, and in the darkness contrived, successfully, to touch the lady's hand and hold it for a moment with firm and comforting friendliness. He felt instinctively that this was not the moment to ask questions as to the acquaintance between Miss Dallas and Hugh. He talked cheerily of supper. Should they have it then, or wait until the lights went up, as they certainly would before very long? He was sure the raiders would be driven off.

Within an hour the train moved on its way, and drew cautiously into a station where lights showed dimly. The Zepps *had* been driven off; the danger was over! General Allerton got out of the carriage to see if hot tea or coffee could be obtained, and to discover if there were any lonely travellers who needed help and friendliness. His wife, alone with Marjorie Dallas, said tender things. It seemed as if the other passenger could not talk at all of the man who had filled her thoughts for so long, even blamed herself for confidences made in the darkness; but Kitty Allerton was full of happy confidence. Hugh must certainly love this Dear Lady of the Starlight, but she respected the dignified and quiet reticence.

When General Allerton returned, and the journey was resumed, with the comfort of light, his cheery friendliness made everything easy. He talked of many things, but not of his brother. He looked at the stranger with approval. Even in the dimly lighted carriage he could see she was of charming appearance. Was beautiful the right word? If there were anything between her and Hugh—well, then, his brother was a lucky fellow. Was she not the only daughter of a fine soldier, General Sir Henry Dallas? Curious she and his wife should make friends in a railway carriage, and through a Zeppelin raid! If only the lady would obligingly go to sleep, he would seize upon the opportunity and ask Kitty discreet questions in a whisper. But she showed no sign of any real intention of going to sleep, though sometimes she closed her eyes, and he was able to have a good look at the sweet face. It was not until the long journey was over that real enlightenment came. He saw his brother on the rather crowded platform filled with people anxious to welcome the belated travellers.

'Why,' he exclaimed, 'Hugh has reached town before us, after all! And we meant to be here to meet him.' He blocked the carriage window completely for a minute or two, until Major Allerton looked past him and saw his Dear Lady of the Starlight! The look on his face was easily read by a brother's eyes; General Allerton literally tumbled out on to the platform, and told his wife to follow him.

Hugh and the other passenger were lovers; there were worse places than a railway carriage for a tender meeting.

FROM BOSRAH.

WHO is this, in regal state, who cometh from afar,
His Tyrian purple garments dyed to a fierce
blood-red,
His sword unsheathed and rusted with dreadful
stains of war,
A crown of gold and jewels set on his royal
head?

Triumphantly he passes o'er Edom's tranquil plain,
Death with his captives following across the
ruined fields,
Unharvested, ungarnered, blood-stained the golden
grain,
Where war demands the tribute that stubborn
valour yields.

Before him spreads in radiance the glory of the
world,
God's splendid gift that all men are bound to
hold in trust;
Behind him grief and anguish 'neath terror's flag
unfurled,
Where flaming homes hide secrets of murder,
rapine, lust.

This is he, whose regal state proclaims him Lord
of War,
Death following in his footsteps, close as a new-
made bride;
With glittering spear uplifted he cometh from afar,
The crimson of his raiment in blood of thousands
died.

Who is this with wayworn feet and head in anguish
bowed,
Blood-drops upon His vesture, His forehead bathed
in sweat;
Thorn-crowned, and gibed and jeered at amid a
following crowd,
Who mock the stern endurance where God and
man have met?

Here, strong to save, One cometh, speaking in
righteousness,
Who in His blood-stained garments alone the
wine-press trod;
No one stood by to answer the cry of His distress
When in His love and pity He faced the wrath
of God.

This is He, the Lord of Peace, with travel-weary
feet,
In crown of thorns, and stained with blood, who
cometh from afar;
He who, upon the reckoning day when God and
man shall meet,
Shall show Himself a conqueror, triumphant over
war.

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

IN olden days of wars and warriors, when empires were shattered and reshaped, magicians had an inspiring part to play, and seem to have done their business well. Crafty fellows they were. We cannot tell how much or how little they believed in their own forecasts, or to what extent they dared ever, in secret communion with themselves, confess to purposeful imposture; but this is clear, that rarely have there been such opportunists, such time-servers and toadies, as those old magicians, who always prophesied for the best in the case of the most powerful. Good auguries were recorded everywhere when Alexander, Cæsar, or Napoleon went conquering on. They had a keen discernment, those old magicians; they conducted their profession with high intelligence. When Alexander was born they were quick to seize upon the portent that two eagles perched that day on the house of Philip, his father—a sure omen that the child would rise to be master of Europe and of Asia. Now, in these present times old and settled ways of thought have been disturbed. Life is tumultuously upheaved. There are incongruities, contradictions, wonders everywhere. There are those who say in all sincerity they have seen angels beat their wings in blessing on our armies. When a people in affliction strains towards hope, yearns with a strenuous passion, imagination gains intensity and assumes strange creative powers. Looking for 'signs,' one sees them in many places, some strikingly apposite. Never before in our modern days have these signs and portents been so frequent and so kindly looked upon as now. You may prove it by any issue of a morning newspaper; in some report or article there is a mention of an omen, a sign, a good augury; it is put forward as something to hearten us, a cordial from the gods. If now people seem to lean a little more to superstition, and give the sign a solid value, is there not a fair excuse?

* * *

Present-day literature illustrates this same superstitious tendency. Two cases in point stand out most clearly in my memory. One is associated with the work of the Zionist Mule Corps in the Gallipoli campaign. This was a fighting

unit made up of Russian and other Jews, commanded by an English officer, Lieutenant-Colonel J. H. Patterson. Some hundreds of these men came down to Egypt out of Palestine, fleeing from the wrath of the Turks, and strongly desired to band themselves together and place their services at our disposal. A unit was made up of them, and the Grand Rabbi addressed them in stirring words, in which he compared them to their forefathers who were led by Moses out of Egypt. The corps as completed consisted of five hundred men, with seven hundred and fifty pack-mules for transport work. In Gallipoli these Jews did excellent service, of which Colonel Patterson has given us a vivid account; and in one picturesque passage he says that never since the days of Judas Maccabæus had such sights and sounds been seen and heard in a military camp. Had that redoubtable General, says Colonel Patterson, paid them a visit he might have imagined himself with his own legions. He would have found a great camp, with the tents of the Children of Israel pitched round about; would have heard the Hebrew tongue spoken on all sides, and seen a little host of the Sons of Judah drilling to the same words of command that he himself used to those who fought so bravely under his banner against Rome. And he would even have heard the plaintive, soul-stirring music of the Maccabean hymn chanted by the men as they marched through their camp. A strange sign was given to the soldiers of this willing corps, which took as its badge the representation of the Shield of David. That consists, as you may know, of three concentric circles, with two triangles in the innermost circle (one inverted and superimposed upon the other) and a dot in the centre. When the cold weather descended upon the peninsula, the colonel determined to have a good stone house built for his men, in which there would always be a big fire to keep them warm and to dry their clothes when they came back from the trenches. Only in the village of Sedd-el-Bahr could building-stone be obtained; and, as it was not in their zone, he had to obtain the permission of the chief engineer of the French army to take it from there. As they were pulling down a house and excavating the foundations, they dug up a slab of marble, on the outer edge of which was carved a beautiful filigree design,

and, lo! in the centre was the Shield of David! The officer remarks that the stone must have been very, very old, and adds that it was a complete mystery how it got there. Perhaps, he conjectures, it may have been taken from Solomon's Temple in Jerusalem! However that may be, the men of the Zionist Mule Corps were delighted with their discovery, took it in triumph to their camp, and kept it in the new house as a talisman to ward off shells. And it came to pass that though shells fell all around that house, none of them touched the building, nor was any man hurt when in its vicinity.

* * *

The other story of a sign is of a different kind. A fascinating book was written lately by the Viscountess Wolsley, a warm believer in gardening not merely as a pastime, but as a profession for women. She would like to see women's work in England have the same relation to that of man, and the two co-ordinated, as in Canada. These things cannot be done in old countries as they can in new, and even a mighty war will not dissolve all traditions and the customs and regulations of centuries. Still, vast changes are inevitable, and Lady Wolsley thinks women might do a great and profitable work by going to the land and becoming market-gardeners. But if they do that they must be skilled and well equipped; there is no room in work of this kind for ignorance and mediocrity; the land of Britain must be humoured and coaxed and brought to yield its utmost in future seasons. Years ago Lady Wolsley established a women's college of gardening at Glynde, in Sussex, where a large number of young ladies are trained in the most thorough and practical manner for market-gardening work. The institution seems to be conducted on unique lines, and to be highly successful. What impresses one most on reading this instructive book is the keen sympathy for nature that is exhibited by the writer in her daily labour in the garden, and the insistence that the students shall also cultivate an intense sympathy for the plants committed to their care. Highly practical as is this work, the outlook is that of the garden lover of poetic or romantic mood. Among the notices posted up at this college of gardening is one that no student must bang the greenhouse doors or shout loudly whilst working, because plants, especially cyclamen, tomatoes, fuchsias, and, in a lesser degree, carnations, do not like noise. 'It shocks their system and retards growth,' says this notice. Yet if flowers hate mere noise, they are said to be susceptible to music, and it is suggested to gardeners that they should try sympathetic singing when at work upon their borders. Is there not more consciousness in plant-life than we have suspected? All this has been something of a digression, and we must turn without further ado to one slender note in Lady Wolsley's narrative upon a sign or omen. She says that at

the beginning of the first year of war they hesitated about growing cornflowers, knowing that they were the Kaiser's favourite. Punishment was duly meted out for allowing them a place in the garden, because they had a very bad attack of rust, to which they had never been subject before. That comes of being allies of the enemy! Alas, poor cornflower!

* * *

In this space between two periods of the world an odd *olla-podrida* of literary labour has been flung; and to one who has read—has been obliged to read, one might say—a great conglomeration of war-time pages, it seems to be a good test of interest to take stock of what few memories, like the above, still flourish and survive from the mass. One might make up from one's reading a little bunch of memories, a few choice posies from a thickly planted garden. Such a diversion may pardonably be indulged in. A few weeks ago there passed from the world of war Lord Kitchener, himself, we are told, not free from the superstitious leanings to which we have referred. Our own writers seemed to boggle somewhat when they came to the endeavour to find words in harmony with the tragedy. There was excuse enough, no doubt; the circumstances were so stupefying. But on the second day one was reminded of the keener perceptions, the more sensitive spirit, of some of our French brothers of the pen, for it appeared that it was M. Jean Herbette, in the *Echo de Paris*, who hit upon the most apposite imagery, touched most exactly upon the wonder and the grandeur of this awful happening. Englishmen exclaimed, 'What a pitiable ending at such a time to this great life!' And this sentiment shows that though the Englishman's heart may be in the right place, his spirit too often lacks sympathy with circumstance. The French saw the magnificence of this end, and M. Herbette, declaring that the death that came to Kitchener in the discharge of his duty worthily crowned his career, continued: 'A personage almost legendary, the marshal of the steely eyes, vanished like a figure of romance. A battleship is his coffin, and the sea, heritage of Britain, is his tomb. The northern mists amidst which he has been lost seem to wrap clouds of apotheosis about his death. We imagine his great strong form ascending in space and watching, like a spectator from the Beyond, the battling of the armies that he created for the crushing of the German foe.' However carefully one may select English words, something must inevitably be lost in the translation of a few lines in a French newspaper which raise in our mind a scene that might have belonged to the *Nibelungenlied* itself.

* * *

Amid the hundreds of printed sheets that were filled with the history, the achievements, of the

great Kitchener, one looked vainly for any paragraph that would give information of what the lost leader in the depth of his own consciousness thought of war—the value of war in the abstract. Surely that is what we most often wonder about the great commanders who, inevitably and not of their own volition it may be, are the instruments of the killing of thousands and thousands of the human kind. Theirs is the profession of arms, necessary, it may seem, in this imperfect world, conducted for the good of their own people. But how do they justify it in high and fundamental ethics? The Germans, devoting themselves as a whole people to aggressive warfare, take the hellish doctrines of Bernhardi for their conscience salve. Do great Generals of peacefully disposed Britain also think of war as a splendid thing for national improvement? Not quite so; but Kitchener was not a condemner of war. So far as can be discovered, there is only one place in which there lies a record of his views on war in the abstract, and seemingly it remained undiscovered at the time the biographers laboured with their sudden task. When I found it stored among the divers reminiscences contained in an American book, it appeared of enormous interest. The volume was the *Memories of Mr George Haven Putnam*, the famous New York publisher, who has had an almost unique experience in meeting and conversing with persons of the best and worthiest celebrity. One time he found himself crossing the Atlantic on the same great liner as Lord Kitchener, who was going home that way from India. It was in 1910, and one evening Kitchener, despite his general reserve and silence, gave Mr Putnam the benefit of a talk all to himself on the essential importance and value of war for the development and maintenance of character and manliness in the individual and in the community; and in the narrative set before me I read that Kitchener said he could conceive of no power or factor that could replace war as an influence to preserve man from degeneracy. He did not lose sight of the miseries and the suffering resulting from war, but he believed that the loss to mankind would be far greater from what he called the 'rotteness' of a long peace. Speaking from recent experience, he pointed out that the princes and 'gentle' classes of India, who considered war as the only possible occupation (with the exception of hunting) for gentlemen, found their chief grievance against British rule in the fact that it prevented fighting throughout the Peninsula. Kitchener agreed with the Indian princes in the belief that they and their noble subjects were decaying in character under the enforced idleness of the *pax Britannica*, and he sympathised keenly with their princely grievance. Mr Putnam thereupon sug-

gested to him that during the periods in which Europe had accepted most thoroughly the domination of the soldier class and the influence of the military ideal—as, for instance, during the Thirty Years' War—there had been no satisfactory development of the nobility of character. Kitchener admitted this objection as pertinent, but contended that war could be carried on with methods and with standards that would preserve it as an instrument of civilisation. Mr Putnam asked whether it would be a good thing for India if the British force, once every ten years or so, were to establish a ring-fence within which the princes might, for the purpose of keeping themselves in condition, carry on a little fighting with their own followers, a kind of twentieth-century tournament. The great soldier replied that he could hardly take the responsibility of recommending such a plan, though he was convinced it would have many advantages.

* * *

Few as are the items culled from the new library of a season I wished to include in this small collection, their completion must be deferred till a later month. But one thing I remember in the new books, fair comment upon which would be very difficult. In a foremost journal the other day there was printed a very penetrating and thoughtful article on what was called 'our national vice of hypocrisy.' Where do we stand in this matter now? Look carefully upon this passage which I quote from the newly published volume of the authoritative *Life of Disraeli*. It is a letter from Disraeli to the Queen after the death of the Prince Consort: 'The Prince is the only person whom Mr Disraeli has ever known who realised the Ideal. None with whom he is acquainted have ever approached it. There was in him an union of manly grace and sublime simplicity, of chivalry with the intellectual splendour of the Attic Academe. The only character in English history that would in some respects draw near to him is Sir Philip Sidney: the same high tone, the same universal accomplishment, the same blended tenderness and vigour, the same rare combination of romantic energy and classic repose. Both left us in their youth. But there is no person in our history who has established such a permanent and almost mystic ascendancy over national feeling as Sir Philip Sidney; and the writer of these lines is much mistaken if, as time advances, the thought and sentiment of a progressive age will not cluster round the Prince; his plans will become systems, his suggestions dogmas, and the name of Albert will be accepted as the master-type of a generation of profounder feeling and vaster range than that which he formed and guided with benignant power.' This is amazing.

THE LAUGH.

PART II.

HE had long since lost all sense of time and distance when there came a change in the proceedings. Either he or the horse had come to a standstill. Yates was not sure which. Was it possible that they had reached home? He decided to risk it.

'Put the horse in,' he told the woman in a voice that sounded a long way off. 'I'm afraid I'— Then he crumpled down into the snow. The last atom of his unconscious energy had been expended.

He came to on his own bed, which in itself was something of a miracle. He lay quite still, allowing remembrance to filter slowly into his mind. Some one was moving about the shack. He heard the familiar ring of a stove-lid being lifted. Of course it must be the woman, the woman with red hair and wallflower eyes. Yates swung himself on to the edge of the bed with a suddenness that sent something crashing to the floor.

'Oh!' gasped the woman.

'I say,' said Yates, 'are the calves all right?'

There was a brief pause before the woman answered. 'Yes, quite,' she said. 'Are you?'

'Yes, thanks.' Yates drew his hand across his eyes. 'Bit blind, but it'll be all right in a day or two. What on earth happened?'

'Happened?' Yates heard the woman coming over to the bed. 'Do you mean to say you don't know?'

'Oh, all that, yes; but I wasn't here when—when I went off.' He flushed at the remembrance.

'No; you were down at the corral gate.'

'Then how the—how did you get me up here?'

'On a cowhide; it was quite easy in the snow.' Yates sat swinging his legs.

'I see,' he said; 'just as easy as levering a hundred and sixty odd pounds on to this bed, I suppose. Thanks.'

'Don't talk about it,' said the woman. 'Can you see anything at all?'

'I can see a sort of dark-red smudge,' said Yates.

'That's me,' laughed the woman. 'Drink this.'

Yates obeyed, and returned the bowl to the dark-red smudge.

'Are your feet all right?' he asked presently.

'A little sore, that's all,' said the woman; 'they must have only just "gone" when you found me. She paused, waiting for him to ask her something more about herself, but Yates said nothing. She had long since come to the conclusion that this was a strange man. It occurred to her to wonder now if he had ever laughed.

'I went out with my brothers to see what riding in a blizzard was like,' she went on,

because she found it impossible to remain silent with his sightless eyes upon her. 'They told me not to; we had a tiff about it, and I just went. We found the cattle, and started to drift with them, and then—I don't know how it happened'—

'You got separated?' Yates interrupted. 'I know. Half your bunch drifted into the War Lodge. That's what took mine there.'

'You mean'—

'Just that,' said Yates. 'The Priest boys went on with the other half, that's all.'

'You know my brothers, then?'

'Oh, yes, I know them.'

'They have never spoken of you.'

'No one ever does,' said Yates.

They seemed to have reached a *cul-de-sac* in the conversation. It was the woman again who broke silence at last, because she felt that she must.

'Well, then I rode and rode, and dismounted to stamp my feet and try to think, and'—

'Yes,' said Yates with his exasperating deliberation. 'I know just what it is when you lose control.'

'But I didn't,' protested the woman; 'not for one minute.'

'Not when you fell asleep in a six-foot snow-drift?' Yates's mouth curved into a grim smile as he slid to the floor and crossed the room with hands outstretched. 'Look here,' he said irrelevantly, 'can you find everything?'

His hands passed lightly over one familiar object after another until they came into contact with a plug of tobacco on the shelf behind the stove.

'Oh yes,' said the woman. 'I've never seen a shack so scrupulously neat.'

Yates pared the tobacco into the palm of his hand and rubbed it with a slow, circular motion. The woman watched him fill and light his pipe, then saw his hand go out and feel the surface of the table. It came into contact with the wash-pan standing empty, as she had left it. He frowned as he turned it upside-down and propped it against the wall. 'Where's the dish-rag?' he asked.

She brought it to him from the nail where she had hung it, and he spread it over the inverted wash-pan to air.

'I always do that,' he said. 'I think it's better.'

The woman regarded him wonderingly; then an understanding smile came into her eyes and curved the corners of her mouth. 'Very well,' she said gravely.

Yates found several things out of place. It annoyed him intensely, but he said nothing until

late that evening. He was sitting in the home-made rocker beside the stove, while the woman cleared away the tea-things.

'Where are you going to sleep?' he asked suddenly.

'Over in the corner, where I did last night,' she answered promptly.

'Last night?' queried Yates incredulously.

'Yes. You don't seem to realise that you slept forty-eight hours.'

'Good Lord!' said Yates, and relapsed into momentary silence.

'Well, to-night you must have my bed,' he announced presently; 'and to-morrow, I suppose, you could ride to Bear Creek? You can see it from here.'

The woman was putting the sugar-basin into the dresser cupboard. She paused before shutting the door quietly but firmly. 'I'm not going back to Bear Creek until your eyes are all right,' she said.

Yates appeared to digest this decision for a space. 'Afraid of losing your way again?' he suggested.

'Yes,' lied the woman.

A little later the work was done, and the woman sat at the table turning over the pages of a six-months-old magazine.

'This is very dull,' she announced at last.

'Down on Bear Creek we play poker.'

'Really?' said Yates.

'Yes; it's the only thing that keeps me alive—that and the thought that I'm going home in the spring. I only came out to my brothers to see how I should like it.'

'I see,' said Yates. 'And you don't like the prairie?'

'Like it?' flashed the woman, with unexpected heat. 'I hate it. I've never hated anything so much in my life.'

'Good gracious!' murmured Yates.

'And you?' The woman leant forward with some show of interest.

'I?' Yates appeared to ponder the matter, with his hands interlocked behind his head. 'I really haven't thought about it; there's too much to do. It's one kind of life, I suppose.'

'One kind of death, you mean,' corrected the woman. 'The prairie takes a man—usually the best sort—and deadens him, and goes on deadening him until he forgets that he has ever lived. Sometimes I think it must be alive, like the sea. Why do men go on living such lives when there's no need?' The woman paused as though awaiting an answer, but none came. 'Because the prairie tells them to,' she ended triumphantly.

'You seem to feel this pretty deeply,' said Yates.

'I do,' came the swift answer. 'Look what it has done to my two brothers, and—and others. They weren't like that three years ago. Of course, they say they are going to make their fortunes and get back to "God's Country," but they

won't. They'll go on and on like all the rest until the prairie has devoured them body and soul.'

'It came pretty near devouring you, didn't it?' said Yates whimsically.

'Yes,' agreed the woman. 'And that is another thing that I believe. Oh, I know you'll laugh at me inside, think I'm touched, perhaps; but this has all come to me during long, lonely rides. I believe the prairie knows those who don't belong. I believe she punishes those who hate her.'

Yates nodded slowly. 'Perhaps,' he said.

The woman gave him an appraising look, and saw that he had spoken in all seriousness. 'Was it possible that she had met some one who understood? 'And the prairie man,' she went on, 'he maddens me. Every one thinks that he must be a great big man, leading a great big life, because the prairie is a great big place, when he is really the smallest-minded thing on earth, crawling along a rut a mile deep and an inch wide. Why can't he climb up into the light just for one minute, think it out, and give the prairie the laugh? I can get amusement out of most funny things, but not out of the poor prairie man. He's too pathetic. To any normal person he's like—like a blind clown.' Her hand shot out and rested on Yates's sleeve. 'Oh, I'm sorry,' she added with swift compassion.

Yates smiled serenely. 'Don't apologise,' he said. 'It was rather apt, that's all. Please go on. It doesn't look as if we shall have such a dull evening after all.'

'I can't,' said the woman. 'Not after that. Besides, I may be all wrong.'

Yates got to his feet, felt carefully for the stove damper, and knocked out his pipe.

'You may,' he said slowly, 'but—I'm not so sure about it.' He felt his way to the door and stood with his hand on the latch. 'Just put the blankets over my arm, will you? I'm going to sleep with Pinto to-night.'

The woman hesitated, then obeyed. 'Shall I lead you down?' she suggested.

'Lead me!' scoffed Yates. 'I wonder how many millions of times I've been backward and forward between here and the stable. Pity the poor prairie man! Good-night.'

The woman watched him move off down the track with sure step. 'Good-night,' she called after him, and shut the door.

She sat for some time on the edge of the bed, her hands clasped in her lap, her eyes turned towards the tiny square of window-pane. Through it she saw an expanse of moonlit snow, the prairie asleep under its coverlet. A coyote howled somewhere out in the night, and others answered. The woman shivered, and went to bed.

In the morning Yates found that he could see—dimly, it is true, but sufficiently to carry on the day's routine. He fed the calves and went up to the shack. 'Are you awake?' he called.

'Awake?' The woman crossed the room and flung open the door. Behind her was the homely background of a steaming kettle and a table laid for breakfast. 'You can see!' she exclaimed, as he passed inside.

'Quite passably, thanks,' said Yates, and stood by the stove regarding her with his whimsical smile. The woman wondered what he thought of her, but Yates offered no information on the subject. 'Well, do you feel any kinder towards the prairie this morning?' he bantered her during breakfast.

She shook her head. 'Not a bit,' she said, with her eyes on her plate. 'You haven't forgotten, then?'

'No,' said Yates, 'I haven't forgotten.'

'And you still laugh at me inside?' Her wallflower eyes met his frankly.

'Not a bit of it,' he assured her. 'I never did that.'

'Thanks,' said the woman. 'It's a gorgeous day for riding to Bear Creek, isn't it?'

'You're going, then?'

'Yes.'

'I'll saddle the horses.' Yates pushed back his chair.

'No, please,' said the woman. 'I'm going alone. There's no need for you to come all the way down there. My brother will bring the pinto back, and—and thank you.'

'But I thought'—

'Oh, nonsense!' said the woman. 'You surely don't think me so helpless as that? You can see Bear Creek from here.'

Yates felt vaguely disappointed. 'I know,' he admitted lamely.

'Very well, then,' said the woman with the red hair. 'But I'm going to wash up before I go.'

'No,' Yates objected firmly. 'I always do the whole lot at one go in the evening.'

'And spread the dish-rag over the wash-pan,' added the woman, with a twinkle in her wallflower eyes.

Yates regarded her blankly for a moment, then smiled his slow smile. 'Yes,' he said.

The woman went out of the door laughing, and it was at that moment, with the sunlight full upon her, that Yates noticed her hair was not red, but auburn. Had she known it, Yates had paid her the highest compliment of his life.

Down at the corral they stood for a moment in the snow, the pinto champing at his bit. The woman held out her hand. 'Good-bye,' she said, and hesitated. Then, when he had helped her to mount, she nodded her head towards the snow-clad prairie. 'Try to give it the laugh,' she said.

Yates looked up at her. 'I'll see about it,' he said. 'But take care it doesn't gobble you up, that's all.'

The woman flung back her head with a gesture of defiance. 'Let it!' she said, and, laughing, rode out into the snow.

That day was a curious one for Yates. Never before had it occurred to him that the day's work could be wearisome. But it was. Quaint and wholly unaccustomed thoughts flashed in and out of his mind like a busy shuttle, weaving a mesh that hampered the ordinary routine abominably. Was he feeding the calves, then, instead of admiring their fitness; and saying aloud, 'Ought to winter all right,' he asked himself what was the use of their wintering well if they were to be caught in a death-trap like the War Lodge Coolie the following year?

Up at the shack it was the same. What sort of life was this perpetual round of trivial toil, the whittling of shavings for the morning fire, the bread-baking every Thursday that had become almost a rite, with its effeminate details of settings and raisings? Why did he work? What did he work for? What was he? 'A blind clown!' The answer came pat, as though the woman herself had spoken. He fell to thinking of her.

But the climax came with the washing-up. He was spreading the dish-rag over the inverted wash-pan to air, when his own action came home to him with a force that caused him to fling it to the ground in a sudden access of disgust. For a moment he stood staring at it, astonished at the thing he had done; then he carefully replaced it on the table and crossed the room to a cracked shaving-glass that he had not consulted since growing a beard.

For the next few minutes Yates stood, as it were, a detached spectator, viewing himself with critical eye. 'A blind clown!' He was, he always had been, and he always would be, if the prairie had her way. The woman was right to the last letter. She was sensible, that woman, unlike any other Yates had met. He sat in the home-made rocker, thinking, thinking.

It was about midnight that he opened the shack door and stood looking out over the eternal expanse of moonlit snow. His mind was made up. After the fashion of a machine that has run evenly and overlong, the stoppage was all the more sudden and complete. He would sell out to the Priest boys; they would jump at the chance of his range stock, and he would go home to 'God's Country' and the woman with the auburn hair. She would be pleased at what he had done. Yates experienced an overwhelming desire to see her, to speak to her again. Already he felt freer, more alert, as though suddenly rid of a spell. Already he saw the prairie with different eyes—her eyes. Heavens, how she hated it! So did he. Remembering all that it had caused him to endure needlessly, he looked upon it again, lying white and silent under the moon, and laughed quietly to himself, the short, satisfied laugh of the freed.

The melting snow was swelling the creeks into torrents, and the geese were flying up from

the south, flock after flock, when Yates drew rein at the Priest boys' homestead.

The elder brother, a long wire of a man with a prematurely lined face and sombre eyes, came out to meet him. It was the first time they had seen each other for six months.

'Breaking up,' said Yates.

'I guess so,' agreed the other.

'Loss many?'

'Bout 25 per cent.'

Yates crooked his leg round the horn of the Mexican saddle. 'I came down to see about selling out,' he said. 'I'm full to the teeth. Thought you'd like first offer of the outfit.'

Priest's sombre eyes lit up a trifle. 'I don't mind. What's it worth?'

'Twenty dollars a-head all round.'

'That's a go. Better put your horse in.'

'Is your sister in?' asked Yates.

Priest stood stone-still for a moment, staring at the ground. When he looked up, something in his eyes caused Yates to stiffen.

'My sister's dead,' he said.

'Dead!' It was little more than a whisper.

'Yes, two weeks ago—over Cooper's cut bank. Better put your horse in.'

Yates did not answer. He sat quite still for a space, then mechanically turned his horse's head towards home.

'Sometimes I think it must be alive, like the sea. I believe the prairie knows those who don't belong. I believe she punishes those who hate her.'

Yates went into the shack and closed the door.

THE END.

PITFALLS FOR THE PATENTEE.

By W. O. HORSNAILL, A.M.I.Mech.E., A.M.I.E.E.

MOST of us have coveted at some time or another the fortunes made by the happy possessors of successful patents, and nearly every one has racked his brains for ideas which will 'rake up the shekels' in this easy manner.

More often than not the man or woman with an idea which promises a fortune if patented rushes off to the nearest patent agent and instructs him to apply for protection, the result being the dead loss of a considerable number of guineas. In many cases nothing more is done, but a few enthusiasts proceed to further reckless expenditure by having models of their inventions made. They then find not infrequently that the devices are well known or have been previously patented by some one else.

Nearly thirty thousand applications for British patents are made every year, and quite 90 per cent. of them refer to ideas which have been protected in the thoughtless manner described above. Many of the applicants, moreover, are poor men or women who can ill afford to waste their time and money in this way. Out of the few applications which have some real value, nearly all are made by trade inventors for business purposes, or by professional patentees who know all the tricks of the trade. One or two, however, will be good inventions which have been stumbled upon by lucky outsiders; but it by no means follows that the patentees in such cases will benefit to any great extent, as the development and sale of a patent requires great perseverance, coupled with a strong aptitude for business. Once, now and again, however, some fortunate man or woman succeeds in making a large sum of money out of a patent, and it is these occasional successes which make the game so attractive. Moreover, some of these successes are scored by very unlikely people. A clergy-

man, for instance, invented and patented a rotary fan for ventilating mines, which brought him in a large income from royalties. Perhaps not quite so improbable was the invention of the hump hook for fastening female attire by two maiden ladies, who did very well out of it. The best advice to would-be patentees is that given by *Punch* to those about to marry; but, if any man or woman persists in this course, certain procedure should be followed with a view to cutting the loss in case the invention proves to be valueless.

One of the first points to consider is the extent of the market for the article it is proposed to protect. For example, a new form of instrument for measuring the rainfall would have a very limited sale, while such articles last for many years, so that once the few people wanting them are supplied the demand ceases. On the other hand, a large and continuous sale can be confidently expected for a bicycle-tire which will not puncture.

To make the procedure recommended easier to understand, we will suppose that a school-master, or some other person quite unconnected with the trade, has invented a knife-cleaner, for which there would certainly be a large demand if it became popular. The first thing to do, for the simple reason that it costs nothing, is to find out what other knife-cleaners are already on the market. This information can be got from any wholesale ironmongery catalogue, where all kinds of machines for this purpose are illustrated and priced. The new invention must be at least as good value as any of them to have any chance of success. In other words, its effectiveness, wearing qualities, and convenience in working must be equal with other knife-cleaners, without costing any more. Naturally, also, it must be substantially different

from other makes, otherwise it cannot be patented. The next move is to search the patent records in order to find out whether any one else has patented a similar contrivance already. These patent records may be consulted at the Patent Office Library in London and in many of the larger provincial cities and towns. It would take up too much space here to describe how such a search is carried out; but, provided that the records are within reach, any intelligent person can do the work. If a previous patent is discovered which to some extent resembles the new invention, a detailed description and drawings can be obtained from the Patent Office for eightpence, and these should be very carefully studied.

So far it will be noted that our inventor has spent no money at all, while he has assured himself that there is no other knife-cleaner like his on the market, and that no one has already patented his device. It will now be advisable to apply for what is known as provisional protection, which lasts for six months. The application must be sent to the Patent Office on a prescribed form, which can be obtained at any post-office for one pound, although the forms are only kept in stock in the larger provincial towns. Whether the inventor should employ a patent agent at this stage depends upon his descriptive skill and the nature of the invention. Legal style is not necessary, only a clear description in simple language. Many inventors are certainly capable of drafting an application for provisional protection; others may have to employ an agent. The charge through an agent is seldom less than three guineas, including the Government stamped form; and for a complex invention the fee would be a good deal higher.

Having obtained protection for six months, our inventor can show his invention to any one likely to offer useful advice without any fear of having the design stolen. At this stage—if, indeed, it has not already been done—the new knife-cleaner must be made, and it is most important that it should be *well made*. The machine can then be tried against other knife-cleaners, and the results compared. If the inventor cannot borrow or have the use of all other types of machine, he may have to buy those which are not otherwise available. In any case he must be certain that his invention will clean knives at least as quickly and well as any other. In making comparisons he should obtain the candid opinion of his friends, as his own judgment is certain to be biased in favour of his own invention. If possible, also, the man who cleans the knives at a large house or hotel should be persuaded to try the new machine, as such a man's opinion would be most valuable, although allowance must be made for possible prejudice.

The above comparisons having proved favourable to the invention, the next important question is how much it will cost to make. The

best way of finding this out is to take the machine round to every manufacturer who makes knife-cleaners or similar domestic appliances. These firms will be glad enough to consider a new type which promises to pay, and for which the full protected period of fourteen years (the life of a British patent) is available; in fact, one of them may even offer to manufacture the machine after the complete patent has been obtained.

The inventor now has to decide whether to proceed further or not, and the comments of the manufacturers will form a useful guide for him in this respect. If every firm approached condemns the new knife-cleaner as being too costly, or having other faults, he may be pretty certain that there is no money in it. On the other hand, if one or two of them express a favourable opinion he can go ahead.

The next stage is the drafting of what is known as the complete specification, which contains a detailed description of the invention and the claims of the inventor for what is novel in it. It is most important that this work should be well done; hence a patent agent must be employed. Furthermore, the patent will be more easily sold or worked on a royalty basis if the complete specification has been drafted by a well-known firm of agents. The charges for this work vary according to the complexity of the invention and the number of drawings required to explain it; but ten guineas may be taken as a minimum.

Letters patent having been granted, the invention is now ready for sale or for manufacture on a royalty basis, the latter being the more usual arrangement. In the customary agreement between the patentee and the manufacturer, the latter agrees to pay a royalty to the patentee upon each knife-cleaner sold, and he should also agree to pay a minimum sum, increasing year by year, whether the royalties reach this figure or not. This arrangement ensures that the manufacturer will begin making and selling as soon as possible.

It will be gathered from the above description that the bringing out of a patent is not such a simple matter as many people suppose; in fact, it generally means a lot of worry and hard work.

So far we have taken as an example a simple appliance which is very easily tried at a low cost, and which can be patented or abandoned according to the results. Certain mechanical problems have always had a great fascination for inventors, and in these cases expert advice should be sought before any money is spent. Dozens of patents, for instance, have been taken out for various forms of tidal-power, or for obtaining power from the waves. One very attractive idea for tidal-power is to construct an enormous float which rises and falls with the tide, and which is made to give out power through a rack and pinion with multiplying gear. It is quite possible to produce power in this way, but the cost of the apparatus is so great that the interest on the

capital would much more than pay for the coal for a gas or a steam engine. Another favourite idea is a boat supported on rollers, an example of which on a large scale was actually built in France some years ago; while inventors with just enough knowledge of oil-engines to be dangerous are very fond of advocating a mixture of steam and gas to increase the efficiency. All these ideas, and many of a similar nature, can be proved valueless by any engineer worthy of the name; and money is well spent in getting an expert opinion before taking any steps to apply for a patent. In such cases an independent engineer should be approached in preference to a patent agent, as the former has the requisite

knowledge, and it is of no consequence to him whether the patent is proceeded with or not. The patent agent, on the other hand, loses his fees if the idea is abandoned.

Another direction in which inexperienced inventors often fail is in making models of their inventions. Many a good idea has been patented and subsequently abandoned because the working model was badly made, and failed to convince any manufacturer of the advantages embodied in the invention.

This dissertation on patenting may be concluded with the well-known dictum that any fool can think of an idea, but it takes a clever man to make it and a genius to sell it.

PINCHER MARTIN, O.D.

CHAPTER XI.—BLACK FRIDAY.

I.

[The reader is cautioned against accepting this story as an official narrative of the great war. The incidents described have actually happened; but, for obvious reasons, it has been necessary to give them fictitious colouring.]

'APPY Noo Year, chum,' said the lookout-man on the starboard side of the *Belligerent's* bridge, as Pincher Martin came up to relieve him at five minutes past midnight on the morning of 1st January. 'Lawd!' he added with a shiver, stamping his sea-booted feet, 'I shall be glad ter git inter me bloomin' 'am-mick.'

'Noo Year, is it?' Pincher queried with a prolonged yawn. 'Well, th' compliments o' th' season to yer, Shiner White. 'Strewth!' he added, 'it's a bit parky, ain't it?' He undid the toggles of his thick lammy coat,* and gave the muffler another turn round his neck.

The other man nodded. 'There ain't nothink in sight,' he went on hastily, anxious not to prolong the conversation; 'but if yer sees a light or anythink, look out yer sings out sharp an' loud, so that th' officer of the watch 'll 'ear yer. S'long, chum!'

'S'long, Shiner! 'Appy dreams.'

Pincher, left to his own devices, looked about him. The squadron was at sea, and to his unpractised eye the night seemed unusually fine. What little wind there was seemed to be coming in from the south-westward in fitful, erratic puffs, and the great ship rode over a smooth, gradually increasing swell without perceptible movement. If he had been a weather prophet the state of the sea and the sky would have warned him to expect a change in the weather; but he was a novice at such things, and the signs and portents of sky and sea conveyed little to his mind.

* 'Lammy coats,' the name given by the men to the thick duffel coats with hoods served out in cold weather. They are fastened with toggles and beackets instead of buttons and button-holes.

The moon was up, and the night was not really dark as nights go; but every now and then the brilliance of the moon was temporarily dimmed by great high cloud-masses travelling down from windward across the face of the blue, star-spangled heavens. Away to the south-westward a heavy piled-up bank of dark hue, looking for all the world like a gigantic mountain range overtopping the horizon, was gradually encroaching on the sky as it mounted up and up into space. Its upper edges were frayed and fretted by the wind, and occasional wisps of cloud torn from the main mass were being flung off into space by the upper air-currents, to come scurrying to leeward in low-lying, streaky fragments like spun silk. They were mares'-tails, and the swell and the watery halo round the moon were other bad tokens. They portended wind—wind, and plenty of it. Soon the sky would be completely overcast. Before daylight it would probably be blowing hard.

The *Belligerent* was somewhere near the tail of the line of battleships. A short distance in front of her came the huge hull of the next ahead clearly silhouetted against the sky. Farther ahead again were the dark outlines of other vessels, their shapes getting smaller and less distinct as they merged in the deep shadows on the horizon.

On board the *Belligerent* herself half the seamen were at their stations at the guns ready for repelling a possible torpedo attack, and the other half, who had been relieved at midnight, had just retired to their hammocks for four hours' rest before being called up for the morning watch at four o'clock. The ship was in the charge of the officer of the watch, who leant placidly against the standard compass on the upper bridge gazing at the next ahead; while Colomb, the navigator, was asleep on the settee in the charthouse. Captain Spencer was in his

sleeping-cabin just underneath, and was dozing, fully dressed, in an arm-chair in front of the stove. The book he had been reading had dropped to the floor, and Joe, his fox-terrier, lay curled up in a tight little bundle at his feet. The captain was a light sleeper at the best of times, and the least unusual sound, even the opening of the door, would have brought him to his feet in an instant. As an extra precaution there was an electric bell screwed to the bulk-head close beside his left ear, and if the officer of the watch desired his immediate presence all he had to do was to place a finger on a push close by the standard compass. The resulting jangle would have roused the Seven Sleepers of Ephesus, let alone the skipper, who never indulged in anything but cat-naps at sea. The officers of watches were well aware of it, for Captain Spencer had a habit of prowling about at night, and frequently came on to the bridge when he was least expected. Once or twice he had found the ship some distance out of station, and then there had been trouble.

Of what really occurred, how long it lasted, and of the actual sequence of events, Pincher had a very hazy recollection. He remembered noticing the captain come on to the bridge and start walking up and down with his hands in his greatcoat pockets and his dog padding softly after him. Then, quite suddenly, and for no apparent reason, there came the shattering roar of a heavy explosion. The ship quivered and shook violently; and, glancing aft with his heart in his mouth, Pincher saw a great column of white-gray water towering high over the boat-deck half-way along the starboard side. He watched it spell-bound. The mass hung for a moment glimmering in the half light, and then tottered and fell with a sound like a waterfall. He could feel the damp spray of it on his face.

The familiar throb of the engines died away, and there came the roaring bellow of escaping steam; and the ship, evidently holed far below the water-line, heeled over to starboard. Then the roaring of the steam ceased, and there came a moment's dead silence, followed by excited shouting as the men who had been asleep in their hammocks thronged on to the upper deck.

The whole thing happened so suddenly and unexpectedly that for the moment Captain Spencer was taken by surprise; and, running to the after side of the bridge, he stood there gripping the rail spasmodically with a look of utter astonishment on his face. A bare instant later, however, he turned forward again with a gesture of annoyance; while Joe, taking it for some new game for his especial benefit, frisked beside him. 'Down, Joe! down!' Pincher heard him say in his ordinary voice.—'Stop both engines!' came his first order.—'Officer of the watch!'

'Sir.'

'Go down and tell the commander to get the

collision-mat out, and then to turn out all boats. He's not to lower them without orders from me; and tell him to let me know the damage as soon as he can!'

'Ay, ay, sir,' said English quite calmly, leaving the bridge.

The captain turned on his heel and dictated a signal informing the flagship of what had occurred. Pincher watched, for even now Captain Spencer's face was absolutely inscrutable, and showed nothing of the awful anxiety which must have been in his heart.

The commander, who had rushed from his cabin when the crash came, had already taken charge on deck. Order was evolved out of chaos, and the shouting had ceased. An instant later a bugle blared the 'Still,' and the boat-swain's mates could be heard piping.

There was dead silence among the men as the word was passed, and then the bugle sounded 'Carry on,' and the tramping of feet could be heard as the ship's company ran to their stations.

All except a few unimportant watertight doors, which were closed at the last moment by specially detailed men, were always kept shut at sea; so little could be done to add to the safety of the ship beyond endeavouring to prevent the ingress of water.

The men were well disciplined. They must have felt nervous, must have realised that there was an enormous hole below the water-line through which the water was pouring like a mill-race; added to which, it was dark, and there were no lights on deck. But there were not the smallest signs of panic or confusion. They behaved splendidly, and worked silently under the orders of their officers as if it were an ordinary peacetime evolution instead of grim reality.

Pincher himself was undecided for the moment as to what he should do. Ought he to join his part of the ship and assist in getting out the collision-mat, or should he remain where he was? He had no orders to leave his post, but it was hardly likely that any one would trouble his head about him now. For a moment he was torn with doubt, but finally made up his mind that he would stay on the bridge. He might be of some use in carrying messages, he thought.

The stricken vessel seemed to be leaning more and more over to starboard; but before very long the collision-mat, a large square of several thicknesses of the stoutest canvas well thrummed with oakum, was being lowered into place under the bottom. It was designed, by being stretched taut over the orifice, to reduce the flow of water through a comparatively small hole caused by a collision with another ship, and it seemed hardly likely that it would be of any use in checking the inrush through the gigantic rent caused by an underwater explosion; but there was no harm in trying it. It might do some good.

'Haul away the bottom line!' the first lieutenant's voice could be heard. 'That's the way, lads! Away with her!'

'Vast hauling!' came the next order, accompanied by the shrill trilling of a boatswain's whistle. 'Away with the fore and afters!'

The mat was out of sight below the water, its bottom corner dragged taut against the ship's side by the bottom line passing under the keel and hauled taut on the opposite side of the deck, and the upper corner held in place by the depth-line. The fore and afters were the ropes secured to the side corners, and they, on being hauled taut and belayed, held it out square.

'Mat's placed, sir!' came Chase's voice again.

The wind had increased, and white-capped seas had replaced the smooth swell of an hour before. The ship, listing to an angle of about fifteen degrees, seemed to be remaining fairly steady, but she was appreciably lower in the water, and the starboard edge of the forecabin was barely six feet above the crests of the waves as they raced by.

The cutters at the davits had been turned out ready for lowering, but all the smaller boats, galley, whalers, and gigs, had been landed. Hatherley, who was working the steam boat-hoist used for getting out the heavier boats stowed on the booms between the after funnel and the mainmast, had the derrick topped and the largest rowing-boat in the ship—the forty-two-foot launch, which, at a pinch, could carry one hundred and forty men—hooked on all ready for swinging out into the water as soon as he got orders to do so.

Circling round the injured ship were a couple of light cruisers which had been sent by the vice-admiral to render what assistance they could. Flashing-signals were passing between them and the *Belligerent*, and they were evidently asking if they should lower their boats.

'Tell 'em to wait,' Pincher heard Captain Spencer say to a signalman without a tremor in his voice. 'Tell 'em to wait. I think we shall be able to keep afloat.'

The sky was nearly overcast, and the night had become very dark, and all the remainder of the squadron had vanished. They were only acting in accordance with their orders, however, for since the loss of the *Aboukir*, the *Cressy*, and the *Hogue* in the North Sea the previous September, it had been definitely laid down that heavy, deep-draught ships were not to go to the assistance of vessels which had been torpedoed or mined, lest they should share the same fate. It went sadly against the grain for British officers to be forced to leave comrades in distress; but every one realised the necessity for the order, and the two small cruisers were the only ships available for the work of rescue.

'Messenger!' the captain called.

No reply.

'Here, boy, come here!' he went on, catching

sight of Pincher on the starboard side of the bridge.

Martin went forward, and felt himself grabbed by the sleeve.

'Go down and tell the commander that I'm waiting to know what damage there is,' Captain Spencer said hurriedly. 'Away you go!'

Pincher scrambled down the sloping ladder with difficulty, but had barely reached the boat-deck to go aft when he cannoned into Commander Travers coming in the opposite direction. 'The capten would like ter know wet th' damage is, sir,' he explained.

'All right, I'm on my way to tell him,' the officer returned curtly. 'Get out of the way, boy!'

Martin stood aside, and followed him up the ladder again, without really meaning to overhear his conversation with the captain.

'How goes it, Travers?' was Captain Spencer's first anxious question.

'Pretty bad, sir,' the commander replied with the least trace of anxiety in his voice. 'Some of the boiler-rooms are flooded, and the water seems to be making its way forward and aft. One or two bulkheads have gone already!'

'Good God!' the captain exclaimed; 'is it as bad as that? Is the mat doing any good?'

The commander shook his head. 'Might just as well try to stop the hole with a bit o' stickin'-plaster, sir,' he said tersely. 'I've just seen the engineer-commander,' he went on, 'and he tells me he's doing all he can, but that the water's gaining on us fast. I've got men down below shoring up bulkheads to prevent their bursting, but I doubt if they'll do much good. However, sir,' he added hopefully, 'she hasn't listed much during the last few minutes, and perhaps we'll be able to save her yet.'

'Pray God we shall, Travers!' Captain Spencer returned gravely. 'You'd better get all the boats out as soon as you can, and keep 'em alongside; but don't allow the men into them until I give orders. I'll tell the cruisers to send theirs across, but we'll make 'em lie off for the time being. Well, so long, commander, in case we don't meet each other again. Do all you can.'

'I hope it's not so bad as I think, sir,' Travers said with a forced laugh as he turned to leave the bridge. 'It's a damned nasty night to go swimmin', I must say. It was a submarine, I suppose, sir?'

'Must have been. By the way, you'd better warn 'em to blow up their swimming-collars.' The captain was ever mindful of his men.

'I will, sir. What about you?'

'Don't worry about me, man. You see to the ship's company. I'll look out for myself.'

The commander disappeared.

The time passed. There was still a chance of the ship remaining afloat, and by about three o'clock, merely as a precautionary measure, the launch and the pinnace had been hoisted out and

the boats lowered; though one cutter, lowered too rapidly, had capsized and disappeared. During the interval the ship did not seem to have listed any more to starboard, and favourable reports had come from down below as to the chances of remaining afloat. In fact, they were all congratulating themselves that the damage had been overrated, when another heavy explosion roared out from the port side aft.

'By God!' muttered the captain under his breath; 'that's another torpedo!'

The *Belligerent*, with a fresh wound open to the sea, shuddered violently, and then gave a sickening lurch to starboard, and lay over until her masts were at an angle of thirty degrees from the vertical. The starboard side of the upper deck was under water, and the other lifted high in the air, while the inclination was so great that it was barely possible to walk. Realising that the end could not be long delayed, Captain Spencer dragged himself to the bridge-rail and raised a megaphone to his lips. 'Abandon ship!' he roared in a voice which could be heard above the howling of the wind and the raging of the sea. 'Save yourselves, men! Save yourselves!'

The word was passed along, but still there was no undue haste or confusion. Stokers and other men of the engine-room department who had been employed below until the last moment, some of them clad in their grimy working clothes, others nearly naked, came pouring up the hatchways leading to the upper deck.

A cloud drifted away from the face of the moon and a subdued silvery light lit up the awful scene.

The boats, plunging wildly on the rapidly rising sea, pounded and crashed alongside. A small group of officers stood beside each one superintending the disembarkation, and the men, standing in long queues, could be seen jumping into them one by one. Several, leaping too late or too early, fell between the boats and the ship's side, and were never seen again.

The doctors and the sick-berth staff, unmindful of their own safety, passed their sick and ailing into the boats, and remained behind themselves.

'Steady, lads! steady!' the chaplain, gallant man that he was, could be heard saying coolly. 'One at a time! Keep cool, boys! Keep cool!'

Many men, relying on their life-belts or swimming-collars, had flung themselves overboard and were swimming in the direction of the cruisers, whose rescuing boats were on their way across as fast as their eager crews could drive them. A certain number of the swimmers were eventually picked up and saved, but by far the greater proportion perished in the wild tumult. Every one knew that there was room for barely more than a fifth of the ship's company in the boats; but, in the face of almost certain death, there was no panic.

'Ullo, 'Orace,' a burly stoker remarked to a friend with a laugh, 'copin' swimmin'!'

'Looks like it, chum,' answered the other glumly, eyeing the white-capped seas with nervous apprehension. 'Ain't much o' a night fur a picnic like, this 'ere, is it?'

'Rottenest bloomin' regatta ever I saw,' rejoined the first speaker, who was attired in nothing but a singlet and an inflated swimming-collar. 'Ow's this fur a bathin' costoom! What'd my ole 'ooman say if she see'd me on th' beach at Margit in this 'ere? Ow!' he yelled, as a breaking wave deluged him with icy spray. 'Gawd! ain't it cold? Come on, boys; come an' 'ave a dip! Any more fur th' shore?'

The others hung back.

'Wot! not comin'?' he went on, walking to the edge of the boat-deck and gazing out at the sea. 'Well, s'long, blokes. 'Ere goes!'

He clambered down the ship's side on to the net-shelf, waited till a large sea came swishing past, and then slipped into the water, to vanish in a smother of foam. An instant later he reappeared, swimming strongly in the direction of the nearer cruiser. He was never seen again.

Somebody started the chorus of 'Tipperary' to cheer the flagging spirits of his shipmates, but the gallant effort met with little response. Numbers of men, trying to nerve themselves for the ordeal of leaping overboard and of saving themselves by swimming, shrank back at the sight of the raging sea. It was enough to appal the bravest heart, and the ship, though sinking fast, still seemed to offer a safer refuge than that wild waste of water.

The captain, holding on to the bridge-rail to prevent himself from being carried off his feet, surveyed the scene calmly. 'Jump, men! Jump!' he bellowed to a hesitating group on the boat-deck. 'For God's sake, jump! It's your only chance!' Turning round, he noticed that Pincher and one or two signalmen were still on the bridge. 'What are you doing here?' he demanded with a touch of his old asperity. 'The ship's sinking! Get down out of it, and save yourselves!'

Pincher and some of the others obeyed, but the chief yeoman of signals, noticing that the captain wore no life-belt or swimming-collar, calmly proceeded to divest himself of a cork jacket. 'Take this, sir,' he said, handing it across; 'I've got my collar.'

Captain Spencer pushed it away. 'Use it yourself, man!' he said firmly. 'Use it yourself!'

'But I don't want it, sir,' the chief yeoman persisted.

'Do what you're told, Grimes,' came the answer. 'Leave the bridge and save yourself; she'll go in another minute or two! I'll look out for myself!'

Grimes hesitated for another instant, saw his commanding officer was in earnest, and left the bridge.

'Good-luck to you, Grimes!' the captain called out after him.

'Good-luck, sir.'

Captain Spencer, alone with his dog, leant down and lifted him into his arms. 'I'm afraid we're done in this time, old man,' he whispered sadly. 'We may as well go together. Good-bye, old Joe!' His voice was husky with emotion as he buried his face in the animal's warm coat; and the dog, seeming to understand, turned his head and licked his master's cheek.

The end came almost immediately, for before some of the boats had got clear the ship lurched drunkenly to starboard, to hurl men and movable fittings in one awful chaotic avalanche into the water. For one moment there was wild confusion, and the sea was covered with the heads of swimmers fighting for their lives. The next, there came the muffled roar of bursting bulkheads, and the *Belligerent* hove herself back

on to an even keel, with the water washing across her decks.

A searchlight flickered out from one of the cruisers and lit up the scene. Lower and lower sank the doomed ship, until at last the waves were breaking across the top of the boat-deck, and only the two masts, the funnels, and the bridge showed above the surface. She seemed to hesitate for a moment as if unwilling to take the final plunge; and then, with a dull, booming sound as the water reached the boilers, slowly slid from view.

There was no vortex or upheaval of spray, merely a swift rush of sparks and a cloud of smoke and steam, which rapidly dissolved on the wind, and in a few more seconds the ship had vanished for ever. Nothing remained to tell of her presence except the boats, the dark heads of the battling survivors, some debris, and an ever-widening circle of calm, oil-strewn water, on the outskirts of which the waves leapt tumultuously. But on the bridge, game to the very last, two heroic spirits, a man and a dog, had gone to their long last rest together.

(Continued on page 631.)

THE MONTH: SCIENCE AND ARTS.

A SAFE SEDATIVE.

ALONG with the manufacture of aniline dyes from coal-tar, the German chemists have developed the production of several specifics which have come to be regarded as indispensable items in the pharmacopœia. The majority of these drugs, such as sulphonal and veronal, are nerve sedatives; and, owing to their excellent therapeutic qualities, and to the facility with which they could be obtained, they attained a remarkable vogue. But these drugs, especially those of the veronal type, suffer from the grave disability of being highly toxic, so that extreme care has to be observed in regard to the doses, the margin between safety and danger being somewhat slender. To realise the dangerous character of the drug one has only to recall the numerous cases of poisoning from overdoses of veronal, which resulted in the introduction of more stringent precautions concerning the sale of the substance. To obviate this danger, the Teuton chemists succeeded in evolving an improved drug of the veronal type, to which they gave the distinctive name of bromural, the outstanding virtue of which is that it is far less toxic than the more familiar sedative. The new and safer specific was soon in active demand; but as its manufacture was confined to the country of its origin, the outbreak of hostilities brought about a stoppage of supplies to this country. Inability to procure the drug produced a mild crisis in medical circles, for doctors were compelled to fall back upon the more dangerous

predecessor, or to resort to morphia. British scientists were urged to devise a process for the manufacture of bromural, and recently success has crowned their efforts, the British article, which is identical with that of German origin, being known as dormigene. A license to manufacture the drug has been granted to the British firm which carried out the preliminary investigations, such a license being rendered necessary by the fact that bromural is a Teuton patent fully protected in this country. Since the outbreak of war British science has been indefatigable in its efforts to rival German success in connection with coal-tar products, and many of the drugs for which we at one time depended exclusively upon the enemy are now being produced in these islands and sold under British names. The discovery of the process for manufacturing bromural is of far-reaching importance to our hospitals, both military and civil, although at present the drug is somewhat expensive, the retail price being about eight shillings per ounce. Still, the achievement is noteworthy, inasmuch as it proves once again that, provided adequate support is given, British scientists are perfectly capable of holding their own against their Teuton rivals in the work of harnessing science to the needs of industry.

LABOUR-SAVING MACHINERY.

The dearth of semi-skilled and unskilled labour in this country is affecting to a very severe degree those industries not intimately connected with the production of munitions.

This is especially noticeable in the handling of goods in our factories and warehouses. The gravity of the situation is accentuated by the fact that it cannot be met by female or juvenile labour. The true solution of the problem is the more extensive utilisation of labour-saving machinery, which often also produces an appreciable saving in time and expense. An interesting step in this direction is the introduction of the portable goods elevator, which has recently appeared upon the market. This apparatus, mounted upon four wheels to ensure mobility, is entirely self-contained, and can be adapted to the speedy and safe handling of almost any kind of packages. The principle upon which it operates resembles that of the familiar escalator, which has been introduced upon our underground railways to facilitate and expedite the movement of passengers between the platforms and the street-level. The elevator has an overall length of twenty-three and a half feet and a width of two feet. The free end of the boom may be elevated to any height between six feet and fourteen and a half feet, but greater or less distances may be arranged for by means of specially built machines. A three-horse-power electric motor furnishes the requisite energy, and this is sufficient to impart a travelling speed of one hundred feet per minute. It is a most serviceable device for lifting goods packed in bags, bales, or boxes from one floor to another, or from a dock to a warehouse, the only attention necessary being the loading of the escalator at the lower end, and the removal of the goods from the upper extremity. Inasmuch as the motor is reversible, goods can also be transferred from a higher to a lower level. The carrying capacity of the elevator is approximately five hundred packages of an average weight of three hundred pounds, or double that number of packages half the weight.

SAWDUST AS A BUILDING MATERIAL.

During the past few years sawdust, which was formerly regarded as a waste-product of the sawmills, has been turned to various economic uses, one of the latest being its utilisation as a building material. It has been found to form an excellent flooring material under certain conditions; while it is also valuable in the manufacture of hollow earthenware, semi-porous and porous bricks, and tiles for partitions. When used as a flooring material it is combined with concrete, and the mixture is laid in the usual manner. Its scope in this direction, however, is somewhat limited, as its tendency to absorb moisture renders it unsuitable for floors which are not intended to be covered—as, for example, factory floors. On the other hand, where the floors are to be covered with linoleum, say, the presence of the sawdust in the concrete softens the latter, enabling tacks and nails to be driven in without difficulty and without risk

of chipping the concrete. Semi-porous and porous bricks and tiles are obtained by mixing sawdust with the clay in varying proportions. To secure semi-porosity, 2 per cent. of sawdust suffices; by increasing this to 35 per cent. a highly porous brick or tile is obtained, which can be readily cut with a saw, and into which nails may be driven for the hanging of pictures and other mural decorations. The experiments which have been carried out in this field are said to be highly promising, and there seems no reason why sawdust should not become a useful addition to our building materials.

A GAS COOKING-STOVE ECONOMISER.

In a recent issue we drew attention in 'The Month' to a device which has for its purpose the more economical working of the familiar gas-cooker. Recently another simple, inexpensive, and effective attachment, having the same end in view, has been placed upon the market. This attachment consists of a steel plate of substantial construction, with steel sides about one and a half inches deep, which fits to the top of the stove. This plate is freely perforated with small round holes, forming air-vents; there are also two openings, corresponding to those in the top of an ordinary kitchen stove, over which saucepans may be placed and exposed directly to the gas-flame if desired. When the whole of the plate is in demand, however, these openings may be closed, suitable discs being provided for the purpose. The design of the plate is such as to secure the maximum heating effect with the minimum expenditure of gas. When a gas-stove is used in the ordinary manner it is only the vessel placed over the gas-ring which receives the heat, much of which is lost. But by means of this contrivance the whole of the top of the gas-stove is transformed into a hot-plate, on which as many saucepans as it will hold may be heated. In ordinary circumstances only one burner is required to heat up the hot-plate, but two, of course, will do it in less time. One advantage resulting from cooking upon this plate is the protection of the contents of the saucepans against burning, unless the heating surface is allowed to become red-hot. Cooking by this method is decidedly cheaper than by the open gas-ring when the stove is being employed to its utmost capacity, four saucepans being boiled with the gas which would under ordinary circumstances be used for heating one. But when the heating of only a single saucepan or kettle is required, direct boiling over the open gas-ring may be both more economical and more expeditious.

ROLLED SHEET-GLASS.

One disastrous result of the German invasion of Belgium was the cessation of the supply of common sheet-glass, which plays a vital part in many British industries, more especially in the

building trade. Previous to the outbreak of hostilities our glass manufacturers devoted but scant attention to this market. The consequence was that after the Belgian sources of supply were stopped common sheet-glass soared to a high figure in these islands. One enterprising native firm, realising the gravity of the situation, embarked upon a series of investigations with a view to meeting the deficiency with a product comparable in price and other qualities with the imported article. As a result of its endeavours, which have been attended with complete success, it is now possible to obtain rolled sheet-glass of British manufacture of excellent transparency at a moderate price. The new article ranks as the most transparent rolled glass which has yet been placed on the market. It is quite colourless, and transmits more light than common sheet-glass of equal thickness—features which make it an ideal glazing medium for factories, offices, and conservatories. In comparison with the common twenty-one ounce sheet-glass, the rolled sheet-glass is stronger, cheaper, and whiter; while there is the additional advantage that it is obtainable in larger sizes, being made in sheets measuring ninety by thirty-six inches, or eighty by forty-two inches.

A NEW MILITARY SHIELD.

A well-known engineer, formerly attached to one of our leading armament establishments, has devised a body-shield for the protection of soldiers upon the battlefield. It is made of special material, giving extreme lightness, with the maximum of impenetrability to shrapnel, sword, or bayonet; while it is rustless, cool, and comfortable. The shield is designed to protect the vital parts of the body, and is secured in position by neck and body straps. Owing to the design and the method of construction, perfect flexibility is secured, so that no hindrance whatever is offered to the free movement of the body and the limbs. It also protects the wearer against vermin; while, by immersing the shield, which has no cloth cover, in disinfectant, contagion may be avoided. The material of which it is made is of such a character that antiseptics—strong carbolic acid, for example—exercise no deleterious effects; while it complies with all hygienic requirements. The shield has been submitted to practical application in the trenches, where it has fully substantiated the claims which have been advanced for its protective qualities.

BOOT SOLE AND HEEL PROTECTORS.

Campaigning plays sad havoc with the stoutest boots, and it is the soles and heels, despite the use of the strongest leather, which constitute the most vulnerable part. Recently an improved type of boot-protector has been devised. It consists of thin rubber plates fitted with raised studs, which are attached to the ordinary sole and heel. Three protectors are fitted to each

boot. There is the toe-piece, carrying a protective toecap, and four side-studs of varying sizes disposed in pairs. Behind this, and attached to the widest part of the sole, is another plate having a round stud and two bars. The heel-plate, although of special design, recalls the india-rubber protector of familiar form. The disposition of the protectors is such as to secure the fullest protection for the leather sole, since it is prevented from coming into contact with the ground. The rubber also acts as a cushion, thus rendering marching less irksome; and, as the sole cannot become saturated with moisture, the feet are kept dry even in wet weather. Smoothness is imparted to the tread, and a firm grip is obtained even upon the most greasy surface, thus preventing slipping. Although primarily devised for giving longer life to service boots, these protectors are equally applicable to the footwear of civilians of both sexes and of all ages, being made in various sizes and weights to meet individual requirements. The protectors are readily fitted, and can be renewed inexpensively as occasion demands.

THE COLOURING OF FLOWERS.

The use of litmus-paper for the detection of an acid or an alkali is well known. It is prepared by soaking paper in a solution produced by the fermentation of the juices of certain lichens. On being dipped into an acid solution litmus-paper turns red; the presence of an alkali makes it blue. But how many people are aware that this reaction is based upon a natural phenomenon? The prevailing colour in the floral kingdom is a purplish pink, and the pigment which produces this tint will give either blue or red according to circumstances. If the sap of the plant be alkaline the purplish pink turns to blue, while if it be acid the tint becomes reddish. Hence, by varying the acid or alkali content of the cell sap, the colour of the plant's blossom will be changed. This undoubtedly explains why blue and red blossoms are sometimes found blooming simultaneously upon a single plant, although upon separate stalks—'sports,' as the freak is colloquially termed. If a little baking-soda (an alkali) is added to the water in which a red pickling cabbage has been boiled the liquid will turn blue, but the original colour can be restored by the aid of vinegar or some other acid. Beet and many fruit juices give similar results. An American botanical contemporary, which draws attention to this phenomenon of nature, states that many pink flowers may be turned blue by submitting them to the fumes of ammonia for a few seconds, while blue flowers will change to pink under acid treatment. But in conducting these experiments one often observes a startling result. The colour does not always change to pink or blue according to the treatment, but sometimes becomes green, a fact which, says the periodical

referred to, 'opens up other avenues of speculation, in all of which we discover how cleverly nature produces a variety of effects with almost identical materials.'

THE PRACTICAL PRINCIPLES OF PLAIN PHOTO-MICROGRAPHY.

There are few more fascinating fields of investigation than photo-micrography. By the combination of the camera and the microscope one is introduced to a new and little-known world of nature. This art has received an added stimulus during recent months from the combination of the microscope with the kinematograph, whereby we are enabled to follow the 'life' of the most minute organisms in nature upon an enlarged scale. Many to whom the art makes a powerful appeal would appreciate the opportunity to delve into this unfamiliar world of marvels. But they hesitate, not only because they fear that the study may be expensive, but also because the acquisition of the rudimentary principles of the craft is likely to prove laborious. Numerous works dealing with the subject are available, but the majority do not meet the contemplative student's requirements. Now, however, he is able to profit from the contribution to the literature of this art by Mr George West, Lecturer in Botany, University College, Dundee. In this recent work, *The Practical Principles of Plain Photo-Micrography* (price 4s. 6d. net, published by the author), the neophyte is afforded just that essential elementary information which is requisite if he is to become proficient in the art. The subject is perhaps treated in an unconventional manner, but the book is lucidly written and fully explanatory. The author does not confine himself exclusively to the subject of micrography, but deals with the principles of photography so far as is necessary. The volume treats briefly, yet adequately, of the microscope, of illumination, of the screen, and other essential apparatus; and describes at length the author's arrangements for prosecuting the work with and without a camera. But the most informative pages are those devoted to a supposititious dialogue between a master and a student, in which the latter is carried through the complete process of preparing, taking, developing, printing, and mounting a photo-micrograph. Each step is minutely explained, and the 'why' and the 'wherefore' cunningly introduced. A close perusal of this chapter should enable the beginner to master the rudiments of the craft, and to steer clear of many of the snares and pitfalls which beset the feet of the unwary. The list of photographic necessities given, the reasons furnished for their use, the exposure and development tables, the formulæ provided, and the information supplied concerning the various chemicals employed and their influence render the volume one of handy reference. It not only forms an excellent introduction to the

subject, but it may also lead the diligent student on to the latest development of this branch of knowledge—namely, micro-kinematography.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

SUMMER HEAT.

In the open fields
The barren sea of the brown bleached grasses
Droops and breathes heavily, overwrought:
The promise of summer is come to nought.
The hot, close air overpowers as it passes
The treasure of flowers July amasses
And trustfully yields.

The throbbing sky
Sickens the sight with its slumbrous burning,
And wearies the mind with the merciless glow
That beats on the prostrate earth below.
No cloud responds to her deep mute yearning
With promise of ease in the rain's returning.
No birds fly.

The silent lane
Lies still, like death, in the pitiless gleaming,
And white, like the dead whose veins are dry,
Pallid and parched to the torrid sky;
With glistening stones and dense dust teeming
Low in the haze that moves not, seeming
Dazed with pain.

The brook's dry bed
Is choked with the torture of weary grasses
And close stone-moss that the heat has browned.
No life seems here, neither motion nor sound,
Save a low, dull drone where the gadfly passes.
The gleam on the stones, like burnished brass, is
Blinding and dead.

Oh for the breath
Of the winged winds in the forests calling,
Cooled by a thousand leagues of the sea,
A loud-voiced herald of rains to be—
Sharp, fresh rains on the faint trees falling,
Laving the leaves that the dust is galling
Nigh unto death.

Water and air!
Rushing of boisterous winds and swift showers:
What is there left but these to gain,
Impetuous winds and silvery rain?
Now, faint in her fullness, Nature cowers,
With these for ever dreams through the brooding
hours,
These for her prayer.

G. H. BROWNING.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

AFTER MANY YEARS.

By C. A. NASH.

CHAPTER I.

LAYING down my pen, and shading my eyes with my hand to look out through the open window on the vineyard, which was bathed in the refulgence of the setting September sun, I said to my wife, '*He concluido*' ('I have finished'). Far in the distance I could see the heights of Fuente Sauco, and to the right the Tormes flowed like a river of molten gold. And surely I had good reason to pause for a while and think. I am now an old man, and my present surroundings seem little likely to suggest thoughts of far-off England and Taunton in Somerset county. And yet back thither must I go to tell the story which I have now finished. I am sitting in what was once the library of a Carthusian monastery. My wife, Doña Maria, is a Spanish lady. My eldest son, who is staying with us for the quail-shooting, is a captain of Engineers in the army of his Catholic Majesty. But to begin.

In the month of November 1864 I left Rock-hurst College, where I had spent the previous seven years of my life, and returned to my father's house at Cherston, some four miles from Taunton. Our family, an old one, had gone through many vicissitudes, and lost most of its ancient wealth and all its landed property through its adherence to the old faith during the penal times. My father had, unfortunately, sunk a large portion of his fortune, such as it was, in a London joint-stock company, whose failure, at the time I write of, had spread destruction broadcast, and ruined literally thousands. The intention of my father, therefore, that I should study for the Bar was impossible of fulfilment, and it became necessary to look round, and that without loss of time, for some other career, as I had completed my eighteenth year, and the education of three brothers and two sisters, all my juniors, was a heavy burden on the restricted family resources.

My father was himself the elder of two brothers; and my uncle George had—some twenty years before this time, breaking away from the traditional aloofness from trade, in those days so inherent a sentiment in old families—gone to Spain, and invested his small patrimony in a firm in the wine trade in Valencia. He had never returned to England, having

married a Spanish lady, but still kept up a very friendly, though somewhat infrequent, correspondence with my father.

'What about trying Uncle George, father?' I said. 'He has done very well in Spain. He might give me a helping hand by taking me into his business in Valencia. He has no children of his own, and he has always been very friendly. And, besides, I have always had a hankering after Spain—I suppose because of what we have heard of the country from Uncle George's letters. In addition to that,' I said, 'I fear I should not care to begin business at the foot of the ladder at home. I shall be nineteen next birthday, and in an English office I should find myself, as to usefulness, very much behind my equals in age.'

'Yes,' said my father, 'I think the idea is a good one. Your uncle, I have no doubt, will not refuse; so write to him, and if he should not fall in with your views you will be no worse off for having tried. Spain, too, you know,' continued my father, 'has interest for us in another way. Your great-uncle, James Lambert, left his bones there during the Peninsular War.'

'Yes,' I said. 'I have heard you speak of your uncle James. He was killed, I believe, at Salamanca?'

'Yes,' replied my father, 'he was a captain in the 60th Foot, and had been mentioned in a despatch by Lord Wellington only a month previous. My grandfather expected that a brilliant career was before him; but, as you have heard before, no word ever came of him after the battle.'

I wrote at once to my uncle, and in the course of a few weeks he replied:

'VALENCIA, 27th December 1864.

'MY DEAR ARTHUR,—I duly received your letter. A previous one from your father had informed me of the serious loss he has suffered, which gave me great pain. I shall be willing to do all I can for you; and as you think you would like to try the Spanish wine trade, by all means come. I have not been unsuccessful, and the house of Lambert & Cordero is not unknown. The steamer *Marqués del Duero* leaves Liverpool

on or about the 3rd of February. The line to which she belongs has all my trade, and I have spoken to Captain Rivas, her skipper, who will do all in his power to make you comfortable. Though the season of the year may give you a bit of rough weather in the Bay, still it will be better than the changing and trouble of the overland journey. Your passage-money will be my concern. I enclose a draft on London for £50 (fifty pounds), and, with kindest regards to your father and mother, and all at Cherston, which, I suppose, I shall never see again, I am, my dear Arthur, your affectionate uncle,

‘GEORGE LAMBERT.’

I arrived in Valencia at the end of February, and was cordially received by my uncle. My aunt was, as I have said before, a Spaniard; and though she was, I believe, some five or six years my uncle's junior, she seemed to my juvenile eyes quite an elderly woman. What she was conversationally I had at first no means of judging, as she was completely ignorant of English, and my knowledge of Spanish was limited to the few words I had learned from Captain Rivas and his mate. Indeed, during the first week at sea I had been prostrate with sickness, as the weather was terribly severe.

I was soon in harness and at work learning the alphabet of fining and blending wines. As there was no one in the *almacen* with whom I could speak a word of English, and as my hours were rather long—from about seven in the morning to five or six in the evening—I soon got a good working knowledge of Spanish.

So the first year passed away—somewhat monotonously, it is true; still, the novelty had not worn off. Besides, my uncle had held out the hope of sending me into the country after the next vintage, to accompany the *capataz*, or chief cellarman, to buy the new wine. My uncle had some vineyards of his own; but the greater part of the wine which he handled was purchased from farmers in the surrounding districts.

I had made few acquaintances in Valencia. My days were pretty well occupied in the *bodega* or on the wharf seeing to the shipment of the wine, and the only amusement I had I got at the *circulo*, or club, where I spent a few hours every evening.

I have said before that my uncle had no family. Perhaps it was this that made him take a somewhat narrow view of things generally. However that may be, he thought, apparently, that I should find sufficient entertainment in the society of the few old friends who visited him nightly—old Don Gaspar, the *parroco* of San Blas; Don Gumerindo, a very clever but somewhat melancholy lawyer; and Señor Villaroel, the manager of the largest of his outlying vineyards.

I had thus spent two years when I made the acquaintance of a young Spaniard who was studying law at the university, Gabriel Moreno by

name. He came from Old Castile, and had chosen Valencia as his Alma Mater instead of Salamanca, which would have been more convenient, as his maternal uncle held the position of Collector of Customs at Valencia, and with his family Gabriel stayed.

From the first our similarity of tastes created a bond of sympathy between us. My literary proclivities had been too well fostered at Rockhurst to be uprooted by two years of ‘business’ life, and I suppose my reading of Cervantes and Lope de Vega took my mind off somewhat from my work in the *bodega*. Be that as it may, my uncle spoke to me a few times, with what I thought needless severity, about some mistakes which were not, indeed, altogether mine, and that did not tend to smooth matters. The midsummer of my third year in Valencia saw the end of Gabriel's stay there, and I frankly told him that I was sick of the cellars and the wharf, and that I had serious thoughts of going to Madrid and seeking a position as teacher of English there.

‘*Amigo Arturo*,’ said Gabriel, ‘I fear that would be, as we say, out of the frying-pan into the fire. I tell you what you will do. The long vacation will be on in another month. You have never had a holiday. Nothing will be doing in your way until after the vintage in October. Come and spend the hot summer months with me and my people at Huerta. We will talk the matter over between this and the vintage-time.’

I told my uncle of the invitation which I had received, and he made no objection. What I thought strange was that his wife put no obstacle in the way, for she seemed to find pleasure in blocking anything in the way of amusement as far as she could.

My uncle had, I must say, fulfilled to a generous degree his promise of doing what he could for me, for, in addition to the present which he had made me before leaving England, he allowed me a salary of ten thousand reales, or one hundred pounds, although at the beginning I was of little use to him. Of this I had saved about a hundred and fifty pounds, as the only expenses which I had incurred were for my clothes and my club subscription, with an odd visit to the theatre.

So, bidding good-bye to my uncle and aunt, as it proved for ever, I left Valencia on the 29th June 1867, the hottest day I ever felt before or since.

In those days the only railway from Valencia went south; so, to get to Madrid, which was our first objective, we had five days of diligence travelling, sleeping at night at some wretched *posada*, or inn. But these little inconveniences weigh very lightly at twenty-one.

The great heat in Madrid prevented our making any stay there. So, on the day following that of our arrival, we took the train for

Avila, where we stayed the night, and next day proceeded by diligence to Salamanca. There we found awaiting us at the Posada de San José a ramshackle *tartana*, a kind of four-wheeled van with an awning, which had been sent to fetch us by Gabriel's father, and in this primitive vehicle we took our seats, and arrived in the afternoon at the village of Huerta. The village is some twelve miles from Salamanca, and is in the midst of a very extensive plain, altogether given over to the cultivation of vines and corn, chiefly barley and rye.

My host, Don Manuel Moreno, received me with the courtesy of a Spanish gentleman of the old school. It is said that every Spaniard is a gentleman. But in the case of Don Manuel I could easily see that his cordial reception was not of the perfunctory kind which places all a Spaniard's belongings at your disposal. I guessed that my friend Gabriel had in his letters home spoken favourably of me. Certainly we were great friends, and, thank God! our friendship has never waned.

The house of Don Manuel was situated about a mile from the village of Huerta, between it and San Morales. The property was called La Ribera. It was beautifully situated, some quarter of a mile from a small river called the Caudal, which flowed into the Tormes about two miles beyond Huerta, in the direction of Arapiles. The front of the house looked towards the river, and at the back were the wooded heights of Fuente Saucó (or 'the spring of the elders'), a delightful and shady retreat in hot weather. The hills were covered with wild thyme, and when the wind blew from that side towards La Ribera one lived in an atmosphere of the most delicious fragrance.

Don Manuel's family was small, consisting of himself, his wife, and two children—namely, my friend Gabriel, then twenty-two years old, and one daughter, Maria, known also by the diminutive name of Mariquita, then entering her eighteenth year. His wife, Doña Eulalia, was a typical Castilian lady, with much dignity, which was not in the least embarrassing to her new guest, as it was tempered with the most delightful frankness, and she put me at my ease at once. She told me at dinner on the evening of my arrival that her daughter was just then on a visit to some friends at Valladolid, but was expected home in a week or so.

Don Manuel had retired from the army after attaining captain's rank, and at the time of my visit held the appointment of inspector of the Guardia Civil of the province. His official duties were slight, and afforded him sufficient time to attend to the cares of his property, which was considerable, consisting chiefly of vineyards. Gabriel and I spent our first days—or, rather, afternoons, for the weather was very hot—quail-shooting, and the breech-loading gun which I had brought from England was looked upon as

an extraordinary novelty by the gamekeeper at Fuente Saucó and the rest of the neighbours.

I was walking, a few days after my arrival, with my host on the high ground at the back of the house, and asked him what was the large building, or, rather, cluster of buildings, some couple of miles to the west. 'A portion of it,' I said, 'seems to be a church.'

'You are right,' said Don Manuel. 'That building was, more than thirty years ago, a Carthusian monastery. At that time, as you know, the religious houses were suppressed and put up for sale by the Government of the day. This one, called La Cartuja, was bought for quite a small sum by a very peculiar man whom I barely remember seeing at San Morales, the village yonder, when I was a boy. He must now be an immense age. He has not left the precincts of his own property certainly for twenty years. You see, the Church property was sold at a time when many people thought that Don Carlos stood a very good chance of coming to the throne of Spain, and it was well known that if he succeeded the property would be restored to the Church. Hence the Government of Queen Isabella—whom may God preserve!—in many cases failed to effect a sale, and when one was effected the price obtained was, as in this case, ridiculously small. Indeed,' said Don Manuel, 'I should be afraid to commit myself to an actual statement; but I think La Cartuja was sold for something like seven or eight hundred pounds of your English money. And when you see, as you will some day soon, the immense range of buildings, and when I tell you there are some three hundred acres of the best vines in the province, you will understand that Don Diego, as the old gentleman is called, made a good bargain. I may tell you that Don Diego is not a born Spaniard. The old notary here, Don Martin, remembers Don Diego for more than fifty years. He was then living at San Morales, and it was some twenty years after Don Martin's first recollection of him that he bought the property of La Cartuja. He seems to have been at all times a mysterious kind of person; but, as I say, for the last twenty years or more he has never gone outside the bounds of his own domain.'

As we were returning to La Ribera in the evening, at a short distance from the house we were met by a young lady, who on seeing Don Manuel came running towards us, and, having first kissed his hand, embraced him repeatedly. She looked at me somewhat shyly at first; but Don Manuel immediately introduced me to her as his daughter Mariquita. How shall I describe what I saw for the first time? She was dressed all in white, even to a white mantilla. The only note of colour was the red rose in her jet-black hair. She was small and slight, and exquisitely proportioned. Her eyes instantly brought to my mind Espronceda's description

of Elvira in the *Student of Salamanca*, the *timida estrella* ('the timid star') 'reflecting to earth rays of light, brilliant, yet doubting.'

Our mornings were spent in fishing in the Tormes, and in the evening after dinner Mariquita, Gabriel, and I went up to the heights of Fuente Saucó, and sat there for an hour, or sometimes two, enjoying the cool breeze that generally came on after sundown. The subject of our conversation was mostly confined to the accounts of England which I gave them. Spaniards in the provinces in those days seldom went far from home, ladies never. So I suppose events in themselves rather uninteresting assumed in the eyes of Mariquita more importance than they deserved.

All this could only have one termination, and before I was two months at La Ribera, to say that I had lost my heart would poorly express the effect which the companionship of Mariquita had wrought in me. There was no talk between Gabriel and myself as to my future. Whenever he even distantly referred to the subject, I hastened to change the theme. The truth was that the thought of going away, and returning to Valencia, filled me with such despair that, like many another coward, I declined to give it thought, and trusted to Providence, or fate, or whatever you will, for something at present in the clouds to turn up to solve the difficulty.

I had, as I have said, been two months at La Ribera when the stock of cartridges which I had brought became exhausted, and to replenish it, and as I also required some small matters in the way of clothes, it was necessary that I should ride to Salamanca to make my purchases.

Early, then, on a September morning I mounted the horse which Don Manuel kindly placed at my disposal, and set out from La Ribera for my twelve-mile ride. My road led me past the buildings of La Cartuja, and when I reached the turning which brought me in front of the beautiful pile I pulled up to have a good look.

It certainly was worth it. The main building was a beautiful stone edifice of two storeys, flanked at each end by a tower. In that at the north end I could see a bell still hung. On the side facing me I counted thirty windows. Detached from the main building was a somewhat small church, with a very beautiful rose-window. The church, though a separate edifice, was connected with the rest by a covered way. The land all round was given up to vines, and on this beautiful morning their appearance—full as they were, some of golden and some of purple clusters—was delightful.

After satisfying my curiosity I resumed my journey. As the morning had now become somewhat hot, and I was anxious to get to Salamanca before the oppressive noonday heat should come on, I struck my horse with the switch which I carried. Whether the horse had not been accustomed to it, or he was ill-tempered, I do not know; but, in any case, he shied violently to the side, and before I could recover myself had thrown me from the saddle just at the edge of the road, which ran along a deep ravine. I remember rolling down the slope, and after that all was blank.

(Continued on page 642.)

THROUGH SEA AND AIR.

A VISION OF TO-MORROW.

By EDWIN L. ARNOLD.

WAR does not often give welcome gifts to peace, but it appears likely the present struggle may present us with at least one such legacy. Those who have time to think and observe during these strenuous months cannot fail to be impressed by the wonderful promise of air and submarine travel that the immediate future holds out to us. Before the war commenced the Zeppelin was but a dubious experiment, and even the aeroplane little more than an interesting innovation. Very few even of those whose business it was to foresee guessed that the conquest of the sky was actually at hand. Sir Alexander Bannerman, commandant of our air battalion in 1911, published two depressing articles in the *Army Review* on aeroplanes, pouring official cold water on the enthusiasm of flying men, and advising the public to restrain its expectations until the process of time enabled it to decide

whether the new invention was capable of practical development. At the end of the same year the nation claimed the services of no more than seven military pilots and a job lot of about a dozen machines, most of which had never stood a cross-country flight. Somewhat earlier the then First Lord of the Admiralty had politely refused the aeronautical patents of the Wright Brothers on the ground that 'they would not be of any use to the naval service.' Lord Tweedmouth, and Lord Haldane at the War Office, carried on the traditional attitude of British officialdom to innovations, and took the most despondent view of aviation. They were only following in the footsteps of the head of one of our great departments who once informed an inventor of a brilliant advance in the electrical transmission of messages that 'telegraphs of any kind were wholly unnecessary;' the nation had

no need of such newfangled ideas. These things are only mentioned to show how little officialdom, in continuation of its traditions, realised the military importance of the air two years ago; and by analogy we may be quite certain it now not only fails to appreciate the new era of international travel which is dawning for the world, but will oppose its development with customary inertia until such opposition is no longer possible.

Not only in high places but amongst the public generally there are always those to whom Providence seems to have assigned the duties of acting as skids upon the wheels of human progress, and these duties are rarely neglected. It was well-meaning folks of this kind who fought tooth and nail against the introduction of the first railway, seriously urging, amongst other kindred objections, that the steam-engine might affect the nerves of cattle through whose neighbourhood it passed. They lifted up their voices against the power-loom as unscriptural, they struggled against Jenner's beneficent discovery, and quite lately condemned the motor-carriage to proceed at a walking pace along our thoroughfares, with a man carrying a red flag in front of it, as though some novel kind of wild beast were approaching. The story of resistance to human progress, could it be written, would make one of the most delightfully quaint and humorous volumes in existence. And it must be remembered that the contributors to this volume are still in active existence amongst us. No doubt when we seek to travel generally by air or under water these timid counsellors will tremble for our chimney-stacks, and bemoan the outraged feelings of the crabs and cuttlefish whose privacy we violate. But the inexorable march of events, I am convinced, will in the long-run prove too much for such critics.

No crude speculation is championed, no fancy picture drawn of bare possibilities, in saying that submarine voyages to the remotest parts of the earth, and aerial travel only a little more circumscribed, are realities of the present moment. The journey which the murderous German Zeppelins make from their lairs on the Continent to our northern coasts and back again is more than equal to half the width of the Atlantic between Ireland and Newfoundland. Can any one doubt that, with their cargoes of bombs replaced by extra fuel and provisions, they will not very speedily be able to accomplish the remaining distance? It is to our national shame that all deductions as to the actual capacity of the long-distance Zeppelin depend on Teutonic data. According to the best information from this source, the lifting capacity of the average airship is about thirty tons. As the vessel with its engines weighs twenty-five tons, this leaves five tons for the carrying load. It is not much; but, accepting it for the moment, and applying it to the needs of the peace ship, then thirty

passengers and crew would weigh two tons. There would have to be, say, six hundred and fifty gallons of petrol and oil, amounting to another two tons, leaving a margin of one ton for food and water. Doubtless the figures will be improved on with greater experience; but as they stand they open up a fascinating vision of the voyaging possibilities of the sky-cruiser.

In regard to speed, the question as to whether the wind is for or against the vessel of course makes considerable difference. The opposition of air-currents at once lessens progress and reduces the distance that can be travelled with an available supply of oil. In a perfectly calm air a modern Zeppelin can easily journey seven hundred miles out and seven hundred miles home, or fourteen hundred in a straight line. In such an atmospheric calm, which, it should not be forgotten, can often be found somewhere when stiff breezes are blowing at other elevations, she can do seventy miles an hour at full speed. When a favourable wind is met with this can be increased to the tremendous rate of one hundred miles an hour. But, to be well within the margin of assured practicability, let us suppose that a Zeppelin is capable of making a flight of fourteen hundred miles at sixty miles an hour without once coming to earth. Under these circumstances, with a professional crew of five, and twenty-five passengers, on board, the nations being at peace below and the skies propitious above, what would the cruising capacities of the Zeppelin mean?

Northward from London a flight would include the whole of Iceland, the time occupied in transit being about seventeen hours. That is to say, the enthusiastic salmon-fisher or adventurous tourist would mount his airship about seven in the evening at some metropolitan terminus, sleep and breakfast on board, and by noon the next day would be amongst the glaciers and snow-mountains of the northern island. To the north-westward a non-stop flight would take him to Tromsøe, in Norway, for a week-end in the land of the midnight sun. It would deposit him anywhere he liked amongst the forests and lakes of Sweden or Finland, or carry him to Petrograd without a change. More to the east, a Zep cruise from London, across seas and continents, without halting for fuel or provisions, or troubling about frontiers, would convey the traveller to historic Moscow, to the western shores of the Black Sea, to Adrianople, within a few hours of Constantinople itself, and to northern Greece.

From another platform of the great London air-terminus which rises to the mind's eyes in this delightful forecast, a commodious 'liner' might start for places farther south. It would reach Paris in a little over three hours of luxurious travel compared to the eight hours of rattle, hurry, and probable sea-sickness which is now the

lot of the voyager. The seeker after sunshine could breakfast in the chilly gloom of a London fog, and be amongst the palms and orange-trees of the south of France in time for a game of tennis before tea. Having dropped some of its passengers at Nice or Monte Carlo, then Sicily, Malta, or the Algerian highlands would all be within the possibilities of this 'liner,' and it might be docked for the night in northern Morocco! Westward the vast expanses of the Atlantic offer fewer landing-places; but even in this direction our airship, starting from the coast of Ireland, could accomplish a non-stop run of twenty-three hours to the southern part of Greenland, to the Azores, to Madeira, or the edge of the Sahara. The passenger might take one breakfast in Belgravia, and the next in a mid-African village.

The objection may be raised that all such travel must depend on ideal atmospheric conditions. But that is not so. Nothing is more certain than that the upper air is marked by currents constantly playing in different directions, and it will be the business of the future sky-pilot to understand and take advantage of this fact. Actual earth-storms, no doubt, might keep the airship from setting out; but they hinder all sailing-vessels in the same way, and even steamers at times. When, on the other hand, the winds were favourable, the mind boggles at the wonders the airship might accomplish. I will not venture into this alluring field of speculation, but leave it to the intelligent imagination of the reader. As for the safety and comfort of atmospheric travel, they are matters scarcely needing argument. The mere fact that amongst the clouds commerce could go and come on an indefinite number of planes, while at sea it is restricted to one, would make collisions almost impossible. In regard to comfort, those who have travelled by the new means say no more delightful and soothing method of progression was ever discovered by the inventive genius of man. As a rest cure the airship will probably prove a great success; the idler will be able to doze round the world, taking only so much interest as he pleases in the parti-coloured pageantry of sea and land that slips by six thousand feet or more below his deck-chair.

Submarine travel is also a certain asset of the immediate future, even if it prove more strictly utilitarian. There are under-water craft in existence at the present moment capable of crossing the Atlantic, cruising on the American coasts for a month or more, and returning home all on their original supply of fuel. Submarine craft, to our chagrin, have left German ports, made the long voyage through the Bay of Biscay, and penetrated far into the Mediterranean, without, it is to be presumed, seeking supplies anywhere. If this is possible with every man's hand against them, amidst the

enmity and difficulties of active warfare, who will venture to say that the same thing would not be feasible on a larger scale in peace-time? The possibility is self-evident. The submarine can be run with an extraordinarily small staff. The jettisoning of her war stores and fighting men, and some moderate increase of her cubic capacity, as to which there are no real difficulties, would speedily fit her for many commercial and passenger-carrying purposes. We may still be some way from the day of the great under-ocean liner, with its hive of men and women on board; fares may still be somewhat high, as they are apt to be when all novel forms of travel are tried; but these are drawbacks of the moment. Germany is said to be even now preparing a submarine mail service between her coast and the United States; nor is there anything impracticable in the idea. The new submergible vessels are four hundred and fifty feet long by forty-five feet beam. They thus exceed in length our sixteen-thousand-ton battleships, though their own tonnage does not amount to two thousand. As another instance of the way in which the war has forced on development, it may be noted that the largest submarines in existence two years ago were the seven hundred and eighty-seven ton craft of the French *Nereide* class. The latest German boats carry in war-time twenty-five torpedoes, weighing, with their tubes, twenty tons, and an expert fighting crew of sixty men. By leaving out the war gear and reducing the staff by half, a carrying capacity for a paying number of passengers and choicer merchandise would readily be obtained.

It is most likely in this direction of mail service, pleasure tours, and 'urgent' traffic that the submarine will for a long time prove most useful. Those who do not care for travel under the clouds will have the alternative of swift and commodious voyages over the bed of the ocean. They must not expect to realise all Jules Verne has foreseen in the depths, but they will get very much. The navigator of the nether twilight will go aboard at Tilbury or Gravesend, and when the hatches close on the pleasant English landscape he will resign himself to reading and light amusements, comfortable quarters, and repose unspoiled by the accompaniment of the low, harmonious thrill of tireless machinery. He may be allowed an after-dinner cigarette on the whale-like back of his ship for the purpose of watching a sunset in the Bay of Biscay or somewhere else; but in the main he will know and care for neither time nor distance till the stewards begin to collect the light baggage, the hum of the screw drops down to nothing, and he mounts the companion-ladder to find himself, with astonishment, in a new world of light and colour, amongst strange surroundings, and a thousand miles from where he thought he was.

PINCHER MARTIN, O.D.

A REALISTIC STORY OF THE INNER LIFE OF THE ROYAL NAVY.

By TAFFRAIL, Author of *The Bad Hat*, *The Decoy*, *An Eye for an Eye*, &c.CHAPTER XI.—*continued.*

II.

TO this day Pincher never really remembers how he got into the water. The events of that night still seem like some ghastly nightmare, a horrible dream in which incidents and impressions succeeded each other with such rapidity that the memory of them seems almost unreal. He recollects standing on the boat-deck with a group of other men and divesting himself of his thick duffel coat. He did it reluctantly, for it was bitterly cold. Then, after inflating the rubber swimming-collar round his neck, he waited. The ship lay over at an alarming angle, and it was all he could do to stand upright.

'Jump, men! jump!' an officer kept on shouting. 'For God's sake, save yourselves!'

A few, nerving themselves for the effort, cast themselves overboard, and were lost to sight in the raging sea; but Pincher and many others, eyeing the tumult with horror, instinctively hung back. Life was very dear at that moment, and it seemed sheer madness to cast one's self into that seething maelström of one's own free-will. Then it was that he remembered his heavy sea-boots. Fool! They would infallibly drag him under if he had to swim for it; and, bending down, he kicked and wriggled his right foot free. He was repeating the process with the other when the end came. The ship lurched horribly to starboard, and flung him to the deck with a shock which jarred every bone in his body. The next instant he started slithering and sliding down a steep slope, to bring up with a thud against a projection on the deck. The impact nearly knocked the wind out of his body; but, stretching out his arms with an instinct of self-preservation, he grasped something solid with both hands, and clung madly on to it with all his strength. For a second or two he hung there, gasping for breath, with sheets of spray flying over his head. Then something soft cannoned into him and tore him from his hold. He felt himself sliding again, then falling, falling.

Next a feeling of bitter cold and utter darkness as a sea snatched him in its grasp and flung him away. He went down and down until his lungs seemed on the point of bursting for want of air; but the swimming-collar was still round his neck, and with a swift upward rush he felt himself borne to the surface. On opening his mouth for air a gigantic white-cap promptly broke over his head and left him spluttering and gasping. At one moment he was carried

high on the crest of a sea, and the next he was deep down in a hollow; but by some miracle he still managed to breathe, and retained sufficient presence of mind to strike out away from the sinking ship.

He could see nothing, but the sea all round him was dotted with the heads of other swimmers. Some had life-belts, some swimming-collars or flotsam, and, like Pincher, were making the best of their way from the scene of the disaster. Others had no life-saving appliances at all, and were drowning in dozens.

Twice was Pincher clutched round the body, but each time he fought with the mad desperation of despair, and wrenched himself free of the suffocating embrace of a shipmate less lucky than himself. He was no coward, but it was a case of each man for himself, and his desire to live was overwhelming.

How long he was in the water he never knew. He merely battled on, fighting for breath. Presently, when all but exhausted and numb through and through with cold, he was carried to the summit of a huge wave to see the dark shape of a boat barely twenty feet from him. In the dim half-light he could see it was crowded with men, and raising his voice, he tried to shout for help. He emitted no sound but a feeble croak, and the next time he was borne aloft the boat had vanished. Then it was that Pincher commended his soul to his Maker. He could do no more.

He seemed to have been swimming for hours, and was breathless and very weary. His limbs felt incapable of further movement, and it was with almost a feeling of relief that he gave up the struggle as hopeless. But for his swimming-collar he would have sunk then and there. How long he remained quiescent he could not tell; but during this awful time his senses never left him, and he found himself wondering how long it would take him to die. He did not dread the prospect; anything seemed better than this awful shortness of breath and the constant buffeting by the seas. The most trivial events and the most important happenings of his short life crowded into his overwrought brain. His thoughts travelled to his home, and he pictured his mother the last time he had seen her, framed in the doorway of her cottage. He almost laughed when he remembered himself tearing down the road to catch the train. He must have looked funny, excruciatingly funny, but

he felt a slight pang of regret on thinking that he would never tread that road again. Next his mind reverted to Billings, and he wondered hazily what had become of him. Poor Joshua, he had been a good friend to him! He hoped he was not drowned. What was Emmeline doing at this moment? The recollection of her seemed indistinct and shadowy, somehow. He could not picture her face, merely remembered that she was pretty and fascinating. What would she say when she heard he had been drowned? Would she go into mourning and cry her pretty eyes out? Perhaps she would marry some one else.

Then, quite suddenly, he heard a voice. 'Ere's another on 'em!' it said gruffly. He felt his head come into violent contact with something solid and unyielding, and the next moment he was seized by the hair. The pain of it hurt him abominably, but he was far too weak and short of breath to expostulate. Then he was grasped under the armpits, and, after describing what seemed a giddy and interminable parabola through the air, heard himself descend with a crash on to something very hard. The impact should have hurt him, but he felt nothing, and merely realised in a hazy sort of way that he was in the bottom of a boat.

It was bitterly cold. He shivered as with ague, while constant showers of spray left him coughing and gasping for breath. Water washed over him perpetually, and a horrible, never-ceasing oscillation flung him violently to and fro. It was almost as bad as being in the water. But he was past caring. Then came a feeling of horrible nausea, and, rolling over abjectly, he was violently sick. Next, darkness, the utter blackness of absolute oblivion. Pincher Martin had fainted.

When he recovered his senses some hours later he could not for the moment recollect where he was or what had happened. He felt chilled through and through with the cold, but some kind Samaritan had removed his sodden garments, and had left him lying in the bottom of the boat covered with a portion of the sail and its tarpaulin cover. Several other men lay there with him. Then he remembered. He felt bruised all over, stiff, miserable, and very weak; but he could breathe, and found, on trying to shift his position, that he had recovered the use of his limbs, though the effort caused him agony. Glancing round, he saw he was in the stern-sheets of the *Belligerent's* forty-two feet launch, the largest pulling-boat she had carried.

The sea was still running very high, and the boat pitched and rolled violently and unceasingly, while constant showers of spray came driving aft as her bluff bows plunged into the waves. At one moment he found himself watching the dark clouds chasing each other across the gray sky overhead; and the next, as the boat rolled, he

was vouchsafed momentary glimpses of a heaving expanse of gray-green sea, lashed and torn into white, insensate fury by the wind. It was blowing a full gale.

The boat was half-full of water, and amidsthips some men were busy bailing, one with a bucket and others with boots and caps. Crouching down under the thwarts, with the water washing over them, were many more men in the last stages of misery. Some showed signs of life; some looked almost dead. Another melancholy party were clustered in the stern, huddling together to get some warmth into their numbed limbs. All sorts and conditions of men were there—stokers in their grimy flannel shirts and fearnought trousers, just as they had come up out of the stokehold; bluejackets in jerseys and blue serge trousers; some marines; and a ship's steward's assistant with nothing but a swimming-collar and a sodden white cotton shirt. Their lips were blue with cold, their teeth were chattering, they looked abject and utterly forlorn, but they were still alive. One or two of them were actually talking.

Standing up in the stern with the gunner and the boatswain was Petty Officer Bartlett. The last-named was attired in his undergarments, a cholera-belt, and one blue stocking, and in the intervals of gazing anxiously round the horizon he was flapping his arms to restore his circulation. How he managed to keep on his feet at all was a marvel.

'Anythink in sight?' somebody asked in a husky whisper.

'Not a ruddy thing!' Bartlett returned. 'I thought I seen somethin' 'bout ten minutes since, the smoke o' a steamer on the 'orizon, but she ain't there now.'

The questioner, an able seaman, cursed under his breath. 'Ow long's this — show goin' ter last?' he queried plaintively. 'I'm so — cold. Such a — picnic I never did see. Gawd! why didn't I join th' ruddy army? They kills yer quick there, not like this 'ere. I'll be a gonner in another hour, see if I ain't,' he added weakly, trying to get a little sympathy. 'Carn't feel me bloomin' legs no'ow; ain't got none p'raps.'

'Cheer up, Joe!' said the man alongside him, who seemed a little happier; 'we ain't dead yet. Like me ter give yer another rub dahn!'

Joe nodded wearily and closed his eyes.

Pincher, unwilling to leave the shelter of his canvas, tried to attract some one's attention. He endeavoured to speak, but could get no more than a husky, almost inaudible, whisper; so, withdrawing one arm from its covering, he moved it feebly up and down. After a lengthy pause one of the marines noticed him.

'Ere,' he said, patting Petty Officer Bartlett on the leg, 'one o' them 'ere deaders 'as come back ter life!'

Bartlett turned round. 'Deader!' he said. 'Which one?'

'One o' them 'ere blokes yer pulled out o' th' ditch,' the marine answered.

'Blimy! So he has!' the petty officer exclaimed, rather surprised. 'I thought he'd chucked his hand in long ago.—Here, me son,' he added, coming across to where Martin lay, 'how goes it?'

Pincher smiled wearily.

'Carn't talk, eh?' Bartlett remarked with rough kindness. 'Like a drop o' rum* an' a bit o' somethin' t' eat?'

Martin nodded.

'Hand us that there rum-jar,' the petty officer said over his shoulder. 'Easy now—easy!' as the man he had spoken to nearly let it fall. 'That there may have to last us for days!' He extracted the cork from the wicker-covered jar and poured some of the spirit into a small tin mug. 'Damn me eyes!' came an angry ejaculation, as the boat gave a particularly violent lurch and a few drops of the precious liquid slopped over the edge. He replaced the cork carefully, and, putting one arm under Pincher's head, held the pannikin to his lips. 'Try to swaller it,' he said. 'It'll do you good.'

Martin obeyed; and, though a certain amount of the liquor trickled over his face, the greater proportion went down his throat. The burning fieriness of the neat spirit made him choke and splutter, but the feeling of warmth it induced was very comforting.

'Here's a bit o' biscuit,' said Bartlett again, extracting a broken fragment from the waistband of his nether garments, where he had been keeping it dry. 'Put that inside you, an' when you've finished it I'll come along an' give you a bit o' a rub down like to warm you up—see?'

Pincher, still too weak to bite, consumed the flinty fragment by nibbling round its edge until he could nibble no more, and then, when the petty officer had rubbed his numbed and aching body with a pair of horny hands, which rasped him like a file and threatened to take every inch of skin off his long-suffering limbs, he felt tolerably warm and much better. The blood coursed through his veins. Life was again worth living.

'Thanks!' he was able to murmur feebly when the painful ordeal was over.

'That's all right, me son. See if you carn't get a bit o' a caulk,' said Bartlett, getting up from his knees.

It may have been the dose of rum, a spirit to which he was entirely unaccustomed, which had the desired effect, but five minutes later Pincher Martin was asleep.

Immediately on being hoisted out, the launch

had been dashed bows on into the ship. She had been badly damaged; but men, stripping themselves, had stuffed their clothes into the rents to keep the water out. Time after time breaking seas had nearly swamped her; but by dint of constant bailing with boots, caps, and anything they could lay their hands upon, they had somehow managed to keep her afloat.

Most of the oars had been broken in frantic efforts to fend the boat off from the ship, and none remained to keep her head on to the sea when they finally got clear of the wreck. Then they had lashed all the boat's lumber together, and had dropped it overboard to form a floating sea-anchor; and the launch, secured to it by a rope, rode head on to the waves. But still the wretched survivors were in a bad way. They had yearned, with all the longing their souls possessed, that a ship would be in sight when morning came. They had practically pinned their faith to it, for they were aware that they were in a part of the English Channel where traffic was constant. But when the night lifted and the gray dawn gave way to full daylight there was nothing in sight. Not the least vestige of a steamer or the welcome gleam of a rescuing sail; only the gray-white expanse of the raging sea, and the sombre, wind-driven clouds chasing each other across the gray void overhead. Then a faint feather of smoke had shown up over the rim of the horizon to the southward. It was fully ten miles off, but they all thought for one wild moment that salvation was at hand. Their drooping spirits revived; but a minute later the smoke had disappeared, and their hopes were dashed to the ground.

They were exhausted, wet through, chilled to the bone, and utterly miserable, and some of that little band of two warrant-officers and seventy odd men resigned themselves to their fate. They could not last much longer. And so the launch, with a woollen scarf lashed to an oar amidships fluttering as a mute signal of distress, drifted on at the mercy of the wind and sea. Her crew were past caring.

III.

Early in the morning of that fateful New Year's Day the Brixham trawler *Providence* was running back to her port for shelter from the gale; but when she was off Start Point the wind and sea had increased to such an extent that there was nothing to be done but to heave-to and ride out the storm. Between eleven o'clock and noon the smack was hove-to on the starboard tack, when the third hand, who was on deck, saw a large gray open boat to leeward. She was full of men, and was flying a muffer tied to an upright oar as a signal of distress; but so heavy was the sea that she was obscured for minutes at a time in the trough of the waves.

The smack's crew of three men and a boy,

* When a ship is abandoned a certain amount of water, biscuit, and rum is placed in all the boats.

Little Dan, were soon on deck, and promptly got to work to take another reef in the mainsail and to set their small storm jib. It was a hard tussle, for the wind was blowing with hurricane force, and seas were constantly breaking over the deck; but it was the only thing to be done if a rescue was to be effected.

The *Providence* was on the starboard tack, let it be understood. This meant that the wind was blowing from her starboard side; but, to reach the launch at all, she had to pass round on to the port tack. There are two ways of manœuvring a sailing-vessel from one tack to the other. The first, the shortest method, is by 'going about,' or turning the vessel round head to wind, and then allowing her sails to fill on the other side. The second way, a longer method, in which more ground is lost, is by 'gybing' or 'wearing,' in which the ship passes from tack to tack by turning her stern to the wind. Both are comparatively simple evolutions in calm weather, but any sailor will say that in a small fore-and-aft rigged craft both are dangerous in a heavy sea and a gale of wind. Of the two, however, gybing is by far the more hazardous, even perilous, for there is a grave risk of the craft being pooped by a heavy sea, or of her being dismasted when the large mainsail swings across the deck and suddenly bellies out on the other side. But Captain Pillar, the skipper, realised it was the only thing to be done. He was a thorough seaman, who knew his craft well, and he decided to take the risk.

The helm was put hard up, and the *Providence* paid off gradually until her stern was in the wind's eye, and then, sweeping round on the crest of a gigantic billow, came on to the port tack. An enormous sea broke on board as she did so, and the heavy mainsail came across with a crash and a jerk which nearly wrenched the mast out. But the men who had built the sturdy *Providence* knew their work, and the mast was a good sound stick, and the rigging honest steel wire. It was a good test

of their workmanship, for by some miracle the gear held.

Drawing close to windward of the launch, the smackmen hove a rope across as they drifted by. It missed. Another attempt, and yet another, but on each occasion the line fell short. Then, when those in the boat had almost given it up as hopeless, a fourth heave was successful. The rope was caught by the blue-jackets, held, and belayed, and slowly but surely the launch was hauled toward the stern of her rescuer. Then the warp was passed forward along the lee side of the *Providence*, and the man-of-war's boat was drawn cautiously ahead until her bows were level with the lee quarter of the smack.

The exhausted bluejackets were ordered to jump on board, and one by one they obeyed. It was a perilous business, for the waves were running twenty to thirty feet high, and at one moment both craft were lifted high in the air, while the next they were deep down in a hollow with an awful, roaring breaker threatening to overwhelm them. It took half-an-hour before the whole seventy of them reached their haven of refuge; but the work was accomplished without the loss of a single soul; while the senior officer present, the torpedo gunner, true to the traditions of the service, was the last man to leave. Then the launch was cast adrift. She had served her purpose, and was never seen again.

The rescued men, many of them in the last stages of exhaustion and numbness after their frightful ordeal, were accommodated wherever room could be found for them. What food and tobacco the smack carried were shared out equally, and hot coffee was served out all round.

The *Providence* then shaped her course for home, and, after being taken in tow by another vessel when close to her destination, eventually berthed alongside the quay at Brixham at eight o'clock in the evening. And so, from the very jaws of death, Pincher Martin stepped ashore.

TO 'SOMEWHERE IN FRANCE' AND BACK.

By the Right Hon. Sir J. H. A. MACDONALD, G.C.B., LL.D.,
Author of *Life Jottings of an Old Edinburgh Citizen*, &c.

PART I.

THE War Office authorities were good enough to give assent to my request as a Volunteer of fifty years' standing, now retired, granting me an official permit to proceed to France to visit the place of rest of one who gave his life in fulfilling his duty. As I am in no way associated with the military organisation in France, or with the Press, an account of my experiences and observations made in connection with the visit to the front may be of interest, particularly as

the present position of affairs makes it difficult to fall into dullness in description, the country being now, in the parts visited, in such different case from that of the France of the past.

Although armed with the War Office letter of assent, I soon found that this was not enough. Much procedure had to be gone through in preliminaries, before the journey could be undertaken, if risk was not to be run of being held back and forcibly kept in this country, or even

of being arrested on attempting to land at the other side of the Channel. Further, advice was given by officers of high position that it would be advisable to wear uniform, 'to avoid the formalities and questionings to which civil dress exposes one'—namely, the challenges by scores of sentries encountered on the road, the tedious examination of passports and permits at every town, and even the possibility of being locked up on suspicion of being a spy, at the order of some youthful officer desirous of showing zeal and initiative. Fortunately, long service in former days had been rewarded by sanction to wear uniform on retirement; and before leaving home, the old man, who had not donned military clothes, except on ceremonial occasions, for many years, arrived in London in a full suit of khaki, as worn by my old corps, now at the front. It came as something unwonted to find one's self receiving at every twenty or thirty yards a military salute from soldiers, and even from young officers. The unaccustomed action of acknowledging salutes some hundreds of times in the course of a couple of hours produced sensible fatigue to an unexercised shoulder.

What had to be gone through in completing the necessary forms was somewhat complex. A portrait had to be taken for attachment to the passport. Incredible as it may seem, three copies were ready printed and dried at eleven o'clock, although the camera was only snapped for the negative at five minutes past ten, the most rapid piece of official work in the whole proceedings. Next came War Office procedure; and although three different departments were visited, the door of that office was never passed. When that vast building was erected in Whitehall to take the place of the old dirty rabbit-warren in Pall Mall, it was supposed that ample accommodation would be found within the walls for all War Office requirements. But to-day, even with the aid of tables placed in corridors, room cannot be found in Whitehall for carrying on many departments of military business. Large hotels and old roomy mansions are crowded with busy officials, the only physical connection of their desks with the War Office to which they belong being the telephone wires. Thus it came about that — House, — Square, must be first visited, where the Director of the Graves Registration Units has his chief office. It was under his kindly care that the visit to the front was to be made, as he happened to be at home, and was about to proceed to his headquarters in France. He willingly proffered his safe conduct, and made himself a kind friend from the start. From thence, conducted by a most obliging staff-officer, I made the journey to a great wooden shed in the quadrangle of the Foreign Office, where the colour of eyes and eyebrows, and what colour could be traced in hair which had been parting with its natural

shade for many years, were all carefully noted, and the photograph duly pasted down on the passport by a bland official. Thence northwards to —, to an ancient mansion in — Square, where the Principal Permit Officer does his work. Here the formalities came to an end by the document of permit being handed over, and the passport *visé* by a French official, the likeness being stamped across the corner, so as to prevent the substitution of another physiognomy, should the document by any accident fall into wrong hands.

Some one might be inclined, going over this elaborate procedure, to ejaculate, 'Red tape.' It is but just to say that in these days of German thoroughness in intrigue and tireless espionage, it is only by such careful routine that danger of wrong people finding their way into places where their spying or bombing arts may be plied with possible destructive effect can be efficiently guarded against.

Next came the journey to —, and the embarkation. Khaki, khaki everywhere; not a trace of colour except when a staff-officer showed a red cap-band and red tags on his collar. There was only one bright spot in the crowd. As we walked along the lower deck, suddenly a mass of bright colours struck the eye, from which as we passed came most formal and polite salutes, which I need not say were responded to with equal formality. It was a group of Russian officers, gorgeous in their great silver epaulettes and belts, and with broad stripes in scarlet. Theirs were the only swords to be seen. The British officer of to-day never shows himself wearing a sword unless it be at a ceremony or a funeral. Many officers carry trench-daggers besides their revolvers. It may be doubted whether many officers at the front have swords in their kits. The contrast of this bouquet of colour in the midst of the mass of sand-toned uniforms was very marked. Indeed, nothing is more remarkable than the change in military dress. The time was, and that not so long ago, when show was the essential characteristic of the soldier's uniform, whether in peace or in war. A royal personage in the second quarter of the last century laid it down as a military maxim not to be gainsaid, 'A seam in a soldier's coat is permissible; a crease is a crime.' No such thing as a pocket was permitted in a military uniform; and the soldier was sent to war in the awful winter of the Crimea, or in the broiling heat of an Indian plain, in the same tight tunic and leather stock in which he paraded at home. The phrase 'the pomp and circumstance of glorious war' contained a true description as regarded dress. As Lord Wolseley expresses it in his *Life of Marlborough*, speaking of Monmouth's army, 'To officers of his class it was—and still is—heresy to hold that a man can be capable of doing a soldier's work unless he is dressed up like a cockatoo.' Now everything is business-like. The soldier

has as many and as roomy pockets as the civilian, and the officer is dressed as simply as the private. Common-sense has at last prevailed.

On our boarding the steamer, a seaman at once advanced with a lifebelt and a firm injunction that it must be put on, as that was 'the order.' It made a somewhat comical tableau—the hundreds in khaki, the civilians and ladies, and, most of all, the magnificent Russian officers, all bound up in gray canvas belts of great breadth, sewn over squares of cork.

The crossing to ——— (*horresco referens*) began. By reason of a very tightly packed and weighty deck-load of 'Tommies' with their rifles and kits, there was some top-heaviness, aggravating outside and relative inside motion—much of both. The repeated peals of loud laughter from a group of youths near were provocative to a sufferer, and even in one's own misery, grim satisfaction followed when the laughter died away, and sounds more in consonance with one's condition were compulsorily substituted. The worst of the sea is that, although in crossing the Channel but an hour or two has to be endured in actual time, the sense of the passage of minutes is lost, and the time of groaning seems immeasurable. Oh, the relief at hearing the ting, ting, tong of the Captain's Chadburn telegraph, which says 'Stand by' to the engine-room, and assures the prostrate one that the landlocked water of the harbour is at hand!

When we arrived at ——— the question presented itself very forcibly, 'Is this France?' Where are the *douaniers* in their long pale-blue coats, ready to demand whether there is anything to declare? Where are the many officials, *sergents de ville* and others, that one was wont to see on the quay? All seems to be British—khaki and kilts everywhere. Where are the *flacres* with their stout red-faced drivers, and the importunate touts, shouting, 'Here, ice ay, nice 'otel'? Instead of all this, khaki-clad motor-drivers stand in dozens, waiting for their chiefs to guide them to their cars. Another indication of change is seen in the absence of all horsed vehicles. Some fifty or sixty autocars stood side by side on the quay. My kind colonel led me to his car, by which the awful journey by rail was avoided, for at present he who enters a railway carriage going to the front has to face the probability of a crowded train moving at an average speed of ten miles an hour, including stops, the lines being so congested with goods trains conveying guns and stores of all kinds, and ambulance trains, that ordinary speed is not to be hoped for. Instead of this ordeal, within two minutes of stepping on to the quay the car was loaded up, the handle turned, the clutch let in, and the journey of seventy or eighty miles begun, to be accomplished in two hours and a half, there being no twenty-mile speed limit at the present time in France.

On passing out of the town, no doubt could remain as to the country being France, when

one looked at the long, straight stretch of switch-back road, flanked by the invariable poplars, very ragged and twisted near the seacoast from the buffeting of the storms, and drearily formal farther inland, all so unlike the sweetly wooded, curving, winding roads of home. But nothing else seemed to speak of France, neither the weather nor the sights. The hope that by going southwards to the Continent one would escape the frigid June of home was at once dashed. The landing had been made as the last showers of cold hail were falling, and a chamois jacket, a heavy military greatcoat, and a fur rug were not sufficient to defeat the cold air that searched every crevice.

As to what was seen, the khaki-clad soldier was everywhere. The returning of salutes was as fatiguing as in London. The *poilu* was not visible. For many miles scarcely anything was to be observed that did not speak of British occupation. Here would be seen what once was a London General omnibus, but was now a travelling larder for carcasses, toned down outside in colour so as to be unrecognisable. Then great lumbering wagons would roll past with the names of Daimler, and Thornycroft, and Straker Squire, and others, having W.D. in large letters and the official Broad Arrow on the sides. Standing here and there upon the road were seen vast convoys of wagons full of food for guns and Tommies, ready to be moved forward to the front when required. It gives an idea of the splendid organisation of the Army Service Corps and the Supply Department to learn that the number of road wagons used in the transport service of the British force is twenty-seven thousand eight hundred and fifty. The figures being so vast, it has been found necessary to group the wagons by distinguishing marks. For example, one set has a figure like a shamrock painted in red on the sides of the wagons; another has a figure like a sugar-loaf, probably suggested by the shape of a shell. By means of these and other marks, the risk of confusion is diminished in a way which would not be possible if numbers running up to so many thousands were the sole means of identification to aid in sorting.

Every precaution to prevent confusion is observed. That the troops and convoys may not go astray in using the roads, all the sign-posts and public notices prescribing routes, and forbidding heavy traffic on certain roads, &c., are expressed in English. In short, the whole of this great sector in which Sir Douglas Haig is in command is in the occupation of the British army, although, of course, the relations with the resident population are very friendly. But domination, though absolutely friendly, is quite complete. So strict is the rule, that all residents are required to be indoors by eight p.m., and not to be abroad till next day, under pain of arrest, unless a British permit has been ob-

tained. Strange it is to think that this state of friendly unity exists now in France, when it is recalled how rarely before were British troops in that country except as enemies. In driving forward, the route was not far from the fields of Crécy and Agincourt, where England fought the chivalry of France, and one's thoughts turned to many a field of battle of later times—Fontenoy and Namur, and still later to Ligny, Quatre Bras, and Waterloo.

It is not absolutely accurate to say that no French soldier was seen. The sight of a figure without arms, dressed in a short blue jacket, blue breeches and puttees, with a dish-cover helmet painted in the same colour, led to surprise and a question to the colonel, 'What is that man's uniform?'

'Oh, that's the dress of *gens d'armes* now.'

'*Gens d'armes*! Shades of the two Napoleons, is it possible? Where are the broad, heavily laced cocked hat, the great silver epaulettes, the ropes of aiguillettes, the long coat-tails, the clanking sabre, and the white duck trousers?'

All gone, and probably never to be seen again. No doubt it was a magnificent *tenue*, but absolutely unsuitable for police duties, a last remnant of senseless display. Fancy chasing a thief through a field in such a dress!

At every turn the temporary Anglicising of the country was manifest. First on one side of the road would be seen a vigorous football match, then on the other side a little farther on a game of cricket, and last of all at the same place an individual coming down the road, clothed only, if clothed it could be called, in the shortest of running-tights and track shoes, ready for a foot-race. Nothing could be more comical than his evident hesitation whether he should salute or not in passing, seeing that his sparse clothing could not be classed as uniform. Wisely, and probably correctly, he looked the other way; but his air of bewilderment made one laugh.

As final indication of British occupation comes an English postman in his old-fashioned shako, which, copied from the French dress of many years ago, reminded one of home. And, last but not least, a motor-van standing at a corner bore in gilt on its sides, 'LENA ASHWELL'S FIRING-LINE CONCERT PARTY,' a symbol of that unselfish ministering by the theatrical profession to the cheering-up of the soldier returning for a rest from the fatigues and horrors of the trenches, which doubtless wards off many a nervous breakdown. After more than an hour's run, we

reached the place which happened at the time to be the headquarters of Sir Douglas Haig, the Commander-in-Chief of the British Expeditionary Force. The place was tens of miles behind the firing-line, which brought forcibly to notice how different is the conduct of war from what was the case in earlier times. At Waterloo, Wellington could see with the naked eye the review by Napoleon of his army before the battle; and although the story of the Duke's supposed shout, 'Up, Guards, and at 'em!' is legendary only, there is no doubt that he was near enough to his line of battle to have given a direct command with his own voice; otherwise the legend could never have arisen. To-day the commanders of the two armies struggling at the salient of Ypres are personally far apart. With eighty to a hundred miles of front to control, direct command is impossible. Each chief fights his battle from a room, where the progress of the combat is marked by shifting blocks on great maps laid out on a table. News arrives from all parts of the front by telephone or telegraph, aided when necessary by coveys of motor-bicyclists, whose machines may be seen in groups at the headquarters. By these means reports from the front are received, the blocks are moved forward or backward, and orders sent to the army corps commanders, who in their turn are working with the aid of maps, on which blocks representing their own forces are laid down, the blocks being moved about as reports come from the front or as orders arrive from the supreme commander at the rear.

Thus it has come about that a commander's staff-officers are no longer seen galloping about to convey orders and bring in reports. The distances are too great. They speak through telephones or send messages by telegraph or motorcycle. Indeed, such a thing as a General or a staff-officer on horseback is a very rare sight. When they have to move from their headquarters the autocar is the mode of conveyance, being quicker and more enduring than the horse can be. Spurs as insignia of rank may be worn, but they certainly seem out of place in a motor-car, and very often they are not worn. It is recorded of Hindenburg that on one occasion, when he desired to visit his command, a foot full of gout made a boot impossible, yet he was able to visit two hundred miles of front in amazingly short time by using a motor-car, from which he never alighted during the whole journey.

(Continued on page 645.)

WAR SAVINGS CERTIFICATES.

By JOHN BURNS, W.S.

THE HIGH INCOME YIELD.

WE have reason to know from actual experience that the high merits of the Government's war savings certificates as an investment are not thoroughly understood even by men accustomed to deal with financial matters. The official announcements are not models of lucidity or accuracy, and perhaps sufficient publicity has not been given to the merits of the scheme.

The idea of the scheme is that you pay in so much money now, let it lie fructifying, and leave it alone for five years, and at the end of that period draw out the whole accumulated sum. The least sum you are allowed to pay in is 15s. 6d.; the most that will be accepted is £387, 10s. Between these extremes you are allowed to pay in any sum you please, so long as it is a multiple of 15s. 6d. So long as the scheme is open you may pay in 15s. 6d. or any multiple of it—say £1, 11s. or £3, 2s., and so on—every month or at any other intervals you think fit or find convenient; but each investment will run its own five years' course from the day on which it is paid in, and altogether you are not allowed to pay in more than five hundred times 15s. 6d., which is the maximum sum of £387, 10s. above mentioned.

At the end of the five years each 15s. 6d. will have become £1, so that

£7, 15s.	becomes	£10.	£155	becomes	£200.
£15, 10s.	"	£20.	£232, 10s.	"	£300.
£38, 15s.	"	£50.	£310	"	£400.
£77, 10s.	"	£100.	£387, 10s.	"	£500.

There is no trouble about making the investment. No professional assistance is required. All necessary information may be obtained at any post-office and at almost any bank.

Let it be understood at the outset that the scheme is essentially applicable only to money which the investor or saver is reasonably certain he or she will be able to do without for at least two years. Further, the investor or saver must be prepared to dispense with the actual receipt of any income or interest for the period of the investment. Of course, the interest is daily mounting up in his favour on a splendid basis, but still it is not cash in hand half-yearly. In other words, the essence of the scheme is a savings fund. The investor saves what he puts in originally—the principal; he saves the half-yearly interest—the income; and he saves the interest on his income—the compound interest. It is all intended to roll up as one increasing snowball for five winters and five summers, and then at the end the saver steps into the possession of his thrifty accumulations. It must have

been a very careful man, even for a Scot, who said that the counsel of economical perfection was to live, not as Micawber preached but did not practise, within one's income, but on the interest of one's income. This war savings scheme is, however, an improvement on even that, for not even the interest of the income is to be drawn out till all shall be accomplished.

This is obviously the unsurpassable limit of thrift. But it is more; it is also patriotism and the securing of the highest yield and finest security ever offered in modern times to any investor anywhere. The patriotism consists in finding money to carry on the war, and lending it to the Government on their own terms. The security is equally clear; the investor is absolutely protected against the remotest possibility of any capital shrinkage or any loss of interest. But it is when we come to the interest terms that the very special attractiveness of the scheme comes into view.

INTEREST AND INCOME-TAX.

The Government advertisements bear that the rate of interest is 5 per cent. per annum, free of income-tax. But three things must be kept in view: First, apart altogether from the income-tax gain, the interest rate is £5, 3s. per cent. per annum. Second, this is not simple, but compound, interest. Third, the compounding or accumulating in favour of the investor is done not once a year, but half-yearly; that is to say, on each half-yearly date the income or interest which on an ordinary investment would be paid and received in cash is retained by the Government and treated as a new and further loan on that date, to bear interest for the future on the same favourable basis; and so the process goes on in favour of the investor half-yearly and half-yearly.

FREE OF INCOME-TAX.

These are well known as misleading words. We know that in this case the announcement as regards tax has been misunderstood. Many people still think that it merely means that the accumulation is made without deducting income-tax, so as to meet the case of those who, having incomes not exceeding £130, are not liable to tax; but that in all other cases the fortunate investors will be assessed direct for the income-tax on the accumulating interest, either year by year or at the end of the five years when the cash is paid out. But that is not so. There is total immunity from income-tax, no matter how large may be the investor's income from all

sources. It is this fact which makes the scheme so extremely valuable to many people. If the income does not exceed £130, this income-tax point adds nothing to the already great attractiveness of the investment, for the investor pays no income-tax at all, and so the freedom from tax under this scheme is no additional boon to him. In the case of people with incomes over £130 the benefit appears, and roughly that benefit becomes the more valuable as the income increases. But as considerations of space must be regarded, we shall illustrate only two cases—that of the man or woman whose income is over £700, and that of the ultra-rich man who is liable in the highest rate of super-tax. The former of these cases is the best example of the attractiveness of the scheme; the latter may be thought to indicate a danger.

COMPOUND INTEREST $6\frac{1}{2}$ PER CENT.

A few years ago any one who had asserted that the British Government would soon be paying such a rate as this on loans would have been considered insane. But test the figures on the basis of the new income-tax scale on non-earned incomes recently announced by the Chancellor of the Exchequer, assuming its continuance during the five years. Take the case of a man whose income is over £700, but not over £1000. Every £100 of his original investment and its accumulations then yields per annum, gross, practically the $6\frac{1}{2}$ per cent., or, to be quite exact, £6, 4s. 10d. Deduct income-tax at 3s. 6d. per £1, £1, 1s. 10d. This gives the free yield above stated—namely, £5, 3s. It should be particularly noted that all the compound interest is on the same scale. The investor, to enable him to do as well in some other investment, must find as good a security (which he cannot) which pays $6\frac{1}{2}$ per cent. Once this is realised we do not doubt that there will be a still greater rush of well-to-do people eager to put down the maximum of £387, 10s., for which after five years they will draw £500. The above figures hold exactly also for those whose income is between £500 and £700, if, as is probable, the abatement of tax on £100 or £70 to which they are entitled comes off earned, and not off unearned, income.

COMPOUND INTEREST 9 PER CENT.

If $6\frac{1}{2}$ seems almost too good to be true, what shall we say of a rate within a fraction of a shilling of 9 per cent.? That is how this scheme works out for the ultra super-tax payer. Thus, £100 in a year yields £8, 19s. 3d. Deduct 8s. 6d. per £1 for tax and super-tax, £3, 16s. 3d., leaving the free yield of £5, 3s. So if this wealthy man desires to do as well elsewhere he must find absolute security plus 9 per cent. interest.

OTHER INCOME-TAX ASPECTS.

A matter which still requires to be cleared up is whether the income on these savings is to affect the saver's income-tax rights and liabilities in respect of his *other* income. If a lady's income is only a little over the £130, can she bring herself below it by going in for this scheme to a small extent? If a man is only slightly over £500, can he by the same method get the lower rate as not exceeding £500? If his income is somewhat over £700, can he by adopting this scheme bring himself under that figure for income-tax purposes, and so obtain an abatement equal to the tax on £70 of income, and also the further very substantial abatements for, say, four children under sixteen years of age, which abatements are limited to those whose incomes do not exceed £700? If these questions are answered in the affirmative (as we believe will be found to be the case), then so much the better still; but even if they are answered in the negative, the parties are no worse off in these respects than with any other investment, and much better off in having the very handsome returns we have brought out, plus absolute security.

SURRENDERS.

All who purchase these certificates ought to do so with the intention of allowing the money to lie undisturbed for the full period of five years, and they ought to strain every nerve within reason to accomplish that purpose. Far better take a smaller sum to begin with, and carry it to full fruition, than a larger amount and find that the cash is required during the currency of the period. But, of course, no one can foretell the future, and many unexpected things may happen to disturb one's plans. A prudent person will for that reason desire to know how he or she would stand in such a case. On the whole, the position is, in this respect also, very satisfactory. In every case, and at any date, the investor is entitled to have his original money returned to him on demand, without delay, without conditions of any kind, and, in particular, without any deduction. In the unlikely case of the cash being required before the end of the first year, no interest is added. But even in that extreme case, if the amount were large, it might be possible to obtain the consent of the Postmaster-General to a sale to some one who would give a price which included something for interest. At the end of the first year, if repayment be demanded, there is an addition of 3d. for every 15s. 6d., which means that one who pays in the maximum of £387, 10s. can at the end of the first year draw out £393, 15s., which no doubt is a poor return, being less than 2 per cent. But after that date the terms gradually and greatly improve, the addition of 1d. per month after the

end of the first year being made on each original 15s. 6d., which is equivalent to £2, 1s. 8d. per month, or £12, 10s. per each half-year, on an original maximum investment of £387, 10s. As many people may attach great importance to these surrender values, it may be stated broadly that at any time after eighteen months from the date of investment there is really nothing of which to complain. More in detail, at the following dates the terms of repayment for an original £387, 10s. stand thus:

END OF SECOND YEAR,

The investor can receive £418, 15s. This includes £31, 5s. of interest, which is rather more than simple interest, and rather less than compound interest, at 4 per cent. per annum, free of tax.

END OF THIRD YEAR,

The investor can receive £443, 15s. This includes £56, 5s. of interest, which is simple interest at nearly 5 per cent. per annum, or compound interest at nearly $4\frac{1}{2}$ per cent. per annum, both free of tax.

END OF FOURTH YEAR,

The investor can receive £468, 15s. This includes £81, 5s. of interest, which is simple interest at $5\frac{1}{2}$ per cent. per annum, or compound interest at $4\frac{1}{2}$ per cent. per annum, both free of tax.

NOT BEARER DOCUMENTS.

Most people will be glad to know that the certificate which they receive from the Government in exchange for their money is not, like a bank-note, payable to bearer, but runs in their own name. It thus shows on its face whose property it is, and the grave dangers of destruction, theft, or loss which attach to bank-notes and 'bearer' securities are all avoided. So little serious is the loss of the document that the statement is officially made that in such a case a new certificate will be issued to supply its place at a charge of one shilling.

TRANSFERS.

The investment cannot be sold or transferred except with the consent of the Postmaster-General. This has no doubt been thought to be a necessary condition in order to prevent evasion of the rule against one person holding more than the £500 limit. That limit itself is very necessary, for otherwise the yield of income-tax might be gravely prejudiced by wealthy people especially investing very large sums in this form, and buying up for that purpose certificates issued to other and probably less wealthy persons. In this connection it is interesting to observe that if a certificate were sold by one whose whole income is, say, not over £130 to a millionaire, the certificate would by the process of sale actually increase in value; for while the income return

to the seller was a little over 5 per cent., to the purchaser it would be nearly 9 per cent. Further, it has no doubt also been thought that transfers ought to be unnecessary in view of the very liberal surrender values which the Government offer. But, as we have seen, these do not fully meet the case of a desire to realise during the first two years; nor do they at any time meet the desire to use the certificate as a fund of credit by borrowing on the security of it. There is, however, no reason to believe that the official sanction to a transfer would ever be unreasonably refused.

THE CONCLUSION OF THE MATTER.

It is open to critics to suggest, as has already been done with less reason in the case of other war issues, that the Government are paying too much for their money. A separate objection might be that it is not right for the State to give a better return to the rich man than to the man of less ample means, who presumably needs it more; but that is an objection which must be inherent in every issue free of income-tax.

However, without delaying over questions of high finance or theoretical economics, here is the offer, and every wise man and woman who can will take advantage of it, and to the maximum if possible; and, as so far getting over the £500 limit, we expect to see nearly every father in easy circumstances taking not only a £500 certificate for himself, but also one for his wife and one for each of his children.

A WAR CEMETERY.

THERE is a windmill here which standeth high,
With straining timbers 'gainst the windy sky;
Old, tarred, and bent, with walls and flooring
riven,

It spreads its arms to court the winds of heaven.
The country rolls about it, mile on mile,

Like some vast ocean moved by far-off storm,
And in the gaps remote horizons smile,

Tenuous and blue, like phantoms void of form.

And here beneath the mill that feedeth still

Their children came the villagers to lie,

When the last furrow on the chalk-brown hill
Their hands had turned and the last cup was dry;

Nor dreamed they as they lay in their dark bed

The harvest of the fields they used to plough

Was turned to one of death, and the gray lead

Was all the seed men used to sow with now.

A ruined church stands up across the wold,

Round which the shells still shriek and spit
their fire;

'Twas there these hundreds fell that in the mould
Beneath us dream away their last desire:

Frenchman and Turco, Spahi from Algiers,

Here all together, as the battle goes,

Rest them 'neath crosses, while in their deaf ears

The din falls as on sun-kissed hills the snows.

Chambers's Journal

SEVENTH SERIES

PAGES OF PEACE FROM DARTMOOR.

By BEATRICE CHASE, Author of *The Heart of the Moor* and *Through a Dartmoor Window*.

CHAPTER I.

'IT takes all sorts to make a world,' says the old saw. If we elevate the homely truth to the dignity of a philosophical principle, clothed in more stately language, we may find solace in the fact that compensation is a universal law of nature. The scales must balance one another. Weights must be readjusted and kept in equal proportions. At this epoch of world-wide turmoil—turmoil never before known in history—it is revitalising to visit, if only in thought and spirit, the earth's unspoiled places of peace, among which moor and hill and mountain country hold the foremost rank. To war-worn nerves, the restlessness of the sea is wearisome. Besides, that same sea, alas! cannot now be watched without sore memories. Forests also, except in the stillest weather, have almost perpetual sound and movement. It is to the eternal hills that we lift our eyes for peace materialised, and it is they which are adjusting the balance, silent and immobile, in opposition to the tempest of war which is ravaging the earth in other places.

I will confess at once, as I often have done before, that I hold a brief for Dartmoor. It is not only her wide undulating spaces, her unmolested reaches of bogland, which convey the sense of utter rest; it is, above all, the tors which crown every hilltop. The mammoth rocks composing each tor stand for majestic repose. Huge piles of granite suggest the immutable far more forcibly than any ordinary hill can. Again, each tor differs from all its kin in shape. There are two hundred tors on Dartmoor, and no two are alike; each has its own characteristics and its own name. These give it an individuality, even a personality. We dwellers on the moor are surrounded by these beneficent giants whom we know and love from childhood to old age. Nations may clash in deadly conflict; kings may pass; empires may fall. Here will stand Hey, Bellever, Rippon, Yes, with their kinsmen, unmoved and immovable, untroubled, unchanging, and at peace.

Many weary pilgrims are seeking the healing of Dartmoor this year, and I rejoice to see them, for I know by experience what she will do for them, body and soul. I am glad to see them

come, and I am thankful for the magic of print by which I may convey, however feebly, some faint touches of the glamour and gloom and peace of the moor to all who are captives on the wrong side of her hills. Many of the living seek the moor, and, I hope, many, too, of the so-called dead. If I wished to, I cannot forget that my sheltered home lying in the arms of the great moor is safe because of the men who are fighting and dying to protect us. Some of these men are Devonians, who will never again see the loveliness of their native county. After the loss of his boy, a Devon clergyman wrote to me: 'And Jack did so long to come again to "Dartymoor," as he always called it! Well, he sees now even a fairer land.' Yes, and it is sweet to think that these victorious young souls who have touched the zenith of human achievement may visit and rejoice in the land they died to save. If guardian angels are so busy all about the world's highways and byways, it is not overstretching our faith to think that the spirits of our guardian men are also very near to us, and I love to think of the great moor as visited by these radiant young warrior-souls.

The fittest time to commune heart to heart with the moor is at twilight, when the day's work is done. Only a stone's-throw from the house is the moor gate; and, once through that, we are among the bogs in a world ages old which knows nothing of war and twentieth-century ways. Up along the rough, narrow sheep-track that winds between two sweeps of bog, throw the plaid down on the short turf beside the same friendly boulder which awaits us every evening, then throw yourself upon the plaid, and open ears, eyes, and heart to the life, work, and traffic of the moor—to the things which really matter.

In the bog just below are still some lingering blossoms of bog-bean, with its filmy white flowers tipped with delicate old rose. In May month the bogs are white with it, white as though for a wedding. It grows so far from solid ground that it is impossible to gather it; I can only love it from afar, and watch, May after May, for its unfailing blooms. Gemming the edges

of the bogs, generally growing in a clump of moss, is the ruby-red sundew, that mysterious sentient plant which is nearest of vegetables to the animal world. Its tiny leaves, as round as the sun, are covered with fine hairs, and a dew-drop glitters at the end of each hair. These leaves always grow in a circle round the root, and in August a small white flower rises in the centre of the circle. I usually go on my knees to the sundew to watch her extraordinary operations. Each tiny dewdrop is in reality a drop of digestive fluid which both catches and consumes any little fly within reach. All healthy sundew-leaves contain the remains of the digested flies upon which the plant feeds and thrives by some wonderful process of absorption. In the emerald-green sponge of the bog's heart rises a stream of water as clear as crystal and as cold as ice. It steals, without a sound, along the quivering nursery floor of bog, and then, with a tinkle of laughter, runs out over the turf among the heather and gorse and bracken, around the gray old boulders, to make a granite path for itself down to the farm, where it is welcomed by beast and man for every need. It is not piped anywhere, but falls into the old granite trough, and we drink it, bathe in it, wash our clothes and houses with its water, which is like liquid silk. For countless centuries has the tiny moor-born stream been giving life to humanity in this hamlet. When it has done with us it ripples under the flower-flanked highroad, and travels over some fields to join the Webburn, which carries it into the Dart, which bears it out into the sea.

I sit in the twilight and watch the bog-world till it is too dusk to distinguish the plants. Then the wonderful birds of the moor call eyes and heart to themselves—those enviable creatures whose lives are lived half on earth and half in heaven. The birds are always very busy on the moor at sunset, not with returning home, because

the wise winged things do not leave it. I never can make out why there is such a stir at the close of day, unless it is that they all meet for complime or for a social evening to discuss the events of the day. The curlews are my favourites, with their long, plaintive, quivering cry. They wheel slowly round and round in circles, with their long bills outlined sharply against the dappled gray sky. Black-and-white crested plovers rise and fall fitfully in the middle of the curlew circle, uttering their peculiar squeal, which always sounds menacing. The little brown larks go to bed long before the bog-birds do, and you see one scurrying along among the heather to his nest, with an occasional chirp as he runs. Above the curlews' circle are some birds whose name I have never been able to ascertain. They are small birds with big, deep voices, and the cry is like the rapid bleat of a lamb or like the scraping on one deep string of a violin. They can only be heard hovering above the bogs, and never except at dusk.

Twilight these evenings, for some reason, is always robed in gray. She hangs a vast curtain of dappled gray right across the sky from rim to rim of the moor. Round the gray tors overhead are folds of dove-gray mist. The boulders, the bogs, all are gray. The west wind floats by on wide gray pinions. Gradually objects become less distinct. The robes of twilight grow opaque, and veil the outlines. The curlews and their satellites cease to circle and call. No sound punctuates the creed of the great silence except the occasional shrill bleat of a lamb in the flock near the distant farm. I sit in a dove-gray world beneath a dove-gray sky, steeping every tired sense in dove-like calm.

Verily, in the bogs of Dartmoor, at summer twilight, there is peace.

(Continued on page 662.)

AFTER MANY YEARS.

CHAPTER II.

WHEN I returned to consciousness, or, rather, to a semi-dazed condition, I found myself in what seemed a small but very lofty room. The one window was somewhat darkened by a *persiana*, or kind of venetian blind, but the window seemed to be open, as I felt the air blowing gently on my face. So weak was I that even the exertion of opening my eyes seemed to exhaust my strength, for I immediately fell asleep again. When I next awoke it was quite dark; but I felt some one was moving about the room, and heard the gentle rattle of what might have been a cup laid on a saucer.

'Who is there?' I asked, and the effort cost me something.

A voice, apparently that of a man, answered

me reassuringly. 'You must not talk. The doctor will come again early in the morning. And now drink this. You are with friends.'

I heard the striking of a match, and saw by the light of a small hand-lamp the figure of a man, who came to me with a cup in his hand. Raising my pillow very gently from behind, he held the cup to my lips. I drank its contents, and immediately fell asleep again. I was told afterwards that my sleep lasted fully ten hours.

My mind was much clearer on awaking, and looking round, I saw two persons in the room. One, who sat by the side of my bed, was a middle-aged man dressed in black. He was holding my hand, evidently feeling my pulse.

He smiled, and said, 'Good! we are getting along. Now, *señorito*, I will do all the talking; and even of that, one-sided though it be, there must not be much at present. All I can say is, you must be built of very good material. You had a bad fall. Luckily no bones were broken, and the trouble in your head will soon be over.' He laughed pleasantly, and added, 'Though I am a Spanish doctor, I am not of the school of Sangrado. We will not bleed you or starve you. I will come again to-morrow; and, meanwhile, Señor Luis here will take care of you. But no talking.'

He then took leave of me, and I had time to have a look at Señor Luis, to whose care I was committed. He was a rather small man, very slight, and with a most comical, good-humoured face. Round his head was tied a brilliantly variegated handkerchief, the knots of which stuck out over his ears like a pair of flexible horns. His dress was made of something like brown frieze, and consisted of a short jacket with silver buttons, and wide trousers, while round his waist he wore a red *faja*, or cummerbund. On his feet were gray felt slippers.

'Well, *señorito*,' he said, 'as the *señor medico* told you, you must be pretty tough to escape as you did. There is nothing to be done now but to be a bit patient. Your friends at La Ribera know all about your accident, and that you are being taken care of.'

'But will you tell me,' I said, 'where I am?'

'You are in your comfortable bed at La Cartuja, with old Luis to look after you just now. But, as the *señor medico* ordered, you must keep very quiet for the present. There will be plenty of time for talking later on.'

'Only one question, then,' I said, 'and I will be dumb till to-morrow. How long have I been here?'

'Just ten days,' said Luis. 'But now I must go and tell *el señor* the master how much better you are. He has been very anxious about you, though just now his gout has prevented him from coming to see you.'

The doctor came next morning, and found me so much better that I was allowed to sit up in bed, and in a few days I was propped in a comfortable arm-chair that might have belonged to a cardinal, its brown leather back was so beautifully decorated with a gilt mitre and other armorial bearings. This was placed close to the window, which overlooked a vineyard in which were perhaps twenty men and women, some pulling the bunches of ripe grapes, while others carried the baskets, when filled, to the mules which took them off to the wine-press. Oh, how good it was to look on the sunlit world again!

Up to this time Luis was the only one of the

household to visit me; but on the second day of what I may, I suppose, call my convalescence, he brought with him in the afternoon an elderly lady, who, he told me, was Doña Felisa, the housekeeper. The old lady was dressed as if for a visit out of doors, wearing her black mantilla, and carrying a most imposing fan. She was dressed altogether in black, and struck me as being very well-bred. I was simply presented to her as Don Arturo, which Don Manuel's people had said was my name. She was most gracious, and told me that Don Diego wished me to feel very much at home, and that he hoped I would soon be able to pay him a visit, as he himself was at present unable to move about. At the same time, he wished me to know that if I desired a visit from my friends at La Ribera I was quite welcome to invite them, always subject to the doctor's permission.

I need not say that at the doctor's next visit I asked for the desired leave. He said that as I was going on so well it might be prudent to wait for another week; and at the end of that time, which seemed an eternity to me, I was allowed to send a letter to Gabriel, inviting him over.

Gabriel lost no time in coming. After congratulating me on my recovery, he told me that they had been anxious at home on account of his sister's sudden illness. On the day subsequent to my accident she had fainted. As she had always been very healthy, this caused much alarm. Old Don Francisco, the village medico, was quite puzzled, and after a couple of days suggested that they should take advantage of the presence of Dr Azevedo of Salamanca, who, he had heard, was attending the young gentleman at La Cartuja. This was done, though my friend the doctor had made no mention of it to me. I suppose, indeed, he would have considered doing so a breach of professional etiquette. In any case, after one visit from Dr Azevedo, Mariquita improved at once, and was now quite well.

I had my own idea—perhaps somewhat sanguine—as to what caused her faintness, but I kept it to myself.

Gabriel's visits were now a regular daily event, and always lasted some hours. I was permitted to walk for a short time every day in the corridor which ran the whole length of the building, and on to which my room opened. I had written to Valencia, informing my uncle of my accident, and he had replied in a very kind letter, telling me that I should have patience, and not be in too great a hurry to return to Valencia. 'When you are leaving La Cartuja,' he added, 'let me know, so that I may write a letter of thanks to your kind host for all his goodness to you.'

Luis came into my room one morning as usual with my breakfast, and after arranging the tray

he told me that Don Diego would be glad to make my personal acquaintance. 'So,' said Luis, 'I will come about eleven o'clock, and conduct you to him.'

At the hour mentioned he returned, and we crossed the *patio*, or courtyard, and ascended a noble flight of stairs to the upper floor, round which ran a gallery looking into the *patio*, and, stopping at a door just at the end, Luis knocked, and we entered.

The three large windows of the apartment were darkened considerably by the half-closed *persianas*, and on coming in from the brilliant sunshine my sight was at first somewhat dim. At the end of the room, however, I saw a very massive form seated in an arm-chair, which might have been a twin brother of that in my room; and, on my approaching, the occupant said, '*Señorito*, I am glad to be able to congratulate you on your escape, and doubly so that it should have been my privilege to put my poor services, such as they are, at your disposal.' He excused himself for not having risen, and invited me to a chair which had been placed by his side.

By this time my eyes had grown accustomed to the shaded room, and I was able to see my host distinctly. He was, to all appearances, very old, but a figure which must have claimed attention in the largest assembly. Though he was seated, I could see that he was of great height and of unusually large build. His beard, which was clipped, was white, but still preserved, here and there, some reddish patches. His hair was perfectly white, and he had no signs of baldness. His eyes, which were remarkably bright, were overshadowed by very thick eyebrows. The expression of his countenance was very grave, but pleasing. He wore a long, loose-fitting kind of overall, of some gray material, edged with red braid or piping, like what was formerly called, I think, a *gabardine*.

The table by his side was covered with books and papers, and the walls of the room were all fitted with old walnut shelves, packed from floor to ceiling with books, chiefly bound in parchment.

'I must apologise to you personally for not having visited you during your imprisonment,' he said; 'but, unfortunately, I am a prisoner myself. I have been for years a martyr to *erysipelas* in the feet, which prevents my moving about while it lasts; so much so, that when the cold weather sets in about December I am obliged to stay in bed, as I find the cold affects my complaint very much, and I cannot go near a fire, as that seems to be equally bad. However, I cannot complain. When I tell you my next birthday will be my ninetieth you will allow that I have no cause for grumbling.

Your friend Dr Azevedo thinks that I should try the mineral waters at Montemayor, which is only one long day's journey from here; but I tell him that I am hardly worth mending now.'

He certainly was a most astonishing old man. The only thing old about him was his age. His mental activity was amazing. He spoke with the greatest interest about the vintage, of the quality of the wine, which he expected would be above the average; in fine, of everything local. But in the doings of the world at large he seemed to take no interest.

'But, sir,' I said, 'why not take Dr Azevedo's advice, and try the baths at Montemayor?'

It seemed almost ridiculous talking like this to a man in his ninetieth year, but it would be impossible to describe the total absence of the usual concomitants of old age in this wonderful old man.

'Well,' he said, 'the truth is I am thinking of doing so. In fact, I am only waiting for the pressing of the grapes to be finished, to see the quality of the must.'

'Well, sir,' I said, 'it is possible I might be of some use to you in this matter. I have had three years' experience in a *bodega* in Valencia, and I think I may say there is not much in the making of wine that I do not understand.'

'You are very good,' he replied, 'to make such a kind proposal. Indeed, I did not connect you in any way with commerce. From what old Luis told me about you, I concluded you were a student. Old fellows like Luis will talk, you know, and when once they are set going it is not easy to stop them. Besides, Luis is privileged. You will be surprised to hear that he was, forty years ago, a lay brother in this very house. He has been for more than thirty years my most respected servant and friend.'

I told Don Diego of the reasons which had led to my giving up the professional career originally intended for me, and how it was that I had come to Valencia. He seemed to be much interested in my story, and said that if my uncle in Valencia was willing, he would gladly take advantage of my offer to remain some time longer at La Cartuja.

I wrote the same day to my uncle, who replied that there was no reason whatever why I should not do something, however inadequate, to pay the great debt of obligation which I owed to Don Diego. He added in his letter that I had omitted, up to now, to mention Don Diego's family name, and asked me to do so, in order that he might write to thank him for all he had done for me.

(Continued on page 659.)

TO 'SOMEWHERE IN FRANCE' AND BACK.

PART II.

ON leaving this place and going forward towards the front, it was at once seen how communications were provided for. The existing French telegraph-poles were crowded with extra wires on military insulators. Telephone-lines were run up in the fields alongside the roads, the Royal Engineers having commandeered hop-poles wherever hops were being cultivated. Driving along and seeing these networks of wires spreading out in all directions, I thought, with curious feelings, how it might be that most momentous messages were passing by these lines from minute to minute; and indeed it must have been so, for it was just at the time that the Colonials were to make their dashing attack in front of Ypres, recovering the ground which had been lost shortly before.

Reaching H—, the colonel's headquarters, and receiving a kindly welcome from the major and other officers of the G.R.C., I ended the day's journey in an old château, which displayed the mixture of style and tawdriness so often seen in French mansions. I was most hospitably put up and entertained by the group of officers who were on duty there, one, the major, being a friend of some standing and a close comrade of him who was gone, and the others having been friends of his, and some of them chums while they served together.

The following morning, under the major's care, the journey was made farther forward to B—. One of the sections of the Commission was located there, nearer the front than H—, and here I first came in contact with symbols of the grimness of war. In the garden behind the house, which was occupied as an office, stacks of plain wooden crosses were seen piled up ready for use wherever burials might take place. A drive with the major to a little distance outside the town brought me to the British military cemetery, established beside the town burying-place. Here those remains which could be brought back from the firing-line were laid close together, officers and men, side by side, and a simple cross, with a metal label giving name and corps, was placed at the head of each grave. Row upon row, closely set together, spoke of the sacrifice of all ranks without discrimination, the officers with the men, comrades in death, as they had been in life, still together, silent witnesses of love for King and Country, resting in peace after the good fight. On coming to the grave which was the object of the visit, it was touching to find that kind hands had planted young trees at the head, and that flowers were blooming at the foot; and gratitude flowed at the knowledge that the members of a French family, who had become close friends of him who lay there, came

every third day and brightened the spot with fresh flowers. The memory of such loving kindness will never fade.

It cannot but be comforting to those who mourn for the dear ones they have yielded up to the good cause to know that everything possible is done, even at personal risk to the doers, to keep record of where they are laid. It will come as a surprise to many to learn that a staff of eight hundred officers and men are daily engaged on this duty, and it is most carefully performed. When burials took place close up to the trenches it was usual to put a note of the name, &c., in a corked bottle at the grave, from which a record could be made up. Now labels are supplied, and these are fastened down at the graves, and when the cross is erected the label is nailed to it, thus making a permanent record. But this is not all. Such graves may be obliterated by the ploughing effect of shell-fire, and the further work is done of laying off the positions by exact measurement on plans, so that the graves may be traceable with certainty.

It was at such work that he whose resting-place was visited had been engaged when he fell. Some flowers from his home and a sprig of white heather were added to the gifts of the good French friends.

On the road that day, returning from B—, something was seen and heard of the great struggle. By going up to the top of a rising ground it was possible to see Ypres and Poppeinghe at a distance of four or five miles. The great church tower of Ypres was seen still standing in the midst of a once attractive town laid in ruins. This view had a special melancholy interest, as it was in front of Ypres that he whose resting-place had just been visited was locating a grave near a trench, and met a bursting shell which brought him to his end. Those who worked on the Graves Registration had often to take risks, so that the graves near the front might be registered on the plans, and a certain record preserved.

There were great contrasts that day. In looking towards Ypres, the view was across a slightly undulating plain, charmingly wooded here and there. With a bright sun and great white clouds, like those of a typical Scottish summer day, the light was breaking here and there, shifting over the landscape. All seemed to speak of a peaceful countryside. But as one gazed the serenity of the scene was marred by the sight of 'sausage' balloons at rest in the air for observation, and by bursts of smoke rising in columns near the town as shells exploded, followed to the ear by the boom of the great

guns which caused the marring of the sweetness of the landscape. It was about the beginning of the activity which ended in the recapture by the Colonials of the terrain which had been lost a few days before.

A little farther in a different direction there was another disturbance to the peacefulness of the scene. An aeroplane was visible, round which there burst out puffs of white smoke from shells, as the enemy, with aircraft guns, tried to bring it down. But the attack failed, and soon the aeroplane was heard approaching; and, coming down low, it passed over the car I was travelling in, descending at its hangar a short distance forward, where it was seen safely settled on the alighting-ground.

On the afternoon of this day, the calmness with which the inhabitants are taking their troubles was quite remarkable. The children were seen coming from school as if everything was as usual. From an open window came the sound of scales being worked out laboriously upon a not over well-tuned pianoforte, as if no guns were pounding at the trenches a few miles off. But the patient serenity of the people was shown in a more touching manner. There had been held that day within the sound of the guns a reception of young girls to first communion in the parish churches of the district, and they were to be seen, singly and in twos and threes, returning home after the celebration, dressed in their veils and in pure white from head to foot, bright and happy, with no fear of the need of an escort while the British soldier was their protector. Truly, the incident spoke to the heart of that 'peace which passeth all understanding'; a people going through a very furnace of trial, devoting their young maidens in God's house, in the midst of the sounding of the guns, which seemed to mock the *Gloria in Excelsis*, the song of 'peace on earth and goodwill to men.' It would cause a shudder to think what the fate of these young girls, just budding from sweet childhood into womanhood, might be should those who have invaded France succeed in pushing their way forward over this pleasant country once more. Let the reader judge when an incident is brought before him, the story of which was narrated at first hand. When the advance of the Germans from Mons to the Aisne took place, the town of B—— already referred to was occupied by the enemy. A number of officers were billeted in the house of a well-to-do citizen, and showed their gentlemanly feeling by using the drawing-room as a stable for their horses. This was blackguardly enough; but worse was to follow. The senior officer, described as a great hulking brute, greeted the lady of the house thus: 'I want your sons who are of military age.' Receiving the reply that there were none, this exemplar of German *Kultur*—this 'officer'—went on to say to the terrified mother, 'Then I want your daughters.'

Surely if any novelist were to invent such an incident, it would be criticised as an overdrawn piece of imagination of shameless blackguardism. But it took place in actual life, this heartless brutality, this devilish demand to a woman to deliver up her dear ones to worse than death. There was but one daughter, a young girl, who was kept concealed in an attic until this ghoul went his way. Such a case of bestial scoundrelism, known to be a fact, tends to lead to the belief of many another story which has been received with doubt of its truth as being beyond belief, or with a feeling that it must at least be exaggerated.

When we were at B—— a rumour spread through the town that Lord Kitchener had been drowned. It received little credence, as he was not known to have left London. But on the way back to H——, when we were passing through a small town, English papers—*Times*, *Morning Post*, &c.—were seen in a rack outside a small shop; and on my securing a copy of the Paris edition of the *Daily Mail* of that morning, which had just arrived, the sad fact was no longer doubtful. All has been well said of this calamity, and this is not the place to comment on it. But the incident at the little French town was another indication of how France in some parts is for the time Anglified. Before the war it may well be doubted whether a newspaper printed in English was ever seen in that little place. Yet here, within twenty hours of the catastrophe to the *Hampshire*, an English newspaper giving the full news of the event was offered for sale seventy miles inland in France.

The last day of the visit was spent at H——, where some interesting things were to be seen. On leaving the château to go down to the Registration Office, some uncertainty as regarded direction led to the stopping of a soldier in khaki, and a request for guidance. The reply was, 'Jist ye gang doon, sir, to the saykint tuurn te ye left, an' ye're there.'

'Hallo,' I replied, 'you're a fellow-countryman of mine! Where do you come from?'

'Me! Ah come fra Glesca.'

At parting, pleasure was expressed at meeting a compatriot; and, as does not always happen when a direction is given to the traveller, it turned out to be correct. As I entered the street to reach the office, an English regiment, led by the fife and drum band, was crossing the end of it, the inhabitants rushing to door and window to watch it pass.

One of the officers kindly came with me to show me the little lions of H——, which is quite a typical French country town, with its wide market-place, its quaint Town Hall, and its ancient church. This last, it was said, dated from the thirteenth century, as its style seemed to indicate, showing a splendid specimen of a great Norman doorway; while the interior was in a style somewhat transitional, the arches

being very slightly pointed, much like Early English. The proportions are beautiful, and the pleasure to the eye was not marred by the too common garishness and tawdriness of fittings and carpets, which so often detract from the architectural beauty of Continental churches. The Town Hall is typical of the Mairie of the French market-town, and there are interesting relics in the museum in the building. Once a fortress, here are to be seen many plans of the Vauban-like ramparts, and on a plaque hang the old keys of the fort's gateway. On the walls are specimens of the very finest tapestry, well worth seeing, and numerous portraits of royal personages and mayors, not so well worth seeing.

On visiting the market-place, the weekly market was found in full swing. To me, who remembered the noise and gesticulation of a market bargaining in France in time of peace, the more subdued tone observable to-day told its own tale of the solemnising influence of a cruel war. While nowhere was there any sign of depression or gloom, the predominant black of the crowd, where scarcely any colour in dress was to be seen, was in marked contrast to the brightness of former days. As one would naturally expect, business was done in more subdued tone and manner than of yore. The bustle of the days of peace was toned down.

It was amusing to see the British sergeant bargaining for onions or leeks to be a relish to the rations of his unit. The conversation was carried on in English on the one side and in country French on the other, neither party comprehending the other's words, but both getting in some mysterious way to an understanding to mutual satisfaction. A kilted man is seen with two eggs, and the following occurs between him and a comrade meeting him.

'Hoo did ye ask for thae, then?'

'Oh, sez I to the wummin, "Uff."

'Ay, bit ye've gotten twae.'

'Weel, wantin' twa, sez I, determined-like, "Twa uff," and she gied me three, and I hands her back yin.'

Sawnie's gruff 'twa' had evidently been taken as *trois*.

This incident naturally drew attention to the egg department of the market, which was held in a street apart from the market-place, and was a wonderful sight. There must have been tens of thousands of eggs laid out in boxes, which in the course of an hour or two were almost all purchased. I shrewdly surmised that most of them went to form part of the millions of eggs which cross the Channel to take the place of the eggs which Great Britain ought to produce for herself. The spread of intensiveness in the breeding and management of poultry, which is going on rapidly, and which we are bid to expect will result in many flat roofs in London and the great towns becoming egg-producing areas—that is *not* a bull—may tend

towards a measure of self-supporting improvement.

All I saw of the intercourse between the occupying army and the inhabitants spoke of hearty good feeling. And that is no cause for wonder. The British 'Tommies' and 'Jocks' are the very opposite of the proverbial 'brutal and licentious soldiery.' The contrast to the people of town and country, who knew the tender mercies of the enemy, who held them in durance vile, and pillaged them, till he was thrust back from the Marne, must have been very great. Cheerful and kindly, the British soldier's good offices are always at the service of the women of their billets, who are having the time of their lives. Of the tens of thousands of British pounds sterling that are expended daily at the front, no small proportion finds its resting-place in the thrifty store stockings of the French peasantry and small shopkeepers. When the day comes for evacuation at the end of the war, the feelings of those who see the British troops returning towards home will be like those of the Britons who mourned when the Romans took to their ships to return to the Continent, called there to fight the Goths. The beneficent stay of our army will be remembered for generations, not only for the aid given in overcoming the invader, but also for the prosperity brought in hard cash to France.

Taking farewell next morning of the G.R.C. friends, whose kindness will be a lasting memory, we made the journey back to — without special incident. Only one thing was observed which calls for mention. In crossing a canal, a great barge with a roof set on the deck was seen moored at the landing-stage, having brightly curtained windows, and numerous Geneva crosses on the sides. In this and similar barges bad cases of sickness and wounds are taken to the coast, by which mode of travelling freedom from aggravation of suffering by the jolting which must be undergone in even the best ambulances going by road is secured. It was another indication of the thoughtful care given to the disabled in the present war, by which so many lives are saved, and the evil effects of so many injuries mitigated.

It is a pleasure to be able to make a statement in conclusion, as the result of observation during the journey from start to finish, bearing a testimony to the British army. Amid the many thousands of soldiers seen in travelling, both in London and in France, not one single case of drunkenness was witnessed, all looking pictures of steadiness and health, and a state of discipline was observable on all hands. And as with the human machine, so with the mechanical. No sign of shakiness was visible. Many hundreds, indeed some thousands, of motor vehicles were seen on the roads—and roads not always of the best—all run for duty, none for pleasure, yet nowhere was there a sign of a breakdown. To

be absolutely accurate, a platform luggage-trolley trundled by a railway porter at a station was seen to lose a wheel, but this may well be held the exception which proves the rule. All the motor vehicles were run by petrol except two, which were driven by steam, and all were working most efficiently. Their use enabled the contest to be carried on with a vigour which would have been quite impossible had animal power only been available. This war has demonstrated that for all distribution of food and munitions, and even movements of large bodies of men for such distances as eighty to a hundred miles next the fighting front, the road vehicle is more efficient and more rapid than the railway train. Facts have convinced authority on this point—authority which formerly brushed aside the contention that the railroad was not the most efficient mode of conveyance on a large scale. 'Of course,' it was said, 'the railroad is the only efficient mode of transit.' There was a refusal even to consider the other side of the question, in entire forgetfulness of the possibility that in many places in which war was being carried on there might at certain parts of the

country be no railways, or, if there were any, they might not lead satisfactorily to the places where delivery of men and munitions was called for. Authority sometimes has had its eyes forced open by facts, when exercise of imagination at an earlier date would have prevented loss of time—ay, and loss of life—at the opening of war, and waste of much money in obtaining what should have been ready.

A smooth passage brought an interesting journey to a pleasant end, the more pleasant because I came back with a mind free from all doubt that the work which remains to be done will be done, and that the day of peace will come, not by the enemy talking about it, and suggesting that the Allies should ask for it, appealing to maps to convince them. All this indicates his anxiety to avoid a fight to a finish. It is the enemy only that is talking of peace, and trying to show that the Allies should sue for it. They will not sue for it. Peace will only come when the conviction is forced upon our enemies that they must ask for it themselves, and accept terms instead of dictating them.

PINCHER MARTIN, O.D.

CHAPTER XII.—H.M.S. 'MARINER.'

I.

[The reader is cautioned against accepting this story as an official narrative of the great war. The incidents described have actually happened; but, for obvious reasons, it has been necessary to give them fictitious colouring.]

YOUR modern destroyer differs from her prototype of twenty years ago in much the same way as does the present-day Rolls-Royce from the early motor-car of 1895. She is just about four times as large, is infinitely more seaworthy, is much faster, and better armed. She is an ocean-going craft which, with judicious handling, can keep the sea in practically any weather, whereas her more elderly sister usually had to run for shelter in a really bad gale of wind, and was unfit for constant work in the North Sea except in summer.

Pincher had seen destroyers at work, and had heard a great deal about them in one way and another; and when, in the first week in February, he found himself detailed as one of the crew of a new craft of this type on the verge of completion in a northern port, he was happy. True, he knew he 'wouldn't be 'arf seasick,' as he put it, and did not at all relish the idea, though the extra sixpence a day 'hard-lying money' was always something to be grateful for. He was aware, moreover, that life in a destroyer in wartime was considered rather a hard and risky existence; but he would probably be in the thick of anything which took place in the North Sea, and he owed 'them 'Uns' something for

sinking his first ship and drowning many of his shipmates.

He wondered why he had been sent to a destroyer at all, however, for he knew that as a rule ordinary seamen were not eligible. As a matter of fact, it was Peter Wooten, the late senior watch-keeper of the *Belligerent*, who had worked the oracle. Wooten was the sort of person whom nothing could kill. I don't know how many times he had been wrecked, or how often his life had been in danger; but after the battleship sank he had been in the water for half-an-hour in nothing but a singlet and a pair of socks, in one of which was stuffed his last five-pound note. He had been picked up by a boat from one of the cruisers at the last moment, and purely by a lucky accident; but even then he had been rather annoyed with his rescuers because they laughed at his scanty and unofficer-like attire. He also had a grievance because he had lost his best uniform cap, a brand-new article which, he informed any one who cared to listen, had cost him the sum of twenty-two shillings and sixpence, and had last been on his head when he jumped overboard. Incidentally he had saved the lives of two men by helping them to reach pieces of wreckage; but, being as hard as nails himself, he was not one whit the worse for his aquatic adventures.

He eventually got ashore in a borrowed overcoat, proceeded on a fortnight's leave, and then,

as the result of a visit to a friend at the Admiralty, found himself appointed to the *Mariner*, a new destroyer. Naturally he was delighted, and at once set about collecting a good ship's company for his new ship. He far preferred having men he knew to strangers who had never served with him before; and, by dint of a little judicious conversation with the officer in charge of the drafting-office at the barracks, Petty Officer Casey, Billings, M'Sweeny, and Pincher were officially detailed for his ship. It was Casey himself who had suggested Martin's inclusion, though that youth was unaware who had caused a point to be stretched in his favour.

Pincher was not really a nervous, highly strung individual with a vivid and preying imagination; but even so, five weeks had elapsed before the doctors consented to allow him to go to sea again. His nerves had been badly shaken, and the sudden banging of a door or unusual sounds of any kind brought him out in a cold and horrible perspiration. Crossing a street through traffic or entering a boat was an ordeal which caused him many moments of poignant mental agony.

They had sent him on three weeks' leave, and the twenty-and-one days of blissful ease, during which he saw nothing of the sea, and was treated as more or less of an invalid and as very much of a war-worn hero, helped to restore him to his normal self. The presence of Emmeline, by special request, also had its effect, for with the girl as his constant companion he was able to forget many painful incidents which it was as well should be forgotten.

Some of the *Mariner's* ship's company and all the officers had been sent up north beforehand to become acquainted with their new ship; but at last came the day when the remainder—some sixty odd seamen and stokers—were put into a train with their bags, hammocks, and some mascots, in the shape of a monkey, two cats, and one small goat, for which they had not taken tickets.

The goat, Pompey, was young, but had a voracious appetite, for before they got to London he had eaten two pork-pies, the property of Pincher Martin, three packets of Wild Woodbine cigarettes of M'Sweeny's, and half a magazine belonging to some one else, while the respective owners slumbered peacefully. On arrival in the Metropolis he was so overcome by his miscellaneous diet as to be violently and unexpectedly ill in the omnibus on the way to King's Cross, whereupon the conveyance was stopped for brandy to revive him. As a consequence, they very nearly missed their train to the north; while Pompey, unused to potations in any form, spent the remainder of the journey in a state of coma.

The two cats behaved well; but, in the small hours of the morning, just before the train was due to start from one station, Jane the monkey

was discovered to be missing. The whistle had already blown, but the train was stopped, and forty-three bluejackets, vowing that nothing on earth would induce them to be parted from their pet, swarmed from their carriages and went off in search of the truant. Ten minutes later, Jane, gibbering like a lunatic, but with absolutely no malicious intent, was discovered chasing a middle-aged, portly, highly respectable, and very terrified female round and round the table in the third-class waiting-room. The monkey was enjoying herself hugely; not so the lady.

'Such goin's on didn't oughter be allowed, young man!' she panted breathlessly when Billings stormed her retreat, and Jane abandoned the pursuit.

'Lor' bless yer, marm!' laughed Joshua, helping her to collect her scattered parcels, 'she's that tame she'd feed out o' yer 'and.—Come 'ere, Jane,' he added coaxingly. 'Come an' show th' lady 'ow nice ye kin be 'ave.'

The animal, busily investigating the contents of the water-carafe on the table, clucked twice, and evinced no further interest.

'Them wild hanimals didn't oughter be allowed!' the woman retorted nervously. 'An' you, young man,' she went on, fixing Joshua with a horny eye, 'is a disgrace to your uniform! You oughter be fightin' them Germans instead o' chasin' monkeys round railway stations at this time o' night. I'm a respectable married woman, I am, an' if my 'usband knoo o' these goin's on 'e'd be very angry. My 'usband's a foreman bricklayer'—

'I'm sorry yer takes it that way, marm,' said Joshua apologetically, picking up the protesting animal by the scruff of her neck, and then touching his forelock. 'I'm sure our Jane didn't mean no 'arm. I'm a respectable married man meself, an'—'

'Married man, are you?' interrupted the lady, with a snort, as the seaman, with Jane perched on his shoulder, prepared to take his departure. 'Married? Shame on you! What'd your poor wife say if she see'd you be'avin' like this, an' chasin' respectable women with your wild hanimals instead o' fightin' for your country? I've a good mind to 'ave the lor on you! The wild beast nearly bit me; would 'ave done if I 'adn't run'—

There was no pacifying her, and Joshua, smothering his amusement, beat a hasty retreat. Her strident remarks followed him down the platform.

It took some time to collect the others, who had scattered all over the station in search of the deserter; but eventually, after a long and heated altercation with two ticket-collectors and three porters, reinforced by the guard and a sleepy stationmaster, the train was suffered to proceed on its journey twenty minutes late. The travellers, hungry, irritable, and very peevish, arrived at their destination at six

o'clock in the morning, in a thick fog and a depressing north-country drizzle, to discover, on disembarking with their menagerie, that half-a-dozen hammocks and three kit-bags had, by inadvertence on some one's part, been left behind in London.

But all's well that ends well; and, two hours later, after breakfast, and slightly more cheerful, the party arrived at the shipyard where the *Mariner* was being completed. They found the workmen still busy upon her; and as she would not be ready for commissioning for another week, the men were billeted in lodgings for the time being.

But they were not allowed to kick their heels in idleness. There is always plenty to be done before a new ship is ready for sea; while in war, when every one is working at full pressure, the labour of a fortnight has often to be crammed into three or four days. Ammunition had to be transferred from railway trucks to the magazines and shellrooms; torpedoes had to be placed in their tubes; and a whole trainload of stores unloaded, sorted out, checked, and carried on board—dozens of drums of oil, tons of paint, bolts of canvas, bundles of cotton-waste, coils of wire and hemp rope, broomsticks and boat-hook staves, oars, cooking utensils, crockery, knives, spoons, forks, bedding, provisions, rum, and many other things too numerous to mention! It was like furnishing a new and empty house, except that a dwelling is not expected to cruise about the countryside at something over thirty knots, and does not as a rule contain sufficient in the way of lethal weapons and explosives to sink a squadron of battleships. Neither does the average residence accommodate eighty odd people. It was hard work, for the men were busy all day and every day, from early morn till dewy eve.

The shipyard was a depressing place, full of gaunt cranes, overhead gantries, grimy buildings, and huge corrugated-iron erections with tall chimneys which befouled and blotted out every vestige of the sky with their oily black smoke. Besides two destroyers and some other small craft, the firm were building a battleship, and the noise and clatter of the pneumatic riveters and drilling-machines was deafening. Cranes, with steel plates hanging precariously from their jibs, staggered drunkenly to and fro on their lines, screeching as they went. Piles of rusty plates, which presently would be built into some ship, lay everywhere in seeming confusion for people to bark their shins against after dark; while pale, apathetic youths stood here and there working the bellows of huge brazier affairs with coke fires for heating rivets. A shout from a grimy gentleman perilously balanced on a plank some ten feet overhead would warn them that another rivet was wanted; and, seizing the morsel of red-hot steel in a pair of tongs, the boys, with a dexterous flick of their

wrists, would send it flying through space, to be caught as cleverly by a man with a bucket. To an outsider the whole yard seemed to be in a state of chaotic confusion, but in reality it was very highly organised, for gang relieved gang, and the work went on night and day.

II.

At last came the day when the *Mariner* left the river to carry out the first of a series of steam trials. As yet she was not a full-fledged man-of-war, and, being still in the hands of the contractors, was in the charge of a pilot. Wooten was present merely as a spectator, and to take over the command in the rare eventuality of their happening to sight an enemy. They sighted no enemy; but the trip shook many of the civilian voyagers to the core.

It was a cold and blustery day. The wind was off the shore, and had raised what Wooten called 'a little bit of a lop,' but what, in the opinion of the contractors' men, was 'a terrible storm.' It is true that the motion was supremely uncomfortable, and that when the destroyer was travelling at something over thirty knots she was deluged fore and aft in sheets of spray. The ship was very crowded, too. To start with, she carried the eighty odd souls which formed her proper naval crew. Then there were the Admiralty officers, overseers, and officials, the builders' representatives and foremen, and others from different sub-contracting firms who had supplied various portions of the machinery. The firm, who never did anything by halves, provided lunch in the wardroom for the officers and the more important officials. And such a lunch it was, brought on board in three enormous wicker hampers which filled the officers' bathroom! It would seem that food and drink were presently to circulate as freely in the wardroom as would lubricating oil and north-country blasphemy in the engine-room. But most of them had no food until the ship returned into harbour in the afternoon. They had reckoned without that fickle mistress, the sea, and she flattened most of them out. Beer and brandy were more to their liking than solid food. Moreover, some of them were rather nervous about going out of the harbour at all.

'I say, commander,' one of the firm's bigwigs had said to Wooten as they steamed down the river, 'is it true that the Germans have been laying mines off the coast?'

'M'yes,' said the lieutenant-commander; 'I believe it is.'

'Is there any chance of our being blown up?'

'No-o,' said Wooten slowly; 'I don't really think there is, though of course this bad weather we've been having lately will have broken many of 'em adrift.'

'And what'll happen if we hit one?' his companion wanted to know.

'Happen?' said the naval officer. 'The

bloomin' thing'll probably go off, and we shall take single tickets to heaven in a puff of smoke. We're chock-full of lyddite and gun-cotton, and'—

The civilian seemed rather perturbed. 'Of course, I'm not really nervous,' he hastened to explain, looking rather white about the gills as he fidgeted with an inflatable rubber life-belt round his middle; 'but I do hope you'll keep a careful eye on the pilot.'

'Of course I will. I'm not going to let him bump one of the bally things unless I can't help it. She's still your ship, though,' added Wooten, 'and I'm not really responsible.'

'No, I quite understand that,' said the other; 'but, you see, I'm not used to—er—risks of this kind. I'm not paid for it, and I've a wife and five children.'

'You're insured, I suppose?' asked Wooten, smiling to himself.

'Yes; but my policy doesn't cover war risks.'

'H'm! that's bad; but I shouldn't worry about it if I were you. If we do go sky-high'—Wooten paused.

'What were you going to say?' the bigwig asked apprehensively.

'I was thinking,' Wooten went on with a malicious twinkle in his eye—'well, I was thinking that if we are blown up there will be quite a merry little lot of us—nearly a couple of hundred—what? I can almost see myself as a nice fat little cherub sitting on a damp cloud twanging a harp—eh? They'll probably serve you out with a trombone. Can you play one?' He laughed, for somehow his companion reminded him of the man who had played that instrument in the orchestra of the Portsmouth Hippodrome in pre-war days.

'I do wish you'd be serious,' the contractors' representative observed sadly. 'This is no joking matter.'

'I am serious,' Wooten protested, trying hard to control his face.

'But you seem to like the idea.'

Wooten shook his head. 'Don't you believe it,' he replied. 'But just think what a glorious death it would be for you if you did go sky-high! Why, your name would be in the Roll of Honour, and your photo in the *Daily Mirror*. You'd be a public hero!'

'Better be a live convict than a dead hero,' observed the bigwig glumly, going off to seek consolation elsewhere.

But when they did get to sea, and the *Mariner* started first to bob and curtsy, and then, as she gathered speed, to kick and dance like a bucking mule, the violent motion drove all thoughts of mines or German submarines out of their heads. They were seasick—fearfully and wonderfully seasick. The joys of a sailor's life were not for them, and most of the contractors' men and not a few of the ship's company wished that they might die. The very thought of food made

their gorges rise in disgust, so lunch was delayed until their return into harbour just before dark.

Wooten and the officers were enthusiastic about the ship. 'She's a rattling good sea-bout,' the former remarked, rubbing the caked salt out of his eyes as he sat down in the wardroom when the ship had secured alongside her wharf. 'We hardly took a green sea on board the whole time.—Give me some of that game-pie and a whisky-and-soda, steward! I'm perishing with hunger.'

'Green seas!' laughed a lately revived contractors' official, busy with a plate of galantine on the opposite side of the table; 'the water seemed to be coming on board everywhere. I thought the weather was absolutely poisonous.'

'Poisonous!' echoed the skipper, looking up with his mouth full. 'My dear sir, it was a ripping day. Nearly flat calm.'

'You call that nearly flat calm?'

'Course I do. There was nothing but a little bit of a lop.'

'A lop, d'you call it? And what the deuce are these craft like in a gale?'

'A bit lively, and most damnably wet,' said Wooten.

'Well, thank God I'm not a destroyer sailor!' exclaimed the civilian with a sigh of heartfelt relief. 'I think you fellows ought to get treble pay in bad weather.'

'So do I,' the naval officer agreed. 'But none of us get our deserts, thank Heaven!'

Every one laughed.

The first trial was not a complete success, and the ship was delayed for a few days with defective fan engines. Then, with the faults rectified, they went to sea again, and this time everything worked smoothly—far more smoothly than Thompson, the engineer-lieutenant-commander, had dared to hope.

The *Mariner* was a flyer, or at least she flew faster than any other ship most of them had ever been in before. The ship's company talked of her being able to do thirty-seven knots, and thought themselves no small beer in consequence; but as a matter of fact their estimate was exaggerated.

They carried out several more trials, and eventually, in the third week of February, the ship commissioned. Her officers and men shifted themselves and their belongings on board from their respective hotels and lodgings. Pompey, Jane, the two cats, and a newly acquired fox-terrier puppy rejoicing in the name of Tirpitz were dragged ruthlessly on board, and the destroyer hoisted her pendant and ensign. She was a man-of-war at last.

Two days later she sailed to the southward. The good wishes of her builders went with her; for, if anything serious went wrong with her interior economy within the next few months, they, by their contract, were due to pay the piper.

And so the *Mariner* put out to sea.

(Continued on page 665.)

INVESTIGATIONS IN EASTER ISLAND.

By OSWALD H. EVANS, F.G.S.

MR LOUIS BECKE, in one of his South Sea stories, hits upon a phrase very happily descriptive of Easter Island; he has called it 'the ghostly outlier of Polynesia.' Easter Island—Isla de Pascua, Rapa Nui—is indeed a ghostly land, this arid scrap of volcanic desolation lost in the vast Pacific, two thousand miles from the South American mainland, and one thousand from the nearest of the Polynesian Archipelagoes whence came the forefathers of the handful of present-day inhabitants.

Every one knows something vaguely of Easter Island, if only through the dumb testimony of that stolid god who sits through London fog and watery sunshine at the portals of the British Museum, sung by Stevenson:

The rude monument
Of faiths forgot and races undivined,
Sits now disconsolate, remembering well
The priest, the victim, and the songful crowd.

While Pierre Loti was a naval cadet on board the *Flore* he visited Easter Island in 1872. His diary on this occasion is printed in his volume entitled in the translation *On Life's By-Ways*.

The chief interest of Rapa Nui—to use its native name—lies in its extraordinary monuments, the remains of stone buildings and terraces, and hundreds of statues, some of them of giant size weighing up to fifty tons, carved from the volcanic rock which constitutes the mass of the island. Many of these statues have been transported for considerable distances over very irregular country to the places where they were erected. There have been found, also, objects carved in wood, which are probably of later date than the stone giants, together with the scanty remains of an elaborate but hitherto undeciphered picture-writing graved on wooden tablets or on the backs of stone figures.

These wonders have been a puzzle to the learned since the discovery of the island by the Dutch navigator Roggenwein on Easter Day 1721. The population of the island, even in its most flourishing state, can never have exceeded a few thousands, a number wholly inadequate to accomplish, even in a long succession of uneventful years, the quarrying, carving, and transport of the huge masses of stone. Needless to say, scores of theories, most of them of a fantastic character, have been put forward to account for the facts, and it is no wonder that the strangest ideas have sprung up in a soil so well adapted for the growth of wild speculations. Much serious work has been carried out on the spot, with the result of a great addition to our knowledge; but it cannot be said that the problem has yet reached a satisfactory solution.

Easter Island remains 'the ghostly outlier of Polynesia,' and its uncouth, grim, gigantic statues, with rigid brows and compressed lips, guard their secret well.

The Routledge expedition has been at work in the island, and the result of the self-sacrificing labours of Dr and Mrs Routledge is awaited with the utmost interest by the scientific world. Their motor-yacht, the *Mana*—which looked so tiny when she lay moored among the big mail-boats and warships in Valparaiso Bay—made a long and adventurous voyage from England, and a residence of many months in so isolated and barren a spot must necessarily have involved many hardships. It is impossible to refrain from an expression of admiration in the presence of such an example of zeal for the advancement of science.

The schooner-yacht *Mana*, after a stay of more than sixteen months, sailed on 18th August 1915, and arrived at San Francisco after a three years' series of adventures in a world tour, commencing in Southampton, through the South Seas, and round to California. She brought the news that the German fleet operating in the Pacific Ocean had repeatedly and flagrantly violated the neutrality of Chile, and had not only sunk French vessels within the three-mile limit of Chilean territory, but had coaled from captured vessels in a Chilean port, and had landed at Easter Island and violated Chilean neutrality to the extent of an armed force of Germans erecting a huge signalling station for observation purposes and the despatch of wireless messages.

A correspondent of the *Scotsman* related that 'the eye-witnesses bringing first word of these violations to the United States were Mr W. Scoresby Routledge, M.A. (Oxon.), and his wife, Mrs Katherine Routledge, M.A. (Dublin), who were commissioned by the British Museum of London to visit the South Seas in an important archæological expedition, chiefly for investigation at Easter Island, where they excavated giant monoliths, and where they met German warships—first the Pacific fleet of Admiral von Spee (destroyed by the British in the battle of Falkland Islands), and then the auxiliary cruiser *Prinz Eitel Friedrich* (interned at Norfolk, Virginia).

'The *Mana*, magnificently fitted out, was specially designed for the British Museum expedition by Mr Charles Nicholson, of Gosport, the designer of the new *Shamrock*, owned by Sir Thomas Lipton. The *Mana* is of twenty-three registered tonnage, is ninety feet over all, and boasts a beam of twenty feet; "but," says her captain and owner, Mr Routledge, "although she has travelled over forty thousand miles, and has been

buffeted in terrible storms, she rode buoyantly over the waves, and is a tribute to her English builder of seaworthiness, and has proved herself one of the finest boats that ever went afloat." Captain and Mrs Routledge tell tales picturesque to a rare degree of the German ships encountered, of a native uprising on Easter Island, and of a quaint ultimatum addressed to the English manager of the Chilean ranch there; of how the inhabitants of Pitcairn Island are Seventh Day Adventists, and have residing among them an Australian missionary of that faith; and of how they have aboard the *Mana* two descendants of Midshipman Young, of the British frigate *Bounty*, whose crew went ashore at Pitcairn.

Captain and Mrs Routledge bore away with them photographs and sketches of the stone terraces and monoliths of Easter Island, which were to be published soon after their return to England.

The lot of the people of Rapa Nui is not a happy one. While they are nominally of Chilean nationality, and proud of it, they enjoy few of the privileges of citizenship. Both mentally and morally they are in a very backward state, and unless considerable efforts on their behalf are made in the near future their prospects are not bright. So far removed from the outside world and its myriad interests, hemmed in by the barrier of a thousand miles of ocean, they are a weariness to themselves, a thorn in the side of the company which farms the island, and a hopeless, everlasting minor problem for the Chilean Government. Men, women, and children, there are to-day some two hundred and fifty of them, of Polynesian race, with a trifling foreign admixture. In number the sexes are about equal, with a tendency, shown by statistics, to increase very slowly.

Once a year on an average the Chilean steam-corvette *General Baquedano* visits the island, and may be considered as the only means of communication with the mainland, save for the chance visit of a whaler or the still rarer call of a tramp steamer.

The *Baquedano* is a very beautiful little vessel, which serves as a school-ship for the future mariners of the Chilean navy. With her graceful white-painted hull, fine spread of snowy canvas, and glittering brasswork, she would look like the pleasure-yacht of some wealthy amateur were it not for her long quick-firers and wireless installation—features, contrasting with her general aspect, which vividly recall the seafaring of an earlier day. Her commander, appearing suddenly from outer space as the only representative of authority the islanders ever see, listens with what patience he is master of to the 'chronicles of small beer,' consisting mainly of the disputes between the company and the natives begotten of mutual irritation, pronounces his common-sense decisions, and generally patches things up for another year; then, no doubt with a sigh of

relief, turns the prow of his vessel towards Valparaiso and his mind to the preparation of a report.

The report of the commander of the *Baquedano*, Don Carlos Ward, dealing with the last voyage, has recently been published in Chile, and is a document of considerable interest, as containing recent and authentic information. The only representative of the Chilean Government resident in the island is Don Ignacio Vives, who is also in charge of the school. This gentleman occasionally communicates his impressions of exile in well-written letters to journals on the mainland, and he has many curious tales to tell of the queer doings of his charge.

The general conditions of life are very miserable. The country is barren, and, save for a few trees planted of late years, is almost entirely lacking in wood, a fact which very probably determined the extensive use of stone by the statue-builders for their great figures of chiefs or gods, for the Oceanic peoples who practised carving on the grand scale carried out their works in wood.

Restricted as they are to what is practically a reservation, the natives lack all incentive to improve their condition. No great labour is required to produce sufficient vegetable food-stuffs for their simple needs, and there is no surplus energy available for any attempt to better the general condition of the community by co-operative work directed to a useful end. It has only been with extreme difficulty that provision has been made for the construction of a water-tank. About a score of the men are employed by the company in the work of tending the flocks, repairing the fences, and the like. These workmen receive pay and food, but a labour dispute is always in progress. At certain times—lambling and shearing, for example—a much greater number of hands are required, but are not, it appears, readily obtainable. Hence a burning question exists as to the rights and wrongs of compulsory labour during these seasons.

To quote the discreet official report (in which the assignment of Government land to the people is recommended), 'they do not cultivate the ground on a larger scale, because they are not the owners of the lands they occupy. The natives feel discontent and resentment against those who represent the *Compañía Explotadora de Pascua* by reason of its possessing the greater portion of the lands which belonged to their forefathers, and of which they can take no account, since they have passed into strange hands. Formerly they possessed animals and lands; to-day they have nothing, and occupy ground that they know is not theirs; as a consequence, they do not cultivate, and continually murmur against the managers of the said company, attempting at times to take justice into their own hands.' In other words, it is the old story of the conflict

of a native race brought against its will into contact with a more complex state of culture. The natives cannot resist the temptation to appropriate a sheep now and then; the company accordingly takes measures to protect its property by restricting the free circulation of the offenders in a country which they can scarcely be blamed for considering as being in justice their own. This restriction has even gone so far as to render difficult the fishing expeditions, because, it was said, these sometimes took the form of cattle-raids. So the irritation grows, and leads sooner or later to more serious trouble.

The Easter Islanders are 'a tall people, thin and small-muscled, but agile and hardy, and of lively intelligence. A considerable proportion speak Spanish fairly well, and some read and write it, and not a few have picked up English easily since the residence in the island of individuals of this nationality.' The one and only centre of population is the town of Hanga-Roa. Here are congregated the poor dwellings of the natives, about thirty in number, badly overcrowded, surrounded by the gardens and cultivated patches, on the produce of which they chiefly subsist. The company runs a 'store,' in which necessities and a very few luxuries (from the Robinson Crusoe standpoint) can be obtained at fair prices. It is commonly supposed in Chile that the islanders are without clothing; but this is not correct, only some of the children being nude, a matter of no great importance in a warm climate. When the *Baquedano* is expected to leave Chile for Isla de Pascua it is customary for an appeal to be made in the papers for gifts of old clothing and other oddments for these poor people; and, as charity is a virtue honoured in this country, it is likely that a very varied assortment reaches them.

Until recently a crying problem was that occasioned by the lack of proper nutriment for the children, since the people possessed no cattle. Action has been taken in the matter, and to-day, says the report, 'the children are very well fed with the milk of forty-five cows which, according to an arrangement made on the previous voyage with Señor Merlet (of the company), this gentleman provides, without any compensation, to the natives of the island.'

Education, also, is not utterly neglected. In the 'mixed' school primary instruction is given to forty-seven pupils. (It looks as though 'one child one cow' was the law of the land.) 'No great progress in instruction can be noted, owing to the children having first to learn Spanish, a fact which has weakened somewhat the energy and enthusiasm of the teacher.'

A dark shadow ever hanging over the island is the presence among the natives of that fearful scourge of the South Seas—leprosy. The plague appears to have been introduced from Tahiti within comparatively recent years, and it is stated to have at one time affected 10 per cent.

of the population. According to the statement of the medical officer of the *Baquedano*, there are at present seven persons who are suffering from the disease in a clearly defined form. Those affected by the complaint live 'in a group of houses removed from the centre of population. These are four in number, each surrounded by sufficient ground to produce, when cultivated by themselves, enough for subsistence. . . . The sick lack absolutely any other resource than that which nature gives them. It is a problem for science, and an easy one, to free the island from this plague, and a duty in the highest degree humane to succour the unfortunates suffering from it,' says the medical officer above quoted.

The religious condition of the Easter Islanders is a matter of considerable interest. They profess, nominally, the Catholic faith, and have a pastor of their own race; but they have very imperfectly assimilated the doctrines of the Roman Church, incorporating a strange medley of beliefs peculiar to themselves, and admitting without censure an extremely loose code of morals. It seems that the marriage tie is somewhat insecurely knotted. On this point the report very faithfully enlarges. One negative virtue they possess, at any rate—they firmly refuse to do any work on Sundays.

A prominent figure among the native population died recently. This was the old prophetess Anata, who, like the Kaiser, claimed to be intimate with the Almighty. Her revelations were received without question by the majority of her hearers, the more readily perhaps from her habit of 'propheying smooth things,' and directing her followers along the lines in which their inclinations already urge them. A notable example was furnished not long since. I have already referred to the sore feeling of the people against the lessees of the island, whose operations have so restricted the activities of the original owners of the soil, the latter objecting strongly to prohibited areas and to barbed-wire fencing. It was, therefore, with great glee that they obeyed the injunctions of the prophetess, which she communicated as a revelation from heaven to Taniera, a person who looks upon himself as the rightful king of the island. I quote from the columns of *El Mercurio de Valparaíso*: 'Anata stated that the island did not belong to Chile, but had been given to her by God. The animals on the island did not belong to Señor Merlet, the manager, but to God, who required that a great sacrifice should be made of them. This news being communicated to the inhabitants, it was received with great rejoicing, and at once an expedition was organised, which rounded up many animals, an enormous flock, towards the native holdings. The wall which separated the lands of the populace from the *hacienda* was broken down for the passage of the animals, and a great slaughtering began, only part of the meat

being made use of, since they had no salt to make *charqui* of the remainder. In the desire to preserve some of the meat, and lacking salt, they put quantities of it into sea-water; but all was lost, together with the hides.'

The old prophetess, on her deathbed, told her followers not to weep, 'since in a short time she would come to life again; and ordered that she should be buried upright, as she wished to rest on foot.' She was, it is stated, buried in a vertical position, according to her wish, between two mattresses.

The recent history of the natives has been a sad one. In the early years of the last century the place was so seldom visited by ships that the inhabitants retained their primitive simplicity, and did not do so badly. In the year 1863, however, a sorrowful event, which still looms darkly in the memory of the older people, brought awful ruin upon the lonely little community. Strange vessels appeared off the anchorage—thirty of them, according to vague native tradition. The crews landed, and behaved in a friendly manner to the simple folk, who made them welcome, the more so as they brought gifts of beads,

tools, and other desirable things. After a few days of intercourse, when the confidence of the natives had been won, the blow came. The white men, if Peruvians could be so called, showed themselves in their true colours—surely the livery of Satan—and by a sudden attack captured nearly all the male population, including the king, old Kay-ma-Koy, and his son Maurata, and carried them off to work as slaves in the deadly guano deposits of Peru. The scandalous outrage met with little success, as the poor wretches nearly all died within a very short time. At the instance of the French Government the few survivors were returned to the island; but the mischief had been done; epidemic sicknesses, smallpox, and the rest had been introduced, and since that time the number of the people has never greatly augmented, and their spirit has been broken.

From the tenor of the passages which I have quoted from the reports of the commander of the Chilean warship and his medical officer, it will readily be gathered that an earnest desire is felt for the improvement of the moral and physical condition of these people.

SOME UNFAMILIAR METALS.

By L. L. BLACKNELL.

SEVERAL unfamiliar metals have come into prominence since the outbreak of the great war, on account of their greatly increased use in connection with the production of armaments. A great demand has arisen for 'special' steels, the hardness and toughness of which depend on the presence of such ingredients as the metals tungsten, chromium, and vanadium. One of the most important uses of these specially hard steels is for making 'high-speed' machine tools—that is to say, tools which retain their hardness, and hence their cutting power, even when heated to redness by the friction of the work which is being done. A machinist can cut steel or iron six times as fast with a lathe tool of high-speed steel as with one of carbon steel, because with the latter the cutting speed must be slow, so that the tool is not heated by the friction above a certain temperature, lest it be softened.

Orders for special steels have been received by Sheffield steelmakers during the past eighteen months from Russia, France, Italy, and the United States, as well as from users at home, of a magnitude never before experienced or even contemplated by them.

In the manufacture of hard steels, ferro-tungsten, ferro-chromium, or ferro-vanadium, which are alloys of these metals with iron, is added to steel, either alone or in combination with nickel or manganese, or with each other.

Sheffield steelmakers have experimented with

electric furnaces for making high-speed steel, but they are not yet convinced that as good an article is obtained as by the old-established crucible process in which smaller quantities are handled at one time. Nevertheless a number of electric furnaces have been installed during the past year, and a largely increased output of alloy steel for motor parts, aeroplanes, and small castings has resulted.

TUNGSTEN.

Before the war British steelmakers were almost entirely dependent on Germany for supplies of refined tungsten, notwithstanding the fact that the chief source of supply of wolfram, the ore of tungsten, is in the British Empire—namely, in Burma. Important quantities of wolfram ore are also produced in Australia, whilst there is a not inconsiderable output in Cornwall. On the outbreak of war it was speedily realised that the establishment of a tungsten refinery in this country was of the utmost importance, and by co-operation and energetic action on the part of the steelmakers this was very quickly accomplished. Regulations have been made for controlling the export of wolfram ore from the British territories where it is mined, and it is hoped to induce the Government to continue these regulations after the conclusion of peace, in order that the refining of tungsten and the manufacture of high-speed steel may be retained in British hands.

The quantity of tungsten present in cutting-tools is often as much as 14 to 19 per cent. In addition to its use for alloying with steel, tungsten has been largely used in Germany for the manufacture of metal filament electric lamps. During 1913 the exports of such lamps from Germany amounted in value to over two million pounds. Tungsten is also used for spark-plugs and voltage-regulators, and for needle-points for gramophones. The price of ferro-tungsten, containing 75 to 85 per cent. of tungsten and a maximum of 1 per cent. of carbon, is from six shillings and sixpence to seven shillings a pound.

CHROMIUM.

To the majority of people, chromium is most familiar in the 'chrome' compounds which are used as pigments, dyes, mordants, and tanning powders. The value of chromium compounds in tanning lies in their property of rendering the leather specially resistant to moisture. Large quantities of chromic iron ore are used in the manufacture of ferro-chromium, which is employed, either alone or in combination with nickel, manganese, or tungsten, for making steel for cutting-tools, projectiles, and armour-plates. The largest deposits of chromic iron ore occur in British territory—namely, in Rhodesia. The ore is mined at Selukwe, and transported by rail across Portuguese East Africa to Beira for shipment. The next most important deposits of chrome iron ore are in the French colony of New Caledonia, whose output runs that of Rhodesia very close. Ore of high quality is also mined in Baluchistan, and shipped from Karachi. The price of ferro-chrome alloy is from thirty-five pounds to thirty-eight pounds per ton.

VANADIUM.

The principal commercial source of supply of vanadium at present is Peru, where the chief deposits known and worked are at Minas Ragra. Here a black mineral called patronite is found, having the appearance of slaty coal. It contains about 30 per cent. of free sulphur, which is burnt out, leaving a mineral containing about 52 per cent. of vanadium oxide.

The addition of ferro-vanadium, the alloy of iron and vanadium, to steel produces a very tough and durable metal, which is specially resistant to the effects of vibration. An important advantage in the use of vanadium steel is that weight can be reduced in the construction of heavy machinery by the use of a smaller quantity of the tougher and stronger steel. Vanadium was first used in steel in France about twenty years ago in making armour-plates, tests of which showed them to possess exceptional toughness and resistance. The quantity of vanadium added in the form of ferro-vanadium to ordinary engineering structural steel is only about .25 per cent.; that is to say, a hundred pounds of vanadium steel would contain a quarter

of a pound of vanadium. In high-quality tool steels as much as 2 per cent. may be present. Ferro-vanadium is worth fourteen shillings and sixpence a pound.

MOLYBDENUM.

A few years ago molybdenum was of quite small importance. It was during the war between Turkey and Bulgaria in 1912 that the value of molybdenum steel in the manufacture of field-guns was first demonstrated, and during succeeding years the demand for molybdenum increased and the price rose rapidly. Now the chief ore of molybdenum—molybdenite—is worth four hundred and seventy pounds a ton. The addition of a small proportion of molybdenum, in the form of ferro-molybdenum, to steel greatly increases the hardness and toughness of the metal, and machine tools made of molybdenum steel retain their cutting properties even though raised to a high temperature. Ferro-molybdenum containing 70 to 80 per cent. of molybdenum realises fifteen shillings and sixpence per pound. New South Wales and Queensland are the world's largest producers of molybdenum ores. Canada possesses deposits of molybdenite which will no doubt become of commercial importance, but at present the production of the ore is small.

Of molybdenum ores, as of so many other valuable minerals, the British Empire possesses ample supplies, and it is to be hoped that regulations will be made so that after the war the deposits may not get under foreign control, but be exploited by British enterprise for the advantage of British industries.

A MIDSUMMER NIGHT.

OH mystical Night, with your wondrous beauty
and your tender silence encompassing spheres,
With your stars full of passionate trembling, looking
down on sorrows that come with the years;
And to me you're the loveliest things in the heavens,
though I worship you smiling through tears.

From the scented rose-garden under my window
comes the sleepy 'good-night' of a bird,
And from the ivied tower an owl answering a mate
stirred by love for you too can be heard;
While the hush of your tender silence comforts
sore hearts, though with never a word.

I can see your fairy-like touches on dewdrops
making love to the heart of a rose,
As far off they are sparkling on spiders' webs
down where the streamlet flows;
And dusky twilight 'neath starlit heavens turns to
silver world as day comes to a close.

Come near—creep close, silver moonbeams—in this
hour when I hold you supreme,
For your exquisite touches seem to help and caress
me as you ride with the stars in between,
While sleeping blossoms waken to waft you sweet
perfumes, as I greet you, my Queen! my Queen!

EVELINE A. STARKEY.

Chambers's Journal

SEVENTH SERIES

FRAUDULENT ART.

By W. J. STEVENSON.

THE advent of the multi-millionaire collector, perhaps more than any other single factor, has been instrumental in sending up to a truly appalling figure the prices of those masterpieces of ancient and medieval art which have been preserved to us. There has always, of course, been a market in such things; but in the past it has been mainly among the cognoscenti who really understood and appreciated the articles they collected. Now the wealthy individual collector—often quite ignorant both of antiquity and of art, and inspired mainly by the sheer lust of possessing costly and envied things—has changed the situation in more than one respect. And among the more curious and less desirable of these has been the enormous impetus given to the trade in forged antiques.

Not, of course, that his trade is of recent origin. On the contrary, it probably goes back almost as far as the history of art itself. In fact, in the literature of the subject, a literature which is fast assuming huge proportions, at least one volume has been already devoted to the forgeries of classical and ancient times. The Renaissance was almost as notable for its activities in this respect as in the more legitimate fields of literature and art, and at no time since has the industry fallen altogether into abeyance. And, curiously enough, the work of forgers of past times, recognised to-day as such, has of late acquired a value of its own, and has even become the object of imitation by forgers of our own day. It must, in fact, be recognised that many of these spurious objects of art possess, apart from any question of their origin, a very distinct artistic value of their own, and not the least interesting departments of some of our great museums are those devoted entirely to proved forgeries and imitations.

Among the earliest instances we possess to-day we may class the forged scarabs and ornaments found in such quantities in perfectly genuine and untouched Egyptian tombs of the later dynasties. These were imported from Greece, and as a rule are easily distinguished from the genuine article, being by no means such good imitations as those turned out in immense quantities from Birmingham to-day, and destined to be palmed off as genuine on the guileless tourist beneath the very shadow of the Pyramids.

In their turn, Greek artists were imitated by the Romans, and both became the subjects of attention on a large scale in Italy when the Renaissance brought classical antiquities again into favour in Europe. Indeed, as possibly the most illustrious of all 'fakers' we must mention no less a name than that of Michelangelo, a good many of whose earlier works were chipped and buried, to be later resurrected and passed off by the dealers of his time as classical antiques. One example at least is still preserved in the shape of the 'Hercules' at Turin, bought by Cæsar Borgia from the sculptor for a mere trifle after it had been returned on the latter's hands by an indignant purchaser who had discovered the trick played upon him. And this is not an isolated instance, for such artists as Fra Filippo Lippi, Andrea del Sarto, Botticelli, and others of equal fame were not above turning out the most amazingly exact reproductions of famous pictures, either to the order of a patron or occasionally as a mere exercise in technical skill. In fact, in more than one instance the question of which is original and which reproduction has been ever since hotly debated. And to come to a somewhat later period, it was by no means unusual for a son or other relative to inherit alike the family name and skill, and go on turning out paintings long after the reputed artist was laid under the sod. Such an instance was that of Jacob van Huysum, who signed most of his work with the name of the more famous Jan; while artists as skilful as Teniers the Younger would confine their talents largely to work in the style of others, notably to that of Titian. Indeed, so prevalent was this practice that it is only in the case of a very few works assigned to the Old Masters, even those in the best-known collections, whose authenticity is usually regarded as beyond question, that we can really be certain that they are the work of the artists whose names they bear. Thus, for instance, a painting so well authenticated by history and record as that known as the 'Rokeby Venus,' bought a few years ago for a record sum for the National Gallery, and not long since brought prominently into notice by the hatchet of a misguided Suffragette, is not by many experts believed to be the work of Velasquez at all.

In the above instances the question of authorship does not, perhaps, seriously affect even the pecuniary value of the work ; but this, of course, does not apply to the more modern and properly so-called forgeries. Of these the best still come, as is natural, from Italy, where Sienna may perhaps be regarded as the headquarters of the industry. Works sold for thousands of pounds have often been turned out by Italian workmen who received no more than a few shillings a day as the reward for their labours, of the valuable nature of which they had naturally no idea. Many of these pictures, even including the panels on which they are painted and the very worm-holes in the panels, are 'fakes,' but sometimes a genuine picture which has been ruined by age and neglect or by improper cleaning by ignorant owners is used as a basis for more ambitious efforts. Signatures offer no difficulty at all, for there is not the slightest difficulty in getting the signature of any artist, ancient or modern, imitated with the utmost exactitude ; and one very favourite trick is to have the signature concealed by dirt or varnish, so that it shows only after the picture has been restored. In the case of a collector supremely ignorant of his subject, but possessed of the highest opinion of his own judgment, this trick is particularly successful in removing any lingering doubts.

Fly-specks, dirt, cracks, the effects of damp and neglect, all these can be, and are, perfectly imitated ; while the mastery some of these obscure modern copyists have over the characteristic tricks and methods of the Old Masters is little short of miraculous. Of late, methods of chemical analysis have been called in to the aid of the art expert ; but while these have revealed more than one forgery of past date, the present-day artist has, as the Americans say, 'got wise' to the methods. These consist, of course, chiefly in the knowledge of the pigments used at given dates, and if analysis reveals the presence of colours unknown to the supposed artist, the inference is clear. More intricate tests may reveal the effects of age on the pigments, but it would scarcely be correct to say that the data thus given are very reliable at present. More useful in certain cases has proved the employment of X-ray photography, which reveals to some extent corrections and alterations in the work, which of course would not usually be found in a copy. Still, the need once being understood, the copyist is again perfectly willing to oblige. As a means of instituting minute comparisons as to brushwork, micro-photography in low powers has also been found useful.

Even in paintings of late date and by living artists it is quite possible to go wrong. Some artists, in fact, have of recent years turned an honest penny by giving—for a consideration—expert opinion as to whether certain pictures attributed to them are authentic or not. One

very well-known man declared that some 92 per cent. of those he had examined were not. And, of course, in these instances it is practically always the private purchaser who is victimised.

In plastic art quite the most notorious fabricator on record was the wonderfully gifted Bastianini. As a youth he was the assistant to a Florentine sculptor, and he developed an astonishing genius at imitating the best Italian work. About the middle of the nineteenth century his gifts were recognised by a Florentine antiquary, who gave him the means of studying the subject systematically, and of employing his talents in the work he genuinely loved. Work of his was sold as that of the best Italian sculptors, and examples found their way even to the Louvre and to South Kensington. A good deal, doubtless, passes unsuspected even to-day ; but the fact of Bastianini's existence was revealed to the world by his claiming a reward of six hundred pounds offered by the Director of the Louvre to any one who could execute a work in similar style to a bust of the Italian poet Girolamo Benivieni. This bust had been bought by the Louvre for a large sum as genuine, though actually it had been made by Bastianini for his master, who had paid him fourteen pounds for it, and the offer had been made as a challenge to some experts who expressed their doubts of its genuineness.

But this is by no means the only, or even the worst, instance where the experts of the Louvre have been imposed upon. In 1896 the Louvre purchased for eight thousand pounds a splendid example of Greek goldsmith's work said by the inscription on it to have been presented to the Scythian king Saitapharnes. It was in the shape of a magnificent crown, or, rather, tiara, and the opinion of experts was unanimous in its favour. Some years after, however, it was found that the crown had been made by a goldsmith of Odessa of the name of Rouchomouski, who was paid two hundred pounds for the work. Rouchomouski was brought to Paris, and in a room of the Louvre actually reproduced from memory a part of the crown, the ornamentation of which was most elaborate.

Odessa, it may be noted, is the home of the 'fake' antique jewellery trade, at least so far as gold and silver work is concerned. Cameos, intaglios, and engraved gems of one kind and another mostly hail either from Switzerland or from Vienna, though the finest examples come as a rule from Italy. Often genuine settings, which are fairly common, the stones having been taken away and either remounted or sold at one time or another, are used, but by no means always. The jeweller of to-day can imitate the old setting to perfection, and a few tricks of the trade will give it the finish associated with that of centuries ago.

Statuettes of all kinds in clay, marble, alabaster, wax, and so on are turned out in

Paris in immense numbers. Ancient Italian bronze statuettes are imitated to perfection in Tuscany, the fine green patina which so many collectors regard as a guarantee of age being produced by chemical means. Ancient iron-work is also a specialty of Italy, especially of Florence, and wonderfully exact reproductions of ancient armour and weapons are made both in France and Italy. Italy excels more particularly in the plainer and ruder work of the earlier period, while French workmen turn out the most magnificent imitations of the highly ornamented and inlaid armour which was a feature of the sixteenth and early seventeenth centuries, and of which some splendid examples—genuine of course—are to be seen in the Tower of London.

Coins of every date, again, constitute a veritable trap to the collector. So well and perfectly are they imitated that, except when the origin is known beyond doubt, no expert, however skilful he may be, will be prepared to vouch unquestioningly for the genuineness of any single specimen. Coins may be imitated *in toto*, or they may be touched up, restruck, or on occasion split through the middle and remade, the obverse of one being fitted to the reverse of the other. This may be done either to produce a singularly fine specimen from two imperfect examples, or, more often, to produce a coin unknown to numismatics, which some unwary collector may be induced to accept as unique. All these methods of sophistication, of course, leave traces which can be detected by sufficiently competent and thorough examination; but they are almost always successful in imposing upon the average collector. The real expert, however, when taken in at all, is, strange to say, most likely to be deceived by the out-and-out modern forgery.

Pottery and glassware, too, as everybody knows, are regularly imitated and 'improved,' very few even of the best collections being altogether free from questionable work. Certain modern makers specialise, quite honestly, in reproductions of the work of the best makers of past centuries, the results being sold at

moderate prices as what they really are. To this, of course, no exception can be taken; but fine specimens of such work are very often sold, after the distinguishing marks have been ingeniously altered, as genuine examples of the work of ancient potters. But a very great deal of pottery and glassware is to-day manufactured expressly to impose on the collector, and it must be admitted that in one important department, the manufacture of bogus Sèvres and Dresden ware, London may claim the dubious honour of being pre-eminent. Paris manufactures the work of French potters from Palissy downward; while Italy, which does not disdain any species of fabrication, does perhaps most in the direction of ancient Græco-Roman ware. Venice still turns out 'ancient' Venetian glass, while German and Bohemian ware of the best periods is still made in Hamburg. The iridescence which is such a lovely feature of long-buried glass until lately presented a difficulty; but more than one secret process now reproduces it more or less perfectly, the most popular being the application of a chemical compound of unknown composition, followed by burial in damp earth for a year or so.

Nor are the instances quoted a tithe of those which could be given. It would, indeed, seem that the particular foibles of the collector are exploited to better purpose than any other human weakness, and certainly than any other weakness of such amiable character. Probably the fabricator of forged antiques himself regards his business as quite a legitimate sphere of activity, and there is something to be said for this view. For he does, in fact, supply a genuine demand, which must otherwise in most cases, owing to the ravages of time and a thousand destructive agencies throughout the centuries, go unsatisfied, and to this extent it is possible that his nefarious activities do on the whole add to the sum of human happiness. And it is almost certain that many a collector, gloating over the possession of some fancied treasure, would thank little enough the expert knowledge that would reveal to him that same treasure's true value and real origin.

AFTER MANY YEARS.

CHAPTER III.

THE doctor was anxious that Don Diego should start as soon as possible for Montemayor; so, through the medium of Luis, I was introduced to the manager of the *bodega* of La Cartuja, who was told that any directions coming from me were to be taken as coming from Don Diego himself.

The next morning the old man was helped to his carriage, a very ponderous but comfortable machine, drawn by four mules; and, accompanied

by his servant, a young man who attended him as valet, he started, intending to go only as far as Bejar the first day, and complete the journey on the morrow.

I arranged to write to him every day, and give him an account of our proceedings during his absence. He at first said that such frequent despatches were unnecessary; but I had my way. I was to address my letters to Don Diego Lombardo, Baños de Montemayor.

I had my usual daily visit from Gabriel; but as I was determined to give all my attention to the business I had undertaken, he had to accompany me on my rounds, and I was eagerly looking forward to a free day on Sunday to go over to La Ribera.

Don Diego had set out on Monday morning, and I wrote my promised letter on Tuesday. I had a great deal to say in it, for I could see my way to effect many improvements in the antiquated methods employed at La Cartuja, and that without any violent innovations, which would naturally be displeasing to the *capataz* and his underlings.

On the Wednesday forenoon I was in the large overground *bodega* where the pressing of the grapes was being carried on, when one of the servants of the house came in and told me that the Señor Luis wanted to see me at once in the *despacho*, which was a little office in which he used to sit keeping the accounts of the household. I found him much disturbed, and he said, 'Don Arturo, I have what I fear is bad news. Look at this,' handing me a telegram which ran:

'PARADOR DE LAS DILIGENCIAS,
BEJAR, 7.40 A.M.

'Á LUIS AGREDO, La Cartuja, Huerta.

'Venga Don Arturo en seguida' ('Let Don Arturo come at once').

It was then one o'clock. The telegram had been sent on by a special messenger from Salamanca, as there was no telegraph office at Huerta. The only thing I could do was to ride into Salamanca that afternoon, and wire to Bejar saying that I would go on by the diligence leaving at six next morning, and asking that a telegram should be sent on to me at the hotel in Salamanca. All this I did, and about eight o'clock that evening I had a wire saying simply: 'Don Diego no worse.'

I then called on Dr Azevedo, and arranged that he should go with me in the morning. We accordingly set out about six o'clock on Thursday morning, and arrived at Bejar about noon. On reaching the inn at which the diligence stopped we were received by the local doctor, who told us that on Tuesday evening Don Diego had had a slight paralytic seizure involving the lower part of his left side. It seemed he had reached Bejar late on Monday night, and was staying over Tuesday, intending to go on to Montemayor on Wednesday. It was after dinner on Tuesday evening that the stroke occurred.

'I have been fearing a recurrence,' said the doctor; 'but, as I wired last night, he is no worse, and is in good spirits, and expecting you. He will be very pleased to see Dr Azevedo with you.'

We were immediately ushered into the room occupied by Don Diego. We found him in bed, but well propped up with pillows. There was

no change perceptible, to me at least, in his appearance. His sight and hearing were quite unimpaired, his mind as alert as ever.

His first words were to Dr Azevedo. 'Well, was I not right,' he said, 'when I told you that I was not worth mending, or, rather, trying to mend? However, thank God, you have come, even if it is to see the last of me.'

'*Vamos, vamos!*' ('Come, come!') said Dr Azevedo, 'who is talking of seeing the last? My opinion is that you will be off to Montemayor in a day or two.'

'Well,' replied Don Diego, '*veremos*' ('we shall see').

During the next few days he seemed quite comfortable, and Dr Azevedo's hopes that no second attack would supervene seemed well founded. He thought it better that his patient should leave his bed, so he was put sitting in a chair, and was very much interested in my history, which I now told him in its entirety, with full particulars, for the first time.

When I had concluded he seemed greatly agitated, and later in the day said to me, 'I think it is as well you should return to La Cartuja. Dr Azevedo is of opinion that I am much better, and that in a couple of weeks I may go either home or on to Montemayor. He will go with you as far as Salamanca.'

So it was arranged that I was to leave next morning.

That evening at dinner Dr Azevedo said to me, 'Don Arturo, I fear your long conversation with Don Diego to-day has been rather trying to him. I find him very much excited this evening. In his present condition it is above all things imperative that he should have the most perfect quiet.'

'I should be very miserable,' I said, 'to think that I had been the cause of retarding his progress by my chatter. But he seemed to take such an interest in my talk that I thought I was doing him good, rather than harm.'

'Of course that goes without saying,' replied the doctor. 'But the fact remains, and I have made up my mind that you shall go alone to-morrow.'

I therefore started next morning at five o'clock, and, hiring a mule in Salamanca, reached La Cartuja that evening.

Dña Felisa and Luis had both been much alarmed at the announcement of Don Diego's seizure.

Luis especially was greatly affected. 'Don Arturo,' he said to me, 'I have never met any one who was such a father to those dependent on him as Don Diego. From the *capataz* down to the youngest lad in his employment, every one was the object of his solicitude. But, please God, we shall have him back again.'

I resumed my duties next morning, and two days passed without any news from Bejar.

I had returned on the Monday, and on Thurs-

day I had a letter from Dr Azevedo stating that after my leaving Bejar Don Diego had sent to Salamanca for the notary who had for many years conducted any legal business in which he was interested. Orders had been given that they were not to be disturbed; and so, with the break of a few minutes' visit on the part of the doctor, the two were alone for several hours. The doctor further informed me that the landlord of the inn and the parish priest had been asked to witness a document which had been drawn up.

'Since then,' added the doctor, 'Don Diego has been very silent, which in one way is good, as I think he made too free while you were here. At the same time, I do not like to see him so pensive and uninterested in any topic which I may touch down. I even mentioned your name to-day, saying you were, no doubt, busy at the *bodega*. But he only said, "*Mas vale tarde que nunca*" ("Better late than never"), which seemed to me to have such little bearing on the subject that I forbore saying any more.'

A few days passed without any news, but on Monday we were alarmed by the arrival of a telegram from Dr Azevedo. The message was: 'All over. Died at four this morning.'

I started at midday, and on reaching Bejar at eleven o'clock that night saw Don Diego in his coffin.

The end, as I heard from the doctor, had come suddenly. About one o'clock Miguel the valet had aroused the doctor, who found that a second seizure had taken place, and at four o'clock, as the telegram had stated, all was over.

We had the remains conveyed next day to La Cartuja, and the same evening they were interred in the old cemetery of the monastery.

It was then evident in what affection he had been held by his people. His old friend the *parroco* of Huerta, who read the burial service, was quite overcome, and all seemed to feel that they had lost a friend.

I asked the notary if there was anything against my continuing my present work until it was completed, or until the testamentary wishes of Don Diego should be revealed. 'It is the least I can do,' I said, 'for all his kindness.'

He replied, 'I am staying here to-night, and to-morrow Don Diego's will is, by his instructions, to be read in the presence of the household.'

About ten o'clock next morning I was returning to the *bodega*, where I had been at work from an early hour until breakfast-time, when the notary told me he was to read Don Diego's will in the library at three o'clock that afternoon.

'I do not think, sir,' I said, 'that I can claim to be one of the household, and perhaps my presence might be looked on as an intrusion.'

'I think,' he replied, 'that you will find there is a very good reason for your presence,' and left me.

We assembled in the library at the hour appointed, and Dr Navarrete, the notary, began by saying that the will of the late Don Diego Lombardo, which he was about to read, had been made under very exceptional circumstances. He told us that under a previous will, made some years since, certain bequests had been made in favour of the workers employed at La Cartuja, and a few personal friends of the deceased. All these remained in the present will unchanged. These bequests were the first recited in the will, and included a sum equal to one year's wages to each man and woman employed on the estate at the time of the testator's death, an annuity of one hundred pounds to his old friend and servant Luis Agredo, the same to his housekeeper, various bequests to the *parroco* of Huerta, the local doctor, and others, and a considerable sum for the poor of the district. These sums, in themselves, were but a very small fraction of the value of the property and of the large amount of money which must have been saved year after year.

And then came the thunderbolt: 'And all the rest of my property, whether in land, buildings, or cash in the bank or invested, I leave absolutely to Don Arturo Lambert, who is at present assisting me in the management of my property at La Cartuja, provided that it shall be proved to the satisfaction of the law that he is the lineal descendant of my late father, James Lambert, of Cherston, in the county of Somerset, England. And, should his claim not be established, I appoint as my residuary legatee the eldest surviving male descendant of the said James Lambert.' And he appointed as his executors Dr Enrique Navarrete and Don Alfonso Hurtado, manager of the Bank of Spain's branch at Salamanca.

Dr Navarrete remained with me in the library after the others had left. 'No doubt,' he said, 'you are overwhelmed with astonishment.' So was I when Don Diego dictated to me the terms of his will at Bejar. I had known him as intimately for some thirty years as was possible, for he was always of a reserved disposition, and I understood that he was of English descent. But I knew no particulars of either his birth or youth. He gave me, however, to understand when I was with him at Bejar that in early life he had been an officer in the British army, and had fought against the French at the battle of Salamanca. He also told me that in the event of your proving to be his great-nephew, of which he had little doubt, you would find amongst his papers the account of his life, written by himself from time to time at La Cartuja. All this occurred two days before the second attack, which ended fatally. He seemed very much relieved when his will was made, and it was his intention that you should return to Bejar and remain with him. However, it was otherwise ordained.'

I am nearing the end of my history. Making due allowance for the law's delays, it did not require many weeks to establish my identity. There were many affidavits and interviews with consuls and notaries; but there was no difficulty to be got over, and in less than two months after Don Diego's death his will was proved, and I entered into possession of my inheritance. There was what, to me, was a very large sum invested by my great-uncle—more than thirty thousand pounds. His expenses had never been very great, though at one time he had kept up a certain amount of state; and money put by and never drawn on, but continually added to, will at the end of some thirty years fructify to some purpose when compound interest is considered.

I may here tell Don Diego's story, very briefly, as I found it recorded in his own writing among his papers.

At the battle fought at Arapiles on the 27th June 1812, in the fields which I can see from the room in which I write, he was severely wounded, first by a musket-shot which broke his arm, and afterwards, while lying on the ground in a fainting condition, by a spent cannon-ball which struck the back of his head. On the morning following the battle he was found by the party of peasants who were employed in the burial of the dead, and laid aside, being recognised as an officer, while the privates were buried in the field. Later in the day it was found that he was still alive, though barely breathing. He was removed to the house of one Paco or Francisco Arrevalo, the *fiel de fechos*, or town clerk, of the village of San Morales, and nursed back to consciousness. He spoke in his diary, with much gratitude, of the kindness of this man and his family, as well as of the care and skill of the local doctor. Some months elapsed before he was restored to even partial convalescence. Meanwhile the army under Lord Wellington had gone on to Valladolid, and by the beginning of the following year it was at San Sebastian. My grand-uncle seems never to have communicated with his family—why, I do

not know; and after spending nearly nine months, as his diary states, at San Morales, he went to Mexico, where he spent some eight years, returning to Spain in the year 1821, having meanwhile acquired a considerable amount of wealth in the Mexican gold-mines at Durango. He bought some land in the vicinity of San Morales, and farmed it with much success.

Thus, on the property of La Cartuja coming into the market, he was not only in a position to purchase it, but had sufficient capital to develop its resources beyond anything thought of by the previous owners. He was always known by the name of James (or Diego) Lombardo. I have never been able to get rid of the idea that the injury to his head was the cause of some slight brain lesion, which, though he could never be considered more than 'peculiar,' still rendered him averse to mixing with his fellow-men.

From the time he bought La Cartuja his life was almost patriarchal. His whole interest centred in the well-being of his dependants and the relief of the poor of the surrounding country.

I was thus, in my twenty-second year, in the possession of much wealth both in money and land. A year later I was married in the little church of Huerta to the first and steadfast love of my life. It seems but yesterday, but it is close on fifty years ago. Almost all the friends of those days have long since vanished. Don Manuel and his wife sleep in the Campo Santo at Huerta, my own dear father and mother at Cherston. Mariquita and I paid one visit to England with our eldest boy when he was ten years old. My father and mother were then living. Since then our life has been passed at La Cartuja. When I came to Spain the world of Europe was at peace. The great fratricidal strife in America was just coming to an end. As I write these lines all Europe, I may say, with the exception of my adopted country, is convulsed by the greatest war the world has ever known. Shall we, too, be drawn in?

THE END.

PAGES OF PEACE FROM DARTMOOR.

CHAPTER II.—CONSCIENTIOUS OBJECTORS.

I AM frequently asked how we on Dartmoor like the Daylight Saving Bill. To which I reply that I like it very much, except that it has plunged us into another winter. We have had three winters this season already. The only five warm days of the year were the days before the bill came into operation. After them the weather changed back not merely to cold but to Arctic conditions, and the hour earlier in the morning necessitates every fire and stove we can light. The bill may save light; it certainly

consumes much fuel. Apart from this, which is not exactly the fault of the scheme, I like it greatly. Early rising has always been a mania of mine, and it is a mania not shared by my near neighbours—for instance, my mother, more generally known as the Rainbow Maker. Every summer I grieve at the waste of the best morning hours in bed, but have not nerve to annoy my fellow-creatures by early rising. Now we are compelled to get up, and I revel. On the other hand, Tom Willcocks, the wright, who

in wet weather wears a sack skewered together with a gimlet, and who in all weather adores *Punch*, considers the Daylight Saving Bill to be 'much foolishness,' and 'a lot of ole rummage.' I burrowed into the reasons for this scathing criticism, but found only a general feeling that it was teaching the Almighty His work. Of course, as most of the natives here rise at four o'clock in summer, and work till dark, the thing seems unnecessary. Also, there are one or two drawbacks. The first is the necessity for early morning firing farther into the year. The next trouble will be in hay and corn harvest. On the moor the dew is so drenching in hot weather that they cannot begin to save the crops till ten o'clock in the morning (sun time). Consequently the labourer's early hours will be wasted, and his overtime harvest-work in the evening will make a very long day. I await the solution with interest. Probably they will balance it by beginning work an hour later in the morning, and keep to the sun time.

The real amusement of the scheme, however, is derived from the way in which the animal world ignores it. I call them the conscientious objectors. By great good luck, the cows, during the first few days of the new time, were in the little field exactly underneath our windows, and we could study their demeanour at our leisure. To me, that field so near the house is sheer luxury. All May month it is a sheet of flaming gold buttercups. Behind it the tors rise, darker by contrast with the stretch of cloth of gold which forms the foreground. Our windows have curtains of blue willow-pattern like the china, and the vista from the interiors of the golden field between the folds of blue curtain is inebriating. It is inebriating, too, to rise with the sun and throw wide the casements to the gold of earth and sky. Our windows are all casement, and consequently worth opening. The feeling is utterly different from opening a sash window. When you open a casement you feel that your soul takes a leap with the window into the outdoor paradise beyond. No one could live on Dartmoor with sash windows. The noise would be unbearable. As each of our rooms has two windows, and as it is not possible to sleep with two open if you wish your bed to retain its coverings, there is always the joy of opening one window every morning.

Early on the first morning of daylight saving I was hanging out of my east casement in time to see the cows called. Some were lying, some standing in the buttercups; but all were obviously not really awake. The farmer opened the gate and waited. Usually this is sufficient. That morning they took no notice. Then he called. Heavy heads turned slowly in his direction. He called again, less amiably. Large eyes goggled in silent amazement. Every cow might have been suddenly petrified where she stood or lay. Then he began to call continuously and with rising inflection. The cows remained

literally stupefied. At last one turned her head slowly to the nearest, and her expression said plainly, 'Surely it's not possible he wants to milk us at this hour of the morning? You have been here longer than I have. Has he ever been like it before?' The oldest cow obviously gave it up, utterly unable to face the phenomenon. By this time the man was tired. He scurried across the field, fell upon the rear of a lying cow, and smacked it hard. In due time she gathered that she was intended to awake and rise, and she did so. He went round to the others and administered the same persuasion. Finally one led slowly, with an expression of blank amazement, to the gate; and, with much vocal encouragement in the rear, he marshalled them out of the field. It is still the same. The fact that they are milked an hour earlier overnight does not appear to weigh with them in the least. The first week of the scheme *Punch* had a very amusing series concerning the objections of the animal world, and the artist who drew the cows being kicked awake might have been watching the process from my window. About one of those pictures there is an irreverent tale. The first morning that I went to call the Rainbow Maker at six A.M. (sun time) instead of seven A.M., her inhospitality, not to mention her incivility, struck me as petrified as the farmer had struck the cows. Such a stream of unbroken eloquence flowed from the Rainbow Maker's pillow that it glued me to the ground with a miserable feeling that I was responsible for the whole affair, and was perpetrating outrages upon a helpless invalid. Something had to be done. Quickly I went for *Punch*, cut out the inset of the sulky lark asleep in its nest, pasted it on a tinted card, ran a piece of pale-blue ribbon through the card, returned to the Rainbow Maker's room, hung it over the head of her bed, and said, 'Never mind. You shall stay in bed with the lark, and have your breakfast when you like.' The spell worked. It struck the Rainbow Maker as a fine thing for an invalid to outvie the lark, so she now rises without a murmur at the newly appointed hour.

Other creatures which still keep sun time, and this to their own undoing, are the snails and slugs which infest the old walls of moor gardens. I sometimes wonder if there is any place on earth where what one of the farmers calls 'small slug' abounds as it does here. Snails are comparatively easy to extinguish. They are easily seen, and you know where to look for them. Small slug, about a quarter of an inch long, and earth-coloured, is my despair. There is no trace of them on the ground at the root of the plants. They apparently arrive in airships, and begin at the tops of the hollyhocks and lilies, and eat until nothing is left but stark stems. For years have I struggled with them. It is so disheartening to spend time, strength, and money rearing madonna lilies and hollyhocks only to have them eaten to sticks the first week that they bloom.

Once, in desperation, I wrote to a very high-class horticulturist, describing the scourge, and saying that if he could not advise me adequately I should commit suicide. It was no real business of his to reply to a lunatic woman on Dartmoor, but I suppose all horticulturists are humane men. No one can spend his life among flowers and not be tender-hearted. Possibly he too had suffered something of my woes. Anyway, he wrote sedately back on thick white parchment paper, peppered with gold medals, beginning, 'Madam,' and ending, 'Your obedient servant,' and he refused to charge any fee for his advice, as I begged him to. This was the advice—the soundest I have ever received: 'Take a spoonful or a trowelful of bran, mix it to stiff paste with water, dip a slate into water, put it over the bran beside your favourite plant, raising the slate at one end with a stone. Go to bed and sleep dreamlessly. In the morning, come down and find every small slug in creation under the slate, gorged to repletion, and an easy subject for massacre. You can buy unbound slates for a penny each.' This remedy does answer. I rarely take good advice, but this bit is worth taking. However, the daylight saving obviates the trouble of setting slug-traps. The first few mornings, I arrived in the garden to find the whole army retiring in good order from the lily-bed. Not one slug was left to hand down the story of the Great Massacre to future generations. After that I went round to every part of the garden where the enemy had lurked for years, and I had them all. Beside one of my most tortured hollyhocks I found a snail entering a tiny unsuspected hole in the wall. Out of that hole I raked thirteen snails. Some of them were great-grandfathers. In another bed, near my pet tulips, where not one tulip has lived in spite of all my efforts, I found three slugs six inches long, which I have been after for two years. Yes, there is a great deal to be said for the daylight saving scheme, whatever Tom Willcocks may feel to the contrary. Now and then, though, it is a little bewildering. For instance, when you go out after dinner in the evening, and find the best mother-hen and all her chickens in your flower-bed, you inquire, heatedly and unreflectingly, what on earth she is doing there at this time of night, forgetting that it is not this time of night, and she knows it is not. You open the gate, in a chastened spirit, and bow her back into her own domain with a few mournful remarks as to the privacy and wormlessness of your flower-beds, remarks which she does not in the least believe.

Two other conscientious objectors are two small, black, clean, innocent pigs which live in the other little field below our windows. In this field there is a ramshackle little shanty, thatched, and much prized by the farm tenant as a shelter for young pigs and calves. There is no door to it, and the pigs are not barricaded

in with faggots. Every morning from four-forty-five (sun time) I watch for the uprising of those piglets. At five A.M. (sun time) the cows are fetched to be milked. They have to pass the pigs' gate, and they make some noise in doing it. Dead silence reigns in the shanty. You imagine that the piglets are murmuring in their dreams, 'There goes breakfast. Another hour and a quarter before we need turn out.' The cows are milked, and the milk separated and mixed with meal by six-fifteen (sun time). Then the foaming pail is carried to the field at six-twenty, and emptied into the stone trough. Five minutes before the farmer appears the piglets rise and saunter into the open. How they know the time is a mystery. They are never early; they are never late. They never get a fit of panic as the cows go by, and think, 'I say, we have overslept.' Four mornings ago my clock went wrong, and I rose at what I fondly fancied was six o'clock (freak time). To my amazement, the pigs emerged at six-fifteen. I eyed them complacently, even patronisingly, while doing my hair, glad to see they were becoming less lazy. Suddenly the clink of crockery from below shattered my delusion. The pigs were right, and I was wrong—an hour wrong—and it was almost my breakfast-time. I wish animals could tell us how they know.

This morning I played a low practical joke on the piglets. It was not intentional on my part. For several weeks I have longed to know what goes on or does not go on beyond the opening of that shanty, and what the mysterious influence is which keeps the piglets in it until the same minute every morning. To-day curiosity conquered, and at six-thirty (freak time) I whispered through the gate, crept across the field, and looked into the Abode of Silence. I wish I could have snap-shotted them. There they were, two black, clean, guileless piglets, fast asleep in each other's arms. Four large ears quivered fitfully in their dreams. They were lying in a great heap of dried bracken, and the whole place was spotless enough to sit in if one had wanted to. They were so fast asleep that they did not even hear me, but one of them must have been aroused by the click of the gate-hasp after my departure. It ran, squealing, across the field to the trough, evidently fearing it was late for breakfast. On finding the trough empty, and me gazing over the gate, it said things about me which surpassed even the Rainbow Maker's remarks of the first morning, and trotted straight back to bed, where its wiser mate was still peacefully sleeping. Three-quarters of an hour later they both emerged together, punctual to the minute. Their table manners are of the most artless description, for they invariably feed with their forefeet in the trough.

The evening conscientious objectors are, of course, the wild birds. They do not begin their evening performance till we are thinking of bed.

It is extraordinary to see the farmhouse locked up and all quiet for the night while the birds are singing their loudest. The other evening, as I lay in bed, the curlews were hard at it at

twenty minutes to eleven (freak time). To me, it is another real luxury to hear curlews in my bedroom at that hour of the night.

(Continued on page 680.)

PINCHER MARTIN, O.D.

CHAPTER XIII.—FRITZ THE FRIGHTFUL.

[The reader is cautioned against accepting this story as an official narrative of the great war. The incidents described have actually happened; but, for obvious reasons, it has been necessary to give them fictitious colouring.]

PINCHER soon discovered that life on board a battleship and life in a destroyer were two totally different existences.

In the *Belligerent* a cast-iron routine had always been adhered to, at sea or in harbour, fair weather or foul. Nothing was suffered to disturb that routine, unless it were occasional excursions to sea in the small hours of the morning and frequent coalings. Times were laid down for everything. Day after day bugles blew or pipes twittered at exactly the same hours; and to the ship's company, the actual workers, things seemed to run as smoothly as clockwork with a minimum of effort on the part of every one. They all knew what to do, and when to do it; and the men themselves never realised the forethought, the energy, and the capacity for organisation on the part of the commander and other responsible officers which were necessary to produce such a result. They took it for granted. Their groove was made for them, so to speak, and they suffered themselves to slide along its well-oiled length without troubling their heads as to what supplied the motive-power. Moreover, men were told off for their jobs collectively, not individually. Their bodies seemed to be regarded as machines capable of so many units of work, and there were such numbers of them in the ship, and the vessel herself was so huge, that the labours of any single person, provided always he was not a very important person, did not seem to have any effect on the community as a whole. Indeed, a seaman could even go on the sick-list, or leave the ship altogether, without his absence being noticed or felt except by his own mess-mates and friends.

But in the *Mariner* things were very different, for here the labours of every single individual counted. If a man neglected his work or idled his time away, his shortcomings had their effect on some one else. They were soon noticed, and the laggard speedily found himself chased and goaded into a proper state of activity by Petty Officer Casey; and Casey, a glutton for work himself, always had a persuasive way with him, and a horny fist to back up his arguments.

There was a routine, of course, and very nice it

looked on paper; but the life was so full of sudden surprises that as often as not any preconceived time-table went by the board. It was not surprising, for the *Mariner* and the other destroyers of her flotilla had always to be ready for service at the shortest notice, and her men frequently found themselves bundled unceremoniously out of their hammocks in the middle of the night to get the ship to sea. It did not matter whether it was blowing a gale, raining, or snowing; go to sea they must, and did.

Sometimes they chivied Fritz; and he—a wise man, but no gentleman—waited for no one. It was not the fault of the destroyers that he had usually vanished into space by the time they arrived to strafe him. Fritz was the ubiquitous Hun submarine, any 'untersee-boot' which happened to come into their domain, and a merry little dance he sometimes led them. Occasionally, to vary the monotony, they called him Hans, Adolf, Karl, or some other Teutonic appellation; but more often than not he was just Fritz, and Fritz he will remain until the end of the war. Sometimes, though reported as such, he was not really Fritz at all.

'The skipper of the trawler *Adam and Eve* reports having sighted a periscope flying a large flag in latitude $xy^{\circ} z'$ N., longitude $a^{\circ} bc'$ E., at six-thirty this morning,' was the sort of thing they were sometimes told. 'Proceed to the vicinity with all despatch, and search.'

Proceed they did, hot-foot and full of warlike energy, only to find that the skipper of the *Adam and Eve* had been mistaken, and that his periscope with its large flag was nothing but some other fisherman's dan buoy broken adrift from its nets. Dan buoys, seen in the half-light of the early morning or evening, are apt to be deceptive, particularly when the imagination is stirred at the thought of the substantial honorarium to be earned for authentic information of the enemy.

But even battleships and cruisers make mistakes sometimes. The newspapers have never mentioned one fierce engagement which took place in a certain northern harbour, in the chill gray light of an early dawn, when a long black submarine was suddenly seen approaching the outer cruiser of a line of men-of-war lying peacefully at their anchors. He came in on the flood-tide, grim and menacing, causing a great commotion in the water, and with his periscope

raising its flutter of spray. Now and then he disappeared altogether.

It was Fritz, they thought, come to pay them an early morning visit, and with all the joy in the world the officer of the watch in the cruiser opened fire. It was easy shooting. The guns barked angrily, and four-inch shell spouted, foamed, and burst round the invader until he was a submarine no longer. The fleet was flung into a state of considerable excitement; but the submarine sank gracefully to the bottom, while the officer of the watch, metaphorically patting himself on the back, told his agitated pyjamad-clad commanding officer of what had occurred.

'Are you quite certain you got him?' the latter inquired anxiously.

'Absolutely certain, sir,' the lieutenant replied. 'We all saw him hit several times. He sank by the bows.'

'Have sunk hostile submarine,' was the signal made to the flagship a few minutes later. 'Request permission to send down divers to investigate.'

'Approved!' came back the answer. 'Report results.'

'Divers have been down, but report they can find no traces of the alleged submarine,' another semaphore message went across three hours afterwards.

The flagship did not deign to answer, but her signalmen tittered; the 'alleged' tickled them.

'I'm absolutely certain he was hit, sir,' the officer who had opened fire reiterated for the thousandth time. 'I'm positive I saw him sink—absolutely positive!'

'Well, where the deuce has he got to, then?' the captain wanted to know, shrugging his shoulders unbelievably. 'The damned thing surely can't sink and not leave a trace of anything behind him!' He seemed rather irritable.

Three days later a light cruiser anchored towards the entrance of the harbour, and started talking. 'There is a large black object stranded on the beach abreast the ship,' she said by semaphore. 'Am sending boat to investigate.'

'Object previously reported is a whale,' came a supplementary message in less than half-an-hour. 'It has been dead some days, and appears to have been killed by shell-fire.'

The defunct monster advertised his presence far and wide when the tide fell. People approached him wearing gas-masks and with ammonia-soaked handkerchiefs held to their noses. How the authorities got rid of him history does not relate. One cannot very well bury a thing the size of a house. Perhaps they sold him for fertiliser.

There were no C.B.'s or D.S.O.'s conferred for that battle, though the shooting certainly had been good.

But all this has carried us rather far from the *Mariner* and her men. They always found Fritz, Hans, Adolf, Karl, or whatever they

chose to call him, as cunning as a hatful of monkeys; but the destroyers and other craft which sought to compass his destruction admired him for his efficiency, for efficient he certainly was. He combined boldness with seaman-like caution, and would suddenly appear in an area crowded with traffic, sink a merchant ship or two, and then disappear into space. Occasionally he behaved as a sportsman, and towed the boats containing the crews of the ships he had just sunk in towards the shore. Sometimes, when it came to sinking liners and passenger-ships with women and children on board, his reputation was unsavoury; but even the righteous wrath and indignation of his pursuers, who always played the game themselves, were not levelled so much at Fritz himself as at those who had given him orders to go out and do his dirty work.

The *Mariner* was once working in an area in which Fritz was very active indeed, when Hills the telegraphist clambered on to the bridge in a state of purple excitement, flourishing a sheet of paper.

'Well, what is it?' Wooten demanded. 'What's the matter?'

'There's a steamer down to the south-east'ard makin' the S.O.S. call, sir!' the man ejaculated agitatedly. 'Says she's bein' overhauled by a submarine, who's firing on her. I've got her position, course, and speed!'

'The devil you have!' said Wooten, putting the telegraphs to 'Full speed,' and giving the helmsman a new course. 'Let's have her position.' He took the paper from the telegraphist, and laid the latitude and longitude off on the chart. 'Lord!' he remarked, rather perturbed, 'we're a good forty miles off. It'll take us over an hour to reach her. They'll be strafed by then, poor devils!'

The *Mariner*, meanwhile, with smoke pouring from her funnels and a great bow-wave creaming aft from her sharp stem, was dashing off at something over thirty knots.

Wooten scratched his head. 'Hills,' he said at last, as an inspiration seized him, 'call her up by wireless, and make her in plain English, not in code, mind, "Hang on. Destroyer will be with you in twenty minutes." Got that?'

'Yessir,' said the man, writing it down.

'Very well. Don't make our name, but use all the juice you can, so that they'll think we're very close. Understand?'

'Yessir,' nodded Hills, leaving the bridge rather mystified.

'You see, sub,' the skipper went on, 'we can't possibly get to this chap in time to save him from being sunk. All we can do is to try to frighten Fritz and to make him abandon the chase. D'you see?'

Hargreaves nodded vaguely.

'I don't believe you understand in the least what I'm driving at,' Wooten continued, smiling. 'Fritz has got wireless, and is on the surface.'

If he's the wily bird I imagine him to be, he'll have a fellow in his box-office listening to what's going on. He'll hear my signal, will take it in, translate it—they all know English—and there's just a chance it'll scare the life out of him, and make him shove off out of it. Savvy?' Hargreaves nodded.

The scheme actually did work successfully, and Fritz was badly had, for in less than twenty minutes the unknown steamer was talking again. 'Submarine has abandoned chase, and has dived,' she said abruptly. 'Who are you?'

'Mind your own perishing business!' went back the reply in rather politer language.

Fritz seemed to work in spasms, for a fortnight would go by without a sign of him; and then, quite suddenly, there would come another recrudescence of his activity in another and quite unexpected locality. But the small craft were always hot on the scent the moment he bobbed up. They made his life a misery and a burden; and, though it is true he succeeded in sinking many a merchant ship, many of his species did not return to Wilhelmshaven. There were various effective ways of dealing with him, though exactly what those methods were must perforce be left a secret.

(Continued on page 676.)

COUNTRY FOLKLORE.

IN days far removed from us a fierce war was waged between educated and uneducated people as to the existence or non-existence of the 'good folks' of the outer world—the fairies. The educated mass came out best in all cases. The present writer keeps an open mind.

There are two kinds of sight—one is not usually recognised—the real sight of the optic member, and the inward sight which gives as real a vision to those possessing it. Thus no two people see alike. In consequence, we hold that the man or woman who 'saw a fairy' actually did see one; the expectation arose, the thought became so strong that it resolved itself into a vision, and—hey, presto!—the thing was done.

A sober country farmer, who could read his newspaper and make correct calculations in figures as quickly with his mind as a bank clerk could with pencil and memory combined, seriously told me that he was cutting down a holly-bush—hollies are said, in Ireland at least, to be sacred to the fairy races—and that he actually heard a voice bidding him desist, and threatening certain penalties. He was scared, but went on with his cutting. Next day one of his cows died! We are far from ascribing the animal's death to the fairy agency; but it is remarkable as a coincidence, and might well make even an astute lawyer think. One matter we are not absolutely certain of is whether there may not be beings, unseen by most, who inhabit woods and wildernesses, and who sway our actions. In such a case the fright received would cause him to neglect the cow, and so death might occur. This, doubtless, looks very silly on paper in the twentieth century; but far more silly are the unbelievers. Time and again men have waged war through long centuries against certain notions, such as, for instance, the 'old woman with the herbs,' who makes up a salve or gives a medicine which has been proved to be more effective than the medicine given by

a medical man. A doctor to-day admits the possibility. He will tell you that it is possible for even a simple-minded person to become acquainted with herbs, by test, and so learn the effect of such on various diseases. Why should we admire the glimpses we get of magic potions in Shakespeare's pages, and the fairy-like gleams in those of the renowned Spenser, and yet condemn the peasant for an uttered belief in what has made poetry such a potent instrument for attuning life? All of us, too, profess to believe that 'there are more things in heaven and earth than are dreamt of in our philosophy;' and also that there is 'a light which never was on sea or land,' the 'poet's dream.' Pushed to its full conclusion, what do we mean by this? It must mean that any form of thing, any object, any appearance, may exist independent of the lore of the schools and universities. Shelley, and many other poets as well, entertained, after all, but a rather poor opinion of the lore of the universities; they preferred to go to life, to the meadows, to the stars, for their great and weighty arguments.

Sir Oliver Lodge has lately been giving us distinctive glimpses into other worlds than our own. The word 'distinctive' here implies the death of narrowness. He goes on to show that nothing is fully known, and that, even when known, each subject has many sidelights. History, we think, is to be respected equally. Charles XI. of Sweden had a vision; he saw the 'Unseen,' he saw lights in a chamber not then occupied, on benches there he saw forms, he heard words, which words afterwards came true. His vision is attested by four sane men of his day; it has come down, undenied, through generations; it is a history as substantial as that of the battle of Waterloo. The man who doubts the vision of Charles XI. of Sweden might dispute anything. We once heard a man say that Queen Anne had no existence save on china!

A belief in flaming swords in the heavens, in

old-time records, was almost universal. There may also, for aught we know, be portents. We are inclined to think that heavy lightning, or the Aurora Borealis, was all that the ancient chronicler beheld. Yet he may have seen a flaming sword. Warnings are not disbelieved by all, and the writer's father had a premonition of his death while walking over a lonely moor; something spoke to him, in some sense of the word, and the end came soon! Many folks so fear ridicule that the most wonderful personal experiences are held back for fear of ostracism or the light laugh which such stories evoke from some very superior person.

A man well known to the writer in his early youth once told him a strange story of seeing a person in a narrow lane in a country hamlet. On one side was a hedge, on the other a row of country outhouses—sheep-cotes, byres, dwellings, &c. What was his dismay to notice a man well known by sight, but long since dead, coming towards him! He braced himself up to speak; but instead of coming towards him, the man vanished into the wall of one of the buildings mentioned! Meeting the teller of the story later in life, we tested him. 'Do you now believe the story you used to tell me about So-and-so?' 'Oh yes, there is no doubt about it. I saw Blank; he entered the wall.' What are you to make of this? An impression which goes is not so much to be relied on as an impression that stays. We think this a fair statement of the case. Also, in all cases of modification of the story we are rather inclined to doubt. Stories of phantom sailors, stories of phantom shepherds, stories of miraculous birds, fishes, and all things that fly, have some substructure for the belief. The ignorant man who has read nothing, or little, is liable to a somewhat distorted vision if hasty-tempered or impatient. The story of a stolid man must be accepted on his evidence. There is no other way out. Science shows that we are for ever learning. The wireless system has revolutionised theory. Telepathy, the wireless of the mind, is accepted by the larger number. All could not, possibly, be affected by telepathic messages; but numbers are so affected. It is needless to cite instances. Dream-revelations occur to show that things exactly happen as in the dream. Deny telepathy, you deny dreams; deny dreams, and you deny dream-inventions of which correct records are to be had—in the case of the inventor of the sewing-machine, for example. Is it anything more plausible, then, to believe in a dream-revelation—a thing seen by one, which the crowd does not see—than it is to believe that a man saw a vision of a 'small man' in a woodland path? We hold that all stands or falls in one solid phalanx. Science is spreading her sails, and we shall see much. In the great day that is dawning so rapidly it will be found that the simple peasant of yore, dwelling close to nature, sensed what we have

laboriously discovered. It may even yet be found to be possible that plants, trees, bushes, flowers, have feelings, as we have; that they actually suffer pain, that transplanting them gives to each transplanted thing the pang of home-sickness; that the *manes* of men, as of animals, haunt this globe of ours; that eyes watch us out of every clump and mossy stone, and that, in fact, an unseen 'cloud of witnesses' walk the way we tread, breathe our air, and talk to each other of us in a language unintelligible save to those with a 'gift.' By the way, this 'gift' in the Highlands takes the form of second sight, and there are numberless clear instances of it on record.

In the neighbourhood of Drumbarnett, near the village of Newtoncunningham, in County Donegal, Ireland, a rather strange instance of the verification of old beliefs occurred. A farmer dug up thoroughly an old and stunted thorn-tree, such as is frequently found in fields in Ireland, and levelled its original site. He thoroughly manured the spot, put fresh clay on it, and sowed it with seed-corn when sowing the remainder of the field. Nothing grew on it, however; not even a single stalk. Next season, in rotation, it was tried again, with the same result. In addition, when reaping the surrounding corn the reaper ceased to act when he neared the spot where the blank was—the site of the tree. On taking the reaper to the engineer, it was found that nothing whatever was the matter with it. He tried it next day, but no reaping could take place. Afterwards, in digging on the site of the tree, deep down, a peculiar stone was found, marked like a cornelian with lines of dark brown and black, smooth as oiled cloth. The stone is about the size of an egg, and very beautiful. The farmer who told me this story—which is known also to his sister and his brother—is a man of calm, deliberate character, devoid of peculiar notions, and sober in the extreme—a gentleman of most friendly demeanour. The talk came up in the course of a conversation about peculiar happenings, phenomena, &c., and was only, as it were, forced out of the narrator as about his only experience of what seemed supernatural. A tradition obtains throughout County Donegal—as well as in other counties—concerning trees which grow in fields, especially when they are hawthorns. Most of these bear a very large type of haw. The present writer does not say, of course, that these superstitions are all correct, or that the tales of buried treasure beneath tree-trunks, which is said to occur, have any truth in them. He would merely remark that we know but little of the phenomena of created nature or the mind of man, and that there are unproved stories quite correct; also asserting that all legends, however far-fetched, have some root-basis, otherwise these stories would cease to travel from father to son, as they do, in rural and other districts.

NOT EXACTLY ON THE CARDS.

By ÆSCULAPIUS.

I.

'CHEER-O, Lingate!' murmured several wardroom officers of H.M.S. *Alcibiades*.

'Cheer-o, everybody!' responded the subaltern of marines, who was having a birthday. 'In a quarter of an hour,' he sighed, glancing at his wrist-watch, 'I've got to go on night patrol.—I say, doc,' he said, brightening, 'I'll play you a round of whisky poker. If I win, you'll give me the pleasure of your company on patrol. If you're the lucky one, I'll stand you "bubbly" to-morrow night.'

'Your cheek is colossal,' Staff-Surgeon Michael O'Brien said; 'but, in view of the auspicious occasion, I'm inclined to accommodate you.'

The cards were dealt out.

'Confound your cunning!' O'Brien said, making a grimace.

'Hurrah!' shouted the onlookers.

'Good work, Lingate!' the senior watchkeeper commended; 'and please to do all you can to enlighten the medical branch as to the nocturnal mysteries of our glorious service.'

II.

'Come along, doc,' Lingate urged, as soon as the staff-surgeon appeared on deck in his British 'warm'; 'the drifter is waiting.'

A couple of the drifter's deck-hands held a ladder in position while the two officers descended. Several young seamen from the *Alcibiades* were already on board.

'Shove off, skipper!' Lingate ordered.

The skipper signalled the engine-room to go slow ahead.

It was still light, and there were hundreds of men on the deck of the *Alcibiades*. Some walked the fo'c'sle; others talked and smoked in groups; a few leaned over the ship's side.

'Blime me, Bill,' one of them said, 'if it isn't a fine night for patrol!'

O'Brien thought so too. 'It's my own dear Old Ireland they remind me of,' he said tenderly, alluding to the hills and mountains which loomed up through the clear air.

The subaltern of marines' thoughts took a more practical turn. 'Leading Seaman Morrow,' he called.

'Yes, sir,' the young sailor said, coming up and saluting.

'How many rifles have you aboard?'

'Six, sir.'

'Ground them in front of the wheelhouse, and arrange your watches. And, Morrow,' Lingate said to him as he was turning away, 'you may carry on smoking.'

'Thank you, sir.'

'Have a fag, doc,' Lingate said, offering the staff-surgeon his cigarette-case.

'Thanks.'

Lingate held a lighted match for the staff-surgeon between the palms of his hands. They puffed a few minutes in silence.

'A night like this makes life seem worth while in the navy,' O'Brien remarked.

There was something soothing, too, in the steady throb of the engines, and they both felt a thrill of conscious pride in being out there, helping to shield the fleet from those sudden thrusts which modern warfare renders possible.

'All the same, doc,' Lingate said, voicing the traditional moan of his branch, 'I don't think the sea is any place for a soldier.'

'My lad,' the staff-surgeon replied, 'forget that you are a soldier, and concentrate all your ability on being a sailor. Meantime we might go below and see what these people's mess looks like.'

III.

A narrow hatchway led down to an oval-shaped compartment where the crew of the drifter lived. The place was brightly lighted by an acetylene-gas burner. A linoleum-covered table stood in the centre, the damp surface of which a deck-hand continued to rub for some minutes after they had entered.

'Good-evening to you,' O'Brien said, as they sat down.

'Eh, what's that?' muttered a man with a yellow beard and red, inflamed-looking eyes, who had been dozing in his bunk, and who promptly subsided into a state of somnolence.

'Good-evening, sir,' genially answered a young Scotsman who was reading in one of the opposite bunks.

'Well, how do you like your present life?' the staff-surgeon asked him.

'I'd rather be fishing,' he replied.

'But think of the glory you're achieving. The papers are full of the gallant part your branch is playing in the navy's work.'

'That may be,' said the man, unabashed; 'but it doesn't bring me any nearer to Broughty Ferry.'

'And where may that be?' O'Brien inquired.

'It's in the Firth of Tay.'

'But surely it's very dull there.'

'It's the grandest place in the world for me,' the fisherman said simply; 'it's where my wife and child are.' He put his hand under the pillow, and pulled out a post-card photo, which he handed to the staff-surgeon. 'That's them,' he said proudly.

O'Brien regarded it intently. 'It's the eternal conflict between hearth and empire,' he mused.

'Never mind,' he assured the fisherman; 'it'll seem like another honeymoon when you get back.'

'Indeed, it's long enough for that now, sir,' the man said wistfully.

'Beg pardon, sir,' Leading Seaman Morrow said, thrusting his head in, and addressing the young soldier, 'would you mind coming on deck?'

'Right-o,' responded Lingate.—'Coming, doc?'

IV.

It was now quite dark; and as they made their way cautiously to the starboard side of the drifter the seaman said apologetically, 'I don't know whether I ought to have bothered you, sir, but I thought I saw a craft of some sort moving to leeward of Lowther's Island.'

Lingate peered intently into the darkness through his binoculars. 'You're quite right, Morrow,' he said; 'she's creeping along in a westerly direction.'

Morrow heaved a sigh of relief. He had the sailor's dread of being accused of 'seeing things.'

'Skipper,' Lingate commanded, 'we must cut her off.'

The skipper's answer was to ring 'Full speed ahead,' and to shout down the voice-pipe, 'Give her all the steam you can.'

The drifter gave a perceptible bound ahead, and the bearings began to squeak as the engines were forced on. In about half-an-hour they had neared a projecting point of the island, and they could then make out one of those gallant little vessels which the war has made so familiar to everybody, with her high bow and receding stern, and taut brown sail set up on the main-mast.

'Trawler ahoy!' Lingate called out; 'stop! Who are you?'

'We're the hospital trawler *Industry*,' the skipper responded from the wheelhouse window in a broad-Scotch voice. 'There's been a sea-plane accident off Bell's Point, and we're taking the injured man to the hospital ship.'

By this time the two vessels were side by side, and the figures of several men were visible on the deck of the trawler.

'Perhaps I ought to have a look at him?' the staff-surgeon suggested.

'Oh, I think he's all right,' the skipper said.

'The devil you do!' O'Brien replied. 'Are you a surgeon?'

'No, sir,' the skipper said.

'Well, I am,' O'Brien stoutly asserted.

The skipper hesitated. 'Of course, if you think so, you may see him,' he said; 'but my orders were to make all possible speed.'

'Orders from whom?' the staff-surgeon inquired.

'The people,' he answered, 'who brought the man down.'

'All the same, I'd better see him,' O'Brien said decidedly, stepping from one vessel to the

other.—'I'll only be a minute, Lingate,' he called back to the young soldier.—'I suppose he's for'ard?' the staff-surgeon said to the skipper, indicating the shelter used for stowing away tackle.

'No, sir,' replied the skipper; then, talking in a low voice to one of his crew, 'Show the doctor the way, Jock.'

V.

'Aren't you pursuing a rather unusual course to the hospital ship, skipper?' the young soldier asked suspiciously, after he had waited for about ten minutes for the staff-surgeon to return.

'Oh, no, sir,' the skipper replied. 'I only wanted to skirt the fleet on account of the possibility of night firing.'

'It seems to me you're running into it,' Lingate said fretfully.

At this moment Jock reappeared. He looked at the young soldier earnestly, and said slowly and methodically, as if he had an impediment in his speech, 'The doctor sends word to say he'll see the patient to the hospital ship. We're to shove off immediately, as time is precious.'

'This is damn funny!' the young soldier muttered. 'However, I suppose it's all right. You may proceed,' he said to the skipper grudgingly.

'Ay, ay, sir,' the latter answered.

The deck-hands were about to cast off the lines which held the two vessels together, when there occurred one of those seemingly trifling incidents which often decide the fate of great issues. The *Industry* blew off steam, and Lingate fancied he heard a distinctly German oath.

'Stop the steam escaping,' angrily shouted the skipper down the voice-pipe.

'It's probably pure imagination,' the young soldier exclaimed; 'but I'm going to investigate this funny old trawler.'—'Men of the *Alcibiades*,' he ordered in incisive tones, 'take up arms.'

They lined up with their rifles ready.

'Ready! Board!' commanded Lingate.

They flung themselves over the side of the vessel. When they reached the deck of the *Industry* half-a-dozen pairs of arms suddenly grappled with them in such a way that the rifles were held in a vice, and before they could wrench themselves free they were ordered to put up their hands. As for the young soldier, an unlucky slip sent him sprawling, and gave the skipper an opportunity of hurling himself upon Lingate, and pinning him to the deck.

VI.

'We thought it best to put him in our mess, where it's warm, sir,' Jock said, conducting the staff-surgeon aft. 'You'll find him in one of the bunks, sir,' he added, as he held the door open at the foot of the ladder.

O'Brien entered a compartment very similar to the one he had visited in the patrol, only

larger. Jock quickly reascended the ladder, and a moment later there was a dull thud above as the hatch-cover fell into position over the ladder.

The staff-surgeon paid no attention to this strategy on the part of Jock till, a moment later, he found no patient, and all the bunks unoccupied.

The ever-changing nature of naval life develops a contempt for surprises of all sorts, but in the present instance the staff-surgeon was startled. 'This is a pretty kettle of fish!' he exclaimed, as he went up the ladder, and put his shoulder to the hatch-cover, only to find it securely fastened and immovable. 'There must be a conspiracy on foot.'

Now, O'Brien was accustomed to the avernian-like spaces at the bottom of a ship. His medical dressing-station during action in the *Alcibiades* was below the water-line, and, when all the watertight doors were closed, coming up on deck for a whiff of fresh air or to succour the wounded was like extricating one's self from a Hampton Court maze in the darkness of an anti-Zeppelin night. He therefore proceeded in a methodical way to find an outlet. There was a trap-door in the deck of the messroom, and, raising this, he squeezed himself into the small space below, and by means of his electric torch discovered a small door in the bulkhead. Through this opening he began to make his way along a narrow passage which ran on one side of the boiler. 'It's as hot down here as if Old Nick himself were stoking,' he muttered, as he crawled along, finally reaching the entrance in the forward bulkhead which led to the hold. Entering on all-fours, he stood upright, and balanced himself on a couple of round objects beneath him. At the same time he flashed his torch about him.

'Jehoshaphat!' he exclaimed, as the significance of the many iron spheres, with their sinister-looking horns, was forced upon him; 'if I haven't struck a mine-field!'

O'Brien shuddered as the sound of muffled groans reached him from the starboard side of the hold. Cautiously treading his way between the mines, he came to a space which was partially screened off, and, to his astonishment, found several men there bound and gagged. Searching for a jack-knife among them, he cut the cords which bound them, and removed the gags from their mouths.

'Who are you, and what has happened to you?' he asked, after they had assumed the erect position.

'I'm the skipper of the *Industry*,' one of them said, 'and these are my crew. A couple of hours ago we were tied up alongside of Bell's Pier, when a fishing-smack came in with these scoundrels on board. We were just about turning in, but before we knew where we were they had overpowered us and deposited us down here. They afterwards stowed away these mines, using

our own tackle to do it with,' he concluded bitterly.

'Well, my lads, you've been hardly treated,' the staff-surgeon said; 'but you may yet have your revenge. I'll see how the land lies up top before telling you how. Meantime arm yourselves with marline-spikes and whatever implements you can lay your hands on,' he ordered. — 'Tell me first, skipper,' he inquired, 'is there another hatchway besides this?' pointing to a large planked-over opening above them.

'Yes, sir,' the skipper replied; 'there's a small one for'ard,' indicating the bow, where O'Brien was able to make out the dim outlines of a ladder leading up to it. 'It comes out just in front of the shelter,' the skipper explained.

'Good!' O'Brien said, raising himself up on the mines, and cautiously pushing up one of the planks which covered the hold. It was fast becoming light, the two vessels were still together, and he was just in time to witness the lamentable failure of the young soldier's offensive. Letting the plank down again, he addressed the men in the hold.

'Our situation is a critical one,' he told them. 'They've practically got our people in their power; but I think I see a way out. As Nelson said, "the boldest way is the safest way," and what I propose to do is this. By means of a ruse I hope to make them drop their arms. What I want you to do is to go on deck by way of the forward hatch. The shelter will screen you, and when I say, "Now then!" you're to pounce on them as if you were possessed with a thousand devils, and overcome them the best way you can. Do you understand?'

'Yes, sir,' replied the skipper; 'you leave it to us;' and they prepared to act in accordance with his instructions.

VII.

'Disarm them,' ordered an authoritative voice just as the head of Staff-Surgeon Michael O'Brien appeared above the hatchway but a few feet from where Lingate and his men were in such an awkward predicament.

'Wait a moment!' thundered the staff-surgeon.

The melancholy wail of the seagulls on the island and the flapping of the waves against the trawler were the only sounds that broke the stillness, as the crowd on deck held themselves rigidly, and waited in strained expectancy for what was to follow.

'You know the hold is full of mines,' O'Brien shouted, 'because you put them there yourselves. I have my foot on one of the horns, the pressing of which will cause it and all the others to explode. It's for you to decide whether or not we go to glory together. My terms are simple. You drop your arms, and I'll come on deck.'

There was a hurried whispering among them, and some angry expostulations. Finally O'Brien said impatiently, 'What's your answer? Do

you agree? Who's in command? I don't believe he is,' meaning the erstwhile skipper.

There were a couple of sharp thuds, as of revolvers being dropped.

'Now then!' The staff-surgeon intended adding 'hurry up;' but the fatal words for which his confederates were waiting had been spoken. There was the patter of many unbooted feet, and hoarse cries from several infuriated throats. Simultaneously the clear tones of the young fisherman's voice rang out, 'At them, my lads!' Under cover of a powerful stream of water, which he directed so as almost to knock friend and foe prostrate, the deck-hands of the patrol sprang across just in time to join forces with O'Brien's demons. The effect was pandemonium, and they pounded the common enemy force into insensibility.

'Look out for our own people,' the fisherman warned them, as with fire-hose in hand he followed his mates across the trawler.

'Stop!' roared the staff-surgeon; 'they've had enough. A few minutes more, and you will have them in the mortuary instead of in my lovely little operating-room in the *Alcibiades*.'

The young soldier and his men began to secure their prisoners.

'Thanks awfully, doc.,' the sub. murmured, 'for getting me out of a very nasty fix.'

'Don't mention it,' O'Brien said. 'I've always been noted for the munificence of my birthday gifts,' he added somewhat sardonically.

'You may shove off,' Lingate said to the skipper of the patrol; 'we'll return to our ship in the *Industry*.'

'What's your name?' O'Brien asked the young Scotch fisherman, as the latter left the trawler.

'Murray,' he replied.

'I'll do what I can to get you leave for that honeymoon of yours,' Murray said. 'O'Brien called out, as the two vessels were parting.

'Thank you, sir,' Murray said gratefully.

VIII.

When they had got under way in the *Industry* the staff-surgeon began to examine the prisoners, who were beginning to show signs of returning consciousness. 'They may wear cloth caps and fishermen's jerseys,' he said, 'but they're no more Scotch than I am, and they're more accustomed to the deck of a German warship than they are to a trawler.'

'Hello!' he said, as his eye fell on a pair of well-cared-for hands. 'Here's a fine signet-ring for a deck-hand.' He looked at it closely. 'It's the German Eagle,' he said. The owner of it was a comely young man with flaxen hair. 'He's probably a German naval officer,' O'Brien said.

The man opened his eyes. '*Gott im Himmel*!' he exclaimed, attempting to rise.

'Take that,' the staff-surgeon ordered, giving him stimulants, 'and don't waste your strength.'

Then O'Brien took advantage of the psychological fact that a man on regaining consciousness, whether it be from chloroform, or concussion of the brain, or any other form of head injury, will readily answer questions.

'You're in command of these men,' O'Brien said, indicating the stricken ones, 'and it's easy enough to surmise you came over from the Fatherland in a submarine, captured a fishing-smack, and eventually transferred your mines and your flag to the trawler,' he concluded sarcastically. 'Is that not so?'

The prisoner nodded sullenly.

'You thought you'd drop the mines in a favourable current, trusting to the early morning tide to carry them against our ships. Am I right?'

Again the man nodded.

'Where and when is the submarine going to meet you again?' the staff-surgeon said suddenly.

'Off Cape Pharaoh at noon to-morrow,' he answered.

'You mean to-day,' O'Brien said.

'I suppose so,' the officer answered.

'That's all clear enough,' O'Brien said; 'but what I can't understand is how, in the name of all that's holy, you and your myrmidons speak like Scotsmen.'

'Learning to speak different dialects,' the officer declared, 'is part of our Wilhelmstrasse training.'

'I hope you don't include Irish in your repertoire?' O'Brien asked.

'Indeed,' the officer answered, 'Jock speaks it very well.'

'If ever I hear him violating the tongue of my forefathers,' O'Brien declared savagely, as they came alongside of the *Alcibiades*, 'there'll be no more Jock left.'

IX.

The officer of the watch accosted them on the quarterdeck.

'You're back early,' he said. 'I may be wrong, too,' he added reflectively; 'but it isn't usual to do night patrol in a hospital trawler,' referring to the Red Cross flag which flew at the masthead.

'That's not the point,' the young soldier snapped. 'We've got several prisoners, and they'll need a guard. My further report will be made to the commander himself,' he concluded.

'Don't get huffy, old thing!' the officer of the watch said, as he summoned the quartermaster. 'Call the captain of marines,' he ordered, 'and tell him we need some men for sentry duty.'

'Very good, sir,' the quartermaster said, saluting, and departing on his errand.

'And they're always asking what the navy is doing,' O'Brien muttered peevishly, as he went forward to the sick quarters to make arrangements for the reception of the wounded.

Chambers's Journal

SEVENTH SERIES

THE POOR MAN'S TRIBUNAL

By Sheriff R. L. ORR, K.C., Edinburgh.

TO spend a day in the law courts is a form of holiday recreation which scarcely appeals to the ordinary man (excluding, of course, an occasional member of the Saddletree family), but the student of human nature and social life finds in that scene much to attract and instruct. That is true of any court of law; it is true in an eminent degree of the court which is resorted to by the people with a capital P. The Small Debt Court as we know it in Scotland to-day touches the life of the country more intimately, and affects more deeply the relationships of masses of men to one another, than any other legal tribunal. A few figures will show how the matter stands. In the five years ending 1914 the number of actions before the Sheriff (Small Debt) Courts in Scotland was on the yearly average 70,831. The nearest approach to this is the Sheriff (Ordinary) Court, which is a poor second, showing a yearly average over the same period of 9127 actions. A long way behind comes the Court of Session, with a yearly average of 3207 actions in the same period. Looking more closely at this yearly average of 70,831 actions, we find that of that number final judgments were pronounced in 53,302 cases. This figure includes decrees or judgments in contested and uncontested cases. Of contested cases the yearly average was 14,091; of uncontested cases, between two and three times that number, or 39,211 cases. Taking the test not of numbers of actions, but of money claimed in them, it appears that the contested actions disposed of—namely, 14,091 in the yearly average—represent a total sum claimed of £71,399; uncontested cases represent a total of £152,605.

The utility and popularity of the Small Debt Court to-day is due to several causes. Its jurisdiction is now large enough to cover the great mass of transactions which arise in the lives of the majority of men. Beginning in the sixth year of George IV. with a maximum cautiously fixed at £8, its jurisdiction has risen by successive steps to the present limit of £20. The last of these steps—the rise from £12 to £20—has been proved by the experience of seven or eight years to be an undoubted success. Its real importance is even greater than appears on the surface. It has led many persons to come to the Small Debt Court with claims considerably

above £20, restricting them to that amount in order to secure the benefits of a more rapid and inexpensive decision than can be obtained elsewhere. Actions of damages arising out of accidents caused by collisions, running down, and the like are now familiar features in the lists of causes. Many of these claims might be stated at sums far beyond £20; some of them bear a close resemblance to actions which in another court occupy—often far from profitably—the time of a jury. A claimant who is advised by a prudent agent finds that by stating his claim at a more modest figure he can have his case disposed of promptly and finally, and spare himself the luxury of the bill of costs which tempers the joy of many a successful litigant.

The secret of economy in time and in money is the absence of written pleadings. Along with the summons there is served a copy of the account, if the action be for a merchant's account or the like; if otherwise, a statement in a sentence or two of the nature and ground of claim. Beyond that, written pleadings are unknown. Parties appear at the date named in the summons; the defence is stated orally at the bar; in the greater number of cases the question is decided at the same diet after a short discussion. Where evidence requires to be led the practice varies in different courts; in the Edinburgh court the practice is to adjourn the case for that purpose to a diet fixed one, two, or three weeks ahead, when parties appear with their witnesses, and the case is heard and disposed of. This does not mean that the questions raised are always simple or easy; tangled questions of fact and knotty points of law frequently crop up, but the summary method of procedure, the absence of written pleadings with their statements and answers, and the fact that the judge's opinion does not need to be written, all favour rapid rather than leisurely disposal of cases.

If 'the law's delay' can hardly be said to have any existence here, a second great advantage is the finality of the court. The judgment of the sheriff is final both in law and in fact. There is, indeed, a means of review; to the untrained eye the door appears wide and easy, but experience has proved it to be narrow and difficult.

To say that an appeal can be taken on the ground of 'corruption or malice and oppression,' or on 'deviation in point of form from the statutory enactments' taking place wilfully or preventing substantial justice being done, or on 'incompetency, including defect of jurisdiction of the sheriff,' seems to offer to a litigant quite an embarrassing number of optional avenues of appeal. This, however, is a pleasing delusion; each apparently well-defined road becomes a track, and disappears as he advances. The grounds of review have, very properly, been strictly construed, and appeals are few and far between. In the period of five years to 1914 the average yearly number for the whole of Scotland was only two; at Edinburgh, in the six years 1910 to 1915, in a total of contested cases numbering 5490, not a single appeal was taken.

The usefulness of the court to litigants has been further enhanced by the provisions which are now in force with regard to the employment of law agents. Originally the idea seems to have been that the parties should themselves state their cases to the judge. With the view presumably of saving expense, the employment of law agents was discouraged; they were not allowed to appear without leave of the court. But litigation is a troublesome business to a layman, even though the sum in dispute be not large; it is rarely possible to get through it without skilled assistance. The attempt to shut out the law agent has now been abandoned. Under the most recent statute, that of 1907, agents are entitled to appear in any case, but the fees allowed are carefully fixed and regulated at very moderate figures, and the results of the change are satisfactory, both to litigants and to the bench.

In other matters also the small debt code shows indications of having been built up gradually, under the teaching of experience, to be the serviceable and, at the same time, considerate and humane instrument it has become for securing rights and mitigating burdens. Its scope was widened by the provision making competent actions not only for pecuniary claims, but also for delivery of movables. An excellent feature in the interests of debtors in poor circumstances is the power lodged with the judge of ordering payment by instalments—weekly, monthly, or quarterly.

A noteworthy enactment in recent legislation calls for mention as further illustrating the humane spirit of the law where it touches the interests of the poorest and most helpless. The House Letting Act of 1911 contains a provision that all bedding material and all tools and implements of trade used by the occupier of a small dwelling-house or any member of his family as a means of livelihood which are in the dwelling-house are to be exempt from the landlord's right of hypothec, or distrait. It further provides that, in addition to the above, all such further furnish-

ing and plenishing in a small dwelling-house as the occupier may select, to the value of £10, are also to be exempt from the right of hypothec. While, therefore, the landlord's right of hypothec remains, and in virtue of it he may still apply for power to sequester and sell a tenant's effects for recovery of rent, the latter can no longer by this process be stripped absolutely bare; enough is saved to him to make possible a fresh start and a new home.

It may be thought that this legislation has gone too far against the interests of the landlord; it has certainly led, as might have been expected, to the virtual disuse of the machinery of sequestration for rent in houses of this class (that is, up to a rental of £21). It is still open, however, to a landlord to reach very much the same end by means of an ordinary action, because under a decree he may poind and sell the tenant's effects. But it is satisfactory to know that this latter remedy—poinding—has also largely fallen into disuse for the purpose of recovering rent. The reason of this is still more satisfactory. The system of short lets introduced by the Act has set up a healthier state of matters all round—a short credit instead of a long credit system. A tenant finds it easier to pay a smaller sum than a larger sum at a time, there are fewer defaults in payment, and fewer actions at law.

Turning from the legal machinery in operation in the Small Debt Court, we find in the picture which it presents of human nature and human life a subject of deeper and wider interest. That picture of the humbler classes of our fellow-subjects is no doubt incomplete; it shows us probably neither the best nor the worst. Of the well-ordered lives and quiet homes which form the great majority we see little, little also of those at the other end of the scale which are darkened or destroyed by vice or crime. We are concerned chiefly with human relations and transactions which are expressed in terms of pounds, shillings, and pence; but the annals of the poor consist to no small extent of those very things, and round them play the lights and shadows which make the study of them attractive.

Where a dispute arising out of any of the domestic relations finds its way into a law court, it may be taken for granted that the seamy side of human nature will be exposed. Actions for aliment are by no means uncommon in the court we are dealing with, mostly by parents against children. A penniless old age after a life of manual toil, and after the rearing of a family, is a pathetic sight. Old age pensions have done much to brighten and soften that lot, but many an aged father or mother still needs to seek help from son or daughter. Candour compels one to say that filial affection is too often conspicuous by its absence; where that is lacking the compulsion of law is useful in supplying the want of a higher motive. Sometimes a bit of romance

appears where it is least expected. Here is a widowed mother suing her sons for aliment. One of them, oddly enough, bears a surname different from hers, and his defence is that he is not liable because he is not her son. A nice question to unravel under an innocent-looking crave for aliment! A strange tale is unfolded of a family falling into financial difficulties and disappearing. Under a changed name they settle in a different part of the country, where this son is born, and bears from birth the assumed name. By-and-by the family shift their camp again and resume their original name, but this boy continues to be known by the name given him at birth. He grows up to manhood bearing a name different from the family name, not knowing whether he is one of the family or not, and never able, in spite of frequent efforts, to penetrate the secret of his birth. The parents refuse to disclose to him what they regard as a discreditable chapter of family history. The lad leaves home to push his fortunes, and repudiates the mysterious bond of connection with the family. But the mother knows her boy, and years after, in the hour of necessity, turns to him for help. At length the secret is out; there is no stain, as he had feared, on his birth; the son has found his mother.

The lurid light of the war has revealed splendid pluck and uncomplaining patience in many an obscure man and woman carrying a heavy burden. A widow has fallen behind with her rent. She appears in court in answer to a summons, her face seamed with the lines of toil and sorrow. Her only son, on whom she leant, has been killed in battle. But she makes no complaint, no appeal for sympathy; she has found work and will pay her debts. The discretionary powers which the emergency legislation has placed in the hands of judges come to the aid of this and many another one struggling with unwonted difficulties. Soldiers' wives and mothers are not all drinkers; the good and strong among them far outnumber the bad and weak.

Narrow means, dreaded as an evil, have produced many fine fruits of character; wealth and comfort, desired by all men, are the parents too often of a hard selfishness. One of the evils of poverty is that, by a singular irony, the man who is least able to pay for an article is generally charged the longest price for it. In most cases, too, either through want of knowledge or want of imagination, he does not realise that this is the case; he thinks he is making an excellent bargain. The payment-by instalment system flourishes with tropical luxuriance among the poor. It may be a necessity of their existence, but its bad effects are numerous and obvious. It leads the unthinking and unwary into buying what they do not need; it conceals from them the fact that they are paying extravagant prices for what they do need. The matter is bad

enough in regard to such things as clothing and furniture, but when the plague of book-canvassers and vendors of every species of useless article invades the homes of the poor they fall an easy prey to the disease, and suffer severely from its effects. There is the servant-girl who is induced to subscribe for a gorgeous family Bible, and goes on paying for weeks or months before the absurdity of the affair dawns upon her. An enthusiastic young man signs an agreement for a useless gazetteer, or a series of text-books warranted to carry him triumphantly through some examination. For a time all goes well. By-and-by his ardour cools; he has difficulty in making the payments; he repents his bargain. Finally he puts on a bold face and refuses to pay more; but just as he imagines he has slipped out of the business, he is pulled up with a jerk in the form of a summons demanding payment of the whole staggering sum for which he has made himself liable. This method of dealing breeds a peculiar type of morality. A debtor will maintain he is not liable for goods he has ordered, because the creditor's canvasser has not called on him for a certain week's instalment of the price. A victim of the book-canvasser who has been inveigled into signing an order form for Dickens's works, the delivery of which would last into the distant future, will maintain, in his desperation to escape from the meshes, that he was assured Dickens was an entertaining writer, and that he has been grossly deceived, for he commenced by trying to read *Pickwick*, but found it so insufferably dull that he had to give it up.

The instalment system reaches its full flower in what is known as the hire-purchase agreement. This document is a highly finished product of legal art. It is packed full of clauses, provisions, stipulations dealing with every imaginable contingency designed to secure that the piano or sewing-machine shall remain the property of the seller till the price has been paid up. Then, and then only, it is to become the property of the purchaser; up to that time payments made are to be regarded as payments for the hire of the article. As might be expected, a document of so refined an ingenuity has been the battleground of many litigations. I fear it has to be added that it has been made the ground of not a few attempts—some of them probably successful—to do serious injustice to poor people. The price, let us suppose, has been paid up to within a few shillings of the full sum; then a failure to pay occurs, it may be through temporary illness or slack trade, and proceedings are taken to recover the article, which, on the theory of the agreement, is still the property of the seller. The result, if this succeeds, is that the owners carry through a profitable, if not a very scrupulous, transaction; they have at the end of the day the piano in their store, and the price of it in their pocket. Shylock's bond was sealed and in order,

but a court which administers equity as well as law generally finds means to defeat an unconscionable reading of a contract.

There is another sinister figure which looms large in the lives of many of the poor—I mean the moneylender. One must try to do justice to this person. He lends generally without security. He runs great risks, and occasionally makes considerable losses. Recent legislation has attempted to protect the borrower from his rapacity by giving the courts power in certain cases to interfere with and modify contracts. This well-intended legislation has, I fear, been somewhat of a disappointment. Like many another product of parliamentary wisdom, it has neither fulfilled the hopes of its supporters nor realised the fears of its opponents. The judicial decisions show that it is not so easy as it often seems to brand a moneylending bargain as unconscionable, and to tear it up. But after every fair deduction has been made in his favour, the business of the

moneylender, as we know it, is an ugly one. The unhappy borrower has little real prospect of escape from the toils; after years of struggle he finds himself, like Sisyphus, still staggering under a hopeless burden. Borrowing is a cancer which eats into the life of many homes, and destroys their peace. Yet even in this dark region one sees gleams of the goodness of human nature. A bill of exchange produced in court by a lender bears on it in many cases not only the borrower's name, but the names also of three or four friends, all as poor as himself, who have agreed to become guarantors. This neighbourly act, generally done with the vaguest possible notion of what it involves, simply spreads the mischief over a wider area. It may be sanguine to expect that even a time of abundance for the working-classes like the present will bring the evil to an end, but happily it is possible to discern signs in the records of the courts, if one looks with care for them, that it is growing less.

PINCHER MARTIN, O.D.

CHAPTER XIV.—THE NORTH SEA.

L

[The reader is cautioned against accepting this story as an official narrative of the great war. The incidents described have actually happened; but, for obvious reasons, it has been necessary to give them fictitious colouring.]

WHO would not sell a farm and go to sea?

Life in the navy, even in war, has its compensations. At any rate, the sailor's commodious residence conveys him, his belongings, his food, and his weapons to the scene of his activities at a speed of anything between seven and a half and thirty-six knots, according to circumstances. The soldier, on the other hand, though he may sometimes ride upon a horse or travel in a train, generally has to rely upon his own flat feet for locomotion. Moreover, he carries on his person several days' provisions, spare clothing, a rifle, bayonet, ammunition, and equipment, together with an assortment of bombs, gas-masks, and entrenching tools. Any spare space or weight-carrying capacity which may remain to him is presumably at his own disposal, and may be utilised for accommodating gifts of tobacco, magazines, and socks from home. So the sailor is lucky in a way, while he also escapes the mud of the trenches, the plagues of flies, and other abominations—for which he is duly grateful. It is true, though, that his floating home, particularly if it is a small one like a destroyer, is very subject to the vicissitudes of the weather, and has a knack of being abominably wet and very unstable in a seaway. But life at sea in peace and life at sea in war are not so very different. The ocean, with its gales, calms, and fogs, is always the same, and hostilities only mean more

time spent at sea, a few extra dangers thrown in, in the shape of mines and submarines, and the chance of a 'scrap' with the enemy.

Sometimes, during their expeditions to that region known as 'the other side,' for the express purpose of discomfiting the Hun, the *Mariner* and the light cruisers and other destroyers with her had bad weather. Occasionally it was very bad indeed, and until they got used to it some of the ship's company wished fervently that they had never joined the navy at all. When their little ship was punching home against a rapidly rising gale, the green seas had a playful habit of breaking over the bows and of washing waist-deep over the upper deck; while, even in the quiet intervals, sheets of spray came flying on board until every one was soaked through and through, in spite of oilskins.

The movement was dizzy and maddening. It was usually a combined pitch and roll, a horrible corkscrew motion which left one wondering what antics the ship was going to indulge in next. At one instant the bows would be flung high into the air on the crest of a wave until the forefoot and some length of the bottom were clean out of the water. Then the sea would fall away from underneath, and, after hesitating a little, the bows would fall into the next hollow with a sickening downward plunge. Then a great gray wall of advancing water, topped with a mass of yeasty foam, would rear itself up and obliterate the horizon ahead. Sometimes the ship lifted in time to ride over it. Sometimes she seemed to hang, and the liquid avalanche broke on

board and surged over the forecastle with a crashing and a thudding which made the whole ship quiver and tremble. At such times the mess-decks, wardroom, and cabins, however watertight they were supposed to be, were usually inundated with several inches of water. Hot food was often out of the question, for even if the cook were not seasick, or his fire were not extinguished by the sea, he, not being blessed with the tentacles of an octopus, could hardly prevent himself from being hurled violently forth through his galley door, let alone retain an array of saucepans, kettles, and frying-pans on the top of a nearly red-hot stove. Something was bound to go, and 'cookie' took very good care it was not he. Then it was that officers and men ate and drank what they could. Wooten favoured Bovril from a vacuum flask, corned beef sandwiches, and cheese; but some people, having no appetites, preferred to fast.

Destroyers cannot steam very fast against a heavy head-sea, and with bad weather from the west there was always the possibility that the enemy's battle-cruisers might emerge from their lair and chase and sink the retiring British ships one by one as they punched slowly homewards. Small craft are not suited for fighting in very bad weather, and such an eventuality might have been disastrous; but nobody seemed to trouble his head about it.

Life at sea in the summer, when there was hardly a ripple on the water, with a brilliant sun and no fog, was enjoyable, though it is true that they always ran a certain amount of risk from mines, floating or otherwise. The dangerous red squares, oblongs, and circles on the chart were abundant and well scattered. Ships did not willingly venture over them; but summer sun and absence of wind breed fogs, and they might be at sea in misty weather for a couple or more days with no glimpse of the land, no chance of taking an observation of the sun, and nothing but a dead reckoning position to work from. This—since tides, currents, and wind have a variable effect—might sometimes be anything up to twenty miles wrong, so destroyers occasionally trespassed upon the red danger areas without really meaning to do so. How could they help it?

Liberties should not be taken with mines. They are inventions of the Evil One, and at the beginning of the war caused many people to suffer from insomnia; but later on those who did nothing but traverse waters in which some unscrupulous mine-layer had deposited her eggs lost much of their dread of them. Familiarity had bred not actually contempt, but a species of fatalistic indifference which is rather difficult to describe. A mine explosion is always serious, sometimes disastrous, and it is never exactly pleasant to know that your ship may be blown up at any moment, and that you and your ship-mates may have to take to the boats, if there is

room in them for all hands and the cook, or if there is not, to go bathing in life-belts or swimming-collars. Moreover, some of you may be killed or wounded by the explosion itself, particularly if it occurs under a magazine; and if it happens close to the enemy's coast one may possibly be rescued by the Huns and incarcerated in Germany for the duration of the war. There is a chance of being saved by a British ship if one is anywhere near; but whichever way one looks at it, an under-water explosion is never anything but unpleasant to the victim thereof.

But there is nothing to be gained by worrying. In war one can go to Kingdom Come in such a variety of ways, all equally violent and all horrible, that it is as well never to allow the mind to dwell on any particular method of extinction. People never run unnecessary risks, naturally; but risks have to be taken, and mines moored beneath the surface are invisible at any time. 'Floaters,' too, are a source of danger; and, though mines which have become parted from their moorings are nominally supposed to be harmless, Hague Conventions and the tenets of International Law are sometimes disregarded. War has lost its old-time chivalry. It is now a dirty and an ungentlemanly business—one at which the modern Hun excels.

II.

One dark winter evening the *Mariner* and three other destroyers were groping their way back toward the British coast after being at sea for two days and two nights. They had had the usual North Sea weather, thick haze and some rain; but during the later portion of the trip there had been a gale of wind from the southwest and an unusually bad sea. Even now, when they were close to the coast, and should have been more or less under the lee of the land, it still blew hard, with a heavy perpendicular lop which made the little ships pitch and wallow as they drove through it. The evening was as black as the mouth of the nethermost pit, and the sky was completely overcast, while for the last forty-eight hours they had never had a glimpse of the sun or the land. Their position, as usual in such circumstances, was more or less an unknown thing, a mere matter of dead reckoning and guesswork, which even the constant use of the sounding-machine could not verify.

Making the land after dark in peace-time, with all shore lights blazing, sometimes gives cause for anxiety; but in war, when all the lighthouses and lightships are extinguished, when many buoys are removed, and there are various dangerous mined areas to be dodged and avoided, it becomes something more than a joke. If mines are known to be present, the feeling is not at all a pleasant one. It is rather like being blindfolded and trying to find the door in a

pitch-dark room, the floor of which is well strewn with bombs ready to explode on being touched. That was the sort of sensation at the back of Wooten's mind.

The *Mariner* happened to be the third ship in the line of four, and at five-fifty-one precisely, when the skipper, the sub-lieutenant, and the usual quartermaster, signalman, and lookouts were on the bridge watching the next ahead, there came a rumbling, crashing roar from somewhere close astern. It made the ship dance and tremble, and was nothing the least like the sharp report of a gun. The sound was more or less muffled, and the violent, reverberating thud could only be compared with the sudden banging of a heavy steel velvet-covered door in a jerry-built villa, if such a thing can be imagined.

Wooten, who had heard such reports before, knew at once what it was. 'God!' he exclaimed anxiously, looking astern; 'some one's got it in the neck!'

Some one had—the *Monsoon*, the ship astern—and a moment later her arc lamp was flickering agitatedly in and out in the darkness. 'Have struck a mine!' she spelt out hastily. 'Stern appears to be blown off!'

Wooten cursed under his breath. 'These things always happen on nights like this!' he observed bitterly. 'Just like our rotten luck!—Signalman!'

'Sir?'

'Tell *Monsoon* I'm coming to her assistance.' He gave the necessary orders to the quartermaster at the wheel.—'Hargreaves, have the boats turned out ready for lowering in case she goes, and send down to No. 1, and tell him to be ready for taking her in tow. As fast as you can!'

The sub hurriedly left the bridge, and Wooten, working the helm and the twin screws, circled round until his ship was about fifty yards abreast of the damaged vessel, which had fallen off into the trough of the sea. The *Mariner's* men, meanwhile, in all stages of deshabille, had thronged to the upper deck at the sound of the explosion, and were making the various necessary preparations.

'Are you all right?' the skipper bellowed as the ship slid slowly past, rolling heavily.

'I don't know about being all right,' came back a voice. 'My stern, with the rudder, screws, and the whole bag o' tricks, is missing. I think she'll float, though!'

'Right! I'll take you in tow!' went back the reply.—'Good Lord!' added Wooten, swaying to the heavy rolling and looking at the sea; 'it's going to be the devil's own job.'

It was. When a searchlight shone out and illuminated the scene, the *Monsoon* seemed to be in a very bad way. She was not rolling very heavily, for some portion of her damaged stern was still connected to the hull, causing her to lie over to starboard toward the wind until the

mast was at an angle of thirty degrees to the vertical, and broken water could be seen washing half-way across her upper deck. The spectacle was an alarming one, for she seemed to be in imminent danger of capsizing.

The *Mariner*, meanwhile, had drawn slightly ahead. She was rolling so heavily that at one moment her rails were under water, and the next were high in the air, while the men working on the wet and slippery deck had the greatest difficulty in preventing themselves from being hurled bodily overboard.

Wooten manœuvred his ship until her stern was on a level with the *Monsoon's* bows, and about thirty feet distant; whereupon men stationed aft endeavoured to hurl heaving-lines across on to the forecastle of the damaged vessel. If a small line could be got across from ship to ship, the end of it would be made fast to a coir hawser in the *Monsoon*. The coir would then be dragged over to the *Mariner*, and on the end of it would be secured the steel-wire towing-hawser, one end of which would be hauled on board and secured in the towing ship, and the other in the vessel being towed. But, try as they might, they could not bridge the space. The wind simply laughed at them, and hurled their lines back in their faces, while all the time the throwers were in constant danger of being shot into the sea by the movement. Except for the glare of the searchlight, it was pitch-dark. Wooten could not approach any closer for fear of bringing the vulnerable stern, with its rudder and screws, into collision with the *Monsoon's* bows, and if he allowed that to happen his own ship would be disabled and rendered helpless, and the last state of affairs would be worse than the first. There was only one alternative, and that was to lower a boat to take the lines across; but this again was easier said than done.

Hargreaves, the sub-lieutenant, and five men took their places in the whaler hanging at her davits, and the boat was then lowered gradually toward the water. The skipper watched them with his heart in his mouth, for as she descended, and the falls lengthened, the scope of her oscillation became longer and longer, and dizzier and dizzier. The ship herself was still rolling horribly, and at one instant the whaler was swung giddily out at an impossible angle over the water, while the next she came into contact with the ship's side with a crash and a thump which threatened to stave in her planks and to precipitate every mother's son of her crew into the sea. Watching the business was a ghastly nightmare which seemed to last for minutes. In reality it must have been over in a few seconds, but Wooten heaved a sigh of heartfelt relief when he saw the boat fall with a splash on to the top of a gigantic sea. But the next moment he held his breath again, for she was flung bodily aft on the crest of the billow until she was all but

deposited on deck as the ship rolled drunkenly toward her. Then she sank out of sight somewhere under the bottom as the *Mariner* lurched over the other way, to reappear a few seconds later, with her crew plying their oars lustily. How they ever succeeded in getting clear nobody quite knew, for in that sea only a merciful Providence saved Hargreaves and his five men from disaster.

The line was passed across by the boat, and the end of the *Monsoon's* wire hawser was shackled on to a length of chain cable at the *Mariner's* stern, and when this had been done the two ships were connected and everything was ready for going ahead. The whaler was then rehoisted after another series of hair-breadth experiences, and the struggle began to get the damaged ship head on to the sea and wind preparatory to towing her into safety. A bare hour and twenty-four minutes had passed since the explosion had occurred. To Wooten and his men it had seemed like half the night.

Pincher Martin, who was on the bridge at one of the engine-room telegraphs up till midnight, saw and heard all that went on. By the time the *Monsoon* was safely in tow both vessels were lying broadside on to the wind and sea, with their heads to the south-eastward. The course to get the damaged ship head on to the waves and toward the shelter of the coast was south-west, and at first Wooten went dead slow ahead with both engines to tug her round. But it was a more difficult task than he had bargained for. He could not go fast, for the violent motion on his ship and the consequent jerking on the tow-rope would have caused the latter to part like a piece of thread; and even as it was, the wire was jerking out of the sea one minute, humming like a harp-string, while the next the bight of it was sagging loosely under the water. Moreover, a destroyer is not an ideal ship for towing another at the best of times. The tow-rope necessarily has to be made fast in the extreme stern, not, as is the case in a properly fitted tug, more or less amidships in the spot where the vessel pivots when turning. The consequence is that manœuvring-power is reduced almost to a minimum, while on this particular occasion the *Monsoon*, with her stern cut off and some of the wreckage trailing behind her, lay like a log on the water, and did her very utmost to pull the *Mariner* round the wrong way—that is, to the east, instead of through south to south-west. It was rather like trying to tow a derelict motor-bus with a bicycle.

The skipper worked his engines very gingerly, and tautened out the tow with his helm to port. Then he gradually increased the revolutions of the turbines until they should have been travelling at eight knots.

'How's her head, coxswain?' he asked after an interval.

'South sixty-five east, sir,' said Willis.

Wooten sighed deeply, and verified the statement by glancing at the compass. 'Lord!' he said, 'she was there ten minutes ago. Isn't she moving at all?'

'Wagglin' about a bit,' the coxswain answered, gazing at his compass-card in his usual imperturbable way. 'She's all over the shop. Up to sou'-east one minute, an' back to south-eighty the next. She's just startin' to move to starboard now, sir,' he added eagerly an instant later. 'Blarst!' in a very audible undertone; 'no, she ain't. She's startin' to fall off the wrong way.'

'Damn!' Wooten muttered; 'I don't believe we'll ever get her round.'

Willis gave vent to a throaty sigh. He evidently thought the same.

It certainly did seem an impossible job, for with the drag on her stern the *Mariner* was practically stationary, while using more speed was out of the question without running a dangerous risk of snapping the towing-wire. Time after time the ship's head came round to south-east, sometimes a few degrees farther; but on each occasion, after hesitating for a moment or so, she fell back to her original starting-point, south sixty-five degrees east.

They tugged and tugged for over an hour with no effect. Wooten exhausted all his unparliamentary vocabulary, and Willis became speechless and purple about the face; but nothing happened—absolutely nothing. The *Monsoon* was making signals all the while—urgent signals, signals of real distress. 'Please tow me head to sea and wind as soon as you possibly can,' they said. 'Sea may smash in my after bulkheads, and cause ship to sink.'

'Am doing my very utmost,' said the *Mariner* in reply.

They certainly were. They could do no more.

By about eight-thirty, at which time both ships were still in the trough of the sea, and the *Mariner* was oscillating like the pendulum of a clock, thin, drizzling rain came to add to their discomfort.

'Damn it all!' growled Wooten between his teeth, 'we must do something drastic. We haven't budged an inch since we started.'

'For heaven's sake, don't go any faster, sir!' protested MacDonald. 'The wire won't stand it. It's on the verge of carrying away as it is.'

'We shall have to chance it, No. 1. We can't spend the whole night messing about here like this.'

He solved the difficulty by going slow astern with the starboard propeller and putting the port engine-room telegraph to 'half-speed ahead,' and gradually increasing the revolutions of the port screw to sixteen knots. This exerted a

greater thrust, tending to turn the ship to starboard, and at last, after ten minutes of it, she actually began to move.

'How's she going now?' Wooten inquired five minutes later.

'Comin' round very, very slow, sir,' said Willis. 'She's at south-forty east.'

They persevered. Sometimes the ship swung round a matter of ten degrees or so in the right direction with a rush, only to fall back seven of them a moment later. Sometimes the lubber's line of the compass went back beyond the original starting-point, but generally they managed to gain a degree or two. The *Monsoon* had been in tow at seven-fifteen, and it was not until three hours later that they finally got her on to the desired course of south-west.

The mere recital of the incident seems commonplace and trivial enough; but to Wooten the period was one of poignant anxiety, for the damaged ship, judging from what could be seen of her in the glare of the searchlight, seemed to be on the verge of capsizing. Her signals said as much, too; and if her bulkheads had burst, and she had turned over, the *Mariner*, with a wire made fast to her stern, and a gale of wind blowing, and a sea running in which a small, heavily laden boat had very little chance of remaining afloat, would have been able to do little toward saving her crew. They would have attempted it, of course, but all would probably have perished together. Moreover, in the darkness and generally bad conditions which prevailed, there was always the chance that Wooten would have had luck, and damage, if not lose, his ship. If he did that people would call him a silly fool behind his back, and would say he should have known better, while his career in the service might be marred. If, on the other hand, he succeeded in doing what he set out to do, the powers that be might pat him on the back and call him a good boy, but very possibly would refrain from doing anything of the kind. The standard in the navy is ever a high one, and in time of war incidents of this kind are all in the day's work.

But all's well that ends well, and on this particular occasion Wooten did succeed, and the *Mariner*, with the *Monsoon* in tow, steamed slowly off toward the land. The speed they made was roughly three and a quarter knots, perhaps a trifle less; but it was all in the right

direction, and by midnight the damaged vessel was under the lee of the shore and in safety. They finally dropped the tow at six o'clock the next morning, when the skipper, in a sudden fit of exuberance, went on faster than he really should have done, and promptly parted the wire. But no harm was done, for by this time they were in calm water, and a light cruiser was in attendance.

The same afternoon he met the commanding officer of the *Monsoon*.

'Well, Peter,' said the latter, 'we got jolly well out of that show last night.'

'By George! yes,' Wooten agreed. 'I thought we'd never get you round head to wind. How did your chaps take it?'

'They weren't particularly cheery at first,' said the other, laughing. 'But as soon as you got us in tow they spent their time singing "Lead, kindly Light." You know how it brings in "The night is dark, and I am far from home," so it was quite suitable to the occasion. The ship was in a shocking mess, though; and when the mine went up it blew the after storerooms and most of the wardroom into the sea, so we hadn't any food. We were all jolly glad to get back into harbour again, and it was only by the mercy of God that we had no casualties.'

Wooten nodded.

'I suppose you know, Peter,' continued the other, 'that we were bang on the top of a Hun minefield.'

'Minefield! I thought the one that got you was a floater.'

'Don't you believe it. They tell me the place we were in is strewn as thick as peas. You can thank your lucky stars you didn't bump one.'

The possibility of the *Mariner* also being blown up had never really occurred to Wooten at the time. Perhaps it was just as well for him that it didn't, and that the taking of the *Monsoon* in tow gave him little or no time to think of anything else. 'Great Scott!' he observed, with his usual slow smile and a little whistle of astonishment; 'I'm glad we didn't come a mucker—jolly glad! What about a glass of sherry to celebrate the auspicious occasion?'

'I'm on, Peter,' said his friend; 'but I really think it's up to me to pay for it.'

(Continued on page 711.)

PAGES OF PEACE FROM DARTMOOR.

CHAPTER III.—PILGRIMS.

IN my last book I described the traffic that goes on through the Dartmoor window with the natives. Since that book was written, eighteen months ago, a new traffic has arrived in the form of those who, either in person or by letter, are

sufficiently interested to come. Sometimes I am accused of being an idealist. This annoys me, because the term suggests a person who is always star-gazing rather than seeing reality on earth, or else some one who wilfully ignores the

worst in human nature, and who portrays only the best. But if every one lived my life for a week he would view humanity as I do. Sometimes I wonder if there is something magnetic about the moor which attracts kindness and repels conventions. This country is of volcanic origin, and it seems to me that the human hearts which come into contact with it are always burning with love, and ready to pour it forth at the least pressure in countless gracious ways. During the past year the Dartmoor window has become quite a place of pilgrimage for persons of all shades of thought and from all parts of the world. They arrive by various means—on foot, by bicycle, on horseback, in carriages, by motor-cars. Some spend much time and money in getting here. They all reach here as strangers, and depart as friends. We are too far ever to be a prey to the merely vulgar curious, so we are quite certain that we want to see every one who comes. It is impossible to do justice to the unfailing kindness of these pilgrims; but it is good to try to, for it is good to describe, however feebly, the great fire of kind-heartedness which burns steadfastly here in the arms of the tor-crowned hills.

To begin with, the humility of the pilgrims makes me weep. They behave as if I were doing them a favour in seeing them, instead of the other way round. Then they all love and understand and appreciate everything they see. They miss nothing. If they do, they ask for it. That, I think, is the most touching. Some trivial thing mentioned in one of my books is asked for—a thing I have often entirely forgotten. Yesterday three ladies came—strangers as usual—and were really hurt because my typewriter was not in its usual place in the Dartmoor window, I having taken it into the drawing-room to write these articles, where I should not disturb people. Well, fancy caring whether some one else's typewriter was in its place or not! One man, with his sweet wife, came, saw everything, and said 'Good-bye.' He had actually reached the door, when he suddenly exclaimed, 'There now! I have forgotten the crystal ball.' He returned solemnly, found my writing-table, inspected the ball, and left. And he was a hardened lawyer. Some of them arrive with a list of certain things they wish to see, and they work conscientiously through them from beginning to end. Sometimes I wonder what I should do if all my pen-work or any of it were not literally true to life—even down to the crystal ball. It is pathetic beyond words to find how people care for the tiniest thing so long as it is real. It has always been my instinct to write only exact fact, but the past year has perfected my education upon that point.

Sometimes people are too shy to come to the door. They walk meekly up and down the road till we speak to them. One lady, I remember,

who arrived in a beautiful car, left it round the corner and walked back past the window, remarking in loud tones, 'Is any one at home to-day in the Dartmoor window? Is any one at home to-day in the Dartmoor window?' It is almost superfluous to record that she was a thoroughbred. It takes a thoroughbred to do such things. Men are, of course, much the shyest. They lack the brazen nerve of my sex in such matters. Usually their sheet-anchor is to ask the way to the nearest town. I think the prettiest thing that ever happened with the pilgrims was one autumn Sunday afternoon last year. A car drove up, and three men got out. Two had not nerve enough to do anything; but one, braver than the rest, walked several times sadly past the window. I was out; but the Rainbow Maker, who is conversant with the symptoms, humanely smoothed his thorn-set path by sending out to inquire if he wanted to know the way, or if she could do anything for him. He took the tide at the flood, and said boldly, to be quite frank, he wanted Miss Beatrice Chase. He was informed she was out, but would be in at four, if he cared to wait. He did. So did his two friends. They came in, and were sweet to the Rainbow Maker, who, to entertain them, said they might go by themselves and look round the house, since she was too lame to escort them.

So they wandered about, and eventually came back to her, full of a certain old Indian tortoiseshell cabinet, one of her most beautiful possessions. During the conversation about it, she told them of the theft many years previously, before it came into her possession, of four silver Hindoo gods which used to stand in olden days at the four corners of the cabinet roof. A week later came a heavy little registered parcel for the Rainbow Maker, and when opened it was found to contain four wonderful and exquisite engraved silver Indian gods for the cabinet, to make up to her for those which had been stolen. One of the three gentlemen happened to have a collection of these little images. We often tell this sweet fairy story of how three strange men drove up to the Dartmoor window and handed in four silver gods to the Rainbow Maker. Do such things happen anywhere else? If so, let us hear about them, please.

On another occasion a family came—father, mother, son, and daughter. How sweet those people were to us and to each other! It was good to watch their mutual devotion by all sorts of little signs of which they were unconscious. During their visit they noticed several little cardboard boxes lying on the table beside the Rainbow Maker's lovely Venetian glass necklaces that she was making. They asked if she had difficulty in obtaining such boxes, which are necessary to put necklaces into for travelling either by post or when ladies come and take the

necklaces away with them. When she answered, 'Yes, great difficulty,' father and son whispered together, and a few days later came a beautifully packed box containing several dozen small cardboard boxes of exactly the required size and shape. The young officer, on his last leave before going on active service, had packed and sent them himself to the Rainbow Maker. Well, think of a young man caring or taking the trouble!

The people who cannot come in person come by letter, and send countless gifts. All last July every day was like a birthday. Presents came from all parts. Perfumes, cut-glass, lace, books, pictures, old brass—it is impossible to enumerate them all. And everything is sent in the same spirit, as if I were doing the sender a favour by accepting the things, instead of being under a glad obligation to them for their sweetness in giving. At times my presents take a very practical form, which amuses me and my friends vastly, and shocks the Rainbow Maker. Intimate friends write and ask me what I would like for my birthday. Well, I tell them exactly what I should like. It seems to me both silly and ungracious to let people waste money on something you don't want when they really care to make you a present. A girl wrote last year asking the question, and I replied, 'Jam and a cake.' It was in the days when I was practising war economy, a thing I have long since abandoned. She answered, 'I sha'n't send you either. You only want them for soldiers.' I replied, 'If you didn't want to know, why did you ask me? I have never sent cake or jam or anything else to any soldier in my life, and I never intend to. From all I hear, they are much more able to send such things to me.' The girl was so overjoyed that she sent me two huge cases of home-made jam, sufficient to last six months. And an iced cake appeared once a week for the same period of time.

Another and still older friend asked the same question once upon a time, and to him I promptly replied, 'A cooked lobster and some blocks of camphor.' He answered begging me not to 'jest on so serious a subject as my birthday present.' I explained that lobsters and camphor are my two passions, and I never get either, because the Rainbow Maker restrains me. She disapproves of my passion for lobsters, because she says they are unclean feeders, and she actively dislikes me when I steal her blocks of moth camphor to suck, because she says it is poison. She has the most alluring squares of camphor—real camphor, not that horrible carbon

stuff—which she plants on the top of every drawer against moth, and then locks up. I watch my chance till a drawer is left inadvertently unlocked, pounce on the camphor, and remove it. When the Rainbow Maker finds me sitting in a corner peacefully sucking the block, she is so disagreeable that it struck me it would save much wear and tear on both sides if my friend would send me a supply for myself. I lose my self-control in the presence of blocks of camphor. I carry a block in my pocket. I suck it on and off all day. I pick little bits off the corners to get at the tiny glass ball things inside. I rub it over my hands and go generally mad about it. But my friend sided with the Rainbow Maker, and I never got either the lobster or the camphor.

This year, for my birthday, a friend is sending me two tins of poison. They are not for me, but for the weeds. My conscience still has war spasms, and I feel it is wicked to buy weed-killer when, if I put in a week's hard work, I could weed the cobbles inexpensively by hand. My friend differs violently. He has beautiful illusions that I can do better work in life than weeding. Hence the poison, which does the job in ten minutes. But what present could be more acceptable? Think of the time, the heat, the backache, the black finger-nails it saves. This is where the gifts are so touching. They are such intimate, personal things, affecting my daily life.

Last autumn, when we were all longing to buy bulbs, and virtuously not affording them, just about the time that *Punch* published a most amusing little poem about a man who lost his self-control and bought a whole five shillings' worth in war-time, a stranger from afar sent me a munificent gift of bulbs and bulbs and bulbs. At the same epoch a sweet crippled lady living in the Channel Islands, where vegetation is, of course, beautiful and luxurious, presented me with wonderful things. Between these two, the garden beds and walls this spring have been 'a proper show,' as they say in the vernacular. Every possible shade of magnificent tulip was here, golden trumpet daffodils, lots of the tiny vivid heavenly blue hyacinth; and I was even able to share my joys with the inhabitants of the farm and the cottages. Another friend sent two purple clematis, and a Reine d'Or climbing rose; and, as all these things are perennials, my home will blossom indefinitely with the sweet and gracious kindness of these pilgrim 'ships which pass in the night.'

THE END.

A SCOTTISH LAIRD OF THE SEVENTEENTH CENTURY.

By LADY SKERRINGTON.

A GREAT deal has been said and written about the state of barbarism in which our Scottish ancestors lived until after the time of the Union; and if a thing is repeated sufficiently often, and with sufficient assurance, it is generally in the end accepted as true. The descriptions of the country that gave rise to these traditions were mostly written by English travellers, who recorded in far from flattering terms their impressions of the country and of the people. But it would have been too much to expect that after the two nations had lived at enmity for hundreds of years, they should suddenly settle down to live in brotherly love merely because they happened to be both ruled by one king. It is easy to comprehend that the English traveller would look upon all things Scottish with a prejudiced eye; and it is equally probable that the Scots looked upon these travellers as strangers spying out the land, and therefore did not trouble to show them what was best in their country.

Even though the Union is an old story now, Scotland has retained her distinctive nationality to this day. It often happens that a Scotsman when travelling abroad will be asked, 'Monsieur is English?' And he will immediately reply, 'Oh no; I am Scotch.' He knows, of course, if he comes to think of it, that he is *British*, but he would never allow himself to be described as *English*! This is a peculiarity that few English people realise.

Fortunately a few documents have come down to us that emanated from Scottish sources; and of these not the least interesting is the diary of George Home of Kimmerghame. He was not merely a laird of some importance in Berwickshire, but was related to many of the most influential men of the day in Scotland; therefore these records, which cover a period between 1694 and 1705, ending only ten days before the writer's death, give a wonderfully vivid picture of the life of a Scottish laird of that period.

The diary is a model in its way. It is beautifully written, but in such minute characters that it is almost necessary to use a magnifying-glass to read it. Scarcely a day was allowed to pass without some entry being made. The state of the weather, the direction of the wind, and careful details of his domestic arrangements were recorded, as well as matters of graver importance.

George Home seldom alludes to his early life, though he had been made the hero of a curious and romantic story. The Laird of Ayton, in Berwickshire, who must have died some years previous to 1677, had left his whole estate to his only child Jean. As she was very young,

she was bequeathed to the care of the Countess of Home, who was directed to bring her before the Bar of the Privy Council when she should be twelve years old, so that she might choose her curators in the presence of her general kindred.

Certain members of the Home clan, however, seem to have thought that they could arrange the child's future better themselves. Accordingly, in December 1677, when she was nearly twelve years of age, a number of them, amongst whom were Sir Patrick Home (afterwards first Earl of Marchmont), Robert Home of Kimmerghame, Home of Ninewells, Johnstone of Hilton, and others, abducted the child, and carried her over the Border. There 'they, in a most undutiful and unchristian manner, carried the poor young gentlewoman up and down like a prisoner, protracting the time till they should know how to make the best bargain in bestowing her, and who should offer most. They did, at last, send John Home of Ninewells to Edinburgh, and take a poor young boy, George Home, son to Kimmerghame, out of his bed, and marry him to the said Jean the very day she should have been presented to the Council.'

The ceremony was wholly irregular, and performed by an English minister, 'opening thereby a new way to slight the clergy of Scotland.'

The Council dealt with the offending parties in strict terms of the statutes which they had broken. The young husband lost his interest *jure mariti*, the young wife hers *jure relictæ*. The former was fined in five hundred pounds Scots, and the latter in a thousand merks. Ninewells and Hilton were also fined, the Earl of Home was imprisoned in Edinburgh Castle, and the young couple suffered three months' imprisonment there.

Of the after fate of the poor little bride nothing seems to be known, except that she died in 1684, and left no children. Lord Crosrig, in his *Domestic Details*, mentions that George Home went to France in that same year. Probably, like many other Scottish gentlemen at that period, he found it advisable to seek the hospitality of some other country during these troublous times. 'This was a sad year for the country,' Lord Crosrig writes, 'with circuit courts, and imprisonments, and Polwart fled in harvest'—Polwart being Sir Patrick Home of Polwarth, who was afterwards first Earl of Marchmont. Lord Crosrig adds later that 'against the mind of all his friends, George Home returned to Scotland in 1687.' His second marriage must have taken place shortly after, for in 1694 he is again a widower with one little boy two years old. The second wife

was the only child of Sir James Primrose of Barnbogle, elder brother of the first Viscount Rosebery, who is frequently alluded to in the diary.

A thing that strikes one as particularly noticeable, after reading George Home's careful record of his daily life, is that the life of a country laird in those olden days must have been a good deal livelier than it is now. Rarely a day passed without at least one visitor turning up at Kimmerghame, and often there were half-a-dozen or more. Certainly the visiting hours were much less restricted than they are now. Friends occasionally appeared as early as four o'clock in the morning, which in our more sophisticated days we might find embarrassing, but which seems to have been taken quite as a matter of course by George Home. When he was not receiving visits he was busy paying them. Polwarth House (afterwards called Redbraes Castle), Nisbet, Wedderburn, Kaims, Blackader, The Hirsell, Hutton Hall, Duns Castle, and many others were frequently visited; and all the neighbours seem to have taken a keen interest in one another's affairs.

Another thing that is very noticeable is the wonderful standard of culture that seems to have prevailed amongst the circle of friends who are alluded to in the diary. It is doubtful whether, in the present day, country lairds anywhere in the United Kingdom are in the habit of taking up for their recreation biographies and histories written in French or Latin. Yet these were in such request in Scotland at the end of the seventeenth century that, when visits were paid, volumes were generally carried round and exchanged. George Home apparently suffered in very much the same way as lenders of books do nowadays, and he kept a special book in which he carefully recorded the borrowing and the return of his books. In June 1694 he writes: 'Came home by John Fish at Castlelaw's house. He was not at home, but I found his wife. I found upon the table Bacon's *History of Henry the VII.*, which I lent him ten years ago. I brought it home with me; but he has spoilt the binding of it miserably; and beside inked it so in several places that it is not, or hardly, legible.'

On another occasion the diarist mentions that Sir John Home of Blackader—his cousin, and near neighbour—had been over to see him; and they had spent the afternoon reading 'Boileau's Letters,' an occupation that might overtax the energies even of the enlightened and civilised country gentlemen of the present day.

One extravagance that George Home laments is his expenditure on books. In 1694 he found that he had spent during the past two years one hundred and seventy-one pounds nineteen shillings, and remarks sadly: 'A little money given out from day to day comes to a considerable sum at the year's end.'

Though George Home's general reading was of such a solid description, he seems to have taken a very vivid interest in the events of the day, and constantly mentions that he has written to some friend in Edinburgh or London for news of what was happening; indeed, his correspondence seems to have been voluminous. Sir Patrick Home, who was first made Lord Polwarth, and afterwards Earl of Marchmont, and who was one of the last of the Lords Chancellor of Scotland before the Union, was a near relation and also a near neighbour. George Home was frequently over at Polwarth House, and he always seized the opportunity to read the *News Letter*, *The Gazette*, or the *Flying Post*; and he enters carefully in his diary any matters of importance he may have gleaned from them. These were the days of the ill-fated Darien enterprise, and George Home has much to say about it, and about the 'African Company.'

At present it is the habit to write and speak as if interest in education had entirely originated in this enlightened era. It is, therefore, instructive to read of the trouble and anxiety expended upon the subject by Scottish lairds more than two hundred years ago. In 1697 we find recorded by George Home, who was in Edinburgh, and had left his sister Julian in charge of his only child, Robie, who was then five years old: 'I wrote to Julian to see if she could entice Robie to ask a lesson from her by engaging John Lidgate to ask one.' John Lidgate was the manservant. This shows not merely anxiety about the child's education, but a kindly and tactful way of dealing with a child, which one would scarcely have expected.

In another place he says: 'Sir John Home came over to see me. We spent much time considering the best way to teach our little ones Latin.' It is to be doubted whether a consideration of this subject would seriously disturb the equanimity of the Berwickshire lairds of the present day!

George Home and his friends were constantly lending one another books which dealt with the subject of education, and also books for the instruction of the children. When Robie was eight he was already learning Latin, had begun to study French with his father, and had been provided with a tutor.

The care bestowed upon Robie's education does not seem to have been exceptional, for the school at Duns was already of some importance. In 1700 we find the scholars acting a play, to which their friends and relations were invited; and the description of the performance might serve quite well for that of a similar entertainment at a modern school.

At another time George Home mentions that the two sons of Sir John Home of Blackader had passed by Kimmerghame on their way to stay with their uncle, Sir Walter Pringle of Stichell, so that they might be taught writing

by the tutor of their cousins, who was a specially expert writer. Robie and the other boys seemed to be supplied with lesson-books, dictionaries, &c. with the same painful frequency that is deemed necessary for the modern schoolboy.

In agricultural matters, as in education, the interest and knowledge seem to have been much greater than is generally credited. We find George Home recounting, quite as a matter of course, that having found blight on the barley, 'like a small orange-coloured dust just under the beard,' he took some of it home with him, and examined it under a microscope. He adds: 'It looks round and transparent like amber, whence I imagine it is the spawn of some fly.' Whether or not he was right in his idea, it at any rate shows what an intelligent interest was taken by country lairds of that time in agricultural matters. In the present day country gentlemen do not generally keep a microscope at hand wherewith to puzzle out such questions. If they had such an instrument, it is doubtful if many of them would know how to use it.

In ordinary household matters we might, with advantage, take some hints from our far-away ancestors. Whenever a new servant came to Kimmerghame a careful inventory was taken of everything that was placed under her care, and two copies made, one for the servant and one retained by George Home. When the servant left, this inventory was checked. In his choice of servants the diarist was very particular, and in 1695 he writes: 'Margaret Johnstone came home yesternight, and this night told me that she was going away, but had engaged one of her sisters in her place. I told her I did not desire to have servants till I had seen them and agreed with them myself.'

In September 1700 the terms of the engagement of a manservant are entered in the diary in a most business-like manner: 'I hired Jammy Orange, who was once with Lady Hiltone; he is to come home after Aytone Fair-day. I am to give him a livery coat, and breeches, and a pair of shoes in the half year, and £6 Scots. The livery is mine, and he is to wear his own clothes at work; and is to run and ride as I shall order him, thrash, ditch, and go to the coals.'

English writers have constantly stated with horror that no drinks were known in Scotland except light sour claret and thin new beer. If a large variety of alcoholic drinks is really the hall-mark of civilisation, this stigma of barbarism may be for ever removed from the Scottish people, as George Home and his friends had quite a goodly assortment of liquors: beer and ale, brandy, rum, French light wine, sack, and flasks of wine from Florence. 'But these last,' George Home remarks, 'we did not care for, as we thought them composed.'

If we were to believe English writers, roads suited to vehicular traffic were unknown in Scotland until after the Union, 'even the most

delicate ladies being obliged to make all their journeys on horseback.' It is, therefore, interesting to read that most of George Home's friends owned carriages in which they drove about paying visits, and in which they travelled when they made journeys. 'Coaches,' 'caleches,' 'Berlius,' 'chariottes' are all mentioned; and there were, at any rate, three routes by which the Berwickshire gentry used to drive to and from Edinburgh. One route was by what is called 'the west road.' This went by West-ruther, Lauder, Ginglekirk (now Channelkirk), and over Soutra Hill. Another route was by the 'post road,' by Preston, Quixwood, and Butterdene, Blackburn, Eccle, and Fulfordlees to the post-house at Cockburnspath. As there is generally a good deal of discussion as to the old pronunciation of names, it is interesting to note that George Home always spells Cockburnspath 'Coberspeth'; and, as his spelling of names is always phonetic, we may conclude that that is how the name was then pronounced. The third driving route went from Berwick through Ayton, and over Coldingham moor to Cockburnspath and Dunbar.

George Home himself generally travelled on horseback, and very often used another road by Preston, and across the moors to Gifford. But this was probably only a bridle-road, as he never mentions meeting any coaches upon it, as he does upon the others. Even this road cannot have been very bad, as he records, on one occasion, that he left Edinburgh at twelve o'clock, dined at Gifford, and reached Kimmerghame at eight o'clock. This meant good going, as the distance must have been at least forty-two miles, and for a good part of the way over wild hill and moorland. On arriving in Edinburgh, on another occasion, he writes: 'The way was extremely well-paved and good, so that I told them that asked me that the sands of Musselburgh was the worst way I had got; and they were as good as they were used to be.'

In the present day people are fond of recording the time taken for runs by cycle or motor; but the taste is not a new one. Over two hundred years ago we find George Home timing himself on a ride from Kelso to Kimmerghame just as carefully and minutely as might be done now: 'About 2 o'clock I took horse, and came home. From Kelso to Ednam I rode in 21 minutes, from that to Eccles in 33, to Mersintone in 24, from that to Thos. Mitchel's in 29, from that home in about as much.'

Before the end of the seventeenth century there were both hackney-carriages and mourning-coaches in Edinburgh. At the funeral of Lady Anne Hall, a daughter of the first Earl of Marchmont, three mourning-coaches followed the hearse to Dunglass, and 'a hackney with the Lord Provost of Edinburgh.'

In those early days Scottish lairds had already begun to take a great interest in their gardens

and in arboriculture. Frequent mention is made of orders for large consignments of fruit-trees from Holland, and of seeds of various kinds of trees and of vegetables, which were got from London. Several of the neighbouring lairds seem to have combined, and sent an order at the same time, which probably reduced the cost of carriage. The packages were sent by sea to Berwick or Leith. It seems likely that thorn hedges were already being used, as in February 1699 the diarist notes: 'I got a letter from Sir John Swintone for 1000 thorns, which I granted, he promising me that number of Dutch ones next year.'

It is pathetic to read how many out of the circle of George Home's friends and relations seem to have died from consumption. People were constantly sinking into a 'decline,' and then wasting away. As the favourite remedy for all ailments was bleeding, it is perhaps scarcely surprising that it is never recorded that any one recovered. On two occasions, however, quite a modern course of treatment was followed. On the one occasion two ladies who were threatened with consumption were sent to Alva 'to drink the goat's milk.' On the other, Baillie of Jerviswood, who was suffering from rheumatism and deafness, was sent to Prestonpans for steam baths at the salt-pans; but, as with the salt-water treatment of modern times, the relief seems to have been only temporary. Doctors were apparently quite well paid, for the diarist records the fees he pays on the occasion of their visits, and a guinea seems to have been a usual payment.

George Home was evidently not a greedy man, as he seldom writes anything about food, except on such occasions as when he was invited 'to eat a solan goose,' which was apparently deemed a delicacy. But he always records the orders he has sent to Berwick or Edinburgh for things for the household, and the lists are curiously reminiscent of our own. Oranges, lemons, prunes, coarse sugar, a sugar-loaf, spices, and so on seem to indicate that the style of living cannot have been very rough; and whenever a messenger was sent to one of the towns, he was always ordered to bring back 'a loaf of white bread.' At other times scones were probably used instead; and mention is made of peas being stored for the servants' bannocks. The appearance of the first dish of asparagus, green peas, strawberries, &c. is generally noted, and the dates compare quite favourably with the dates at which they appear in the present century.

An old diary brings back with wonderful vividness, across the mists of years, scenes and people that have long passed away. Little incidents and anecdotes are recorded that would have been ignored as trivial by the historian, or probably might not have been known to him. But it is just such small details that clothe the dry

bones of history with life and interest. Here is an account of an incident in Edinburgh in 1700: 'We have had an account that the Spaniards had sent 3000 men from Carthage to attack our colony. Our people, having intelligence, sent 300 men, who lay in ambush and defeated them, killing 300 of them. It seems, on the news of this, the Marquis of Tweeddale had some friends with him, and put up illuminations; several others did the like. Upon which the mob gathered, and, having first secured the Ports, went and broke all the glass windows in the street that had not out illuminations. Then they fell on the Town Guard, and disarmed them; then went to the Advocate, and desired to be admitted, which was presently done. There they demanded a warrant to set at liberty Heugh Paterson, the apothecary, and — Watstone, the printer, whom the Council had imprisoned for printing and disposing the Grievances.

'The Advocate was wise enough not to deny them anything they demanded, telling them, "My hearts, you shall have it," and presently signed it.

'And, when they were going away, he said to them: "My hearts, cast no more stones at the glass windows." Being asked "Why?" "Lest it be ye miss the windows, and the stones hit the walls and come back, and hurt some of yourselves!"

'From that they went to the Tolbooth, and the Keepers having retired, they set fire to the door, and got in; and not only took out the two mentioned, but dismissed all the prisoners (except two). Lantone got out, and is come home, and gone to England. They broke up Seafeld's cellar, and drunk out his wine. The magistrates durst not appear. B. Johnstone, who thought he might have friends amongst them, returned, but was beaten by them. There are some killed, either of the guard by the mob, or of the last by them. They say there were several gentlemen with them, and that Earl of Marcell and Lord Drummond were seen with them. Row's regiment is now in possession of the Ports, and I think there is a design to make trial, and prosecute the ringleaders.'

A few days afterwards there is an entry which, at the present time, one reads with an understanding sympathy.

'I got a letter from Sir John with a doleful account of our Darien affair. He tells me that when all were big with the former account of our victory, there came on Wednesday night account that the Spaniards had attacked us by sea and land, and routed us, and forced our people to capitulate. This, it seems, he looks on as certain, but tells not what way it came; but says that the Spaniards could not have done it without the help of their allies. God, who brought light out of darkness, I hope will yet bring good out of all these troubles; let

us pray our sins may not stop His mercies ; and grant, Oh Lord, that I may so number my days that I may apply my heart unto wisdom.'

'It gives one to think,' as the French say, when one reads the daily jottings of a man who died two hundred and eleven years ago, and when one realises how little progress we have made since his day in the things that really matter. Of course, there were men then, just as there are now, who acted meanly and dishonour-

ably ; but on the whole, after finishing the reading of the diary of George Home, one's chief feeling is that one has had the privilege of being admitted into the society of cultured, honourable, and interesting people. Their readiness to help and advise one another, and to sympathise in one another's joys and sorrows, might well serve as an example to us in the present day ; and they deserve to be honoured and remembered, as this old manuscript ensures shall be the case.

THE KOLA PENINSULA, OR RUSSIAN LAPLAND.

By G. LINDSAY.

ACCORDING to information recently received from Norwegian sources, it would appear that the line of railway which is to place Petrograd in direct communication—*via* Kun, on the south-western shore of the White Sea, and Kandalaks—with an ice-free harbour on the Murman coast of the Kola Peninsula will in all probability be completed before the end of the year. Interest, therefore, attaches to that remotely situated portion of the Russian Empire.

The great Kola Peninsula, which may be described as bounded on the east by the White Sea, on the north by the Arctic Ocean, on the west by Norway and Finland, and on the south by the White Sea and Karelia, covers an area of approximately forty thousand geographical square miles, of which at least one-half consists of treeless and barren tundra, about three-eighths of forest (pine and birch), and the remainder of lakes and swamps. Its water-systems may conveniently be divided into two groups : those which flow northwards into the Arctic, and those which discharge into the White Sea. Of the former, the most important, between the Norwegian frontier and the Kola Fjord, are the Peisen, Bomenijok, Latscha, Ora, Tschadnajok, Tulern, and Kola or Guollejok ; while the vast tracts of desolate tundra which extend from the Kola Fjord to the east coast are traversed by a number of streams, of which the largest are the Tiriberka, Vuronje, and Jokonga. The Tsohavanga, Varsuga, and Umba flow southwards, as does the Niva, which discharges the waters of the beautiful Imandra Lake into the Gulf of Kandalaks. The only river which runs from west to east is the Ponoï, a majestic stream, which is more than half a mile wide at the mouth. With the exception of the Niva, which has a very rapid course, none of these rivers presents any natural obstacles in the way of falls to the migratory fish, and salmon ascend without difficulty to their upper waters. As a rule, ice begins to form on the lakes about the end of October, and does not break up again until the following May. By a provision of nature, heavy falls of snow invariably occur before the setting in of severe cold, so that the ice is

prevented from attaining a degree of thickness which would be injurious to fish-life.

In addition to salmon, the inland waters of Russian Lapland abound with trout, grayling, and pike, so that when peace returns once more it is probable that British anglers will take advantage of the new railway in order to exploit this wide field of enterprise. Here, however, it may be interpolated that whereas salmon may be taken with the rod in Finmarken in the middle of June, they do not make their appearance in the Kola Fjord until a month later, and in the Gulf of Kandalaks until August. The Murman coast, which extends for a distance of nearly three hundred miles from the Norwegian frontier on the Jakobselv to Svjatoimos (the Holy Cape) at the entrance to the White Sea, has long been celebrated for the quantities of fish which frequent it. Of these the most important species is the cod ; but halibut, coal-fish, haddock, and flounders are also captured in large numbers.

With regard to the herring, a well-known Russian writer states that 'they occur along the coast from the Kola Fjord to Archangel, a distance of one thousand versts. They are also taken in the Gulf of Kandalaks and along the coast to Petschora, a distance of fifteen hundred versts, and they are captured still farther to the eastward at the mouths of the Obi and Yenisei.' 'To the Kola Fjord in autumn,' says Boguslav Bjelomorski, 'there come such shoals of herring that the inhabitants catch more than they know what to do with by means of nets set just outside their houses ;' and in his *Statistical Survey of Russia* Nabolskin remarks : 'When the herring come in from the Arctic to the White Sea—generally in July—they are often so closely packed together that they form huge solid masses. Followed by other fish, they enter the fjords, bays, and mouths of the rivers in such numbers that they cover the shores for long distances. . . . The White Sea herring,' adds this writer, 'are fat, white, and of good flavour, and when salted are not at all inferior to the Dutch.'

In the middle of the sixteenth century the

monk Trifan of Novgorod, the apostle to the Lapps, built a church and founded a monastery at the mouth of the Petschenga, where it enters the Peisen Fjord. In 1556 he journeyed to Moscow, and there obtained from the Grand Duke Ivan Vasilivitch a deed of gift, according to which all the surrounding district was conveyed to the monastery. This document proved a valuable one; and owing to the advantages it conferred, the Peisen Kloster became the most important place on the Murman coast. The monks had their own flocks and herds, they had whale and other fisheries, they built vessels, and they did a considerable trade with foreign countries. Amongst other matters, they despatched twenty thousand pood of salt annually to the interior of Russia by way of Kola, receiving in return flour, wax, linen, &c. The monastery would seem to have attained the height of its prosperity in 1590, when it was attacked and burned down by the Swedes, some two hundred persons perishing in the defence. After that the monks re-established themselves at Kola, and about the beginning of the eighteenth century the monastery which they had erected there ceased to exist.

For the terminus of the Murman Railway, as it is already called, the Russians have selected a spot near the outer end of the Kola Fjord, where the ice presents no difficulties to winter navigation; and at the head of that long Arctic inlet stands the little gray town of Kola. Hither in 1556 came Burroughs in search of intelligence concerning the unfortunate Sir Hugh Willoughby, who, it was afterwards ascertained, perished of cold and hunger, with the crews of his two vessels, on the Arzina River, near the entrance to the White Sea. In the bay he found thirty *ladjes* about to start for Nova Zembla; and here in 1594 Barents found many Russian craft lying. Archangel, Onega, Kem, Mezèn, and other White Sea ports used to vie with Kola in fitting out vessels for the Arctic island groups—Spitzbergen, Jan Mayen, &c.—the principal objects of pursuit being the bear, reindeer, beluga, fox, walrus, and seal. In 1835 no fewer than eighty vessels carrying one thousand men left these ports for Nova Zembla alone. They sailed at midsummer, and most of them returned in autumn; but they were provisioned for eighteen months.

Two important rivers enter the fjord close by the town of Kola. The largest of these, the Tulern (Flood River), is navigable by boat all the way up to Miot-javre, next to Imandra the most extensive sheet of water in Russian Lapland; and salmon not only enter that lake, but ascend its main confluent as far as the frontier of Finland. The lower reaches of the Tulern are slow-flowing and lake-like in character; but at a place called Galjebokkanjarga, fourteen miles from the mouth, the river contracts to a width of about one hundred and fifty yards, and there is a fine rapid, where salmon rise well to the fly.

The route for travellers from Kola to Kandalaks, a distance of one hundred and forty miles, runs along the water-system of the Kola River as far as the lake Guolle Javre; and should the weather be favourable the journey is an enjoyable one. More than a half of it is made in boats on lakes and rivers, the remainder by comparatively short tramps through forest.

Immediately to the south of Guolle Javre lies the narrow swampy neck of land which forms the watershed between the Arctic and the White Sea river-systems; and soon after passing it the traveller reaches beautiful Imandra (four hundred and seventy feet above sea-level), a fine sheet of water nearly sixty miles in length. On some of the numerous and large wooded islands with which it abounds, the Lapps keep reindeer all the year round; and it may be imagined that, when breathing the mosquito-laden atmosphere of the summer months, these animals frequently cast longing eyes upon the distant peaks and cool, snow-clad slopes of Umbolek Dunder, which for a distance of over seventy miles stretches away towards the north. At different points on the shores of Imandra log huts for the accommodation of travellers have been erected by the Government, and from one of these—Jekostrov—Mogylni Ostrov ('the Island of the Dead'), a Lapp place of burial, may be visited. There is plenty of sport with large trout, char, and grayling to be had on this lake, while salmon and grilse also are sometimes captured at the lower end. The remainder of the journey to Kandalaks can easily be performed in a day; but owing to the turbulent character of the effluent stream, the Niva, most of the distance—about twenty-one miles—must be traversed on foot.

FANCY'S WEAVING.

OUT of the purple dusk is Fancy weaving
End for a broken dream,
And her quick shuttle, through the dimness cleav-
ing,
Fashions a golden gleam.

The pattern long since wrought for Time's swift
folding
Was woven sombre-wise,
With here and there a brighter colour holding
Something of sunset skies,

Something of moonlit nights or twilight shading;
But this which she now weaves
Shows not the sunset colours softly fading,
Nor gray of summer eves;

Rather, 'tis as the noontide, great and glowing,
Heart of a golden flower
On its strong stem erect and proudly blowing—
Queen of the day and hour.

Busy the shuttle goes, her will attending,
Flying her fingers seem;
Till comes the golden thread to sudden ending,
Ending once more the dream!

CLARA SINGER POYNTER.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

THE month of October may follow the summer with such a season of mellow lights, of cool and exhilarating air, sparkling with a generous measure of sunlight, as to make of it the most pleasant of all the periods. Of late years nature's forces seem to have been disposed to brighten the atmosphere and the conditions of living for the people of these islands as the end of the cycle approaches, and so October, November, and even December have often afforded a fine climax to the glory of the year. The smell of damp autumn earth is like divine perfume, and the soft sunlight falling gently upon leaves of gold and red and brown makes a colouring than which nothing in the year is better. Incomparable is the beauty of the English autumn when in its happiest mood. And yet, if we but knew it, we are attracted to this season because of a certain pathos associated with it. Our emotions seem to have acquired a new and sudden tenderness. Here are some things, that were very beautiful, dead so soon. Where are the glorious roses? And this golden autumn, flaming in its brilliance, it too will soon be dead. It is but nature's final flash. There are few men who have described the passing effects of the changes of season on the emotions as has that prince of living essayists, M. Anatole France. One thinks of him now for a number of reasons. We have just read in *Le Temps*, of Paris, one of the finest newspapers in the world, a pretty semi-editorial account of his return to the Académie Française. For many years, so acute have been some feelings and differences of opinion, he has absented himself from all the sittings of the forty immortals who are such an authority upon literature and the arts as the world knows not elsewhere. Here is a high tribunal of true culture. One cannot imagine the foes of France achieving such a fineness of spirit as is represented by this body—despite all its mistakes and its little conceits—though they studied and wept and scourged themselves for a thousand years. It is a matter of race and the evolutionary product of ages. Whilst we are concerning ourselves keenly with the tremendous trade problems that will arise upon the conclusion of the war, and wondering how we shall grapple

with them, France and her Academy have paused to reflect that after the war the needs and circumstances of the higher civilisation, the affairs of the mind and spirit, the æsthetic, will most imperatively demand the closest attention, and so a little should be done in advance, in preparation. How splendid are the French! For spiritual quality there is none like them. We see how they have suffered in the war; we may try to realise their appalling losses, how prodigally they have shed their blood, while the invaders have been practising every conceivable kind of horror; yet invariably we find day after day in the leading French newspapers, and particularly in the majestic columns of *Le Temps*, a treatment of matters of art and literature at such length and with such a rare discrimination and exercise of the finest critical faculty as nowhere else, in the war or out of it, at the present time. The French Academy then, like the Chambers of Commerce elsewhere, has its mind upon the future, and doubtless it considers that the work and responsibility with which it is occupied will be the most important in the new time of peace. If we are fighting this war for the preservation and nourishment of ideals, and not for poor commercial reasons, should we not hasten afterwards with the application of the ideals to the best work of mankind? So the Académie Française seems to think, and in all likelihood on the day of peace it will find itself greatly enhanced in the opinion of the civilised world. Its friends declare that it will be one of the first institutions to benefit from the *éclat* that the victory of a people causes to shine upon all it is surrounded by, from its ideas, its sentiments, and its manners to its history and its institutions. The Académie, it is prophesied, will present the point of view of the intellectual world. Now an Académie without M. France would indeed be wanting in something for which no sort of substitute can be found, so the other immortals, as they are called, needing him for his authority, his counsel, and particularly for his share in the election of future Academicians, beckoned to him to resume his seat, and he has done so. It was feared there might be some embarrassment after such an absence, that the exchange of greetings on his return

might be a little awkward; but are not the French masters of every nicety of conduct and deportment? The Académie was delighted to the uttermost upon the occasion; yet it betrayed not a trace of its joy, nothing of surprise, and only showed a smile of welcome. It regarded the exigencies of the case as simple. Here was a guest, as it were, who, for reasons best known to himself, had not had occasion to visit them for some time. It was not for them to assail him with questions upon the subject of his absence if he himself did not wish to speak of it, or even to express anything in the nature of surprise. The mistress of the house invites him to take his place among the guests, and the conversation flows on from the point at which it had been momentarily interrupted. M. France has resumed his seat under the cupola.

* * *

M. France, we set out to remark, has a fine touch with his pen when, as is his wont, he opens one of his shorter essays with a passing reference to prevailing and extraneous circumstances. It was *Le Temps*, by the way, to which years ago he contributed that matchless series which has its place in permanent literature with the title of *La Vie Littéraire*, and in which he used to write with a certain sadness or gentleness when the autumn sped on. You may picture him on the eve of his departure from the country to the lights and life of Paris at the end of the pleasant season. 'The first cold winds of winter,' he writes, 'are beginning to drive us back to town. The days are getting short and gloomy. While I am writing this, by the fire-side in a lonely house, I can see the red moon rising at the end of a glade now strewn with dead leaves. Everything is silent. An infinite sadness spreads out to the horizon. Farewell, ye long sunny days, ye luminous and tuneful hours! Farewell, ye fields, and your untroubled rest! Farewell, earth, beautiful, flower-strewn earth, mother earth from which we all come, and whither one day we shall all return!' And he proceeds to tell us that then, when his boxes were all packed, he had but a single volume loose for his reading, a volume which he goes on to discuss. It was a book on the life of words by M. Darmesteter. And this tempts us to make a further note of something he once wrote in like circumstances, which has an increased significance for us to-day. Again it was autumn. The leaves had fallen, the cold winds were blowing, and the people had returned to the towns. 'Our schoolboys,' he wrote, 'have resumed their satchels, and are once again studying sound learning in those halls where so much ink has been spilt and so much chalk dust scattered around the blackboards. The first day of term is not generally feared. It is even more and more wished for as it draws nearer. The holidays are long and idle. The reopening unites com-

rades who have so much to say to one another. In short, it causes a change. That alone would make it welcome. The young like novelty. We should like it as much as they do if the unknown still inspired us with any confidence. But we have learned to distrust it. And then we know that life never brings anything new, and that, on the contrary, it is we ourselves who give it its novelty when we are young. The universe is just as old as each of us. It is young to the young. It is clothed for fifteen-year-old eyes with the tints of the dawn. It dies with us. It is born again in our children. Who of us is not anxious about a future which he himself will never see? For my own part, I follow the fortunes of our classical studies each year with a more eager and more anxious interest. Consider this, that our French culture is the noblest and most delicate thing in the world, that it is becoming impoverished, and that the most dangerous attempts to regenerate it are being made upon all sides. How, in such a critical time, could one look without emotion at a little schoolboy going to his school in the morning, with his nose in the air and his books upon his back?' What a new and ever fuller meaning have such sentences and thoughts for us now in this straining situation, when we look to the generation that is coming on for the justification of man and for a fair acknowledgment of the sacrifices that have been made for it. The world everywhere and in different ways is now anxious for the children. The other day I read in a newspaper of Madrid some beautiful lines written by a special correspondent in Russia. The ceremonies of one of the religious festivals were being described and commented upon with that nice feeling of which the Spaniards are as capable as any, and the writer declared: 'One of the most arduous duties that life imposes upon us is that of maintaining a firm foothold, so that our children may rest safely in our arms, and that of hiding from them our wounds, our disappointments, so that the rosy hours of their morning shall not be clouded by our sadness.' Yes, '*no se nullen con nuestro desaliento las rosadas horas de su mañana.*' The pathos and the sweetness of the words with their meaning seem to glow more beautifully in the Spanish in which they were written than in our English. And each of us realises now how the world is for the children, how to the best of our ability, and with all our strength and blood we have saved it for them. They will do well with it, they who now again are tripping gladly back to school eager for the renewal of their recent experiences. A glorious Britain and France are to be given to their keeping.

* * *

For the elders it seems more than ever that they must live on memories. There can be little placidity in their future times; the earth will seethe for long after peace is made. The highest

happinesses must often have been in the past ; and so at this time, when autumn comes hurrying on, leaves are falling, the fires are already set alight, and the blinds are lowered early, we inevitably turn to reflection, to memories ; and it is well we should. Surely this will be the last of the war winters that have borne so harshly upon the spirit. At all events we are now no longer to be accounted optimists for thinking so. Men in highest places think it ; and in the City, where, as we are assured, money always talks, they make wagers continually—at Lloyd's and at the Stock Exchange—that it will be so. True, nobody knows, but—the signs. We shall face this winter with a better heart. We move onwards. The spring shall smile upon our victory. Let us think of that as we draw the curtains with a sigh for the hour that is surrendered to the night again, and betake ourselves to the fireside to feed upon our memories. We realise again more acutely than before that the original moments of happy experience are but the preparation for a lasting pleasure, and therefore we should be most careful for the proper choice and ordering of our acts. Fine as may be the emotions of a moment, they are evanescent ; they are thin and vaporous. It is in memory that they are enriched and strengthened, and that their full value spreads through the spirit. Memories are like books and wine and friends ; they are often better for their age. If with a certain envy we consider the children now in their happy carelessness hurrying eagerly again to school, let us reflect that in one respect their elders have an advantage over them. They have the store of memory for the fireside nights.

* * *

There is a test at hand for the truth of this. Some of us, back again in towns for the last of the war winters, may consider long excursions in the way of needed holidays that shall be made again when the world upheaval no longer interferes. Many in the summer that has gone changed the old order of their arrangements, and in some lonely way went into the heart of Britain, and looked upon her in a fashion they had not done before. They have come to know England and Scotland, Wales and Ireland too, in a way they might not otherwise have done, and they have memories that will for ever hold the happiest places in their minds. They have come to realise the beauty of their land. They have known, for example, the ineffable charm, the solemn grandeur of mountains and lakes in Italy and Switzerland ; but, until strange circumstances led them to it, they knew nothing of the wondrous sweetness of the English Lakes. They did not understand that in their own splendid way there is nothing on the surface of the earth to equal them, and that Wordsworth, who lived his life among them, and loved them so, was right when he wrote that this is 'the

loveliest spot that man hath ever found.' Here are the sweetness and grandness of nature at their best, and the mark of England is on them all. There are mountains in full glory, and their majesty and their outline are none the worse if the Alps are taller. There are wild bleak passes, and there are the loveliest lanes. The view of the peaks at the head of Derwent-water from Castle Head, the solemn grandeur of Ullswater, the delicacy of Windermere, the commanding way of the Langdale Pikes, Helvellyn, Skiddaw, and Scaw Fell—these are unforgettable things. You do not know the possible charms of a journey on foot if you have not wandered from Ambleside by the leftward route past the dainty Rydal Water to Grasmere, where Wordsworth lived. Hereabout is an infinite variety of the higher pleasures ready for the taking, but there are some of them you will specially dwell upon in memory afterwards. You will realise the spiritual power of the colour of green. It is nature's colour, and nowhere in the world is it to be found in such perfection as in England, and nowhere in England as by the still waters of the Lake District. Here from the nourishing atmosphere it gathers a richness, a lustre, that is beyond imagination. As it is banked in varied shades up high from the water's edge in a stippled mass, it seems to lay itself soothingly, restfully upon the very soul of him who looks upon it, and makes him feel that indeed this is God's favourite colour, that in green there is His glory as in no other. And here, too, is a land of lovely flowers, with a rare wealth of roses everywhere, hanging over the walls of the waysides for a wanderer to pluck as he passes along. And no imagination is so weak but that it may be strung to many captivating fancies when even in the height of summer, with heat continual, there are seen silver threads in abundance on every mountain-side, the tumbling rills that started only just below the peaks that caught the water from the clouds. Here is exhibited one of the marvellous processes of nature. On the summits of the mountains we often find that the earth is soft and spongy ; it is laden with the water that the peaks have taken from the clouds. Soon it is collected sufficiently to make a little stream, and then, in gay freedom and independence, it slips and scampers down its narrow course on the mountainside. From below you see these silver threads in many places. They glitter on the rough flanks of Helvellyn, and, when their race is run, into the waiting lake of Thirlmere they flow. So ends their freedom. No more of the mountains and the clouds. No more leaping along the rocks. Thirlmere catches them for the use of the lowland creatures. For a while they are held still in this spacious compound, and then away they flow in the dark captivity of pipes south to Lancashire, for the Corporation of Manchester has bought this lake and

all its natural supplies, and depends upon it for the watering of its people. So you may think of rough Helvellyn snatching the water from the clouds that hug her, of the rills that splash from peaks to base, and then of dainty Polly far away setting on the fire a kettle laden with this liquid fruit of the clouds of Westmorland, that in a parlour of Lancashire all may sip their tea. From the spout of the kettle the steam flies hissing with a song; but there is some pathos, if you knew it, in this kitchen scene. It is like a swan-song of the dying water. Here at the happy hearth a little of it is vapour again, just as once it was in those days of freedom when it played about the high points of old Helvellyn.

* * *

They tell us in these parts that people from the south of England go seldom there. They do not know; and they appear not to wish to know. To them it seems to be only England. At a large lakeside hotel last summer there was only one person from the capital; but there were seven Chinese, persons of some distinction in their own country. At a local shop it was said that foreigners like these are their best customers. One salesman asserted strangely that more pictorial post-cards go to China in a summer season than are addressed to London. This is cold information to reflect upon. The war, at any rate, should have brought us nearer to England in this and a hundred other ways. For the sense of peace you should rest upon

these waters in the evening when the sun is setting. Row to the middle of Windermere, and let the boat lie still in solitude, as darkness gathers round. Here is a scene of loveliness. Over the tops of the Langdale Pikes the sun gives way in a dazzle of rose and gold. A copper glow is spread upon the waters, and the surface seems as if it were aflame. The fires burn low, and shades of saffron spread about the peaks instead, and then at last a pale, thin blue tells of the end of this majestic transformation scene. The sense of glorious solitude increases as the night comes on. From far on the waters come the voices of English girls singing a homeland song. From their boat they will try the echoes of the mountains, and the cry they utter flies from hill to hill, and seems to be heard again miles away somewhere around the Scaw Fell range. Over the castle of Wray the harvest moon ascends, and shoots a silver gleam across the water. On the other shore the dull lights of Low Wood make a feeble but harmonious gleam. Then, with the dissolving warmth of day departed, the mists descend. They wrap themselves round about their beloved hills, and hide them from the world until the morning breaks again. No voices, no singing now, no light but from the moon. The water is so still and wide. One is so much alone, and yet, as one feels, alone with England. It is one of the good memories for the fireside, as the autumn marches on to winter, and the war is nearly done.

THE POWER OF THE DOG.*

By DOROTHY E. PAUL.

WHEN the spring winds shrilled over the Land that is Desolate, and the sun, waxing daily in strength, brought to life the mosquito and black fly, there came forth from the interior of Labrador a gray wolf seeking a mate. He chose a bright-eyed, red-coated 'husky.' Her temper was quick and vicious. She snapped, howled, and fought at the approach of her lover; but he caught her ear, he worried her throat, and he was master.

In the course of time Tosok saw the light of day. He was of a litter of three. Amid the reek of seal-oil, decaying fish, and unwashed humanity, in a foul-smelling *igloo* he was born. His two brothers did not survive their birth for many hours, for the summer had been one of undue hardship and privation for the red-coated mother, and so her litter had not been a healthy one. But Tosok the husky was strong. From the first he was sturdy and full of vigorous movement. He nursed fiercely and often, and day by day he grew in strength and size. His coat was thick, and like his mother's it was of a rich red-brown. He had her neat quick limbs,

her bright eyes. He had her vicious temper too; but, unlike her, he did not show it quickly. His was rather the long-drawn snarl, the bared fangs, the 'bide-my-time' temper of his sire, the gray wolf.

His master, the squat, moon-faced Esquimaux, considered him a beauty, and, what was more to the purpose, he judged he would be of value later on when he had attained the full strength of his limbs, and had been broken in to the harness of the *komatik* and the feel of the long whip of walrus hide.

As Tosok the husky grew older the joys and problems of dog-life were unfolded before him. Very early he learned that winter was the time of plenty for such as he. Then, when work was to be done, there was fish to feed on, seal blubber, and deer's flesh. But in the summer, when the 'husky' dog is not required for purposes of transit, he has to forage for himself. What he could find or take away from others was his diet, and this meant a perpetual hunger.

* Book rights reserved.

His thick coat lost its gloss, and became tangled and lustreless; his sunken eyes glared with the savage light of starvation, and all the howling he was capable of—and it was much—could not appease the gnawing within him.

When he discovered that howling did not fill his stomach, Tosok the husky became a thief. He was but following the instincts of his kind; only he was more adroit than some of the others. Also, as he grew older, stronger, and very fierce, he took to fighting. He found this a better way out of the difficulty than stealing, and less likely to bring the walrus-hide whip singing about him; and soon there was not a dog in the whole of Okkak that could equal him in a combat of tooth and nail.

Among the hordes of husky dogs which swarm in the settlements of Labrador, every team has its bully and its bullied. The weakest are harried, attacked, and torn to pieces by their fellows, and when hunger drives the maddened beasts to roam over the settlement looking for prey they are a very great menace indeed. Men who have fallen, and who are unable to defend themselves, have been attacked by them; children left unguarded have been torn to pieces and eaten. No wonder then the dwellers in the northlands, beset on all sides with dangers from elements and from beasts, sing with fervour from the 22nd Psalm, their voices rising unanimously as they congregate in the churches and missions: 'Deliver my soul from the sword; my darling from the power of the dog.'

Tosok the husky became the bully of Okkak. Mothers feared him, men kicked him, and the other dogs slunk off as he made his approach.

His master, the Esquimaux, had not overrated his value; for when he was full grown and had been broken in to the harness and the whip he proved his worth. None pulled quicker than he at the first sound of the word '*Ooisht!*' or stopped so instantaneously at the cry of '*Aw!*'

Tosok liked the harness. He revelled in the mad rush through the keen pure air, the plunge through the snow, the buffeting of the icy winds, the singing of the sledge-runners behind him, the crack of the long whip, and the occasional cry of his fur-clad master. It was work, real hard work, but worth the doing; for afterwards there would come the feed of fish, flesh, and blubber. What mattered if his feet were sometimes cut and bleeding, and if the cruel ice-laden winds bore down upon him, sweeping back the *komatik* and making it a hard task to drag it along? All this became part of the life of Tosok, and he loved it as a husky dog should do. Very soon, by showing his superior strength, his greater intelligence and quickness over that of his companions in harness, he became the leader of the team. His master learned to depend upon his sagacity to guide the other dogs over the best pieces of the road, to single out for avoidance those drifts which were too

deep, and by his own striving to get the greatest amount of work out of his fellow-huskies.

So far as his work in harness is concerned, the 'husky' is faithful enough, and will perform his duty conscientiously when driven by one who understands him and compels his respect. Otherwise, contrary to popular belief, he is a lazy animal, ungrateful and obstinate, and from the tip of his black nose to the end of his bushy tail he is utterly treacherous.

Tosok differed not in these characteristics from any others of his kind. He never failed in his work in the harness; and if his black eyes sometimes shot forth green lights of undue savagery, if his nose was a little sharper than is usual with a husky, and his red-brown coat a trifle coarse, then it was the blood of his sire the wolf that was to blame for these things. To blame also was this fierce blood when Tosok, moved by impulses he did not understand, but could not disobey, would sometimes turn upon his master, and it was only the long association with him and the stinging lash of the walrus hide which would drive him off. Then he would squat on his haunches, nose pointed skywards, and howl. How he would howl! The rest of the team would keep up an incessant chorus varying in pitch as the night advanced and the round cold moon mounted the sky. Sometimes from the distance, out of the silence would come an answering howl, low, throbbing, mournful. When he heard it, the wolf-blood of Tosok would tingle with excitement, and he would howl back strenuously in answer to the voice of his kin, until a flaming bough from the fire, a tin pot, or something hard thrown by his master would catch him on the ribs and bring his song to an untimely end.

Then came the day when the master of Tosok the husky sold him. At the beginning of winter, when iron frost was binding all beneath its seal, and the snow covered the ground and the frozen rivers, there came into Okkak two men from a far-off country. They brought with them a large amount of supplies, tents, cooking utensils, and all the appendages necessary for prolonged travel in a dangerous and difficult country. They had been exploring the coast; their intention now was to travel right into the vast frost-bound silences of the interior, and on over the snow to the frozen seas of Ungava Bay. They needed dog-teams and a guide.

Although the master of Tosok very firmly refused all tempting offers to make the journey himself, he was quite willing, if the sum were large enough, to sell his dogs. Inclusive of Tosok, he had twelve huskies and two *komatiks*. A bargain was struck. Tosok, along with his companions, was turned over to the strangers—men who, in spite of the warnings and tales told of the hardships of the way, the long darkness, the shrieking winds, and immeasurable cold, persisted in attempting the journey.

From the very first Tosok not only disliked

and despised them, but he had a violent prejudice to making the journey at all. Some vague premonition stirred within him. He felt that the journey would be by far the worst he had ever experienced. Had his master accompanied him he might not have been so unwilling; but here were two strange men, strange in all senses of the word, inasmuch as they knew not the country or the conditions of the way, neither did they understand the characteristics of Tosok and the rest of the team. There was, moreover, a third man who had been found willing to act as a guide. This was an Indian half-breed. Tosok both hated and feared him, for he saw that the half-breed too well understood the treatment of dogs and how to wield the walrus-hide whip to ensure the best results. The Esquimaux master had been cruel, but this Indian driver was worse. He never indulged in that encouraging small-talk which helped the animals over an extra rough piece of ground; he only used the whip as a method to urge them on. Tosok in his harness would bare his fangs and grin his hatred as the lash fell about him, and when the teams rested he would squat in front of the half-breed and howl out his venom until a kick sent him away.

'Bad-tempered beast that,' commented one of the strangers as the above-mentioned performance occurred.

'Him very bad dog—dangerous,' assented the half-breed, his fingers curling over the handle of the whip. 'Feed him always—others starve maybe—but feed him!'

As Tosok had suspected, the journey was the worst he had ever been forced to take. Not only was it seemingly endless, but he was in a part of the country he did not know, where the way was incurably difficult and dangerous, where there were unsuspected cliffs and ravines and great snowdrifts. Also, the wind blew with a force he had never experienced before. Down it would come in shrieking gusts, and catching the team sideways would send them staggering out of their course, and the heavily laden *komatik* would jerk and rear, hold back and plunge forward, like a thing possessed.

Tosok, along with the rest of his companions, suffered with cut feet, and they left crimson stains in the snow to mark their trail. The men made some attempt at attending to these hurts, with no result so far as Tosok was concerned beyond being viciously snapped at. After that they left him alone, and he howled and whimpered, strained in his harness, twisted round and lay down, writhed beneath the whip, snarled, and bit. He was a most unhappy dog, and his companions shared his misery.

There came at last something which Tosok had never had to endure in the winter, something which was far worse than hard work. It was hunger—not the hunger that is endured in the harness, and which is satisfied at the end of the day, but the hunger of short rations. By-

and-by there came a day—two days—when Tosok and his companions had no food at all, not even a morsel of dried fish. That night they gathered in a circle and howled out their wrongs in dismal chorus.

They did not know, of course, that the men who drove them were on the verge of starvation themselves. They were unknown miles from the shores of Ungava; they were uncertain of the way, and a violent snowstorm had entirely obliterated such landmarks as the half-breed knew. Thus the little expedition—cut off in a land that is unutterably desolate, with the fury of the storm, ice, snow, and shrieking winds raised against them—was face to face with disaster.

Day after day they travelled in the teeth of the storm, from the first sickly gleam in the sullen sky until their way glimmered before them radiated by the eerie flickering of the 'devil lights' from the Pole; lights which stained the tundra to a blood crimson, now shifting from soft rose to a sulphur yellow, gleaming green and blue and gold. Northern lights! dancing, crackling, evil flames which lead the wanderer over the snows to death!

So exhausted were the men, so weak the dogs, that progress was very slow. The *komatik*, now much less bulkily laden, was nevertheless a heavy weight to pull. Then came a day when three of the dogs were killed to feed the others.

Tosok was the first to fasten his teeth in the flesh of his slaughtered companions. Cannibalism having begun, Tosok and some of the bolder huskies saw to it that it continued, and when starvation again threatened they fell upon two of the team, and tore them to pieces before the men could succour the helpless beasts. Speedily the teams were demolished to serve as food for Tosok and his stronger confrères. Then the *komatiks* were burned for fuel, and the end seemed in sight. There remained now but two huskies, Tosok and a large sulky black dog. These two would eye each other greedily, wondering which would fall to the thirsting fangs of the other. The black dog was a match for Tosok in sheer weight and strength, but Tosok had the sly, quick wits of his wolf sire. Their skill was not to be put to the trial, however; for one day the half-breed slew the large black dog. He served the three men for food, and the offal was thrown to Tosok, who gulped it down ravenously.

So far Tosok had been found sufficiently useful for carrying purposes to escape the fate of the black dog. A blizzard arose, however, which raged several days in succession. To attempt to struggle against it was useless. The three men pitched the tent, and, huddled within around the tent-stove, listened to the voice of Famine. It was then they decided Tosok must go into the cooking-pot. The half-breed went out in search of him. The husky saw him coming; he

read his fate in the hunger-gleaming eyes of the man, and he turned and ran, to be swallowed up in the gloom of the driving snow.

'Him gone!' announced the half-breed, dramatically entering the tent again after an ineffectual search for the dog.

'Well, he wouldn't have lasted us long; he wasn't over fat,' replied one of the men. 'It would only have prolonged things.' He sighed drearily, and cast a look of concern upon his friend, a man who lay helpless and exhausted on the other side of the tent. Silent and uncomplaining, he had lain there since the blizzard had forced the party to pitch their camp. He was obviously dying of starvation, and it was on his account that his friend regretted the loss of Tosok. It is so much worse to see a friend starving than to starve yourself. When you have got over the first days of the pain it hardly troubles you; and as you grow weaker and weaker you cease to desire the food you incessantly think and dream about.

When the next day came with no lessening of the storm, the half-breed decided to try to get help. He knew, he said, that there were Esquimaux not far off. He could travel quickly on his snowshoes; he was more used to the hardships than they were. If he failed in his search, then he had only done what he could; it was better than just waiting for death to claim them. There was a morsel of flour left in the bag, a little pemmican, and some beans. This meagre supply was equally divided; and, taking his share, he left the two men in the tent and disappeared in the gloom.

Meanwhile all had not gone well with Tosok the husky. Certainly he had scented some rotting deer's flesh beneath the snow, and, burrowing for it, he had obtained enough of the fetid mass to appease his hunger for the time being. But alone, out in the vast storm-rent solitude, he missed the cheery glow of the tent-stove and the company of living things, even though they were men he hated. Occasionally, too, the gaunt, shadowy forms of wolves would disturb him, and when he howled and they answered, instead of being filled with the fierce joy he had hitherto experienced at their cry, he was seized with a great terror, which caused him to slink on when he saw them, shadowy and indistinct, looming through the darkness of the falling snow. Instinctively he feared them. The wolf in him taught him to shun his own kind, and so it was that one night saw him slinking back to the tent wherein he had left his masters.

He squatted outside, noiseless and still. In the morning he saw the tent flap open, and one of the men emerge. He caught a glimpse of the interior, and saw that it contained only one other man. Like a flash he darted away to a safer spot from which to observe things. The half-breed, the one he feared, was gone.

There were only two to deal with. It might be possible.

The eyes of Tosok the husky shot forth a green, evil flame, and his tongue licked his chops with eager anticipation. When the short hours of daylight had gone he would set his plans into operation. The wicked slyness of the wolf was uppermost in him now, and worked as one with the hunger which goaded him to madness.

That night again Tosok the husky squatted outside the tent; close against it he crouched, still and silent as a frozen thing, only his eyes were ever watchful and his ears on the alert to catch the slightest sound from within. The side he had craftily chosen was that nearest to the dying man. The glimpse he had had of the interior of the tent had shown him where this man lay, and into his canine brain had flashed the understanding that this man was the weaker of the two, and therefore the easier victim.

When for long past there had been no sound or movement from within, and the fire in the stove had burned very low, Tosok the husky nibbled at the cords and pegs of the tent. Soon he was able to thrust his nose beneath the waterproof silk, and as he did so it came in contact with something cold and stiff—something so cold and stiff that he involuntarily jumped back. Hunger urging him, he thrust his nose again beneath the tent. The cold, stiff object had not moved, and after a cursory sniff of investigation he bit with his fangs deep into the cold flesh and dragged out from beneath the waterproof the arm of the unconscious and dying man.

But even as he tore at the frozen flesh, and his snorts of satisfaction aroused the other man within, there stole out of the darkness and whirling snow a gray shadowy shape. Noiselessly it came, its long, cruel fangs bared with fierce anticipation. The scent of it assailed the keen nostrils of Tosok the husky. With a snarl of rage and fear he sprang from his feast and confronted a large, lean-flanked wolf.

The intruder grinned, while a wicked green light flared in his narrow eyes. Tosok snarled again and backed away. The wolf advanced steadily, and the husky backed still farther, so that he almost bumped into the man who came from the tent, revolver in hand.

At that moment the wolf sprang, and his sharp fangs ripped the throat of the dog. A shot rang out, followed by another and another. The husky rolled over dead, while the wolf spat up its life-blood, jerking convulsively in the snow.

There was plenty to eat after that for the two men in the tent.

'I've never tackled roasted wolf before, but it isn't half bad,' said one of the men as he passed over a piece to his friend. 'And to think,' as his eyes rested on the bandaged arm, 'that that beast of a dog came back to chew you alive!'

'We're chewing him now anyway,' answered

the other. He smiled wanly, and his voice was weak, for he had but lately emerged from the Valley of Shadows, and it was the flesh of Tosok the husky that had brought him thence.

Later, when the half-breed returned, bringing with him Esquimaux and dog teams, he listened

to the tale with a grim smile. 'I tell you him dangerous,' he said, making ready to start on the journey to safety. 'Husky him mostly wolf.—*Ooisht! ooisht!*' He cracked the long hide-whip, it sang over the heads of the team, and they leaped forward.

HONEY.

By F. A. DOUGLAS.

IT has been suggested that if sugar continues to rise in price jam will soon be an extravagance, and that we should use honey more and jam less.

Honey, which is now a luxury, was in old times a necessity, for it was the principal sweetener of food. Sugar was only introduced during the later days of the Roman Empire, and was described first as an 'Indian salt' that was sweet as honey! Its introduction to western Europe was probably due to the Crusaders, those admirable agents of international trade.

The numerous references to honey in the Bible are due to its being the common sweetener of the people; and to this day the Jews, who are fine old crusty conservatives, use honey in cooking where other people would use sugar. Still, it had a certain distinction, and was used as the symbol of fruitfulness and plenty. When Jeroboam's wife wished to propitiate the prophet she took him ten loaves, two cakes, and a cruse of honey. When Jesus reappeared to His disciples they tested His reality by giving Him a piece of broiled fish and some honeycomb to eat. As for John the Baptist, it is known to all that his common food consisted of locusts and wild honey.

Honey is symbolically a very suitable food for times of war economy, for it owes its very existence to the economy of the bee, as it is the food stored by the bee for use in winter. But man's ingenuity has been too much for both the guileless hen and the crafty bee. The untutored hen, having been got into the habit of laying eggs, continues to lay them without the impetus of the cock, and the careful, provident bee as fast as its winter food is ravished continues to procure and store up more.

Honey from the comb is considered the most luxurious form of this delectable sweet, and most people eat the wax with the honey; but, as one points out, this is as foolish as it would be to eat the paper that butter is wrapped in or the blue bag that is the familiar envelope of the sugar. The wax of the honeycomb is in no way nutritious, and it is decidedly indigestible. The proper way is to put a piece of honey in the comb on your plate, with the cells in a vertical position, and press your knife firmly down upon it, so that all the honey runs out. Eat the honey and leave the wax.

The bees, like the ancient gods, drink only nectar. The word and the idea are entirely Greek. The wine of the gods that conferred immortality became the symbol of sweetness and flavour, and so the name came to be used by botanists for the sweet juice which collects in the nectaries of the flowers. It is at once a superfluity and an ingenious device of old Mother Nature. It is indeed the reproductive juice of the plants, and so it confers immortality just as did the wine of Olympus. After the stamen and pistils have taken all they need, a residue remains, and this is the food of the bees and other insects. In seeking the nectar they further the purposes of nature, for the pollen often adheres to their wings, and they aid in fertilising the seeds.

The bee does not care for 'blossoming flowers,' as the poets imagine. It is a practical utilitarian creature, and prefers the period just before fructification. The bees dearly love clover; but many kinds of fruit-blossom and some kinds of forest trees are very useful to them. The black-thorn and the gorse yield it food in spring, and the heather and the blackberry and the ivy keep it going in autumn.

The flavour and quality of honey varies with the plants the bee feeds on. Heather honey is naturally popular in Scotland, and the famous Narbonne honey owes its flavour to rosemary. Hybla and Hymettus yielded admirable honey of old, and this was probably because so many fragrant herbs, such as thyme, grew on the open sunny slopes of those southern hills. Occasionally the bee is injudicious, and chooses injurious herbs, as in the case of the soldiers of Xenophon, who, after eating the honey of Trebizond, became either mad or drunk. This was due to the partiality of the bees for a certain poisonous azalea.

If the plants produced nectar and pollen all the year round we should have no honey; but the wise bee knows winter will come, and makes provision for it. Nectar is the normal food of the bees, honey an 'emergency ration' manufactured from it in as concentrated a form as possible. Nectar consists of 70 per cent. of water, and the rest cane-sugar and flavouring matter. In honey, on the other hand, there is only 7 to 10 per cent. of water; and the cane-sugar, by the process of digestion, has become grape-sugar. All sugar becomes transformed

into grape-sugar in the human system before it is assimilated. The bee, therefore, during summer digests and concentrates his food for winter. Each portion of nectar is digested by two or more bees, and regurgitated. The heat of the hive helps the process, and also aids in the evaporation of the superfluous moisture. Honey may, therefore, be called the Benger's Food of the bee.

Honey is not now much employed in cooking, yet many interesting uses have been made of it. Gingerbread, which we now make with treacle or syrup, was originally made with honey. Bruges and Brunswick are both famous for their honey cakes. The best gingerbread used to be made with honey; it was lighter in colour, and to differentiate and distinguish it further it used to be gilded; hence the common reference to taking 'the gilt off the gingerbread.' Flat gilded gingerbread figures were sold at country fairs, and known as 'husbands.' In an old almanac there is a reference to the choosing of wives. Women 'trickt up with ribbons and knots' were not recommended.

He who with such kind of wife is wed,
Better to have one made of gingerbread.

So there were gingerbread wives as well as husbands. Bruges honey cake is made by mixing one pound of flour, two teaspoonfuls of baking-powder, and one ounce of ground ginger together. Then put in a saucepan four ounces each of butter and sugar, and four tablespoonfuls of honey, stir gently until mixed, and then add the dry ingredients. Finally, stir in two well-beaten eggs, three tablespoonfuls of milk, and a little maraschino. Preserved fruit cut in large thin slices should be used; but, as I have seen it in Bruges, this is put in a layer on the outside, and it is decorative but misleading, for you think there is more fruit inside, and there isn't.

Of course the great use for honey in old English days was to make mead and metheglin. Pliny said mead had all the bad qualities of wine and none of the good ones. Mead was made both in the north and south of Europe; but in the south the grape was more popular, whilst in the north the product of the bee reigned supreme. Mead was the Saxon drink; but the Normans brought the grape wine from France with them, and it became a potent rival.

'Fill me a bowl of meath, my working spirits to raise,' sang an old poet; and it is a heady, exciting drink. The manufacture of it is not wholly abandoned yet, for you find it here and there in the southern counties of England. The honey which the humble bee stores in sunny banks used to be considered the best for it; but ordinary hive honey is now mostly used. The humble bee is old-fashioned in its methods, and not encouraged nowadays. Richard Jefferies mentions the partiality of the badger for humble bee honey, however.

In his *Closet*, Sir Kenelm Digby gives one hundred and six recipes for making mead and metheglin. His disquisition on honey is very quaint. There are three sorts he says: virgin honey, life honey, and stock honey. The virgin honey is made by the young bees, the life honey by the second year bees. 'And ever after it is honey of old stocks.' He tells of metheglin from a Liège recipe and meath of Antwerp; of the 'white metheglin of my Lady Hungerford, which is exceedingly praised,' and of that of the Countess of Bullinbrook. There is the king's meath, which is made with Hyde Park water, hops, and many fragrant herbs and spices. In one recipe he says: 'Before you set the liquor to boil, cause a lusty servant (his arms well washed) to mix the honey and water together, labouring it with his hands at least an hour without intermission.'

Mead is but fermented honey and water, for many make it by stirring five pounds of honey into five gallons of water, adding two ounces of hops and the rind of three lemons, and simmering gently for an hour. Then pour it into a great earthenware bowl, and when lukewarm stir in a tablespoonful of yeast or barm. When this has worked for three days, strain the liquor into a cask, and add what herbs and spices you choose. Cinnamon, ginger, mace, cloves, nutmeg, and rosemary are perhaps the flavourings most used, but there are innumerable others. Sweet-brier figures in some of Sir Kenelm's recipes, parsley roots, and 'eringo-roots splitted.'

Mead is English and metheglin is Welsh, and the Welsh name means 'healing liquor.' Honey has ever been a favourite vehicle for medicine, particularly for cough mixtures and aperients. Athole brose, the Scots remedy for a cold, consists of a judicious compound of honey, whisky, and oatmeal.

Everybody may not know that the honeymoon owes its name to the Teutonic habit of drinking metheglin for thirty days after marriage. Sir John Lubbock, however, thinks the habit of keeping the bride away from her relations for thirty days is a survival of marriage by capture.

Honey has its vinegar as well as wine, and the honey vinegar is made on the same principle as that from the grapes.

Honey is full of joys for the poet. It is a term of endearment, and a seductive adjective much used by Shakespeare. Richard III.'s wife spoke of his 'honey words,' and in the *Winter's Tale* we have 'honey-mouthed' Pauline. 'Honied nothings' have become a familiar commonplace. Milton talks of

The bee, with honied thigh,
That at her flowery work doth sing.

But Herrick is the true laureate of the bee, and is full of delightful fantasies of how it sucked honey from Julia's lips. The bee sings:

Sweet lady-flower, I never brought
 Hither the least one thieving thought;
 But taking those rare lips of yours
 For some fresh, fragrant, luscious flowers,
 I thought I might there take a taste
 Where so much syrup ran to waste.
 Beside, know this, I never sting
 The flower that gives me nourishing;
 But with a kiss of thanks do pay
 For honey that I bear away.

The modern bee lives decorously in well-ventilated, scientific hives, and the picturesque old-fashioned 'skep' is only to be seen in remote, unregenerate country districts. Yet the bee has had many and strange dwellings. There is the humble bee with its holes in sunny banks near its larder; the bees that Pepys knew, that filled fir-trees of honey; and the bees in Africa that store their honey in holes in the rocks. In Egypt the beehives are kept in a vessel on the Nile, and voyage up and down the river wherever there is most nectar to be had, just as in Scotland the wise apiarist takes his hives out to the moors in carts, and plants them among the heather.

Bee-keeping is interesting work, and bees are so easily reared that there is no reason why bee-culture should not be greatly extended, and honey become much cheaper than it is at present.

Another correspondent writes that there will be a great scarcity of honey this year. The disease among bees known as the Isle of Wight disease has wrought such havoc among the honey bees that there are comparatively few healthy stocks left in the country. It will be remembered that this mysterious epidemic first made its appearance in the island from which it takes its name. Then it crossed the water to Hampshire, and has since spread practically all over the country. So far as can be ascertained, the disease appears to be a kind of paralysis. The first symptoms are shown in a more or less lethargic condition of the bees. They crawl about the hive in a sleepy way. If they have been out, on their return they are unable to fly into the hive; they roll over as if intoxicated. They can be seen trying to crawl up the stems of flowers, and, tumbling down, at last they die. Many bee-

keepers have lost their whole stock, owing to the fact that the cause of the disease cannot be traced; and it is extremely infectious. Unless the ground has been thoroughly dug up, mixed with lime, and allowed to remain unoccupied for some months, a fresh stock of bees brought to the infected area most certainly becomes a prey to the disease. The bee-keepers blame the wasps for the wholesale spreading of the disease. It appears that last year wasps were extremely plentiful—almost a plague in fact. Ordinarily, they take advantage of their superior strength to try to rob the hives, and usually make an onslaught on a weak stock. Last year, therefore, when the wasps found a hive of bees weakened by disease they took possession; and, having cleared out the honey, passed on to another hive, carrying with them the germs of the disease. Curiously enough, they themselves seem to be immune from it. Thus the epidemic spread rapidly. A bee-keeper described how twelve hives were invaded in this way, and the owner lost in a few weeks the whole of his stock. One old man on the Wiltshire Downs, whose family for three generations have had bees, being bereft of his all, feels the loss of them keenly as life-long friends.

It is pretty certain that fruit will be scarce this year owing to this disease, as the honey bees are the only ones early enough to fertilise much of the blossom. The work is done before the wild bees and the humble bees are about. Clover, too, may suffer. The red clover depends, fortunately, upon the humble bee, as the honey bee's tongue is not long enough to reach down its tubes; but the white clover is largely fertilised by the honey bee.

What is the remedy? Bee-keepers say the only thing to be done is to wait until the epidemic has worn itself out, and then import a fresh colony of queens from Holland to repopulate the country; but a remedy, discovered by the Rev. A. H. Hollis, and published in the *Bee-keepers' Record* for August, consists of Dioxogen, applied to bees and combs by spraying, or given to them in syrup. Another authority recommends peroxide of hydrogen as equally effective.

FROM GUNPOWDER TO T.N.T.

By Corporal FREEMAN.

IT has been said very often during this war that it is a war of machinery, the machinery users of the phrase having in mind being usually the guns—machine, quick-firing, horse, field, siege, and garrison. It would perhaps be more correct to call it a war of high explosives, guns being merely the means whereby destructive agencies in the form of shells charged with high explosives are dumped into those parts of the enemy territory in which the senders hope they

will do most damage; and explosives in the form of bombs often being used without the intervention of machinery at all. It is almost wholly a war of high explosives, as rifles, revolvers, and bayonets are seldom used—so far as the majority of the battalions in the British Expeditionary Force are concerned—except by snipers, who are sometimes in a position to take aim at a human target, and sportively inclined subalterns and men who go a-hunting rats!

Some days ago, the battalion to which I belong being then in reserve, we were billeted in a village—just a cluster of detached and semi-detached cottages with wide garden spaces, near the firing-line. During the course of an exhibition of ‘morning hate,’ the Germans plumped a shell right into the cottage next the one the guard I commanded used as a guard-room. The concussion was so tremendous that I thought the guard-room itself was hit, and we all hurried out to see just what had happened. When the great cloud of dust, smoke, brick-bats, and splinters had lifted, we saw that the house which had been our nearest neighbour was practically obliterated. There was just a heap of débris where a few seconds before had been a comfortable home.

‘By luck!’ exclaimed one of the guard, ‘who’d have thought ‘at one shell could do all that!’

Very few people even to-day realise the power of modern high explosives, but fewer still ask themselves the question, ‘Why should the stuff we call an “explosive” explode?’ Every day out here men watch the bursting of shells, and they will comment as each smoke-cloud is vomited up, ‘That’s lyddite,’ or ‘T.N.T.’ or whatever explosive they think the shell is charged with; but they have not the faintest notion why T.N.T. *is* T.N.T.; why lyddite *is* lyddite. They see the effect, but they know nothing of the cause. That’s the reason why I sat myself down on the fire-step of a trench high over which ‘iron-rations’ containing samples of these same explosives were pursuing their whining way, to tell you readers who sit comfortably at home in Blighty a little about the terrible destructive agencies used in this war.

It would be rather too dry reading for you if I attempted to detail the various experiments which were conducted in the eighteenth century by a Frenchman, Antoine Lavoisier, and to which the modern high explosive really owes its origin. One simple experiment will give you the corner-stone of the foundation upon which successive generations of chemists have built.

If you take a jet of hydrogen, the lightest gas known, and burn it in a jar of oxygen, it will burn quite quietly, quite steadily; but if you take oxygen and hydrogen and mix them together in the proportion in which they combine (one part oxygen, two parts hydrogen) and apply a light, the result is an explosion. What has happened is that by combining the two gases you have speeded up the rate of burning, of combustion, and instead of the gas burning steadily throughout its volume the combustion of the whole is instantaneous. The original volume to which you applied the light has been converted by the combustion into a far larger volume of gas. This greatly enlarged quantity of gas has to make a way for itself; consequently you have an explosion.

From this and other experiments two things were established: (1) an explosion is the acceleration—the speeding up—of the process of combustion; and (2) the disruptive effect termed ‘explosion’ is caused by the gases liberated by the combustion having to find a way for themselves.

Two things, therefore, are necessary for the manufacture of an explosive: (1) a combustible body, which must not only be combustible, but must give off gases as the product of combustion (hydrogen being the combustible of the foregoing experiment); and (2) an oxygen-carrying body.

Gunpowder, for instance, consists of 25 per cent. of sulphur and charcoal, both complying with requirements laid down in (1), and 75 per cent. of potassium nitrate, which contains six hundred times its own volume of oxygen. Gunpowder, however, though at one time our universal explosive, was unfitted for modern needs because of the enormous volumes of smoke produced by it, and so it was found that for modern guns explosives of quite a different kind were necessary.

Seventy years ago a Swiss chemist named Schönbein discovered that if cotton-wool was soaked in nitric and sulphuric acids compounds were formed which were both oxygen-carrying and combustible, therefore complying with the two demands of an explosive. This material after treatment burned with enormous rapidity, so that, confined in a cartridge, the almost instantaneous conversion of the material into a large volume of gas, which had to find a way for itself, caused a most powerful explosive effect. There being no room in the cartridge for the gas, the cartridge of course had to burst. You follow that?

This discovery of Schönbein’s was named gun-cotton, though it was not until long afterwards, and after numerous experiments, that it could be adapted for use in guns. In fact, two years after its discovery its manufacture had to be abandoned as being too dangerous for those engaged in the work.

It is to Sir Frederick Abel, an Englishman, that the credit of our modern gun-cotton belongs; but Schönbein’s discovery led directly to the discovery of the most powerful modern explosive, for it was while experiments were being conducted in the laboratory of a French chemist along the lines indicated by Schönbein, glycerine being used as a substitute for cotton, that nitro-glycerine was discovered.

The next advance in the development of gun-cotton was made by E. O. Brown, an English chemist, who demonstrated that you may make a fuse of gun-cotton and set fire to it in the ordinary way, and it will burn at the rate of not much more than a foot a second; but if you took a cake of compressed gun-cotton and *detonated* it with a fulminate of mercury cap

the combustion travelled at the rate of two hundred miles a second. Of course, the speed of the combustion in that case is so enormous that there is no time for the gases released to displace the air; the result—an explosion of enormous violence.

The high explosives of which so much has been heard are produced by the products of coal-tar being subjected to the action of nitric acid. Carboic acid, toluene, and benzene are coal-tar products. From the first is produced, by the action of nitric acid, picric acid, the foundation of lyddite. Trinitrotoluol, or T.N.T., is produced by the action of nitric acid on toluene; and though not quite so powerful an explosive as picric, it is far more reliable, and con-

sequently in more general use. When a shell loaded with T.N.T. explodes a dense cloud of black smoke is thrown up, hence the names, 'coal-box,' 'hearse,' 'Jack Johnson' bestowed by Tommy on the shell.

The effect of the bursting of a shell charged with high explosive is not confined to the actual ground brought into contact with the shell or shell fragments. Part of the value of the high explosive shell is due to the fearful concussion caused by its detonation. I have been hundreds of yards away from a bursting shell, and have been thrown to the ground by the violent displacement of the air. Men are killed daily merely by that displacement; they lie untouched, to all appearance unharmed, yet dead.

WHO'S WHO IN AMERICA.

A NINTH issue has been published of that now indispensable work *Who's Who in America* (1916-17), a biographical dictionary of notable living men and women in the United States (Chicago: A. N. Marquis & Co.; London: Stanley, Paul, & Co.). The editor, who is also its publisher, has endeavoured to give a personal sketch of every living American whose position and achievements make his personality of general interest. As in our British *Who's Who*, we find the facts given which every intelligent person wants to know about those conspicuous in every walk of life. The present issue contains twenty-one thousand nine hundred and twenty-two biographies of eminent people living in the United States. Not a few of these were born in Britain, but their working life has been spent in America. A conspicuous example is Andrew Carnegie, born at Dunfermline, Scotland, in 1835. He is credited with having given away over sixty million pounds sterling, including over twelve millions for three thousand municipal library buildings. Amelia E. Barr, born at Huddleston, Lancashire, in 1831, has now sixty-seven novels to her credit. Frances Hodgson Burnett, born at Manchester in 1849, has written over thirty books, of which *Little Lord Fauntleroy* is best known. These examples could be multiplied. Since the last edition of *Who's Who*, besides much international letter writing, and the delivery of many addresses, President Woodrow Wilson has published a volume called *When a Man Comes to Himself*. The American Ambassador to Italy since 1913 has been the well-known author Mr Thomas Nelson Page. The Ambassador Extraordinary and Plenipotentiary to Great Britain since 1913 has been Mr Walter Hines Page, editor, and partner in the publishing firm of Messrs Doubleday, Page, & Co, New York. Two well-known American clergymen acknowledge great indebtedness to home education—

the Rev. Joseph Fort Newton, of Cedar Rapids, Iowa, minister-elect of the London City Temple, who was largely educated at home by his mother; and Dr Lyman Abbott, who has been lawyer, journalist, pastor of Brooklyn Church (1888-99), and is at present editor of the *New York Outlook*. He says in his *Reminiscences* (1915) that there is a royal road to theology, and that is by the way of common sense. His father, Jacob Abbott, the well-known author, gave him, he confesses, the groundwork of all the theology he ever knew. Amongst those good Americans who have been helping us in the great war is Henry Sydnor Harrison, author of *Queed* and *V. V's Eyes*, who has assisted in motor ambulance work on the Western Front. Since this book went to press the death has been announced of Jean Webster (Mrs Glenn Ford McKinney), author of *Daddy Longlegs* and other works. She was a niece of 'Mark Twain' and a daughter of C. L. Webster the publisher. Another author who has also passed away is James Whitcomb Riley, 'the Hoosier Poet.' To William Dean Howells, the doyen of American authors, was awarded in 1915 the gold medal of the National Institution of Arts and Letters for 'distinguished work in fiction.' Over seventy works are here recorded after his name. As many stand to the credit of William Winter, author, editor, and dramatic critic. For more than fifty years he has been writing continuously about the stage, and recently there was a celebration in his honour in New York. His *Vagrant Memories*, *Shakespeare's England*, and *Gray Days and Gold* show a pleasant familiarity with British people and our highways and byways. This whole work is brimful of interest, as it is a kind of compendium of the working energies of over twenty thousand people belonging to the most 'alive,' energetic, and conglomerate race on the face of the globe at the present time.

THE MONTH: SCIENCE AND ARTS.

WAX-BATH TREATMENT FOR WOUNDED SOLDIERS.

IN a recent issue of *Chambers's Journal* we drew attention to the 'whirling' bath, which is now being used in this country in the treatment of certain injuries, the object being to prevent or mitigate stiffness of the joints. In France the wax-bath is also being employed for the same purpose; but so far it has not met with favour in this country. The wax-bath is by no means a recent idea, having been suggested by a Parisian investigator some time ago. A British firm installed a bath at its works for demonstration purposes, but for some reason or other the method has so far failed to find favour with British medical practitioners, although, as time goes on, and the advantages of the treatment become apparent, opinion may change. This particular bath is still in operation, and is available for experiment by those interested in the subject. For a full bath the wax is heated to a temperature ranging between one hundred and twenty and one hundred and twenty-five degrees Fahrenheit, which the patient is able to bear without discomfort. Indeed, if limbs only are involved, the temperature may with safety be as high as one hundred and sixty degrees Fahrenheit. Immersion lasts about a quarter of an hour. The treatment exercises a remarkable effect upon the circulatory system, the stimulation produced continuing for several hours after the bath has been taken, and no immediate reaction setting in. The wax-bath has not been found beneficial in chronic rheumatoid arthritis; but all cases of inflammatory rheumatism, either of the muscles or of the joints, receive distinct benefit. This is shown by the number of persons who, having passed through the course, are now able to follow their employment, for which they would otherwise be totally unfit. One striking case of the cure of phlebitis may be recorded. The doctor ordered the patient to bed for three months, but as a result of the wax-bath treatment a complete cure was effected in two days. Stiffness, resulting from wounds, is prevalent among incapacitated soldiers, and there is reason to believe that this defect may be effectually overcome by recourse to the wax-bath, which has also a direct healing effect upon the wounds themselves. The measure of success met with in France should encourage experiments upon this side, especially as the equipment is available, and can be tested thoroughly and inexpensively.

A BULLET-PROOF JACKET.

From time to time we have drawn attention in 'The Month' to the many ingenious devices, such as body-shields and steel helmets, which have been evolved for the purpose of protecting

the fighting man against shrapnel bullets, bayonet-thrusts, and sword-lunges. In a recent invention the protective device does not constitute an addition to the ordinary uniform, but is ingeniously combined with the clothing. So far it has only been adapted to the dress of officers. The jacket follows the accepted regulation lines, and in outward appearance does not differ in the slightest detail from the ordinary pattern. But the garment is lined with highly tempered steel in such a manner as not to offer the slightest hindrance to the wearer's free movement of the arms and body. Moreover, owing to the system of fitting, the slight additional weight is so distributed as to escape the notice of the wearer. The steel employed is sufficiently strong to resist a .455 Government revolver bullet fired from a distance of twenty yards. Under these circumstances the jacket should be able to protect the wearer completely against flying splinters of shell or fragments of shrapnel, and to safeguard him against many wounds which at present are inflicted by shell-fire. These injuries may not prove fatal, but they are often sufficiently severe to incapacitate the officer for weeks.

IS THE HYGIENIC DOMESTIC DUST-BIN IMPOSSIBLE?

A correspondent draws attention to the urgent necessity for the introduction of more hygienic measures in the handling of household refuse. At the present moment the householder in many towns is compelled to provide a sanitary bin, but in the collection of the refuse contamination of the atmosphere is produced by the discharge of the contents into the collecting cart waiting in the street. Our correspondent suggests that dust-bins should be standard in size, and that the charged receptacle should be removed bodily, with its contents intact, and loaded upon the collecting vehicle for removal to the destructor or dumping ground, a clean, dry, empty bin being left in its place. Certainly the adoption of such a practice would dispense with all offensive smell and the distribution of dust. The obvious reply to this suggestion is the necessity for sinking a certain amount of public capital in the purchase of bins, because each householder would need to be provided with a double set. Against this, however, must be set the doubled or trebled life of the bin. Under present conditions the householder's emptied bin is usually left in a wet and foul condition. It is never thoroughly cleansed, though it may receive a slight sprinkling of a cheap disinfectant. The result is that the bottom of the bin is worn out long before the sides. The correspondent suggests that the charged bins, after being emptied at the destructor or dump pile, should be washed and dried, either in the sun or over

a fire. It is urged that considerable time would be saved in collecting the refuse, while the carts themselves might be fitted with rails to permit of the bins being stacked. The objections to the measure, however, in addition to the initial expense, must not be overlooked. In the first place, the bins would have to be square-shaped, so as to utilise to the full the limited space available upon the collecting cart. Then every bin would have to be filled to its utmost capacity to render removal upon this system profitable. It would not pay to remove bins which were only a quarter or half full; and in any case the weight of the vessels themselves would represent so much 'dead' load.

ROADSIDE CLOVER.

A correspondent writes: In some parts of South Lincolnshire there is a considerable width of sward between the road and the hedges. All observant travellers have noticed that this year these roadsides are bearing a large quantity of white clover. This, of course, has made the roadside cuttings to be of much greater value for feeding cattle than is usually the case. The phenomenon only appears on the sides of the main roads. It has given rise to much comment, and various explanations are offered. In the course of a conversation I had with a practical farmer, he gave what seemed to be a very probable reason. He said that when his pasture land had been given a generous treatment with basic slag, white clover invariably appeared, the seed evidently being in the soil, but not germinating without the assistance of this fertiliser. Of recent years, much use has been made of slag as binding when roads are repaired, and he thinks that the dust, which, by reason of the heavy traffic of this district, is only too abundant, having been blown on to the roadsides, or deposited there as sweepings, has been thoroughly washed into the soil by the unusually heavy rains of this year. Thus the roadsides have received a similar treatment to the pastures, and a like result is evident. In this connection it is interesting to notice the difference in the appropriation of the roadside grass. In this district the eatage, or roadside harvest, is the property of the farmers whose fields adjoin the roads. In an adjacent district the county council lets the eatage to cowkeepers for grazing. These are possessors of one or more cows, and are charged two shillings or two shillings and sixpence per head per week. In the districts where the roadside grass is the property of the adjoining farmers the grazing alluded to is illegal, and all animals must be kept moving at not less than two miles per hour. This difference of law, or what locally has almost legal significance—that is, custom—is curious. As bearing upon the above, the notable improvements of poor grass-land, under Professor Somerville at Denton Hill, on the Sussex Downs near

Newhaven, might be mentioned. Here he has transformed a semi-barren tract into productive pastures, carrying to advantage, says the agricultural correspondent of the *Times*, more than twice the number of sheep that formerly eked out a miserable existence. The only material employed was basic slag. The addition of a potash manure proved to be unnecessary. It would be unwise to conclude, the writer adds, that basic slag would be equally successful on all soils and in all localities, but it is noteworthy that the remarkable results obtained at the Northumberland station have here been reproduced. The appearance of the stock is as convincing as the turf.

A VALUABLE DISCOVERY.

The discovery of coal at Udi, in Southern Nigeria, marks a new and most important epoch in the history of West Africa, as it renders possible many industrial developments in that still little known country. The discovery was made in the course of the mineral survey of Southern Nigeria, which was associated with the Imperial Institute. Following on the very favourable report of the Institute, steps were taken by the Government to work the field, which is no longer in the experimental stage, as up to the month of June ten thousand tons had already been mined and stacked ready for use. The coalfield is in immediate proximity to the new Nigerian Eastern Railway from Port Harcourt, the distance from which is only one hundred and fifty miles. When this line is opened for traffic—some time this year—transport can begin at once, and the coal will be at the service of the whole of Nigeria. Many specimens of Udi coal have been very fully examined, and the fuel value has been definitely determined at the Imperial Institute. Though not equal in quality to Welsh steam coal, it is much better than many varieties which are now being mined all over the world. It has been subjected to exhaustive trials on the Nigerian railways, the officials of which have reported very favourably upon it as a locomotive fuel. The total area of the Udi deposits is, so far as can be at present estimated, not less than two thousand one hundred square miles. In places the seams are five feet thick.

A SOLUTION OF THE HOUSING PROBLEM.

The provision of adequate housing accommodation is one of the most difficult problems in connection with land development. Incidentally it is also a matter of moment in connection with war-workers, who are experiencing a shortage of accommodation in the vicinity of the great munition centres. Owing to the inflated price of materials and labour, coupled with the temporary nature of the demand, houses built of conventional materials are not at present regarded as a promising

speculation. A serious attempt to overcome the difficulty is being made by one of our educational institutions, which is engaged in a series of experiments to determine the suitability of mud for cottage building. The movement is by no means new, for some time ago one well-known enthusiast built upon his estate a cottage of this character, the cost of which was only twelve pounds, as compared with the eighty pounds which would have had to be expended had the more familiar materials been employed. In the experiments alluded to an effort is being made to discover the most serviceable manner in which earth can be utilised in the construction of a house suitable for this climate. Six experimental walls have been raised, and as they are side by side an excellent opportunity is afforded of subjecting them to close comparative study. The first wall is merely of earth which has been tightly pressed between boards; the second is formed of similar material, to which a certain proportion of soft soap has been added; the third is composed of a mixture of earth, soft soap, and lime; the fourth has been given a protective coating of grouting; the fifth has been dressed with tar; while the sixth is fashioned from a mixture of earth, glass, and lime. So far, apparently, the tar-dressed wall has given the most promising results. In addition to the low cost of a mud cottage, it is pointed out that such a building can be run up ready for occupation within three weeks. In this country no experiments appear to have been made with the monolithic system of house-building with cement, in which moulds are employed, and the cement is run in to set and harden. This method has been practised in the United States, and has proved a complete success, buildings costing from twenty to two thousand pounds being run up in this manner. Not only can such houses be built speedily and cheaply, but they possess the additional advantage of being thoroughly hygienic, as they can be flushed, if desired, from roof to floor with a hose.

SALINE versus ANTISEPTIC SURGICAL DRESSINGS.

Considerable interest has been aroused by the successful treatment of one hundred and ten men wounded in the battle of Jutland by saline solutions in preference to the usual antiseptic dressings. Some months ago Sir Almroth Wright created a sensation in medical circles by announcing that far better results were obtainable by the use of weak solutions of salt for washing and sterilising wounds than by the use of antiseptic dressings. The method is very simple. A gauze wick is threaded through the wound, and a warm solution of salt falls upon the wick from a small glass tube connected to a suitable reservoir, such as a vacuum bottle. In its passage through the wick the solution washes or irrigates the wound, carrying away all the

poisonous matter, and discharging into a suitable receptacle. It is interesting to note that this practice is a modern adaptation of a treatment which has obtained in rural districts since time immemorial, for the simple reason that salt is there the most convenient, and often the only, germicide available. The treatment of a wound with salt is of course painful, but it is usually effective. An ugly gash is dressed with crude salt rubbed well into the wound, while slight suppurating injuries, such as those induced by splinters and rusty nails, are dressed with bread soaked in either hot or cold water to which a quantity of salt has been added, the poultice being renewed when the dressing begins to dry. The salt acts as both a sterilising and a healing agent, and is usually quite efficacious.

A NEW MOTOR ROAD-TRAIN.

A recent development of the self-propelled road-train is arousing considerable interest, because, when required, each of the attached trailing vehicles can be converted into a self-propelling unit. This is especially advantageous when starting or negotiating an incline with a full load. The road-train built on this principle is fitted with the Thomas electric transmission system. The tractor proper is equipped with an internal combustion engine using petrol as fuel, and the power thus obtained is transmitted through an electrical system which takes the place of the familiar change-speed gear-box. One axle of each of the succeeding trailing vehicles is converted into a driver, thus contributing to the tractive effort of the train. This auxiliary driving force is continued until full speed is attained, when the driving effort of the trailers is cut off. By this expedient the starting of the train is materially facilitated as well as expedited, while the interval between starting and the attainment of full speed is greatly reduced. Owing to the system of electrical transmission which is adopted a far more flexible drive is obtained than if defined gear-ratios were used, as in the ordinary system of mechanical change-speed gear. A train consisting of a tractor and two vehicles weighs about fourteen tons, and its carrying capacity is from twenty to thirty tons. With the former load a speed of approximately fifteen miles an hour is obtainable upon a level road, while a 10 per cent. gradient can be climbed at a speed of two and a half miles an hour. Upon the normal undulating road the petrol consumption averages about seventy-five ton-miles per gallon. Although the trailers may be utilised as auxiliary drivers, steering is effected from the leader, and automatically transmitted to the following cars. Tracking is so perfect, even when rounding curves, that the deviation from the tractor's wheel lines is only a few inches, while the whole train is protected by a brake operated by the driver on the leading vehicle. The carrying capacity of a train of three vehicles—the tractor and two trailers—

is at least equal to that of four five-ton lorries, but the 'dead-weight' is much less, while the length of road occupied by the four separate vehicles is appreciably greater. Moreover, the road-train is far more economical and remunerative than the four vehicles. Not only is the petrol consumption of the complete train less than that of four lorries, but less labour is necessary, only one driver and an assistant being necessary instead of four drivers. The Thomas transmission system has been applied with conspicuous success to railway working, and it promises to prove equally advantageous in highroad haulage, which in these days of scarcity of skilled labour is no mean advantage.

UPHOLSTERING IN RUBBER CLOTH.

The rapidly increasing scarcity of leather suited to the covering of furniture has been responsible for the perfection of many substitutes. Among these none has proved so conspicuously successful as what is described as grained rubber cloth. As the name implies, this material is composed of india-rubber with a fabric foundation. The rubber is not attached to the surface of the fabric, but the textile is impregnated with the rubber in such a manner as to form a distinctive material, the result being that the rubber face cannot be detached from the fabric. The wearing qualities of the article are striking. It neither cracks nor peels off, but wears in precisely the same manner as genuine leather. It is not only an ideal decorative material for chairs and lounges, but it constitutes an excellent covering for desk and table tops. It is hygienic, and possesses the virtue of being washable with a damp sponge or rag without suffering any ill-effects.

ESTABLISHING THE CATGUT INDUSTRY.

Among the many articles for the supply of which we have had in the past to depend upon the foreigner is catgut for surgical ligatures. Germany supplied practically the whole of our needs in this highly specialised field, though a quantity packed in sealed tubes and ready for immediate use was obtained from the United States. Since the outbreak of war we have been compelled to depend largely upon the American product, but the demand far exceeded the supply. In order to meet the deficiency a Scottish manufacturing chemist embarked upon the manufacture of the article, completing the sterile finished ligature from the raw intestine, and thereby establishing what is generally believed to be a new industry so far as this country is concerned. The production of a sterile ligature is by no means such a simple, straightforward operation as it may appear to the inexperienced. As a result of his individual experiments the chemist referred to concludes that it is impossible to produce a satisfactory sterile ligature by medication after the strings have been twisted

and dried, since the character of the gut and its tensile strength must undergo a greater or less change. The strength of the solutions employed, together with the length of time which it is essential to allow the catgut to remain in contact with them, cannot but detrimentally affect the substance. Moreover, he is inclined to believe that much of the trouble experienced through irritation in the suture and through lack of uniformity in the rate of absorption, is attributable to the non-scientific system in use for the preparation of medicated ligatures. The British product, which is supplied both in hanks and in sealed glass tubes of the American pattern, has been subjected to exacting tests, including bacteriological investigation, and the results are declared to be eminently satisfactory and encouraging. The opportunity which is now presented, owing to the abnormal demands created by the war, for the utilisation of British catgut should be adequate to establish the new industry upon a firm foundation, and should enable it easily to hold its own against the German product.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE TWO ORCHARDS.

A DEVON orchard, warm in mellowed walls,
Where fruit-trees quicken through the golden hour,
And mask each bough in tender leaf when falls
The sudden silver of an April shower.

A Flemish orchard—nay, it once was so—
That little plot to peasant folk endeared;
Where branch and bole are blasted and laid low,
And every grace by Teuton hate is seared.

A charnel-ground. Yet here the linnets sing,
While in the wilderness of blood and tears
One spray of apple-blossom dares to spring
From some old quarrenton of happier years.

Oh Devon orchard, chant thy litany,
Secure from aught save Nature's rough caprice;
But know thy sister's dark Gethsemane
Hath been a shield to thee—a fortalice.

Her song and blossomed spray are as the lilt
Of rippling water 'mid the dust of hell;
A voice divine on which our faith is built,
That high compassion ordereth all things well.

A. T. CORKE.

*. TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible. ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL.*
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

CARELESSNESS.

By R. S. WARREN BELL.

CHAPTER I.

'WHEN you was burglin', Joe,' said Nick Portch, the new fourth gardener, 'didn't you find folks careless like?'

Joe Rudge, third gardener at the Queen's House Gardens, Broken Cross, scowled at his colleague, and at the same time he glanced about him to make sure that nobody had overheard the remark. For two years now Joseph Rudge, ex-convict, had kept the place which, upon his latest release from prison, had been obtained for him by a society which existed for the purpose of setting discharged malefactors on the path to getting an honest living. It was a worthy society, as worthy a society as ever was; for the discharged prisoner, encountering serious difficulty in procuring work once his history is known, too often finds himself compelled to take to his old practices in order to keep body and soul together. Worthy of our esteem for their philanthropy, and perhaps, too, of our admiration for their pluck, are those who accept men through this society. Many of them are narrow-viewed, and their ways and methods of debate are such as to provoke a smile in the man of the world, and jeers from the comic papers. But here and there they do save a poor wretch from wearing out what is left of his life behind prison bars; and so, although they wear black gloves and shake loosely folded umbrellas at the publican straddling in his doorway, they are perhaps as worth taking off your hat to as most of the smart people who laugh at them.

Anyhow, here was Joe Rudge—who had done three months, six months (twice), a year, two years, three years, and, finally, seven years' penal—earning his living as a gardener in the gardens of the Queen's House, which, once the residence of an exiled queen, was now a show-place. Here Joe Rudge had been for two years, and during that time he had followed the ways of virtue and turned a deaf ear to the voice of the tempter. And he had recently been advanced from fourth to third gardener.

His promotion had not been, perhaps, entirely due to his probity. It was, indeed, to some extent automatic, as, the third gardener having been dismissed for committing petty thefts, Joe had simply moved up into his place. Still, it

would have been easy for the committee to appoint a new third gardener, and keep the ex-thief pegged to his place of repentance at the bottom of the ladder. But Joe had two things in his favour. Without being a specialist, he was a good general gardener, with a particular turn for 'veges,' he having invariably been employed in the kitchen-garden—there being no other—at the various jails in which he had been incarcerated; and, secondly, he had actually been suspected—and watched—of committing the thefts of which his senior was ultimately proved guilty. It had been fortunate for Joe that on obtaining employment at the Queen's House he had decided not to play any monkey tricks—not to slip a few seed-potatoes, or a nice lettuce or two, or a bunch of radishes into his capacious pockets on leaving of a night, though he knew the third did these things regularly. Besides, though at the outset of his career, as his early sentences indicate, Joe had indulged in the 'smalls' of his profession, in his later years he had cast his net for big fish. So that to an aristocrat in burglary—as it were—the annexing of lettuces and radishes, apart from the folly and risk of such deeds, was a trifle undignified. Thus, in a fashion, did he earn his promotion, going up to third, *vice* William Carpenter, sacked, but not prosecuted; Nicodemus Portch, lately employed by a local jobbing gardener, being hired to fill the vacancy.

'Stow your noise,' growled Joe. 'Who said I'd ever been burglin'?''

'Sorter 'eard it.'

'Well, then,' returned Mr Rudge, 'forget that you 'ave—see?'

Dusk was just stealing over the gardens of the Queen's House—the two men were sweeping an asphalt path by way of finishing their day's work—and in the half-light Joe's square jaw, thrust out pugnaciously, and hard slit of a mouth looked so ominous that Nick Portch, who was a fair-haired, loosely built, rather weak-faced cockney lad, felt almost frightened. Besides, had it not been mentioned to him, over a tankard of 'bitter'—he was rather given to 'bitter'—at the 'Prince Arthur,' down in the town, that Joe Rudge's last sentence of seven

years had been given him for—for *manslaughter*? (And a lot of big, heavy, sharp tools stand and lie handy in these gardens.)

Inquiring, a shade paler, as to that deed—for manslaughter is oftener than not first cousin to something beginning with the same letter—Nick had learned that it was a clean job enough. Rudge, it was said, was having a fierce quarrel with an accomplice over some stolen goods, and the other man had drawn his gun on him; but Rudge had been just that breath of a tick quicker with his own.

Still, though Nick had experienced a feeling of relief on hearing these particulars, the incident proved Joe Rudge to be a fierce and ready man when he was in a corner. Not a man to take liberties with, anyhow.

'That's all right; I know 'ow to 'old my tongue, Mr Rudge,' hastily replied the fourth gardener, though he tried to turn his nervousness off with an uneasy laugh.

'Glad you do,' said Joe Rudge. 'I'm a gardener, earning as honest a livin' as any man, an' a honest one than some as considers 'emselves honest.'

'That you be,' agreed Nick.

They went on sweeping. Mr MacNair, the head-gardener, and his second in command had some time since ceased operations, and these two, with a boy who was scraping tools in the yard, had the big, shadowy gardens, with their spreading cedars and smooth lawns, their whispering shrubberies and silent dells, all to themselves.

No further word was spoken for, perhaps, five minutes. Then Rudge broke the silence. He felt that he had been a bit sharp—imprudently sharp, perhaps—with Nick. His very sharpness would confirm the tales that had been told into the young fellow's ear. After all, it doesn't pay to be bad friends with folks who can do you good turns as well as bad ones, if they like.

'Wot was that you was sayin' about folks bein' careless?' he asked casually.

'Well, I was just thinkin',' said Nick, desisting from his labours and using the handle of his broom as a support. 'I've been in an' out a lot o' places jobbin', an' it's 'curred to me 'ow easy folk go with their doors an' winders. I could 'ave pinched anything I liked many a time.'

'Not often,' opined the prison-worn Joe. 'You'd 'ave got copped, sure.'

'It's a wonder to me,' continued Nick, 'that the blokes on the game don't take a van along an' collect articles, like callin' for the washin'.'

'They do,' said Joe, with a retrospective sigh. 'I—I've known it done in broad daylight. Pull up the van, drop off, knock, an' if there's somebody about, say you've brought the lino that was ordered. Wrong 'ouse! Thank you! Nobody in, clear the sideboard an' take the stuff out in a 'earthrug.'

Nick chuckled. 'Yes, easy as eatin' your

dinner. Folks ask for trouble, they do. Tell you 'ow. There's a little 'ouse on the way 'ome—pass it every night—kep' by a couple o' ladies—single ladies. 'Ouse o' the name o' Rest 'Arrow.'

'I've noticed it. Very nice-kept place.'

'Oh, they've got some pieces, them old ladies. Nice people to work for. "Cup o' tea, gardener?" Them kind o' folk. Well, they goes out an' leaves the place *any'ow*—winders open, side-door unlocked. Tell you, it's wicked. I said to 'em, "You don't 'arf ask any one in," I says; and they replies, "Why, gardener, it doesn't do to be always thinkin' ill o' your fellow-creatures. We've lived 'ere by ourselves, sometimes with a maid an' sometimes without, these twenty-five years, an' never lost a silver spoon. Besides, what are the police for?"'

Joe Rudge gave vent to a muffled laugh, in which could be distinguished a note of derision. 'Reckon this is tidy enough,' he said, turning the head of his broom on its side and knocking it on the path.

Having put their tools away, the men walked back to the town together. On the way they passed Rest Harrow, the house on which Nicodemus Portch had expended his eloquence. Two elderly ladies were pecking about in the front garden with their trowels. It was an old, shallow-storeyed house, with an easily accessible balcony, and a glance declared it to the experienced eye of Joe Rudge as one of those soft 'cribs' that it was almost a meanness to crack.

To be company for Joe, Nick had wheeled his bike so far. 'See 'em, the dear old birds?' he said. 'If all jobbin' was like jobbin' for 'em I'd feel like stickin' to it. But it ain't. Besides, I want to be a gentleman's gardener, an' comin' from the Queen's 'Ouse, if Mr MacNair will write me a nice letter, will be a recommendation—see?'

'Ay, that's the lay,' agreed Joe Rudge, nodding.

'Think I'll get on now, as I've got to meet my tart,' added Nick, jumping on to his machine and wheeling off, leaving Rudge to follow with his peculiar shuffling tread, got through years of life in prison, where you had to walk so close to the man in front that if you didn't throw your feet out you were likely to tread on his heels. Yet, though it was a shuffle, it covered the ground quickly. Though it was a shuffle, it was a light shuffle.

Joe Rudge was a gardener, yet you had but to scratch him to find a burglar underneath. And, to tell the truth, Nick Portch's tale of the ease with which one could enter Rest Harrow had momentarily revived the burglar in Joe. Not that he contemplated an entry; not in the least. But it acted, for the moment, like the sound of cannon 'on an old war-horse. He had forgotten about it by the next morning; but,

trudging home alone in the cool of the evening, he couldn't help, with a turn of his eye, measuring the distance from the neat grass plot in front to the balcony above. Pooh! a leap, a strong grip, a pull, and you were on it.

Just a passing thought. And Joe soon had

something else very different to think about—in fact, something that made him forget even to glance at Rest Harrow as he shuffled by on his way to work and back to his lodgings in Broken Cross.

(Continued on page 730.)

DOVER TUNNEL AND THE SCOTTISH SHIP-CANAL.

By the Right Hon. Sir J. H. A. MACDONALD, G.C.B., LL.D.,
Author of *Life Jottings of an Old Edinburgh Citizen*, &c.

IT has come to be realised by all thinking persons in this land that when the day arrives for the proclamation of peace, that day will bring no complete cessation of struggle between the nations. A new contest has to begin for the safeguarding and promotion of our commercial interests, without which the victory that is looked for would be in great degree rendered unproductive, and the recovery from the oppression of vast national debt made difficult, if not impossible. Accordingly, much thought is being given and numerous conferences are being held in this country and among the allied nations to find the best policy to be followed for fighting the peaceful war of commerce. It is very plainly discerned that our present enemies are exercising great forethought to ensure, if they can, a defeat of their present enemies in the struggle for the world's trade, that they may in the region of commerce reach that world domination which they are failing to effect by military conquest. It is well known how for many years before the war began our enemies, by their thoroughness in their modes of securing purchasers for their output of merchandise, had ousted our traders—who clung to their old-fashioned ways of doing business—from many a market, not only abroad, but in our own land. They had also secured the output of mines, by which they could obtain raw material at a much cheaper cost than they would exact from us if we sought to buy from them. Now, late in the day, it is being recognised that there is a call for radical change in our way of doing, and that there must be a freeing of ourselves from restraints which hamper us and make us resemble a man fighting with one of his hands tied behind his back.

To succeed in such a contest as lies before us, it is not sufficient to consider the kinds of business that we can undertake with efficiency, and the modes by which such business may be promoted by skilful and well-organised methods, both in the obtaining of raw material, and the securing of markets for the manufactured goods. There are other elements which come in to enable the merchant to bring his materials for his manufacture to his place of work, and to convey his goods to the markets where he can

sell them. He must have the cheapest and most rapid conveyance provided for his materials and his made goods, so that the price at which he can sell at a profit shall not be swamped by too burdensome charges for freights. In a word, he must be provided with the easiest and most efficient means of transit by land and by sea; and if, in so providing, it is possible to make the country more able to defend itself in any future war that may arise, a double advantage will be gained.

The present purpose is to call attention to two great works which have long been in contemplation: the making of a tunnel below the Strait of Dover, and the formation of a ship-canal between the Forth and the Clyde. That these two works would be beneficial to commerce in time of peace is the belief of many. On the other hand, as regards the first, there are still not a few who shrink from the idea of opening a railroad between this country and the Continent, and certainly for many years our best military men looked upon it as a dangerous proceeding, Lord Wolseley, who was our most distinguished soldier in his time, having always been in strong opposition to the idea. As regards the second scheme, the same objection could not be made to the proposed Scottish canal. That it would possibly be useful in case of war with another maritime Power might be freely admitted; but the prevalent opinion was that it could not be made to pay from a commercial point of view. The time has come for earnest and practical consideration of these two projects.

The writer is free to admit that for a long period of years he strongly opposed the idea of joining England and France by a tunnel, and had matters remained as they were thirty years ago the feeling against the proposal would have continued; but more than one change has taken place, affecting both the international question and the working question, and there is ground now for changing opinion, and for holding that the advantages so outweigh any possible disadvantages as to cause the scale of the latter to kick the beam. In former days those who advocated the formation of the tunnel could only meet the objectors, who scented danger, by saying that it would require nothing

but the pressure of a button in Downing Street to cause the sea to enter and flood the tunnel, rendering it useless to an enemy. One can recall the sarcastic speech of Lord Randolph Churchill in the House of Commons in 1887, in which he drew an amusing picture of the Cabinet seated round the council table, with the press-button in the middle, solemnly discussing who was to take the responsibility of pushing it down and causing the catastrophe. It is easy to see how, with an astute enemy, having his spies everywhere, so slender a protection as a wire led from a press-button could be severed, so as to make the pressure of the button of no effect. But the proposal presents itself to-day under a different aspect in more than one particular. The France which in 1859 was threatening us through her bellicose colonels, that France which had been our historical enemy, and which would have declared war against us at so recent a date as that of the Fashoda Incident, being only deterred by the insufficiency of her fleet to come to conclusions with us upon the sea, has now become our staunchest friend, and has not, and never can have, any interest to pick a quarrel with us; while nothing is more certain than that Great Britain can have no interest to break off her alliance, cemented by the blood shed in such oceans during the many months in which the two nations have fought side by side. The making of a tunnel joining the two lands could have in itself no tendency to promote strife; rather the reverse. It could have no tendency to repulsion, but would rather increase free and friendly intercourse by making the journey quick and easy. It would enable thousands of both nations to visit the neighbouring country for business or enjoyment, thus bringing the two peoples socially more closely together, and making an estrangement by separation caused by a very dreadful sea-passage no longer likely. For, short as is the distance, those who suffer at sea get the best possible chance of suffering severely in the choppy cross-seas of what our French friends call *la manche*. If rail connection was completed, many in both lands and of all classes would travel between England and the Continent both ways, who never would think of doing so as long as the journey had to be broken by a sea-passage.

In the case of passenger traffic, the gain in time would be great, as there would be no delay at ports of departure and arrival. The actual run could be accomplished in half-an-hour, and there would be no hindrance, however stormy the weather might be. The discomforts of alighting from a train and perhaps encountering heavy rain driven by a fierce wind, while a crowd carrying hand-bags and hold-alls has to be filtered down a narrow gangway, and again a similar experience gone through at the debarkation—all this, which has now to be faced and

endured, would be avoided. The traveller would reach his London or his Paris without having to leave the seat he took when he began his journey, a journey shortened by at least an hour and a half.

But it is not in the improved conveyance of passengers that the chief gain would be made. The advantages for goods traffic would be very great. At present all goods passing from the Continent to Great Britain, and *vice versa*, must be unloaded to the quay, loaded on the vessel, unloaded on the other side, and loaded once again on the railway wagons. This represents great delay, additional expense, and in many cases damage to the goods. If the Channel Tunnel were completed, goods might be loaded on trucks anywhere, and be carried to any place on the Continent, or if from the Continent to any place in Great Britain—the railway gauge, except that of Russia, being the same—without breaking bulk, and the saving thus effected would have an important bearing on the price to be paid by those to whom the goods were consigned. It would also save at least a day in the time occupied in transit. What loss of time and money would not have been saved during the present war if men and material could have been taken direct from England to their destinations in France or Belgium!

All this is beyond dispute, and the only question which remains is whether there is such danger from a military point of view in having this road available to an enemy in the event of war as to call for a forgoing of these advantages. This danger could only be incurred if by want of foresight such defence was not provided at the English end of the tube as to make its use by an enemy impossible—that is to say, to make it impossible for him to debouch in force from the tunnel-end. To give an enemy the use of the tunnel for such a purpose would require a combination of circumstances not likely to occur. To suppose that a first and direct attack could be made by sending troops through the tunnel as a primary operation of war is a supposition which carries its own refutation upon its face. Nothing is more certain in war than that troops debouching from a narrow defile are courting destruction, unless their movement can be covered by a force able to deal with and hold in check those who are opposing the passage of the main body down and out of the defile. A very small force of artillery and infantry could deal destruction to an enemy advancing on a narrow front, in a gorge, unable to bring any effective fire to bear upon his foe, while the foe could enfilade his narrow column with crushing effect. And if this be true of a defile between hills, how much more true would it be when the advance had to be made from the mouth of a tunnel not having a greater breadth of way than about twenty feet! If the existence of such a

tunnel across the Channel was to be an aid to an enemy attacking England, it would be necessary first that he should succeed in occupying the ground in front of the tunnel-mouth, and that with a considerable force, so as to drive off and keep off any force that could cover the mouth of the tunnel with fire. And this, looking to the immensely increased range of modern guns, would call for a large expeditionary force, which would require to obtain a landing on our shores, not merely of troops and field-artillery, but also of heavy guns, which could effectively meet the fire of protective batteries, many miles inland from the tunnel-mouth. Thus the only assistance the tunnel could give to an invading force would be to facilitate the arrival of his reinforcements. He must first invade in force, and get the command of the mouth, before he can use the tunnel to any advantage. In short, a *coup de main* by sea, and that on a large scale, would be an essential preliminary to the utilisation of the tunnel by an invader. Nothing can be more plain than this, that the moment any demonstration of a raid was made, the tunnel would at once be put out of use, by very simple expedients.

Further, it is clear that without obtaining the mastery of the sea, no enemy could profit by the existence of a Channel Tunnel; and such mastery of the sea would require to be effective in the near neighbourhood of Dover, as a landing anywhere else could not give him the command of the mouth of the tunnel. All this being so, the ordinary British subject would not be nervous if a free railway route was open between England and France. He does not doubt our capacity to keep the mastery of the sea. If we lost it, there would be no question of the fact that we had lost all, and the presence of a tunnel would make no difference. The enemy that can wrest from us the mastery of the sea would, in doing so, wrest from us the mastery of our land. We should be compelled to make the best terms we could with him. We may be thankful that nothing that has happened points in any such direction, and there is no reason to suppose that anything can happen which would make such disaster likely.

But it may be said that all these arguments were equally cogent in former days, and that they did not have such weight with our military advisers as to induce them to consent to the construction of a Channel Tunnel. That is quite true, but two things must be remembered. When they raised their objections the enemy that was in contemplation was the nation who would hold the other end of the tunnel. It was France that had to be thought of as a possible enemy. To-day she is our closest friend, and it is difficult to see what possible interest she could have to turn against us. When the present war is over, we, with her, must enter

on an economic war with our present enemies. Our future prosperity and hers are bound up together, and to quarrel among ourselves would be to give our present foes the victory which they are failing to attain by combat. A war between France and Great Britain would be essentially fratricidal, at which our present enemies would look on with unbounded and sardonic satisfaction. It may be conceivable, but it is so superlatively improbable as not to fall within the contemplation of the practical politician.

The other thing which makes the situation different from that which existed in Lord Wolseley's day is that the effective range of guns has so enormously increased that the artillery defences of such a work as the Channel Tunnel could be twelve or even more miles from the tunnel-mouth, and yet every shot could be fired with such power and such precision of aim that the entrance would in two minutes be reduced to masses of broken masonry, and so choked up with debris that nothing could pass through it. But there is a further development connected with the working of such a tunnel, if made, that creates additional security against successful capture of it by an invading enemy. The now common use of electric traction on railways has altered the whole aspect of the matter in regard to the risks of danger from the use by an enemy of the Channel Tunnel. It is impossible to doubt that if the tunnel were made the motive-power used in it would be electric. If it were for no other reason, the avoidance of fouling of the air by engines, which would be most offensive in a twenty-two mile tunnel used by numerous trains, would undoubtedly determine the question. In any view, in the international arrangements for the construction, electric traction might be insisted on as a condition. And if this were done, as it certainly would be, a possible element of danger could be absolutely eliminated. The driving-power for half of the tunnel between Dover and the middle of the Strait would be from a power-house some distance inland from Dover, and the driving-power for the other half of the tunnel would be provided in France, the two having no connection. If this were so arranged, all power could be taken from the Dover section by the opening of a switch. A train approaching from the Continent would be held immovable in the middle, and a train on the English section could be brought to a stand at any point in the same way. In this manner the use of the tunnel to bring troops or military material through it could be absolutely stopped; and even if by effecting a landing an enemy got possession of the English power-house, he would find it made unworkable before those in charge were driven out. To interrupt and make impossible the transmission of a current is the simplest operation in the world, and the dynamos for

supplying the driving-power could be rendered ineffective without difficulty.

As regards advantages, from a military point of view, of the existence of a tunnel, it is plain enough that if an attack were to be again made on our ally France, our troops in aid could be conveyed through it, and without quitting their trains be at once carried to the front, thus bringing immediate reinforcement wherever it might be required. Allowing for a train every three minutes, an army corps of forty thousand men could be passed through the tunnel in the course of a day, being carried on to the front without changing vehicles.

On these grounds it is thought that the making of a Channel Tunnel would not cause danger to this country, and would be of great advantage both to France and to Great Britain. The only question that remains regards the cost. It has been ascertained that the making of the tunnel would present no difficult engineering problems, and the experience already obtained in the boring of tunnels under water, as in the Mersey and the Severn, gives confidence of easy accomplishment. The length makes no practical difference. There is, of course, more work to be done, but it is the same work in character as that which has already been done with success, and the length does not create any new difficulty. No doubt the cost would be great, but there is little reason to suppose that the capital necessary would not be found; and if, as is believed, the formation of the tunnel would be a national benefit, Parliament might well give some financial aid, either by subsidy or by guaranteeing a small return on the capital subscribed, until the traffic developed, as it certainly would do as years went on. Another aid might be given by allowing the railway company to charge an excess rate for the mileage of the tunnel, as was done in the case of the Forth Bridge, all traffic over which is charged as for a much greater mileage than is represented by the length of the bridge itself.

Weighing all the pros and cons, there seems to be fair reason to hold that the construction of a Channel Tunnel should, in present circumstances, be encouraged.

The Forth and Clyde Ship-Canal need only be considered as to its feasibility, as it involves no question of possible advantage to an enemy. The grounds on which its promoters urge its formation are simple enough, and scarcely to be impugned by any reasonable argument. That it would be a most useful addition to our defensive power at sea is demonstrable. At present, if a large number of vessels of the British fleet were on the east of Great Britain, and cause arose for transferring them to the Irish Channel or to the Atlantic, they could be passed through such a canal in a few hours, whereas at present they must either go down to and through the English Channel or go by the stormy seas that sweep

round the Shetland Islands, involving great loss of time and expenditure of fuel, and with the certainty that their every movement is known to the enemy. A fleet lying in St Margaret's Hope, at Rosyth Dockyard, could cross the country in three or four hours, free from all risk of attack by submarines. On the other hand, in the event of an engagement on the west of the island, ships disabled or requiring repairs, or ships damaged in stormy weather, could pass through the canal by the aid of towing, if necessary, and so quickly reach the dockyard, when their condition might render it hazardous or even impossible to make a voyage under tow round the north by Shetland, apart from the question of exposure to attack by an enemy. Moreover, great loss of time might be saved if time was of importance. War-vessels coming from the North Sea to the Forth might be short of bunker coal and food-supplies; but if their orders were to proceed to the west coast, coals and other supplies could be taken up as they passed through the canal. Lighters made fast alongside could be cleared as they moved through the canal. This would save many hours, and a few hours might make all the difference as to the success of any expedition and the thwarting of the enemy's plans. Short cuts are often hazardous proceedings in navigation, but in the case supposed there could be no sea hazard either from storms or reefs or enemy's craft.

That is the whole simple case from the naval point of view, and it only remains to consider whether the existence of such a canal would be useful to commerce. This it certainly would be. Much traffic from east to west, and *vice versa*, could reach its port more easily and more safely than at present. There is one very obvious instance. Mercantile traffic between Russia and the Baltic—not to speak of Swedish, Norwegian, Dutch, and Belgian traffic—and Glasgow would be as direct as it is now of necessity indirect, requiring either a voyage round Land's End or round Shetland, or breaking bulk and a railway journey. Conversely, trade between India or the Mediterranean and Leith or Dundee or Aberdeen would pass to and from these ports by the Irish Channel and the Forth and Clyde Canal instead of going all the way round by the English Channel.

Unlike the Channel Tunnel, there is no possible ground for thinking that the Forth and Clyde Canal could cause any risk of harm to this country in any of its interests, while the advantages both military and commercial are beyond dispute. No doubt the making of a canal that would allow the greatest ships to pass would be a costly operation. But here again, looking to the great value of having this passage for our naval vessels, it would not be unreasonable to expect that at least for a time the State would give its aid toward the construction. It may safely be said that if the Germans had owned the territory

of the British Islands, this great and obviously national work would have been done long ago. The British subject is not easily moved to loose his purse-strings to help to meet a danger which is only possible. But he has had a severe lesson in the present war, in which for want of forethought—for want of that 'deep thinking' which was so much commended to us, but which did not seem to be put in efficient practice—the nation was found poorly prepared for war, and as a natural consequence has suffered in-

ordinately both in blood and treasure. May the nation not become drowsy once more when peace is attained, but look forward with the vigilance which the lesson of the folly of unpreparedness has brought her! Two subjects to which the public mind should be keenly directed are the two which have now been discussed. It is earnestly to be hoped that deep thought may be given to them, lest once more the words *too late* may have to be written upon the slate.

PINCHER MARTIN, O.D.

A REALISTIC STORY OF THE INNER LIFE OF THE ROYAL NAVY.

By TAFFRAIL, Author of *The Baul Hat*, *The Decoy*, *An Eye for an Eye*, &c.

CHAPTER IV.—COMINGS AND GOINGS.

I.

[The reader is cautioned against accepting this story as an official narrative of the great war. The incidents described have actually happened; but, for obvious reasons, it has been necessary to give them fictitious colouring.]

'ERE, wot's that over there?' inquired Pincher Martin, coming on to the fore-castle early one morning with a basin of hot cocoa for one Billings, able seaman.

Joshua looked round. 'Na then, young fella, don't go spillin' the ruddy stuff,' he grunted agitatedly, taking the bowl with a nod of thanks. 'Wot's wot?'

'That there,' said the ordinary seaman, pointing.

'Er?' remarked the A.B. huskily, breathing heavily on to the hot liquid to cool it. 'That there? Only a bloomin' Zeppelin, Pincher. You've see'd 'em afore, ain't yer?'

'Course I 'as. Only I thort to meself as 'ow she looked a bit different, some'ow. Quite pretty like, ain't she?'

The distant airship, floating apparently motionless above the eastern horizon, certainly did appear a thing of beauty for the time being. Her elongated body, dwarfed by the distance until it appeared barely an inch long, was plainly silhouetted as a gray-blue shape against the clear, rosy sky of the dawn, while her curved underside reflected the scarlet and orange of the rapidly rising sun. She looked graceful and almost ethereal—not a thing of bombs, terror, and destruction.

Joshua assimilated his cocoa with noisy gulps. 'I don't know abart wot she looks like,' he observed at length, wiping his mouth with the back of a particularly grimy hand. 'You wait till she starts droppin' 'er bombs. I reckons them blokes is no better 'n murderers.'

'Why doesn't we 'ave a pop at 'er?'

'Ave a pop at 'er! She's twenty mile orf, if she's a hinch, an' yer knows as well as I does that none o' our ships 'ere 'as got hanti-haircraft

guns wot 'll 'it 'er at that range.' Joshua sucked his teeth, and proceeded to explore the inner recesses of his mouth with the end of a burnt match.

'Why doesn't we chase 'er, then?'

'Chase 'er! Wot's the good? She kin go 'er fifty knots, an' 'll be orf like a rigger afore we gits anywheres near 'er. She'll watch it she don't git inter trouble. You ain't got a fag or a fill o' bacca abart yer, I s'pose?'

Pincher shook his head firmly. He knew Joshua of old.

Billings smiled affably, produced a well-blackened clay from the pocket of his lammy coat, and proceeded to light it. 'Ah!' he sighed contentedly, patting himself gently on the stomach and puffing out a cloud of smoke, 'that drop o' cocoa done me orl th' good in the world. I feels has bright an' has fresh as a li'l dicky-bird.'

Pincher smiled, for the simile was hardly an apt one. Joshua had kept the first watch till midnight, and, after four hours' sleep in his clothes, had been up again since four o'clock as a member of the duty gun's crew. His eyes were sleepy and bloodshot, his hands and face were indescribably filthy, and his chin sported an ugly stubble of three days' growth. He was not a pleasant sight. Moreover, it was summer, and the weather was perfectly fine and unusually warm; but, true to the custom of the British bluejacket, he was wearing sufficient clothing to keep the cold from an Antarctic explorer. His figure was ponderous at the best of times; it was now elephantine, and anything less like a dicky-bird it was impossible to imagine.

'That bloke,' he went on, pointing with his pipe-stem at the far-away airship, 'is spyin' art th' land. She's 'avin' a "looksee" at wot we're doin' of, an' I shouldn't wonder but wot ole Zep wus up there hisself. I did 'ear as 'ow 'e'd bin given th' Iron Cross.'

'Garn!' chortled Pincher rudely. 'Wot for?' 'Strafin', fat'ead; wot else d'you think? Probably 'e's usin' 'is wireless an' tellin' 'ole Tirpitz as 'ow we've come 'ere to pay 'im a visit. "Tirps, ol' fella," 'e sez, "these 'ere gordamned Henglish swine 'ounds 'ave come agen." "Sorry, Zep, ol' chum," sez Tirps; "I can't attend to 'em now. I'm hinvited ter breakfuss wi' th' Hadmiral o' th' 'Igh Sea Fleet, an' I can't git wastin' of 'is bacon an' heggs in these 'ere 'ard times. Tell th' Henglish ter shove orf outa it, an' ter come agen, an' I'll 'ave a few submarines an' mines awaitin' for 'em. Th' navy's 'avin' its make an' mend,* an' can't be disturbed." That's wot ol' man Tirps is sayin', I'll give yer my word.'

The men round about laughed.

'I reckons they'll never come out o' their 'arbour 'cept they knows Jellicoe an' Beatty is outa th' way,' some one observed.

'An' our bloke!' chipped in another man. 'Our bloke's a 'oly 'orror for scroppin'. Look wot 'e done at 'Eligoland! "If yer sees a 'Un, go fur 'im;" that's 'is motter.'

'An' a damn good motter, too,' said Joshua approvingly. 'But I reckon they knows wot they're up against. This 'ere war's like 'ide an' seek. W'en we pops inter 'arbour fur a bit, they pops art, takin' mighty good care not ter git too far from 'ome, mind yer; an' w'en we pops art arter 'em, they pops back 'ome agen. It ain't playin' the game, in a manner o' speakin'. 'Ow many times 'as we bin scullin' round th' North Sea an' never see'd a ruddy thing? Dozens an' dozens! It makes me fair sick sometimes.'

'But they 'ave bin acrost once or twice, an' bombarded places,' Pincher ventured.

Billings snorted loudly. 'Course they 'as; but it don't take much guts ter come scuttlin' acrost th' North Sea durin' th' night, an' ter start pluggin' shell at an undefended town th' nex' mornin'! They takes jolly good care they doesn't stay too long, I hobserves, an' they shoves orf back 'ome agen afore anythin' big 'as a chawnce o' gettin' a slap at 'em. Arter orl, wotever blokes ashore may say abart th' navy not bein' there ter perfect 'em, we can't ruddy well be everywhere. Th' North Sea ain't no bloomin' duck-pond; an' look at th' time we spends on th' briny!'

His hearers nodded in agreement.

'I reckons some o' these 'ere shore-loafers don't know w'en they're well orf,' Joshua went on. 'They gits orl their meals reg'lar; but a good many on 'em don't recollect as 'ow it's th' likes of us wot's keepin' their stummicks full. They 'as ter pay a bit extry fur their vittles pr'aps; but that ain't nothin' ter start 'owlin' abart in war-time.'

'That's a fac,' said Pincher wisely.

'Course it is; but a good many o' th' blokes wot I'm talkin' abart starts yellin' somethink horful when they gits a few shells plugged at 'em, an' wants ter know wot th' navy's doin' of. I don't 'xactly blame 'em, fur no blokes wot ain't mad likes bein' shot at; but they might recollect that we're keepin' 'em from starvin', in a manner o' speakin', an' that we is doin' our bit; damn sight bigger bit than wot some of 'em himagines.' Joshua paused for breath.

'If them Germans 'ad a coast as long as ourn,' he went on—for when once he started to give vent to his opinions little could stop him—'if them Germans 'ad a coast as long as ourn, an' if they 'ad undefended seaside towns th' same as we 'ave, I reckons we could go an' do th' dirty on 'em. Only we wouldn't, 'cos it ain't war ter go killin' a lot o' innercent wimmin an' children wot ain't done no 'arm. I reckons we treats them 'Uns too good; fur wi' their submarines, an' Zeppelings, an' the way they treats our prisoners, they're no better'n murderers!' He cleared his throat noisily, and expectorated with extraordinary violence into the sea. They were somewhere near the German coast at the time, so perhaps that accounted for his expression of contempt.

Billings only voiced the opinions of the remainder of his shipmates. Nobody thought for a single instant that Zeppelins would have any real effect on the war, and as often as not their advent was taken as a joke; while people flocked from their houses to see the fun, thereby running a far greater risk than they themselves imagined.

Billings happened to be on short leave during one raid, and in the midst of a very heavy fire from the anti-aircraft guns he discovered an elderly, scantily attired, and very irate female standing in the road. She had her umbrella up to ward off stray fragments of bombs or pieces of shell, and indeed splinters from the A.A. guns were falling far too close to be pleasant. The Zeppelin, illuminated by the glare of many searchlights, and surrounded by the flashes and little puffs of smoke of exploding projectiles, was almost immediately overhead; but the woman was far too wrathful to be frightened.

'Ere, missis,' said Joshua gallantly, 'adn't you better go 'ome!'

'Go 'ome!' she retorted; 'what for?'

'Er,' said Billings, pointing at the sky.

'Er!' snorted the lady contemptuously. 'I'm not afraid of the likes of 'er.—You dirty dog!' she added angrily, shaking her fist at the invader. 'Come down, you dirty 'ound!'

The 'dirty 'ound' evinced no particular emotion.

If the German public believed the mendacious Berlin *communiqués* as to the damage inflicted on the hated British by their perambulating

* 'Make and mend' = an afternoon set apart for making and mending clothes—that is, a half-holiday.

gas-bags they must have been very well pleased.

'A detachment of our naval airships visited London on the night of the 26th,' wrote Von Ananias, his tongue in his cheek. 'Several important points were attacked. At Poplar three shipbuilding yards were set on fire and completely destroyed, and a battleship in course of completion for the British navy was badly damaged. At Houndsditch a heavy battery was completely demolished, while bombs were successfully dropped on the barracks at White-chapel, flinging the troops into a state of the utmost consternation and causing many casualties. Near Ludgate Hill a munition factory was observed to be in flames. One light cruiser and three destroyers anchored in the Thames near Gravesend were struck by bombs and sank with enormous loss of life. The inhabitants of the invaded districts are said to be petitioning the Government to stop the war, while many of them are leaving the neighbourhood. Our airships, though fired upon heavily from many points, have all returned in safety.'

No Zeppelin had been anywhere near Poplar, no battleship had been damaged, while Houndsditch was as innocent of heavy guns as White-chapel was of soldiers. Neither was there a munition factory near Ludgate Hill; while the light cruiser and three destroyers which had foundered off Gravesend were nothing more or less than one old and empty barge sunk, and one waterman's wherry badly damaged. A more truthful account would have read as follows:

'Near X. a bomb fell into a kitchen-garden and completely overwhelmed a detachment of early lettuces and uprooted three apple-trees. A brigade of spring onions was also completely annihilated, while a regiment of tomatoes in their billets in a greenhouse suffered severe casualties. The owner of the garden is now charging threepence admission to view the damage. The proceeds will be handed over to the local Red Cross Funds, and the sum of twenty-four pounds three shillings and ninepence has already been collected. Fragments of the bomb are on view at Mr Button's shop at 45 High Street, and will be sold by auction at the next Red Cross sale.

'On the outskirts of Y. one aged donkey and four chickens were killed, while one cow, two pigs, and twenty-three fowls were wounded. A black tom-cat, which was visiting the chicken-run at the time of the raid, is also suffering from shock and nervous prostration, but is expected to recover.

'At B. a bomb exploded with terrific force in the street near the statue of the late Alderman Theophilus Buggins, J.P. This well-known work of art was hurled from its pedestal and badly shattered. It is feared it cannot be repaired.'

Truly 'tis an ill wind that blows nobody any good.

Purely from a spectacular point of view I should imagine that all Zeppelin raids are much the same. They generally seem to take place late at night or in the small hours of the morning, while their usual accompaniment is the glare of many searchlights, the barking of guns, the bursting of shell, and the dropping of bombs with or without loss of life and damage to property. The *Mariner's* men saw several raids; but it was the first one they witnessed which left the most lasting impression on their minds.

There had been the usual report early in the evening to the effect that Zeps might be expected; but they had been warned so often before that, beyond taking the usual precautions in regard to lights, nobody on board really paid very much attention to it. The first intimation of the arrival of the invader was the sullen report of a distant anti-aircraft gun; whereupon Wooten, always a light sleeper, rose hastily from his bunk, attired himself in a green dressing-gown and a pair of sea-boots, and repaired to the deck with his binoculars. The other officers and the men, determined not to miss their share of the entertainment, followed his example, and in less than two minutes the deck was thronged with an excited, inquisitive crowd, all peering anxiously at the sky. It was rather like a regatta or a race meeting, except that the greater proportion of the spectators were far too lightly clothed to be strictly presentable.

The long pencils of light from many searchlights streamed forth and swept slowly across the starlit heavens.

'Where is the bloomer?' some one asked impatiently, as if he were at a music-hall waiting for a new turn. 'Why don't she come?'

'She's got cold feet, an' ain't comin',' laughed another man. 'There'll be no show ter-night.'

'I think I'll go back to me 'ammick,' opined somebody else. 'I can't git standin' abart 'ere in these 'ere clo'es. Grr! ain't it parky?' It must have been, for the speaker was simply attired in a flannel shirt. His legs were bare, and his teeth were chattering.

'There she is!' exclaimed a stoker, pointing vaguely overhead. 'See 'er?'

'That ain't 'er. That's a bloomin' cloud!'

'Garn! That ain't no cloud. Not wot I'm lookin' at.'

'Tell yer it is.'

'No, it ain't. It's 'er, right enuf!'

Further conversation was rudely interrupted by the crash of a gun from ashore, and a thin trail of dim light climbed skywards in a curve as a tracer shell* hurtled its way through the air.

* A tracer shell for use against aircraft has a small cavity in its base filled with composition which is ignited when the gun fires. It emits a thin trail of smoke in the daytime and a luminous track at night, so that the gunners are able to see where their projectiles are going.

More guns roared out. More trails of light in the air, rather like the sparks from the tails of rockets!

The sky to the eastward suddenly began to flash and twinkle with momentary spurts of vivid orange flame as the shell started to burst; the searchlights swung round and became stationary, with their beams all pointed at one particular spot in the heavens. But still the spectators could see nothing of the raider. Before very long all the anti-aircraft guns in the place were hard at work pumping projectiles into the atmosphere as fast as they could go. Streaks of light sped upwards like the stars from a Roman candle, and presently the heavens toward the point of junction of the searchlight rays sparkled wickedly and with redoubled energy. Puffs of smoke from the shell explosions filtered slowly through the blue-white beams of the lights; but though the gunners could obviously see what they were firing at, the men on board the *Mariner* had not been vouchsafed a glimpse of anything.

'Ow!' yelled some one, stamping on the deck in his excitement and impatience, 'why can't we see 'er? Where is she?'

'Keep yer flat feet 'orf o' me toes!' expostulated a gruff and very injured voice. 'I ain't got no boots on. Knock orf jumpin' abart like a parishin' loonatic, can't yer?'

The air was as full of sound as were the heavens of bursting shrapnel. Little guns and big guns were having the time of their lives. They banged, boomed, coughed, and spluttered together, and every now and then in the ear-splitting medley of sound one heard the hiccupping, deep-throated *poom-poom* of an anti-aircraft pom-pom, the shrill staccato *ra-ta-ta-ta* of a little .303-inch high-angle Maxim, and the faint but quite unmistakable whistle and report of the shell as they clove their way through the air and exploded.

'Lord!' muttered Wooten with a laugh, his eyes glued to his glasses, 'I wonder where all the bits are coming down. We'll have to get under cover if they start loosin' off anywhere near us.'

It was a magnificent sight, quite the best fireworks display most of them had ever seen. The many searchlights made the night as light as day. The heavens were ablaze with the tell-tale sparkling flashes, while the earth seemed to vomit the fiery trails of tracer shell which crossed and recrossed in all directions. Brock's Benefit at the Crystal Palace was not in it.

Then, quite unexpectedly, there came a roaring thud from somewhere far away. Another, another, and yet another! The reports were loud and reverberating, and almost drowned the sound of the guns. They were bomb explosions, and the onlookers held their breath and glanced anxiously round to see how their

neighbours were taking it. Nobody seemed unduly anxious, but some of them wondered vaguely what would happen if a missile fell on board the *Mariner*. Her thin decks offered no protection whatsoever, and if a bomb did hit her—

At last, after what seemed an eternity of waiting, a great, elongated, silvery-looking mass slid rapidly into view at the point of intersection of two of the searchlight-beams. It looked like an enormous hexagonal pencil suspended from the sky, and travelled with awe-inspiring sedateness and solemnity. It was the Zeppelin; but, from her size, she seemed to be at least ten thousand feet up. The searchlights followed her unremittingly. Her great bulk became indistinct and nebulous amidst wreathing eddies of smoke, while the shell-flashes seemed to be bursting out into space all round her.

'Ow!' yelled the excitable, dancing gentleman, as a particularly brilliant gout of flame flashed out immediately in line with the airship's blunt bows; 'that's got 'er! Did yer see 'er waggle?'

But shooting at a rapidly moving object high up in the air and almost immediately overhead is a much more difficult task than people imagine; and though some of the shell may have caused the Hun a certain amount of annoyance, it was tolerably certain that a good many more expended their energy in space.

But whatever the result, the raider evidently received a warmer reception than she bargained for, for after being in sight for barely a minute she swung off and disappeared from view at a good fifty miles an hour. Whether or not she had been hit remained a mystery. Every anti-aircraft gunner in the place, even the man at the little .303 Maxim, would have taken his solemn affidavit that missiles from his own particular weapon had hit her not once, but many times; while the *Mariner's* men, judging from their conversation, were of the same opinion. Some of them were even prepared to swear that they had seen gaping holes in the Zeppelin's bows, stern, and amidships—all over her, in fact; but if their accounts were to be believed their eyesight must have been abnormally abnormal, while the Zep should have come down a mass of punctured fabric and twisted aluminium framework. She had done nothing of the kind.

The guns ceased firing; one by one the searchlights flickered, glowed redly, and went out. All was peace.

The men, chattering like monkeys, sought their hammocks. Their officers repaired to the wardroom and indulged in a nocturnal orgy of sardines, bread-and-butter, and bottled stout. The mixture was hardly a good one to sleep upon, but the sardines of Jean Peneau and the

stout of Messrs Guinness were the invariable concomitants to a Zeppelin raid if the *Mariner* was anywhere in the neighbourhood.

'I hope nobody got strafed by those bombs,' observed the sub. with his mouth full.

'I think they fell clear of the town,' said the skipper, removing the froth from a tumbler with a spoon.

They had. There had been no casualties.

(Continued on page 724.)

RUSSIAN CANALS.

By F. A. DOUGLAS.

THE extraordinary thing about the waterways of Russia is that, although it has the largest and longest rivers in Europe, they flow only into the smaller and mostly inland seas, and that therefore the advantage of their great carrying-power is very considerably neutralised and reduced. They rise in the great Russian central plain, and flow north, north-west, and south to different seas; and in order that these seas may be connected, canals have to be constructed between the diverging rivers. Canalisation, therefore, is a great national work in Russia, and has been developed by the people with no little energy and perseverance.

Peter the Great was the first to perceive the necessity of canals. In 1698 he engaged Captain John Perry, an English hydraulic engineer, to construct a canal between the Don and the Volga. Singularly enough, the canal had already been begun by a German called Breckell, who, before he had proceeded very far, ran away. Unfortunately this canal was not finished. At Peter's death the work was allowed to drop, and there is now no trace of it. What Peter the Great *did* manage to do was to connect the Neva and the Volga, and this ensures a waterway from the Baltic to the Caspian Sea. At first a small canal between the Isna and Khilina was constructed, but there remained the difficulty of navigating Lake Ládoga. Peter had special lighters with keels made, but transhipment proved troublesome, and he ended in constructing a canal through the swamps. This, also, he did not see completed before his death, but it *was* completed afterwards, and is commercially useful to this day. Nevertheless, it seems a pity that the enterprising Czar did not manage to sail from Petrograd to Moscow, as he had planned to do. Dreamers are the originators of the world, but they do not always see their dreams come true.

Russian rivers all partake of the same characteristics. They have many tributaries, and they pursue a tortuous, serpentine, and sluggish course. Geologists say that old rivers swing to and fro, and do not flow straight; so the Russian rivers must all be very old. They are sluggish because they rise in the great central plain of Russia, and there is nothing to give them impetus. The Dnieper is the only river that has rapids and waterfalls.

One curious feature of the Russian rivers is

that they have annual floods; not spasmodic, unexpected floods, but floods regular as clock-work, and beneficial in their operation. They come in the spring when the snows melt. Then the rivers overflow their banks, and even the lesser ones become great sheets of water. These floods stimulate navigation, and irrigate and improve the soil.

The majority of Russian canals were constructed in the earlier half of the nineteenth century, and the most interesting section of canals to us at present is that which connects the rivers in the west. There are three large canals there: the Beresina or Berezinski Canal, sixty-six miles long, which connects the Western Dwina and Dnieper; the Oghinsk, sixty-seven miles long, which connects the Dnieper and the Niemen; and the Dnieper-Boug Canal, one hundred and twenty-seven miles long, which unites the Dnieper with the Vistula. By this last you can sail from Russia right to Danzig; by the Oghinsk you can sail to Königsberg, and by the Beresina from the Black Sea to Riga.

The worst of the Beresina is that it can only carry small ships. Before the war a great scheme was on hand to construct a new and great canal from the Black Sea to the Baltic, by which inland commerce could have been immensely increased, and which, had it been completed before the war, would have been of very great strategic importance.

The sources of the Western Dwina and the Dnieper do not lie very far apart. Both rivers rise in the lakes and marshes of the Waldai Plateau. Peter the Great and Catherine both perceived how important it would be to connect these rivers, but they had already too many great schemes on hand, and not enough money to carry them out. Belgian and American capitalists later on saw the value of the scheme, and approached the Russian Government with a plan. A Belgian, Gustave Dufosse, published a pamphlet setting forth its advantages. Later on the Russian Admiralty planned a canal for the navigation of its ships, but had not money enough to construct it. It was calculated that it would cost nine hundred million roubles. The Kiel Canal, as completed in 1895, cost first eight millions, and later, when it was deepened, eleven million pounds more.

The scheme at present in hand was planned to cost the more modest sum of one hundred and

sixty million roubles. The idea is to make a great canal, divided into three portions. The first was to consist of the regulation of the Western Dwina from Riga to Vitebsk, and was to be five hundred and fifty-six versts. The second portion was to be the canal proper from Vitebsk to Orsha on the Dnieper, seventy-eight versts long. The third and southern portion would be the regulation of the Dnieper from Orsha to Kherson, fifteen hundred and eighty-three versts. In all the canal would, when complete, be fourteen hundred and seven miles long.

The longest canal in the world is the one that runs from Petrograd to the Chinese frontier, and is four thousand five hundred miles long.

It will at once be perceived what an immense gain to Russia the proposed canal will be when constructed. It will traverse her richest agricultural district, and greatly facilitate the export of her grain. The chief towns upon this waterway will be Riga, Dvinsk, Polotsk, Vitebsk, Moghilev, Kiev, Ekaterinoslav, Alexandrovsk, and Kherson. These towns export grain, timber, flax, naphtha, petroleum, sugar, tobacco, fruit, and vegetables. What the country wants mostly is agricultural machinery and manures. Germany has hitherto supplied Russia with these; it remains for Britain to do it in future.

The economical and strategical value of this canal is concentrated in one fact: it would to a certain extent make Russia independent of the Dardanelles. Goods would pass in twelve days from the Black Sea to the Baltic.

Some progress has actually been made with the canal. In the summer of 1913 a good deal was done between Ekaterinoslav and Gradizsk in the way of blowing up submerged reefs and small rapids, and deepening river-beds. Two million roubles was allowed for this bit of the work, and four years were given to do it in. The deepening of the river between Ekaterinoslav and Kiev has been commenced. From Kiev to Orsha the banks have been strengthened and the channel deepened. In the Vilna district a fresh canal has to be made from Orsha to the Dwina. On the Dnieper from Alexandrovsk to the sea the canal is ready for use. Had the *whole* canal

been ready for use, how greatly it would have aided Russia just now!

Another projected canal is the Caucasian one, between the Don and the Caspian Sea. Finland, too, has a scheme for connecting her lakes by canals. In the matter of canalisation Russia has really been much more enterprising than Germany, probably because her railway system is not so good. Railways naturally appeal more to a modern people like the Germans, canals to a leisurely and primitive people like the Russians.

There is an extraordinary fascination to some minds in canals; kings and emperors have toyed with them. In the hoary East they made and used canals. China made them long before the Christian era. The Ptolemies tried to forestall the Suez Canal, and so did Cleopatra. Demetrius, Cæsar, Caligula, all went canal-making, but 'all the grand projectors,' said cold Jeremy Collier cynically, 'came to a bad end.' His definition of a canal is distinctly quaint. He calls it 'an artificial cavity to receive part of a sea or a river. The ancients,' he continues, 'have often taken a great deal of pains, to no purpose, to cut through isthmuses with a design to make a communication by water from one place to another.'

In spite of Jeremy's scorn, canal-making has gone on, and it is not likely that railways will ever entirely supersede them. Many hold that the secret of power lies in the command of water—whether it be sea, or river, or even canal. The greatness of little Holland lies in her canal system; and all clever people—French, Americans, and others—have set great store upon their canal achievements.

One of the earliest things gained by canals was that by the opening of Lake Ládoga Canal. English merchants were enabled to travel overland from Petrograd *via* the Volga to Persia. Before that they had to go round the Cape of Good Hope to get to it.

A fresh testimony to the value of canals has just been given by the Germans, who quite recently held a meeting to consider how they could improve and extend their system of inland waterways. Their great idea is to connect the Rhine and the Danube by a canal.

SYSTEMATIC CATTLE-STEALING.

By Major C. H. BUCK, I.A., Punjab Commission.

IMAGINE a flat tract of country of much the same size and shape as the counties of Dorset, Wiltshire, and Hampshire, and you will have some idea of the extent of the Karnal district in the Punjab. What an uproar there would be if, during the course of one year, complaints were made of the loss by theft of, say, one hundred head of cattle in those three

counties! Yet in the Indian district I have mentioned the average number of animals stolen annually during the latter half of last century amounted to over ten thousand! It is difficult nowadays to realise the existence of such extensive crime, and particularly so for residents in England, who are accustomed to see bullocks and cows quietly grazing in enclosed pastures,

or being driven along the roads in small herds of a dozen, each perhaps attended by a couple of stalwart men.

India, however, is an agricultural country, and possesses an enormous number of cattle of every description; each hamlet has its hundreds, and the larger villages have their thousands. In Karnal itself, a town containing some twenty-eight thousand inhabitants, there are actually as many as fourteen thousand animals, consisting of buffaloes, cows, bullocks, sheep, and goats. Just think of it—one for every two inhabitants, and that in a town!

Early in the morning each day all the cattle are sent out grazing in the jungle, where maybe the grass is scanty and the herds have to spread over large areas in search of it. Frequently more than fifty fat buffaloes are taken out by two urchins scarcely strong enough to wield the large *lathis*, or long, heavy sticks, which they carry in order to command respect from their charges. Towards dusk the animals are collected, counted, and taken home, to be placed for the night in clumsy pens, the more valuable ones being put into roughly built stalls or even in the living-houses.

As may be imagined, under these conditions every facility is afforded to those who are thievishly inclined; and in some parts of India, but more especially in the north-western tracts, these are legionary. In the desert areas attention is paid to camels, and in certain districts of the Punjab a youth would not be allowed to wear a *pugri* (turban) until he had successfully purloined a camel, a pony, a buffalo, or a bullock. From time immemorial, indeed, cattle and camel lifting has been regarded as an honourable profession in India, and it was not until the middle of last century, when the British annexed the Punjab, that any serious efforts were made to teach the inhabitants the contrary.

In the Punjab and its neighbourhood the operators brought their nefarious business to the status of a fine art; not only were the actual thieves exceptionally skilful in removing animals from the custody of their lawful owners, but the receivers showed considerable aptitude in passing them on and hiding the traces. There was, in fact, a regular system of lines and depots stretching from one end of this province to the other—from the Indus to the Jumna, and thence into the United Provinces. This system might, indeed, be compared to a railway. When a man stole a buffalo in Multan, he would deliver it to a receiver at a depot or station, whence it would be despatched with all speed along one of the lines to some distant junction, and it would then be taken down a branch line until it was finally landed in Saharanpur, over four hundred miles away from its original home. Some of the junctions acted as exchanging stations; not, of course, for returning animals to their homes, but for

sending back others to the original receivers to balance accounts.

On one occasion thirty camels were stolen near Kamalia, in the north-western corner of the Montgomery district, and taken to Hissar, over two hundred miles away; and a few weeks later thirty fine buffaloes arrived at the former place in exchange. Expert trackers in this case actually followed the animals both ways, and many of the culprits concerned were arrested and convicted.

For more than fifty years district and police officers have attempted to solve the problem of preventing this crime, but unfortunately with little success until quite recently. Many were the suggestions made. Some officers tried to introduce branding of all cattle with district and police-station letters and village numbers; others thought of registration of animals, combined with branding; another started registers for each village, in which thefts of cattle had immediately to be entered so as to ensure full reporting; patrols and pickets were placed on the lines and by the depots; the rivers were patrolled by police; and persons using *sarnais* (inflated skins) were required to take out licenses. All of these methods, and many others, met with some temporary success, but none of them was of any permanent use. The branding and registration interfered with honest trading; the patrolling was too expensive, as it required a large force; the village registers were manipulated; and thieves, of course, did not take out licenses for *sarnais*.

The most successful method of dealing with the cattle-lifters which has yet been conceived was that adopted in the district of Karnal, in the extreme east of the Punjab, from 1911 to 1913. During the first year of this period, Mr C. A. Macpherson, superintendent of police, brought up to date all the available information about the organisation of the cattle-thieving gangs in that part of the province; maps showing the three main lines, their branches, depots, and junctions were drawn; lists containing the names of the men suspected of being the principal receivers, passers-on, and thieves were prepared; minute inquiries were made regarding the history of previously convicted offenders.

By the commencement of 1912 the preliminary investigation was completed, and everything was ready for active operations. Early in the morning on a certain date a series of raids were made by the police on the depots of one of the main lines and several of its branches; about fifty suspects were arrested, and almost a thousand head of cattle seized. The animals were collected on the encamping ground at the headquarters of the district, where they were guarded by pickets of police, and where, during the ensuing weeks, thousands of people came to search for cattle which had been stolen from them; and, sure

enough, many recognised their property, which was thereupon set aside. Meantime lists of the witnesses were being got ready, and the whole of the prosecution evidence examined and sifted.

The accused were to be charged with being members of a gang habitually concerned in committing theft; and in order to bring this home to them it was primarily necessary to prove that each member was intimately connected with the others in carrying on the cattle-stealing business. The table of previous convictions was especially useful for this purpose. By its means it was possible to show that accused 1, 10, 14, and 31, who all lived in different parts of the district, had been convicted in a trial four years previously; while numbers 3, 10, and 22 were sentenced together in another case, and accused 3, 14, 25, and 34 were similarly concerned in a cattle-theft two years before. In this manner almost all of the accused were proved to be connected in this class of crime. There was also the evidence as to the places of their arrest, in many instances in the houses attached to pens where stolen cattle were found; witnesses in great numbers were forthcoming who stated that certain of the accused had been present at a *panchayet* (an unauthorised village assembly which made a rough inquiry into a theft and arranged for the return of a stolen animal by the thief), and had handed back stolen cattle on pressure being brought to bear. Among others, there were the witnesses who identified some of the cattle seized during the raid; seventy-five of these animals had been finally selected as being conclusively proved to belong to claimants, their description having been recorded at police-stations when the loss occurred.

This first lot of accused were finally divided into three parties to facilitate the trial, which was conducted by a special magistrate. It took him several months to record the evidence of nearly seven hundred prosecution witnesses, and three more to take that of the defence and to write his judgment.

The final result was that some thirty-five men were convicted and sentenced to imprisonment totalling two hundred years, and to fines amounting to about sixty thousand rupees, or four thousand pounds!

During the course of this first trial other raids were carried out; and later on another special magistrate was appointed to conduct the further trials.

The consequences of this energetic action were extraordinary. Cattle-lifting in the Karnal district came to a sudden end; the lines had been severed and the depots put out of action. Not only did it have a local effect, but the results were felt in all the neighbouring districts. Many persons who were in possession of stolen cattle took them out into the jungle, where they

slaw them, and in all directions one met unsavoury odours until the jackals and other scavengers removed the cause. Some people, who found that there was no longer any fear of their cattle being stolen, let them graze without herdsmen; and others thereupon sent in application for extra cattle pounds, as their crops were being devoured! And when the district and police officers proceeded on tour they were everywhere greeted with such remarks as 'You are our king, you are our father and mother, you are our saviour, and have performed a great work.'

On the conclusion of the second magistrate's labours there was little hope of further raids being successful, for the members of the remaining gangs had taken steps to remove all material evidence.

It was at this stage that the finale occurred. The superintendent of police informed the district magistrate that a number of the chief men wished to bring before him representatives from every part of the district to make a request. Their application was sanctioned; and as it seemed that a good many persons would assemble, the encamping ground was fixed for the meeting a fortnight later. The district magistrate, however, was considerably surprised, when he arrived on the scene, to find a crowd of between five and six thousand people! They addressed him through a lawyer whom they had engaged, and this is the pith of what was said:

His clients wished him to state that they had now come to recognise cattle-stealing as a crime, and not a pastime or lawful profession; they desired to express sorrow for what had occurred in the past, and promised not to take part in such crime in the future, but to make every endeavour to suppress it. The petitioners prayed that the *kar-i-khas* (special proceedings) might cease for the present, so as to give them a chance to show that they were penitent; they took upon themselves full responsibility for putting a stop to this crime, and promised to hand over offenders to justice.

The district magistrate, in replying, mentioned that he was sorry for the unfortunate persons who had been sent to jail, but that it was necessary to make examples; he pointed out that the value of the cattle stolen every year amounted to over five lakhs of rupees—five hundred thousand rupees (thirty-three thousand three hundred and thirty-three pounds)—or, actually, about one-third of the land revenue, a fact which showed what a burden this crime was to those who were honest among the inhabitants of the district. He was pleased to hear their solemn assurances; but he wished to warn them that if at any future time this nefarious business commenced again, the Sirkar (Government) would assuredly reintroduce the *kar-i-khas*, which had proved so effective.

THREE MEMORIES OF THE NILE.

By F. G. AFLALO.

Thou waterest the fields which Rā hath created.

THE Nile is the greatest river in history, the river of all time; but its picturesqueness has outlived its power, which is broken as effectually as that of the Dervishes, in whose final overthrow it proved so valuable an ally. It flows out of the dawn of history. It was to the Egyptians under thirty dynasties, and under the Ptolemies who followed, what the Ganges was to the Hindus; and Jews, Copts, and Moslems were in turn the victims of its wrath and the recipients of its favours. It figures in two of the plagues. Its failure, usually in periods of seven years, brought such misery to Egypt that Isaiah mouthed no curse more awful. It comes winding like some serpent through the papyrus of the Bahr el Gazal, and so through the Soudan to Lower Egypt, the teeming populations of which hung upon its changing moods for five thousand years before modern engineering tamed its spirit.

It is a fascinating stream to the traveller, who recognises in its long and winding career from the heart of Africa to the Mediterranean all the curiously human phases characteristic of most great rivers. Professors of physiography would doubtless trace its source even farther south than the mighty lake from which it takes shape on the map; but it gets its recognition as a river at the point where it comes tumbling out of Victoria Nyanza; and here was my first sight of its beginnings. Like other streams that owe their being to lakes, there is no gradual gathering of its forces such as we are familiar with in torrents of mountain parentage, but a sudden overflow of the lake at the Ripon Falls, a wall of rock some hundred and fifty yards across, though visibly less than twenty feet high, over which the pent-up waters fall with a mighty roar, and go boiling over rocks and surging round creaming pools alive with leaping barbel. Thus the Nile starts in life, so to speak, full-grown, and not in the infantile state of lesser streams that I have seen setting out on their seaward career in the Rocky Mountains and in other ranges. Indeed, though it may gain later in volume and in dignity, nowhere, unless it be at the Murchison Falls, also in Uganda and close to its entry into Lake Albert, is its voice louder or its strength greater than in that first emancipation from the stagnant fastness of its nursery.

The memory that I most treasure of the Ripon Falls takes me back to the pitch-blackness that came before a February dawn at Jinja. With a view to fishing close beside the Falls at day-break, I had clambered down the steep track, without even a lantern to aid me, and guided only by the increasing roar below. So impene-

trable was the gloom that even within fifty yards of the deafening clamour of the Falls the eye could distinguish nothing beyond a vague whiteness revealed by the strange unearthly light that ever broods on the face of the waters. So splendid was the coming of that dawn as to compensate for the comparative defection of the barbel. The rising of the sun is a little more gradual in those latitudes than its setting, but, even so, the coming of day is far swifter than over our Northern skies. The mandate, 'Let there be light,' floods the firmament with sudden radiance; the darkness flees hurriedly before the chariot of the sun-god; and on this occasion that shimmering cascade was suddenly suffused with a roseate radiance very lovely to behold.

There is a striking contrast between the glassy surface of the waters gathering immediately above the Falls and the broken tumult below. The first signs of current are not, indeed, visible until a point is reached a little way beneath a ledge of rocks, a hundred yards or so before the overflow, formerly the base of a telegraph station, but now the basking-place of cormorants and crocodiles. The scene below the Falls is one of great beauty, the picturesque gorge, which recalls more than one east coast salmon-river of Scotland, being the headquarters of fish-eagles, which scream hoarsely overhead as they swoop on their slippery prey or fetch building material for their nests. Until the early days of 1914, a female hippopotamus and her young one lived at peace with all men in a backwater beneath the Jinja golf-course, and afforded a favourite spectacle for visitors. It is to be regretted that a too enterprising cinematograph operator came that way, athirst for records, and, worse still, persuaded an official to shoot the mother that he might 'film' her death-throes. This tragedy achieved, to the disgrace of the too obliging official, the poor little 'toto,' bereft of its mother, disappeared for good and all.

The river that goes racing north over the Murchison Falls and through Lake Albert is cartographically the Victoria Nile. It bore me later to Namasagali, and I found myself close to its entry into Albert Nyanza during a week of March, just fifty years since that other March morning on which Baker had his first sight of the lake, heretofore unknown to white men, from the cliffs on its north shore. Absorbing a number of tributaries and passing under more than one *alias* by the way, it goes, ever swift and turgid, through the Lado and the Bahr el Gazal, and eventually, now the White Nile, emerges at a spot marked by a rocky bluff a little below Khartoum and a little above Omdurman, where it joins forces with the sister river

from the highlands of Abyssinia, which men call the Blue Nile, the word Nile coming from an ancient Hebrew root meaning 'river.' The rendezvous of these seemingly incompatible rivers, which coalesce to form the Nile of history, is a famous ground for big perch and tiger-fish; and the angler, drifting down in his nigger past Omdurman, can plainly distinguish the two streams which, in a condition of benevolent neutrality, course amiably side by side, each at first refusing to mingle with the other, a reluctant partnership also observed in the junction of the Mississippi and Missouri. The White Nile is the swifter, and the pace at which the two run past Omdurman is considerable; while the falling of the Nile in the early days of April still further complicates the manoeuvres of the unwieldy ferry steamers that ply between Omdurman and the 'Magran,' whence a connecting light railway runs to the central square of Khartoum. The Blue Nile, where it runs through that city, past Embankment Street, is broad and swift, and is so swept by wind in the early part of the year that a trip in one of the local feluccas is a tiresome business of endless tacking, with the added excitement of frequently grounding. All the Niles are, in fact, subject to squalls that occasionally overturn the shallow-draft steamers suited to their navigation. I recollect one such storm near Namasagali that all but upset the *Stanley*; and more recently a steamer actually did capsize on the Blue Nile, two officials being drowned. The sapphire water of the Blue Nile, where it runs past Gordon's old palace, now occupied by the Sirdar, is very different from the milky flood that laps the crowded beach at Omdurman. Swift it is, though much of its strength was gone when I fished its dwindling pools in April, and it seemed already a little exhausted by its long and erratic journey from the great lakes fifteen hundred miles farther south, a little weary, a little disillusioned, as is the case with all great rivers that have far to journey to their goal.

Peeps of this historic river gladden the eye throughout the long journey to Cairo, where I first drank the water of its magic many years ago; but I like best to take leave of it as I last saw its mystic surface at Philæ, after having journeyed down from Halfa. That river trip from Halfa to Shellal is not particularly beautiful, and survives in memory as an unchanging panorama of red banks, camels, sakiehs, nuggers floating downstream and feluccas tacking up, with ruins of no particular history, and little groups of fellahin gathered beneath the palms. How different was this African monotony from my last river journey down the Rhine from Mayence to Cologne!

But Philæ! Always it will live with me in dreams as my very own, for I had it to myself for a blissful hour, with no desecrating note of tout or tripper to mar the spell and loneliness of

its flooded columns. The *Ibis* had come to rest in the mud of Shellal at some hour during the night, and a little before daybreak I went on deck and found the river bathed in moonlight. No one was stirring either on board or on the bank, so I untied a little dinghy that some one had left alongside, and rowed softly across the stream, which, thanks to the barrage, is hereabouts more lake than river, to the crumbling island, round which the waters have now been dammed till the very temple is threatened. Then, having tied up to an old palm close to the pictured ruin, I was able to gloat on the change from silver to gold as the moon faded before the ardour of a greater luminary.

Nor were the historic memories of the scene lost in appreciation of its beauty. Here it was that the early Egyptians placed the sources of the Nile, which the Nile god poured out in his subterranean cavern. The monuments in the Temple of Osiris date back to the twelfth dynasty, nearly two thousand five hundred years antecedent to the Christian era. It was humbling to sit alone in that little dinghy while the sunrise reddened those venerable ruins, whose plight brought passing sympathy with the protest uttered by Loti when, with a poet's horror of such sacrilege, he denounced our barrage. Yet a moment's reflection suggested gratitude for the blessings brought to millions of starving peasants by this prosaic curbing of the malevolent river. All through the ages the Nile god made puppets of the Egyptians. One of the earliest recorded famines was that dealt with so effectually by Joseph that even to-day the promise of 'corn in Egypt' has passed into a proverb. A later historic seven years' failure of the Nile, which began in the year of the Norman Conquest, was attended by results so horrible that human flesh was actually sold in the Cairo meat-market. The occupation of Egypt has not been a mere political coup, but a sincere realisation of obligations as well as of priority. Such tragedies are henceforth impossible. As I lingered beside this fascinating fragment of the grandeur that was Egypt, I realised as much. We have chained the Nile god in sight of Philæ, and nevermore may he run utterly to the sea.

HOME.

THERE is a refuge where I fain would flee—
No sweeter thought can buoy a heavy heart;
There is a dearer spot I'd gladly see,
And, seeing, never from that place depart.

Dull are its skies compared with what are here,
Cold are its winters, and its winds are keen;
But, oh, so bright are smiles on faces dear,
And warm are loving hearts so long unseen!

Come soon the day when favouring winds shall bear
This errant minstrel toward his native shore;
And he shall bless his exile, freed from care,
Only because it made him love Home more.

Chambers's Journal

SEVENTH SERIES

DR GUTHRIE: 'THE BIG BEGGAR-MAN.'

By JAMES A. MANSON.

DREAM and dark loomed their future when four hundred and seventy-four ministers of the gospel came out of the Church of Scotland for conscience' sake in 1843. For they had given up their churches, their schools, and their homes, being sustained only by an abiding faith that God, in His infinite mercy, would take care of them. The public acts of the great drama of the Disruption have been faithfully recorded; but the heroism of these pastors, their folk, and their flocks—as shown in the depth of their sufferings and the magnitude of their sacrifices—will never be known, and therefore can never be fully realised.

Among the leaders of the new society, the Free Kirk, as it was called, one of the most familiar was 'lang Tam Guthrie.' There were abler thinkers in their ranks than he, but none equalled him for power and persuasiveness of speech. From the beginning of his pulpit career he resolved to adopt the custom which Lord Cockburn used to observe at the bar. 'When I was addressing a jury,' the famous judge confessed, 'I invariably picked out the stupidest-looking fellow of the lot, and addressed myself specially to him, for this good reason: I knew that if I convinced *him*, I should be sure to carry all the rest.' In the current phrase, Guthrie always aimed at making himself clear to 'the man in the street.'

His gift of picturesque description was remarkable. He once found slight fault with a painting, somewhat to the annoyance of the artist, who hotly reminded him that the critic was a preacher, not a painter. 'My friend,' he answered, 'but I *am* a painter, only I use words, while you use colour.' He believed that his turn for graphic oratory was not only telling, but 'valuable for the highest ends,' and so he did not hesitate to employ it. Its effect upon his hearers was sometimes amusingly illustrated.

One member of an audience remarked of a sermon, 'He is an old sailor; at least he must have been at the sea for a time;' while another, referring to the same discourse, maintained, 'If he stick [give up] the minister trade, yon man 'll mak' his bread as a surgeon!' Neither knew that Guthrie was fond of ships, sailors, and the sea, or that during his student days he attended lectures in the faculty of medicine.

On another occasion, while Guthrie was preaching in his last church (Free St John's, Edinburgh), a Highland drover was noticed to be greatly impressed with the sermon. He had stood throughout the service, for want of sitting-room, and refreshed himself every now and then with a pinch of snuff. Toward the close, when Guthrie was working up to his peroration, the drover was seen to open his mull (a snuff-box usually made out of a ram's horn) and take up a pinch between his forefinger and thumb, which were gradually brought to his nose. The minister's eloquence, however, so entranced him that he paused, eagerly listening, open-eyed and open-mouthed. When the arresting passage was finished, the Highlander completed the operation of snuff-taking, and, forgetting where he was, exclaimed aloud, 'Sirs, but I never heard the likes o' that!'

At one meeting Guthrie moved the audience, now by his pathos and now by his humour, with such effect that at last an old man rose, the tears running down his cheeks, and holding both his sides, and cried out, 'Please, Mr Guthrie, stop! We can stand this nae langer!'

This was the man to whom the leaders of the newly born Free Church entrusted the duty of pleading the cause of the Manse Fund. The choice was ideal; Guthrie was the obvious man for such a task. He toured throughout Scotland, rousing his hearers to provide hearths and homes for their ministers. He began his travels on 5th July 1845, hoping to raise at least fifty thousand pounds; but when his labours were over he was privileged to announce to the General Assembly at Edinburgh on 1st June 1846—barely a twelvemonth later—that, by God's blessing, he had been able to gather the sum of one hundred and sixteen thousand three hundred and seventy pounds. He carried the marks of that year's strain and anxiety to the grave; but he did not grudge the price, and even to the end never slackened in well-doing.

Whether or not the credit of inventing it has ever been claimed for him, he worked what is now everywhere known as the 'instalment principle' with much success. Along with many of his brethren, he subscribed one hundred pounds. 'I am rich,' he told a Glasgow audience, 'in nothing but children, and if any one asked

me to pay down a hundred pounds to-night, he might just as well bid me fly. But if I were asked to pay one hundred pounds, and allowed five years to pay it in, that would be a different matter. I should only need to go home and consult my wife about what things we could do without, and what luxuries could best be spared, and the money could, in that manner, be afforded.' There is thus always a way where there is a will.

Guthrie's first Edinburgh charge (Old Greyfriars) threw him into intimate contact with the poorest of the poor, for his ministry was partly concerned with the Cowgate, where not only the most wretched of the needy herded together, but many of the criminal classes as well. Attempts to impose upon his kindness were often tried, but tried in vain; for room-to-room visitation had given him an insight into character that readily helped him to separate the sham from the real. Painful experiences were at times relieved by others in which—the unsightly surroundings notwithstanding—the finest traits of human nature were exemplified. Guthrie once asked a poor Irishman in the Cowgate whether a wee girl in the room were his bairn.

'No, plaze yer riv'rince, an' she's not,' Paddy answered. 'Her father and mother died next dure, an' she had not a craythur i' the wurld to care for her; so, though we have plinty childer av our own, I said to Mary we'd take her in, and, plaze yer riv'rince, we've nivir missed the lassie's bit o' food!'

Amidst scenes which brought him into touch with bedrock fact, Guthrie learned that there were good points even in the lowest stratum of society, but that if permanent improvement were to be looked for, it could only be achieved by concentrating effort, in and out of season, upon the young. Thus originated his Ragged School work, the keynote of which was based on the maxim that prevention is better than cure. Nor was he long in discovering that the only way to get at the poor children was to provide them with food for the body. Rescue work on other lines was as worthless as it was cruel.

Not long after the consummation of his labours for the Manse Fund, Guthrie's interest in Ragged Schools culminated. Walking with a friend one day on the noble lion-shaped hill of Arthur's Seat, one of Nature's most blessed gifts to Edinburgh, the strollers happened upon two poor wee laddies at St Anthony's Well, who proffered a draught from the crystal spring in 'tinnies,' as the mugs were called, in hope of a welcome ha'penny.

Seated on a rock, Guthrie questioned the boys. One was fatherless; the other's father was an undesirable. Both were poorly clad; one had never been to school; the other now and again went on Sunday. Full of his new idea, Guthrie next inquired whether they would go to school if, besides teaching, they got breakfast, dinner, and supper. The bairns' eyes shone

with joy and their cheeks flushed. 'Ay wull I, sir,' cried one, as he leapt to his feet, 'an' bring the hail land [whole tenement] tae.' Then, fearing lest he might seem greedy, or the bountiful offer be withheld, 'I'll come for my denner, sir.'

Satisfied that he was on the right tack, Guthrie lost no time in carrying out his plans. In answer to his *Plea for Ragged Schools*, seven hundred pounds was speedily subscribed, and rooms were hired on Castle Hill in 1847, three schools being in full swing before the year was out. The results of this social reform were soon apparent. The number of juvenile criminals fell off, and beggar boys and girls no longer disfigured the streets. Mendicancy had been denounced often enough, and the magistrates issued placards imploring people to refrain from almsgiving, but to no purpose. The children were too alert and cunning to be put down by posters. Guthrie saw one urchin go up to an old lady, and with wonted whine appeal to her sympathy. With a poke of her umbrella she bade him begone. Instantly the boy changed his tactics. Baring his dirty arm to the elbow, he ran up to her, exhibiting it, and crying, 'Just oot o' the Infirmary, ledly, wi' typhus!' The acting and byplay were perfect. The lady thrust a shilling into the little rascal's hand and hobbled off for dear life!

On the other hand, when Guthrie was similarly accosted, as he constantly was, he had but one answer, 'Not a bawbee! Go to the Ragged School and say Dr Guthrie sent you.'

Those ragged children, how they twined themselves around his heart! Throughout the rest of his life his loyalty to them was perfect. In the statue erected to his memory in Princes Street, Edinburgh, he is fittingly represented as cherishing a poor waif who clings closely to him. Even when the cause was being undermined to some extent by the establishment of Board schools in crowded cities, he advocated it as stoutly as ever. At a meeting in London in 1871 he pointed to the British colonies as a field for Ragged School children. This remark was fastened upon by the Attorney-General of an Australian state, one of his hearers, who roundly condemned the suggestion of sending 'the scum of the country' to the colonies. Guthrie could not remain silent under this imputation. Holding a sheet of notepaper before the audience, he said, 'This was once "scum"—once foul, dirty, wretched rags. It is now white as the snows of heaven, and in it this gentleman may see an emblem of the material we would send to the colonies, of the work our Ragged Schools have achieved.' The aptness of the retort, conceived on the spur of the moment, brought down the house.

But Dr Guthrie had other qualities besides readiness of speech and the saving grace of humour; his presence of mind, fearlessness, and

common-sense were also remarkable. During his ministry at Arbirlot, near Arbroath, he saved his life almost by a miracle. He was wandering one day among the rocks near the promontory of the Red Head. The tide was flowing and the sea running high. Leaping to a rocky mass that sloped steeply to the ocean, he had no sooner lighted on the rock than his feet went out from under him on the slippery seaweed, and, flat on his back, he slid fast downwards towards the stormy waves. Imminent destruction awaited him, for, though a swimmer, he would be dashed to pieces against the rocks. But the very danger cleared his brain. Suddenly recollecting that the rock formation was what is called conglomerate, or 'pudding-stone,' and that he had had his boot-heels shod with iron the day before, it flashed upon him, as by inspiration, that he might catch his heels on one of the projecting stones, or 'plums,' and so arrest his descent. At once putting this notion into force, he succeeded in bringing himself to a stop, and thus he was, as he said, 'plucked from the jaws of death.'

While waiting for his first church, Guthrie managed the bank agency at Brechin, which had been in his family for more than sixty years, until his nephew was old enough for the post, and conducted the business with marked efficiency. He was once detained in the office until midnight, and had to walk two miles to the cottage where he was then staying. Hearing footsteps behind, he hurried forward; but the faster he walked the faster walked his follower, and at length he concluded he was being shadowed by a footpad. As he carried the bank keys, which must be preserved at all costs, he quietly drew his knife, ready for any emergency, and wheeled around upon his pursuer, sharply calling, 'Who's there?' 'It is you, Mr Guthrie,' came a voice out of the darkness; 'I thocht I kent you atween me an' the sky, an' tried hard to mak' up on you. I've forty p'unds on me, an' it's no canny to be travellin' alane at sic an hour wi' a' that siller!'

Occasionally he had to resort to stratagem. A poor woman having lost her reason, Guthrie persuaded her—as the readiest means of placing her in an asylum—to take a drive with him. She was overjoyed at the honour, but the carriage never stopped until it reached Montrose Asylum. A year's detention served to restore her; and, hearing of her return, and not supposing she would have any memory of the past, he called upon her. Before he had time to speak a word she turned upon him, and, shaking her finger at him, said more in fun than anger, 'Eh, minister, I didna think ye wad ha'e telt a lee!'

Sometimes his presence of mind was displayed in circumstances calculated to provoke a smile or hilarious laughter. During the height of the patronage controversy, the Rev. Dr John Ritchie, of Edinburgh, had accused the clergy of the

Established Church of leading luxurious lives and clothing themselves in soft raiment. At a meeting in Arbroath, Guthrie took up this point. He was wearing strong hobnailed country boots, and his trousers were thickly plastered with mud, for he had walked in from Arbirlot. 'My friends,' he remarked, 'Dr Ritchie declares we are a lot of dandies;' then, protruding his foot and pointing to it, he asked, 'Do you call that the foot of a dandy?'

Dr Ritchie borrowed the illustration at a later meeting, but missed his meed of applause. He was garbed in the most correct style—knee-breeches, silk stockings, and dress-shoes. His party, he said, had been charged with showing the cloven foot; 'but,' he inquired, as he advanced his well-groomed leg, 'do you call that a cloven foot?' Cried a voice from 'the gods,' which spoiled the effect, 'Tak' aff the shoe, sir, an' we'll see!'

Dr Guthrie having once undertaken to preach a charity sermon at St George's, Edinburgh, the church was filled with a fashionable congregation. Whether or not the importance of the occasion had unnerved him, the precentor, or leader of the singing, could not strike the right tune. He tried a second and a third with equally disastrous results. The poor man was now quite helpless, and the people were growing visibly anxious. Guthrie saw that something drastic must be done at once, so he rose as if nothing unusual had happened, and said, 'Let us pray!' After the service the precentor went to the vestry and thanked the minister for coming to his rescue. 'I rather fancy, my friend,' quoth Guthrie, 'I did more for you than you could have done for me in a like predicament. Had I stuck in my sermon, would you have got up to save me by saying, "Let us sing"?'

Dr Guthrie often referred with strong approval to the first school he ever attended. This was kept by a weaver, whose broad blue bonnet covered a big head well packed with brains. Though it was only an infant school, the man taught the bairns on scientific lines. After they had mastered the alphabet and a few words of one syllable, he took them straight to the Book of Proverbs. Guthrie afterwards declared these chapters were unrivalled for learners, with their pure Saxon and 'English undefiled.' 'Take this passage, for example,' he wrote, 'where, with one exception, every word is formed of a single syllable, and belongs to the Saxon tongue: "Train up a child in the way he should go, and when he is old he will not depart from it."'

Joseph Hume, the well-known Radical M.P., hearing that Guthrie had several sons, called at his house one day, and, the minister being from home, saw his wife. To her he explained that he had come to offer his influence on behalf of her boys. Mrs Guthrie declined the proffered kindness with many thanks. Her husband, she said, desirous of preserving his independence,

had made it a rule not to accept patronage for his children from men in place and power. His point of view was characteristic. He had had to fight his own battle, and he thought it better for his youngsters that they should fight theirs. Besides, if he sought favours for his own family, how could he refuse his services for other folk's families in return? He would not risk his power 'for good with those who, under God, shaped the course and ruled the destinies of the country.'

When plain speaking was necessary Guthrie never hesitated to use it. In 1855 cheap Saturday evening concerts of good music were started in Edinburgh mainly for the working classes. Dr Guthrie attended them, and was promptly taken to task—incredible though it may now appear—for countenancing such a form of popular entertainment. He was at the trouble to argue the question with one remonstrant, and concluded an unanswerable letter in these terms:

'I, for one, have no general sympathy with the notion that other people may righteously take part in enjoyments from which ministers should be excluded for decorum's sake. That is but another phase of the old loathsome times when gentlemen got the ladies away to the drawing-room to talk what it was not fit that a decent woman should hear. I hold that a good man should take part in no entertainment to be present at which would raise a blush on a modest woman's cheek, or make a minister of the gospel feel that in being there he was out of place. What is not fit for a lady or a minister to see or hear, or take part in, is an entertainment unfit for any decent, respectable Christian man. That is common-sense and God's truth, or I am greatly mistaken.'

As a matter of fact, Guthrie cherished the ancient Latin sentiment, 'In essentials unity, in matters of doubt liberty, in all things charity,' and practised (as he preached) toleration in small affairs as in great.

For many years he rendered effective service on the platform to the cause of total abstinence. He had not always abstained; but one bitter, windy, rainy day in 1841 he was driving by car from Omagh to Cookstown, in Ireland. By the

time the party reached the half-way house they were wet to the skin, and as soon as they entered the inn ordered toddy. The car-driver, who also was soaking wet, was offered a stiff dram too, but he declined it. 'I am a teetotaler, yer riv'rince, and won't touch a drop uv it.'

That answer stuck in Guthrie's throat, and went to his heart and head. If this poor man, he reasoned, could deny himself this indulgence, why should not he, a Christian minister, do so likewise? The circumstance, combined with the scenes he witnessed daily in Edinburgh slums, made him an abstainer. That experience, set by a humble, uneducated, uncultivated Roman Catholic carman, taught him the value and force of example. He felt he could not urge any one who was becoming a slave of the habit to give up drink entirely if he or she could retort, 'But, doctor, are you an abstainer yourself?' For some years before his death he was obliged to take wine, owing to weakness of the heart's action; but, excepting on medicinal grounds, he was a convinced and firm believer in the wisdom and benefit of teetotalism.

In later life he had to relinquish preaching for several months at a time in consequence of organic injury to his heart during his year's campaign for the Manse Fund. But wherever he travelled for rest and health he was a constant attendant at various places of worship, even in countries or districts in which he could neither speak nor understand the language. In Wales he avowed he was even edified by the devout, fervid, earnest, rude, but telling sermon of a Calvinistic Methodist, although he could not comprehend a word of it. 'I am always glad of an opportunity of being present where God is worshipped in, to me, an unknown tongue,' he wrote; 'it is to my mind the most impressive of all sermons on His omniscience, and the certain sign that He is the common Father of us all.' For like reason he highly admired the remark of the Roman Catholic landlord of the hotel at Chur, in Switzerland, who inadvertently entered the room while Dr Guthrie was conducting worship. At its close the man said, in allusion to the prayer, which was quite unintelligible to him, 'Ah! God knows all tongues.'

PINCHER MARTIN, O.D.

CHAPTER XV.—*continued.*

II.

ALTERCATIONS with Hun seaplanes were by no means uncommon, and their novelty soon wore off.

The North Sea is not celebrated for its clear weather, and in it one's horizontal range of vision is frequently restricted to four miles or less. The vertical visibility, when the clouds are lying low, is sometimes a few hundred feet,

while in summer the absence of wind and the heat of the sun often bring fog or a luminous low-lying haze. When there is any mist it is presumably easier for an aeroplane to see the comparatively large bulk of a ship upon the sea than it is for the ship to spot the slender shape of the aeroplane overhead.

In the earlier days of the war, when the

flotilla and a couple or more light cruisers in massed formation were nosing round not far from the German coast, according to their habit, it was disconcerting, to say the least of it, suddenly to see a neat little line of four or five equally spaced upheavals of water close alongside one or other of the ships. It was more disconcerting still to hear the loud thud of the explosions, and to realise that they were caused by bombs dropped from the heavens for one's benefit by an aerial Hun of most immoral character. An aeroplane bomb exploding ashore may quite conceivably do comparatively little damage; but if the same missile descends upon the deck of a small ship the vessel will be severely injured, and may possibly sink. It is not pleasant to get into difficulties and to have one's ship incapable of movement within a short distance of a hostile coast. It is still more unpleasant to have her sink in the same locality.

On seeing the explosions one instinctively looked overhead, and there, flying low and dimly outlined in the haze, was usually the shape of a hostile seaplane, the inevitable black crosses on his wings proclaiming his nationality. In misty weather he often succeeded in approaching unseen, and sometimes dropped his unsavoury eggs before the anti-aircraft guns could get to work and make his life a misery and a burden. No sooner had he done his dirty work, moreover, than he either climbed and vanished in the clouds, or else circled rapidly round and disappeared whence he had come. His departure was always hastened by a burst of fire from every gun which would bear, but one never had a real chance of strafing him, for the whole affair was all over and done with in a minute or two. It was good luck that his aim was bad and that his bombs invariably missed, though sometimes they missed so close that people on deck were drenched with spray, and spent the rest of the day searching for splinters to keep as mementoes. If one had struck—— But what was the good of considering the possibility? At any rate, it was always very comforting to realise that a ship under way presents a very small and difficult target to a seaplane at the best of times; while, however numerous and thickly clustered a fleet, squadron, or flotilla may be, there is always far and away more area of water than there is of ships.

When the weather was really clear the boot was generally on the other foot, for then the seaplanes were usually driven off before they could get overhead. A good lookout was always kept, and at the first sight of a speck like a mosquito on the horizon, a mosquito which presently assumed the shape and proportions of a dragon-fly, the anti-aircraft guns' crews came tumbling up to their stations, and the muzzles of their weapons started twitching ominously. Then, when the Hun arrived within range, they let drive and let him have it.

With the older type of anti-aircraft gun, shooting at an aeroplane reminded one of trying to bring down a snipe with a Webley revolver. But now that we are provided with the best sort of weapon which brains and money can produce, the process of strafing the aerial Hun may be likened to dealing with the aforesaid bird with a 12-bore hammerless ejector loaded with No. 8 shot. The odds, of course, are always on the snipe or the Hun, as the case may be, but we usually succeed in being accurate enough to make him supremely uncomfortable.

So the shooting with the A.A. guns was generally good. Puffs of smoke from the exploding time-fused shell darted out into space all round their target. The blue sky speedily became pock-marked with the white, bulbous, cotton-wool-like clusters, each one contributing its share of splinters to the unpleasantness of the upper atmosphere. The Hun as speedily retired. But not always. Sometimes he climbed high to get out of range, and then, at a height of twelve thousand to fourteen thousand feet, when scarcely visible, dropped his bombs. But the higher he went the more erratic became his practice, so really it did not matter much.

Occasionally, in the vicinity of their own coast, he and his friends attacked in coveys of six, seven, or a dozen, at a time, and then things became really lively, and the A.A. guns had the time of their lives. Once the Huns attacked continuously from eight a.m. until noon. There were never less than three of them in range at any one time, and each one, after dropping his noisome cargo, hurried back to his base for a fresh consignment, and then returned for another strafe. But the bombs always fell wide, and in course of time people came to treat seaplane attacks with positive indifference. In early days all in the ship who could get away came on deck to watch the fun. They indulged in loud and ribald remarks, and gave the benefit of their advice to the men at the guns, to the Hun or Huns, and to anybody else who cared to listen. They also jeered uproariously when bombs fell a few yards wide and deluged them with water, and fought madly for any splinters which might fall on board. But later on, when they got used to the feeling, the advent of a seaplane or two did not disturb them very much, particularly if it was soon after the midday meal, and they had composed themselves for short naps on the sunny deck before recommencing their labours in the afternoon.

It seems that the British sailor, like his comrade in the trenches, can get used to anything. Moreover, the war seems to have set a new standard of excitement, and what will happen when hostilities cease and the men have to go back to the humdrum life of peace I really do not know. It would seem impossible to raise much real enthusiasm over regattas, boxing competitions, picture-palaces, or football matches

after playing the far more thrilling game with men's lives and ships for the stakes.

But bluejackets are always peculiar people, and the most trivial happenings in the midst of the most appalling danger cause them the greatest amusement. In one merry little destroyer action in the North Sea one of the British vessels was having a very hot time, and a bursting shell caused a small fire in the engine-room. It was promptly extinguished by the fire-party under the charge of the chief stoker, and shortly afterwards an officer noticed this worthy coming aft with broad grins all over his face.

'What's the joke?' he wanted to know, for it struck him as rather peculiar that a man should be so much amused at such a time.

'I can't 'elp larfin', sir!' said the man, bubbling over with glee. 'We 'ad a bit of a bonfire in the hengine-room jest now, sir, an' w'en I 'ears 'em 'ollerin' I runs along with the 'ose-pipe, shoves the end of 'im down the hengine-room 'atch, an' switches the water on.'

'What is there funny about that?' queried the officer.

'Only that we 'arf-drownded the Chief E.R.A., 'oo was standin' at the foot of the ladder, sir,' gurgled the man. 'Funniest thing I've see'd for a long time. 'E ain't got a dry stitch on 'im, and 'is langwidge was somethink 'orrid.' He finished with another cackle of amusement, and went off to spin the yarn to some one else.

At the time of the incident, which has the merit of being quite true, the ship was undergoing a very hot fire. Shell were falling all round her, and splinters were whistling through the air in all directions, and for the man to be convulsed with genuine merriment at the wetting of the chief engine-room artificer, at a moment when he himself was in imminent peril of his life, speaks well for his nerve. It rather reminds one of the true story of two marines, the loading numbers at the after-gun of a light cruiser which shall be nameless. She too was in the middle of a strenuous little action when a shell burst on board, and shortly afterwards both men saw a most desirable memento in the shape of a splinter lying on the deck. They made a simultaneous dart to secure the trophy, but Jones got there first.

'Ere!' said Smith, bitterly aggrieved, 'old on. I saw 'im first!'

'I've got 'im first!' chortled Jones, stooping down and picking up the morsel of steel. 'Ow!' he yelled the next instant, dropping it as if it had stung him, and sucking his fingers; 'the bloomin' thing's red-hot!'

'Serve you ruddy well right,' retorted Smith. 'It ain't yourn, any'ow. You leave it alone!'

'I tell you it is mine,' answered the burnt gentleman. 'I got 'im first!'

'Look 'ere, Jones, if you can't play fair I'll give you a punch on the jaw; s'welp me I will. I'm bigger 'n wot you are, and I tells you I see'd the bloomin' thing first!'

'I got 'old of 'im first, an' don't care wot you says an' does,' exclaimed Jones, putting his foot on the coveted fragment. 'I'—

Further conversation was interrupted by the advance of Smith, and in another instant the quarterdeck of H.M.S. — was the scene of an impromptu battle. It would have been quite a pretty little tussle, for Smith was large, breathless, and bulky, while Jones was thin and wiry; but unfortunately the gunlayer, a sergeant, noticed that something was amiss with his weapon, and removed his eye from the telescopic sight.

'Here, you two,' he shouted, 'behave yourselves, and get on with loading the gun!'

'E's tryin' to pinch my splinter, sargint!' wailed Jones, applying a grimy hand to a rapidly swelling eye. 'E 'it me first!'

'No, sargint, 'e's a liar,' Smith cried with an air of injured innocence; 'I see'd it first!'

'Can't help that!' roared the N.C.O. 'Get along with the loading of the gun, and hafter the haction don't you forget I takes you both before the officer of the watch for unseemly conduct and neglec' of dooty in the face of the enemy!'

The malcontents, rather crestfallen, ceased their bickering, and the gun went on firing. But the sergeant, a strict disciplinarian, was as good as his word. Smith and Jones, both good characters, were let off lightly. They each received fourteen days No. 10 punishment for their misdeeds. The sergeant, a Solomon in his way, appropriated the shell splinter and presented it to his wife.

(Continued on page 744.)

THE MEN OF ANZAC* AND THEIR FOREBEARS.

SOME ASPECTS OF AUSTRALIAN LIFE.

By STORY WHITING.

WHILST the exploits of the 'Men of Anzac' in Gallipoli are still fresh in the minds of the British public, and great things are expected from them in the final struggle on the

western front, one's mind naturally goes back to those hardy pioneers of Australia from whom these brave warriors have sprung.

Australia has its story of endeavour and heroic achievement as well as New Zealand; but I think it is very doubtful if the annals of that story have ever been written, or at least written

* The word 'Anzac' was derived from the term or phrase 'Australian and New Zealand Army Corps.'

so that ordinary folk shall feel the thrill of it all. When Parker wrote *Pierre and his People* he made us feel the story of Canada. When Kipling wrote his *Indian Tales* he made us feel the strife and glory of the white man's work in Asia.

The history, the true inward essential history, of a new nation does not lie in the external public events of political life, but in the long-drawn conflict between Man and Nature. Now, there are three periods in this 'true history of Australia.' First, the explorers, whose records are scattered through many a volume; but people generally do not read these volumes. Then come the pioneers, the first men who opened out and took up the country. That period runs into the period of the diggings and the early tumult of the rush for gold. 'Rolf Boldrewood,' Mrs Campbell Praed, and some few others have dealt with the picturesque phases of early squatting; but there is still much to be revived. As Mark Twain described and recorded the tale of the fight between man and the great river, so ought some writer to keep alive the true history of an Australian life which is all but gone.

The generation of the first squatters has passed away, but some of us who have met and talked with them realised that every one of them was a big man. Some died in the struggle; some went under; some gave it up; but those who survived and came through successfully were all men with a touch of greatness in them. The handsome houses of the larger graziers to-day speak of comfort and luxury and refinement; but the little old house of the original squatter, often standing there still under the lee of the big mansion, tells of the heroism and endurance, and of the successful fight, made by a strong man against heavy odds.

The immigrants who enter Australia to-day think of the original squatter as of a lucky gambler, who struck a 'soft patch.' They do not understand. They never knew the story; it is being forgotten so quickly.

Then comes the third period, that which is still going on—the period of the farmer and the small settler. Henry Lawson tried to make us realise something of that life; but his tone was too frequently pessimistic. The truth, however, is that in Australia Nature has not been generous. It is a difficult country to conquer; floods, droughts, and forest-fires recur at too frequent intervals; but the conquest of it has bred, and will still breed, men of a fine type. The adverse conditions will make the race that survives all the stronger. The law of the survival of the fittest will make the Australian nation a people of great determination, possessing the power of going alone and fighting for their own hands. There will probably never be fortunes made there as in America, and that nervous energy which the hustling for wealth produces will be

absent. A man on horseback, rather tired, rather cynical, never in a hurry, but of an inexhaustible patience and fortitude—that is the type which Nature may produce there as the 'fittest.' Nature will be conquered, but she will not be conquered by one generation or by two; and the race that survives will be a variety of the human species which develops the power of holding on.

Scotland has produced one of the hardiest races in Europe, and one of the most individualistic. It is highly probable that Australia will come a good second; and my unbiassed opinion, after a residence there of many years, is that this will be largely owing to the grit and influence of the Scotsmen scattered throughout that vast continent.

There has been a growing tendency during the last twenty years for population to flock into the towns of Australia in a proportion not known anywhere else. Melbourne contains a far greater percentage of the total people of Victoria than is desirable; and in all the states the capital cities grow in like proportion at the expense of the smaller towns and country districts. Land-laws which favoured the formation of large estates rather than small holdings were at one time thought to explain this centralisation of population, but changes in the law have not checked the tendency. Other causes are apparent. Australia has now an exceptionally large mining population, and the successful miner rarely settles upon the field of his labours, but prefers to go to the city to spend his gains. In the pastoral areas the isolation of the great estates makes the education of families and social intercourse difficult, and for this reason the rich squatter is inclined to make his station a temporary residence, while he fixes his permanent home in the city. The contrast, again, between the activity of city life and the quiet of the country is accentuated. Life on a remote sheep or cattle station is for the workman concentrated monotony, while the cities are particularly full of movement. The prevailing State Socialism is filling the larger towns with good things: excellent museums, splendid libraries, free reading-rooms, parks, botanical gardens, and manifold places of interest or amusement. These are for the multitude, and the multitude in Australia is unquestionably becoming southern in its taste for excitement and amusements. Consequently rich and poor alike crowd into the towns which become large without becoming congested, so wide is the room for expansion, so perfect the appliances of tram, rail, and boat for the suburban residents. Thus the cities have acquired not only an excess of population, but also a social and political dominance which is neither British nor American, and for which only a Continental parallel can be found. The resulting condition of things seems artificial and not without grave dangers, but curiously interesting, as illustrating

new forms of national growth, possibly incidental to extreme democratic development.

The concentration of population has enabled the artisan class to secure unequalled present advantages; but there is justification for the view entertained by many Australians, and others who have lived the greater part of their lives there, that it will sap the very foundations of permanent prosperity unless a check can be found. The gravest problem confronting the Commonwealth at the present time is, apparently, how to get a sufficient agricultural population to stay upon the land.

This, however, seems likely to be, in a measure, solved in the, let us hope, not far distant future. Only the other day it was reported that the Queensland Government had offered one million acres of land for the settlement of those of our soldiers and sailors who, after the termination of the war, may be desirous of living an outdoor life under the most favourable conditions; and doubtless the other states will likewise follow suit.

It must be admitted that the temper of the younger generation of colonials in the country districts is not favourable—unlike their forefathers—to the patient industry of the farm, with its remote results and slow accumulation. Within the last decade the curious phenomenon has occasionally presented itself of a serious dearth of labour in country places, while in the towns masses of unemployed were besieging the Government offices with demands for relief-works. When sent, mostly at the Government expense, to the rural districts, the 'unemployed' soon drift back to the mingled wants and delights of city life.

The cities of Australia have thus come to concentrate in an unusual degree the life of the whole country, and to furnish the key to it. They have, among cities, a type of their own, curiously marked, when we consider that they are largely the growth of barely eighty years. They are, moreover, interesting, which is not always true of new cities. Melbourne, a mere village when gold was discovered in Victoria, has now a population of five hundred thousand souls. It is a city where one feels that men count for more than anything else in the making of a place. The number of people one meets who—or their forefathers—hail from Caledonia is remarkable.

Victoria received the cream of the great immigration after 1851, and the splendid and adventurous energy of the gold period still shows itself in the population, with something, it must be added, of its fever and restlessness. The superfluous vigour of the people makes itself felt to the remotest corners of the Commonwealth, and beyond. Victorian capital and energy give the impulse to enterprise and business in Queensland and large parts of New South Wales and South Australia, and reach out to Western Australia,

Tasmania, and New Zealand as well. A cooler climate assists the native vigour of the people, and gives Melbourne a great advantage over Brisbane, Sydney, or Adelaide. Land has been sold for the same price in Collins Street as in the heart of London; an exaggerated value, it is true, but showing faith in the future of the place.

Energetic Melbourne looks upon its rival city as inert, and climatic influence gives some colour of truth to the criticism. Sydney has the disadvantage, in some minds, of being some hundreds of miles nearer the tropics, and the contiguity of the sea results in relaxing moistness of atmosphere rather than coolness. But if Sydney suffers something from its latitude, in other respects its advantage of geographical position ensures it a place among the great cities of the future. Its harbour is the best in the Southern Seas, and one of the two or three best in the world. The immediate neighbourhood of large coal-measures increases indefinitely its naval and commercial importance. With trade from America, New Zealand, the Pacific Islands, and the China Seas, as well as Britain, tending to centre there, it is the Australasian counterpart of San Francisco, which it already surpasses in size.

Of the beauty of Port Jackson, the wonderful bay or harbour on the shores of which Sydney is built, much has been said and written in what might seem terms of exaggeration. Yet one may fairly doubt if ever traveller or tourist felt any sense of disappointment as, sailing in from the Pacific through the narrow channel which separates the Heads, he sees its picturesque outlines unfold before him. It is, truly, one of the sights of the world. So complicated is the maze of winding waters and prolonged narrow bays that one is not surprised to learn that the water-line of the harbour within the Heads is measured by many hundreds of miles. Low hills and numerous islands, with olive-green woods of eucalyptus sloping down to shining patches of sandy beach, everywhere form the background for the quiet waters of the harbour, and complete a scene of beauty which might satisfy the most critical taste. Graceful yachts float over the waters, and beautiful villas are scattered around the various coves and bays.

I doubt if any public pleasure-grounds in the world contain so many attractions as do the Domain and Botanical Gardens bordering on the bay. Enclosing one large arm of the harbour, facing another, and looking out upon the waters where navies can float at ease, their position is unrivalled. The climate favours the growth of sub-tropical vegetation, and the gardens are embellished with statuary, to which exposure in the open air is as little harmful there as in Greece or Italy. Beautiful public gardens are not confined to Sydney, but form a striking feature of Melbourne, Adelaide, Brisbane, Ballarat, and every considerable Australian town.

In Australia the thought constantly recurs that if ever the æsthetic side of the Anglo-Saxon is to receive full development it will be in these Southern Seas; and one can fancy that he already detects in the masses a refinement of taste and softening of manner such as contact with art appears to have given to the Italian and the Greek, and which intimacy with nature in its most beautiful forms might be expected to produce.

Since the days of Greece and her Olympic and Isthmian Games, I doubt if there has been anything to match the devotion of the Australians to athletic sports. But it is not the success of a few specialists which marks the athleticism of Australia. The heart of the people is in it far more than in Britain, infinitely more than in America. This popularity of games involving severe exertion and strict physical training shared in by the many is showing distinct results in the splendid physique of the young men of the nation. It may well be a corrective for the enervating influences of an easy climate and a comparatively luxurious life, no slight consideration in such a land as Australia.

The English taste for riding and the English love for a good horse prevail everywhere. Men live in the saddle from morning to night on the great stations, or when 'overlanding' cattle from the northern Queensland stations to the southern markets.

Melbourne, Sydney, Adelaide, and Brisbane have each one or two daily papers of which any city in the world might be proud, and which in matter and manner compare favourably with anything that appears in Britain or America. With one or two striking exceptions, the tone of the press is remarkably high. The encyclopædic weeklies of forty or fifty pages issued by the leading city papers for country circulation are marvellous compilations touching on every human interest under the sun.

Looking at Australian life from some viewpoints, one is disposed to think that overflowing activity and energy are its main characteristics. There is, however, another side to this. One whose occupation—as mine has done—takes him practically over the greater part of the continent sees many things which prove that the warm climate and the easy conditions of living are great temptations to idleness and shiftlessness. There are not the natural compulsions to work which are found under sterner skies. The conditions which have produced the Neapolitan lazzaroni and the lazy Southern American negro exist in parts of Australia, and even in the most virile race have their effect. For nine months out of twelve in the greater part of the country sleeping in the open air is possible and pleasant. A calico tent or a roof of bark furnishes a habitable dwelling throughout the year. Food is cheap and plentiful. The

country is, therefore, the paradise of the 'swagman' or 'sundowner,' as he moves from district to district or from station to station in supposed search for work, and, as the saying is, 'praying to God he can't find it.' He is, however, a recognised element of society, and looks upon himself as having certain rights upon which he is disposed to insist, and he certainly has his claims allowed as in few other countries in the world. The squatter or settler who refuses a meal and a 'shakedown' to the 'swagger' may reckon with considerable certainty upon a retributive conflagration of his stacks or outbuildings. But the stimulus of such an anxiety is not needed to make the prosperous Australian considerate for social failures. Success and failure are alike questions of luck. The broken-down wanderer who asks for a 'bit of tucker' or a night's lodging may be one who has just missed the opportunity of being a millionaire. He is perhaps to be pitied rather than blamed. At any rate, he must not be allowed to suffer. Even his feelings must be considered. There are no workhouses in Australia. The State establishments which fill their place are called 'benevolent asylums.' The softening of the name is matched by the comparative respectability of the inmates.

The swarms of people who sleep every night in the Domain in Sydney apparently as their only home give additional proof that favourable conditions are not all that is necessary to make men thrifty and self-reliant. The man who goes to the wall in the Old Country because he is weak is apt to succumb at once to the seductions of the sunny climate and the lenient philanthropy which he finds in Australia, and become a burden on the community.

Australia lacks in her history the moral motive of the fathers of New England or the patriotic stimulus of the loyalist founders of British Canada. She has known little of the severe national discipline by which other peoples have fought out a way to freedom. As in the Western and Pacific States of America, the dominant tone of life has been given by an overmastering spirit of energy and enterprise, and by effort after material success. Moral strenuousness can scarcely be looked for as a characteristic of the popular mind, and circumstances are not favourable to its development. Neither religious restriction nor political tyranny has existed to stimulate the severe virtues.

Not until these years of the great war have the people of Australia been called upon for any great effort of national self-sacrifice. There is without doubt abundant motive-force in the life of all classes, abundant stimulus to effort after social ideals. Nowhere does one find a larger public spirit, nowhere a finer enthusiasm pervading a community for building up a worthy State and assimilating whatever is best from the outer world.

A New Englander, a Canadian, or a Briton may come away from luxuriating in the sunny influences of the best Australian season without losing respect for his own more rigorous or even unpleasant climate. The east wind, the cold, drenching rain, the northern blast, drive men back on home life, on work, on more rigid views

of their relation to things. After all, the environment which makes a people most effective is the best. Great will be the glory of the Australian if he retains in the South that inherited energy which was bred in him by his forebears of the North, who have made his country what it is.

CARELESSNESS.

CHAPTER II.

FOR Joe Rudge was a single man. Years ago he had liked a girl; but his seven years' sentence had lost her to him. In fact, her choice lying, apparently, between a preserver of the law and a breaker of it, during Joe's prolonged absence she had married a policeman.

It had proved, perhaps, a factor in Joe's reformation. It helped to sicken him of the old work. His love being another fellow's—a big blue fellow's—there was no call for him to run further risks in order to build up a home. Add a growing distaste for prison fare as he advanced toward elderliness, and it will be conceived that it was no great pull on his will-power to run straight. Outlawry was not ingrained in him. He had stolen for a living.

One day, about a month after the evening of Nick Portch's tactless question and Joe's discouraging answer, Joe noticed a change in the manner of Mr MacNair, the chief gardener. In speech Mr MacNair was as a rule curt to the point of frostiness. His manner was bleak—bleak as his starch-blue Highland eye. He never chatted or made speeches. He gave little wisp-like directions, and you had to be attentive to catch them.

At first his attitude toward Joe had resembled that of a head-warder. He would keep him under long observation. For the first week he stood by while Joe put his tools away for the night, and then Joe had to turn out his pockets.

'We have had men from the society who have robbed us,' he explained to Joe, by way of apology, 'and I must be careful.'

The Scotsman and Irishman, treated as 'characters' in English tales, are generally represented as speaking Scots or Irish. The effect of education, travel, and change of scene, however, is to eliminate dialect and brogue. The Scotsman employed in England, save when he is drunk or excited, will only use a Scots word here and there, and the introduction of it is generally very effective. Who, for instance, will deny that 'carefu' is far more impressive than 'careful'? It impressed Joe, anyhow.

As time wore on Mr MacNair appeared to leave off watching Joe, but Joe knew that he was still being watched, and was 'carefu.' But that didn't keep him from being suspected of the thefts of which his immediate senior was

ultimately convicted. His innocence established, it was easy to see that he had gone up a number of pegs in MacNair's estimation. He was given more responsible work to do. Mr MacNair thawed a little more every day toward him. And this day, a month after the discourse on the carelessness of folks, Joe became aware that there was something behind the chief's mellowing.

'Where do ye lodge, man?' he asked Joe that evening.

'In the town, with a widow woman.'

'Are ye satisfied?'

'Not over. She's a worrier.'

There was a pause.

'The police—do they trouble ye?'

'They look me over a bit,' acknowledged Joe. Mr MacNair's tongue clicked. 'I shouldn't be surprised.'

There was another pause.

'For why do you ask?' Joe ventured.

'There's a cottage just without the grounds, belonging to the house, that one of the gardeners generally has. It's empty. Likely it might suit ye. Or would it be lonely?'

'Shouldn't mind,' said Joe indifferently.

And that was how he felt. Liberty had a sweet taste. So long as he could make a living, and thus keep out of prison, he was indifferent to worrying widows or police surveillance.

There was a third pause.

'But the committee prefer a married man to have the house,' explained MacNair. 'Ye're single, I take it? Or have ye a wife and bairns who'd come to ye if you could offer them a home?'

'I have no wife, nor ever had.'

'I don't say ye're unwise,' was Mr MacNair's dry comment. And with that the conversation concluded.

But Joe, thinking of it during his shuffle home, perceived that he was in favour. To be regarded as the possible tenant of a house, to have his very own house and patch of garden, to have a door-key of his own, this meant something to a man who, during his brief spells of freedom, had seldom known any roof save a common lodging-house or the back-alley home of a married partner in crime.

Two days later Mr MacNair came to him as

he was hoeing a turnip-bed. 'Rudge, ye're wanted by the committee this afternoon.'

The ex-convict looked perplexed. 'What for, sir?'

'That is the message I had from Mr Gilmour, the secretary. After your bit dinner give yourself a clean up, and be handy when ye're called for.'

There were furrows in Joe's brow as he resumed his hoeing. What could this mean? In giving particulars of himself to the society on his last quittance of prison, he had not been too lavish of the facts as to his past. He had not deemed it necessary to mention that, after a certain spell of 'quod,' he had grown a beard and changed his name before obtaining employment at the Marquis of Worthing's. He did not, in fact, mention that he had ever been in the Marquis of Worthing's service, having the very best of reasons for not returning that particular page of his chequered career.

The buried past! Sometimes it is awkwardly resurrected. Joe was on thorns all that morning. After his 'bit dinner'—which he took in the yard, as it was a mile and a half to the town—he felt strongly inclined to put on his coat and leave. Before now, at places where he had managed to secure employment, he had caught a glimpse of a policeman's uniform coming in by the front gate, and had streaked out by the back one without waiting to learn the reason of the visit. Whereas, with a little calm reflection, it might have occurred to him that policemen, brown satchels slung over shoulder, spend a number of their off-duty hours serving gas-summonses and collecting overdue rates.

However, a two years' character wasn't a thing to be forfeited lightly, and Joe Rudge decided at least to see what it was the committee had against him before making his dive for cover.

It was latish in the afternoon before he was summoned to the committee-room, and Joe was relieved to find that by that time the committee had dwindled down to three people only—a clergyman of bearded and robust appearance, another clergyman of pallid aspect, and a lady of uncertain age.

The bearded clergyman occupied the chair, which stood at the head of a long table. You could see at a glance that he was a gentleman much given to committees and good work.

'Ah, Rudge!' said the chairman. 'Good-afternoon, Rudge! We are sorry to interrupt you in the midst of your labours, and no doubt you share our regrets.'

He laughed, and Rudge breathed again. If it had been to do with the Marquis of Worthing business—or any of 'them old things'—the gentleman wouldn't lead off in this joky way.

'We are glad, Rudge,' continued the chairman, 'to receive good accounts of you—very glad.'

We have been disappointed so many times in our endeavours—ah—that we are all the more pleased.' He glanced at his colleagues. 'We are pleased, and we have communicated our satisfaction to the—ah—society. However, not to detain you, let me get to the—ah—matter we wish to discuss with you. We have on the Queen's House estate a *cottage*, and that cottage we like to place at the disposal of—ah—one of our gardeners. It is handy for him, and it relieves him from the necessity of walking some distance to and from his work.'

'And the temptations that necessarily beset him in so doing,' put in the pale clergyman.

'Quite so. The temptations. Are you, by the way, a teetotaler, Rudge?'

'Can't say I am, sir.'

'You are not? Well, well, we don't wish to be intolerant, but we *prefer* our tenants to be abstainers. However, we are content to know that you are a steady man. In fact, we feel we could safely offer you the cottage, but for one somewhat embarrassing disqualification on your part. You are unmarried?'

'Yes, sir; I'm a single man, sir,' said Rudge.

'Yes, yes. So we learn. A *really* single man. And we like a married man to have the house, as it has four rooms. Now— But sit down, my man, sit down. Take that chair there.'

Then, to Rudge's surprise, the chairman rose, walked down to him, and took the chair next to his own. 'I want to talk to you as man to man.' He laid his hand on Rudge's shoulder.

The pale clergyman glimmered curiously at Rudge through his gold spectacles. The lady held him with an intent, interested gaze.

'Now, Rudge, you are no doubt grateful—yes, grateful—to us for the chance we have given you to—ah—re-establish yourself—to reform. We are sure you are. And now we would like to ask you—would you not like to assist *another* erring soul to re-establish itself? Do you follow me?'

'Have one of my old mates in the garden along o' me, sir?' inquired Rudge. 'The answer to that is, your reverence, I would *not*.'

'I agree with you, Rudge. I do not believe in the renewal of old associations—of that kind. But we were thinking of another sort of person.'

'The man is perplexed. Let me tell him, Mr Irvine,' said the lady, in a calm, collected, rather thin voice. And she, too, rising, took a chair immediately opposite Rudge.

'Yes, you tell him, Miss Pickincroft,' said the chairman, evidently with great relief. 'It is only right that a woman should speak for a woman.'

'A woman!' wondered Rudge, his lips parting slightly. Otherwise he preserved his silent imperturbability.

'Besides,' commenced Miss Pickincroft, 'being

members of the committee of the Queen's House, we three here, Rudge, are Broken Cross Guardians, and as such we are in close communication with the Broken Cross Union.'

'The workhouse,' interpolated the chairman.

'And among the most recent cases to be admitted to the infirmary,' went on Miss Pickincroft, quite steadily, 'is a young woman who has been unfortunate.'

'She is not vicious,' snapped the pale clergyman, taking courage from Miss Pickincroft's firm lead. 'We believe her to have been the victim of ignorance—thoughtlessness—carelessness.'

'She is what is called a "respectable" young woman who has made a false step,' said Miss Pickincroft, cutting in again at this point. 'There was a regiment of soldiers encamped here last autumn'—

'I fancy we need hardly go into particulars, dear lady,' the chairman interrupted. 'To be brief, Rudge, it is in your power—don't reply hastily, my man; give yourself time to think it over—to make a respectable young woman of her. There! That's all. There's the cottage, but we can only give it to a married man. Here are you. There is she. "Do unto others as ye would

they should do unto you." Put yourself in the poor creature's place, Rudge. Consider her shame. And think, my man, think how you might raise the fallen! Do not, I implore you, answer hurriedly. Give the matter your consideration.' He rose, putting both of his large, warm hands on the ex-convict's burly shoulders. 'We don't ask you to give us your answer now. A man of your age invariably likes to think a thing over. You are not a young man, and the thought must have occurred to you: what of the future? This young woman—she is twenty-four, not a mere girl—will make you a happy home. It is worth your consideration. But do not—do not arrive at a decision hurriedly. Take a week.'

And with a confused impression of the big clergyman's big hands still pressed to his shoulders, of the other parson squinting sideways at him through his gold specs, and of the lady staring curiously at him with a look as if the job had a good deal more relish for her than it had for the gentlemen, who plainly had no stomach for it, Joe Rudge found himself standing outside the committee-room, the word said and the dreaded confab over.

(Continued on page 749.)

WILL-O'-TH'-WISP.

By S. BARING-GOULD.

ALAS! a phenomenon well enough known to our forefathers has become almost as extinct as the dodo and the great auk, and that is the will-o'-th'-wisp or jack-o'-lanthorn.

Abraham de la Pryme, writing in his diary in 1695, noted: 'About half a year before my father dyd he sent one of his men to Doncaster about some business; who, as he was coming whome in the night, when it was very dark, chanc'd to meet with an *ignis fatuus* in one of the lains [lanes], which went danceing and leaping before him, and frightened him sore. But, plucking up good courage, within a little while (he really takeing it to be the divel) was resolv'd to light off of his horse and beat it. And so, accordingly, he observeing that when he went it went, and when he stood still it stood still, he lights and tys his hors to the hedge, and falls at it manfully with his great stick, and beat it all to pieces, making one piece fly one way and another. And then, being all in a sweat, he got tryumphantly upon his horse and came home, attesting seriously and soberly that he had killed the divel, which he did really believe for a great while after.

'The like story I have heard of another man in the south: that as he was coming from his work one dark night, in a lane, there came whisking over the hedge to him an *ignis fatuus*, which he, getting a sight on, ran away from it.

But the faster he ran, the faster it followed him, so that he did not know what to do. At length, turning him about, he up with his stick to strike it; but it flinch'd his stroke two or three times. But he, being resolved to vanquish or dy, he followed on his strokes as if it had been for his life; but always when he lifted up his great stick above his head to strike it, then it flew about his ears and put him in a most miserable condition. But, however, tho' the fight was long and fearful, yet the fellow got the victory over this divel, and beat it all to pieces. And he told it all over that he had killed the divel that would needs have carry'd him away i' th' lane if he could but have gotten hold of him. But, says he, I mall'd him.'

Mr Ernest Baker, of Shere Dean, Bath, communicated to *Notes and Queries*, 6th February 1869, that on the 18th December previous, at about six forty-five P.M., he was riding over the Downs to Shere, when there suddenly appeared on his horse's head five lights, one on each ear larger than the rest, about the size of the flame of a small taper, of a bluish colour, two on the left eyebrow, and one on the right. These were like glow-worms, or as if the parts had been rubbed with phosphorus. It was pitch-dark, with a steady rain falling; yet, while the lights lasted (which was while he rode upwards of a quarter of a mile), he could see the buckles on

the bridle. There had been thunder and lightning in the afternoon. He rode steadily, trying to make out what it could be, when it disappeared as suddenly as it came. The horse had been taken from the stable, and had only travelled half a mile, and did not perspire in the least. This communication provoked one from a Mr C. W. Barkley, who related a similar instance in his own family, and added that in Norfolk the luminous gas is exhaled from swampy ground, and is there called 'a lanthorn-man,' and the appearance is feared to this day. That which Mr Baker saw can hardly have been a jack-o'-lanthorn, but an electrical phenomenon.

The writer walked from Plymouth to Tavistock one night in October 1851, where for several miles the road runs over a moor called Rough-borough. It was a darkish night, but not so dark that he could not distinguish the road. On nearing a great pile of volcanic rocks upon the moor he saw on the opposite side of the road a blue flame flickering above a pool of water that occupied an old mining or quarrying depression. Being fully aware what it was, the writer lay down on the ground and stealthily crept towards the water, and for full ten minutes watched the little dancing light; but if he attempted to draw to a portion of the bank nearer to it, it danced away; so also if he waved his hat it drove the flame farther off. All at once it became extinguished.

Mr W. Bennett Dawe, of Hill, near Ashburton, together with his family, saw a will-o'-th'-wisp on several nights in succession in the autumn of 1898. The month of September had been very hot and dry, and this was succeeded by a heavy rainfall in October during twenty-three days. The mean temperature of the month was 54·7, being four degrees above the average of twenty years. The warm, damp season following on the heated ground and the boggy deposits in the Dart valley resulted in the generation of a good deal of decomposition. Mr Dawe and several of his household observed at night a light of a phosphorescent nature in the meadows below Ashburton. It appeared to hover a little above the ground and dance to and fro, then race off in another direction, as if affected by currents of air. This was watched during several evenings, and the members of his family were wont, as darkness fell, to go out and observe it. The meadows are on deep alluvial soil, formerly marsh, and were drained about sixty-five years ago. The same gentleman saw a similar flame in the form of a ball some forty years previously in the low and then marshy valley between Tor Abbey gateway and the Paignton road, south Devon. The valley was then undrained.

A miner on Dartmoor informed the writer that he crossed a great stretch of the moor to reach Cornwood, where was a brother who was dangerously ill; and this was late on Sunday afternoon. In consequence night overtook him,

and he became entangled in the bogs, and was in sore distress, unable to proceed or retreat. Being an eminently God-fearing man, he took off his cap and prayed. At once a little light sprang up and moved forward. He knew that this was a will-o'-th'-wisp, and that it was held to lead into dangerous places; but his confidence in Providence was so strong, and so assured was he that the light was sent in answer to his prayer, that he followed it. He was conducted over ground fairly firm, though miry, till he reached heather and a sound footing, whereupon the flame vanished. Thanking God, he pursued his way, taking his direction by the stars, and reached his destination in safety.

The poet Pfeffel of Colmar was blind, and he employed as his amanuensis a young evangelical pastor named Billing. Pfeffel, as he walked out, was supported and led by this young man. As they walked in the garden, at some distance from the town, Pfeffel observed that whenever they passed over a particular spot the arm of Billing trembled and he betrayed uneasiness. On being questioned, the young man admitted that at that spot a very uneasy feeling came over him, and that there he had observed at night a peculiar light such as he had often seen hovering over graves in a churchyard. Pfeffel, with a view of curing the youth of what he regarded as a fancy, went with him that night to the garden. As they approached the spot Billing perceived a feeble light, and when nearer protested that he saw a luminous column like a female figure wavering above the spot. This, however, so far as the figure went, was an effect of the imagination. Pfeffel went alone, as the young man declined to follow him, up to the place where the figure was said to be, and struck about in all directions with his stick, besides running actually through the luminous appearance; but the figure was not more affected than a flame would have been. Pfeffel had the place dug up. At a considerable depth was found a firm layer of white lime of no little thickness. When this was broken through the bones of a human being were found. No tradition existed in the place to explain this burial, but it was supposed that a person who had died of the plague had been laid there. The bones were removed, the lime scattered abroad, and the pit filled up. When Billing was now brought back to the spot the phenomenon did not return.

The explanation of the *ignis fatuus*, no doubt, is that there is an escape of phosphuretted hydrogen from decaying animal matter. On moors, in marshy and boggy places, cattle often get engulfed, and their bodies suffer decomposition, whereupon there ensues an escape of this gas to the surface. It is the same in churchyards. Formerly sextons were careless about the depth to which they sunk the graves, and when these were shallow the gas generated escaped easily. But nowadays much importance is attached to deep burial, with the conse-

quence that such luminous appearances in churchyards are no longer recorded. A vast system of drainage has enormously reduced the area of morasses; and on the moors, when cattle have

been lost in bogs their owners now seek to recover the carcasses by means of grappling-irons for the sake of the hides. Consequently will-o'-th'-wisp shows himself no more, or with extreme rarity.

TO EMULATE METHUSELAH.

DIFFICULT and uncomfortable as is life in these advanced days—so some say—the people generally, and those who attend to scientific matters for them in particular, are noticeably concerned to devise some means of increasing its average duration. Many a morning on opening your newspaper you find that some clever investigator into the mechanism and mysteries of the human organism has found out a new cure for something, the result of which will tend, it is said, to a prolongation of life; and then periodically there is a grander announcement. It is to the effect that some French or American professor has at last discovered or invented something the consequence of which, it is suggested, will be that, adopting his cure or his system, all of us may, in the absence of accidents or gross carelessness, live far longer.

One of the most interesting remedies for abbreviated life, emanating, too, from a quarter that is estimated among scientists to be hardly less authoritative than any other, was suggested at a medical congress at Geneva. He who was responsible for it was Dr Doyen, a celebrated French surgeon, savant, and scientist, who for a long time past has been prominent in connection with researches for a cancer cure. Dr Doyen is acknowledged to be clever, penetrating, and to be blessed with that best of all gifts for the scientist and the discoverer, a quick and brilliant imagination. He said that, after having observed the therapeutic action of the extracts of the leaves from the lower classes of certain plants, he had succeeded in reinforcing the protective elements of the human system, and in stimulating the activity of the phagocytes, those good soldiers of the human citadel. The phagocytes, he explained, display their activity chiefly in the destruction of the noxious microbes which generate human diseases, and he had come to the conclusion that by means of certain liquids prepared from the leaves the said phagocytes would be endowed with sufficient energy to eat up all the destructive microbes and such as are the chief cause of most infectious diseases.

In his investigations upon the causes of senile decay and death, Professor Metchnikoff, the great advocate of the sour-milk cure, found that deadly microbes breed in the favourable environment of the lower bowel, and urged that the bacilli which make milk turn sour can be cultured in the gut and there arrest the energies of the microbes which bring about putrefaction and by it decay of the system.

This is of the essence of his theories. Now there came to London Dr S. Distaso, assistant to the great professor, sent here by the Pasteur Institute to make some studies and conduct a series of experiments at Guy's Hospital with a view to show that man would live longer and be healthier without any large intestine at all! 'When studying cholera a few years ago,' said Dr Distaso on this occasion, 'Professor Metchnikoff discovered that the intestines of the ordinary healthy man always contained a great number of varieties of bacteria. Some of these were found to be dangerous, because they formed poisons which were harmful to the body when absorbed into the system, and others are beneficial, because they hinder the development of the harmful germs. In the lower large intestine it was found that the harmful germs greatly predominated. The professor therefore concluded that if a man's large intestine were removed he would suffer less from the intestinal bacteria poisons, which, according to the professor's belief, cause the common diseases of degeneration of the internal organs of the body, and generally bring on premature old age. The difficulty was to find patients on whom to test these theories.' Mr W. Arbuthnot Lane, the well-known surgeon of Guy's Hospital, solved his difficulties by placing at his disposal some thirty or forty patients whose large intestines he had removed for necessary reasons. These patients had been going about alive and well for periods varying from a few months to five years since their large intestines had been cut out. The result of Dr Distaso's studies and experiments was that before he went back to Paris he said that the Metchnikoff theory was thoroughly proved, and declared that 'every child should have its large intestine and its appendix removed when it is two or three years old.' He took back with him to Paris for further study and experiment at the Pasteur Institute two persons who were said to be excellent examples of the benefit to health resulting from the removal of the lower intestine. They were practically bedridden before the operation, about four years previously, but at the time of their being taken to Paris were in robust health, and had put on in each case some two stones in weight. 'My experiments have proved,' said Dr Distaso, 'that we should all of us be better off without a lower intestine, which is nothing more or less than an ideal place for breeding disease germs. Almost every chronic disease may be traced back to the action of these

germs.' When he was asked for a recommendation in the matter of diet for those who, while declining to relinquish their lower intestine, still desired to live for a very long time, longer perhaps than seemed probable, this deep student of cause and effect in the matter of longevity said those with such ambitions should eat very little meat at one meal a day only; they should take plenty of green vegetables at this and the other two meals, and water in abundance during the day. They should abstain entirely from tea, coffee, or spirits; but a little diluted wine might be taken at meals if desired.

Sir James Crichton-Browne was speaking at a Public Health Congress on one occasion, when he set forth very plainly the principle of becoming centenarians in a manner that should be encouraging to the lovers of existence in this world who would be satisfied with such a modest achievement; and, be it mentioned as we pass, if any reliance is to be placed on official statistics, there were five thousand centenarians living in the Balkan States in 1896, while in France alone a hundred and fifty people die annually at the nominal age of a hundred or more. Sir James Crichton-Browne, on the occasion mentioned, said that it was a good working hypothesis to regard the natural life of man as a hundred years. Every man, said he, was entitled to a century of life, and every woman to a little more than that, for women lived longer than men. Therefore he urged that every child should be brought up impressed with the obligation of living to be a hundred, and taught to avoid the irregularities of living which tended to prevent the attainment of this ambition. A good start was to be given to the child in life, and then the rules of health were to be carefully observed. There was to be no hunger, no taking of alcohol to excess, no hustling on the American plan, but some kind of a return to a life of simplicity and tranquillity. Sir James did not tell us of any special medicine that would extend our lives for us without any inconvenience.

Professor Rene Quinton, of Paris, has it very strongly in his mind that the sea can do something for us in this matter of prolonging our lives. It would not have been suspected; and in our ignorance and inappreciation of the greater wonders and mysteries of science, many of us do not follow this learned gentleman with full confidence to the end. Once we heard that the sea was laden with gold in solution, and a public company was floated to extract the gold from it. That was not very long since; but the sea still retains its gold. But it is life itself that Professor Quinton says it has to give us. He is theorising and experimenting, and he has obtained some truly very remarkable results. He holds that salt water taken from the lowest depths of the ocean contains the vital elements of organic cells, those elements without which life on earth would be impossible. He believes that

he will prove that salt water contains elements capable of defying the inroads of disease and old age upon the human body, and that when these elements are properly applied to the use of man they will enable him to live practically for ever! The human being, according to Professor Quinton, is something in the nature of an aquarium, his blood being to all intents and purposes an oceanic liquid in which red globules swim, and all parts of the body are being constantly bathed in sea-water, the remains of the medium in which our sponge-like ancestors lived. By a curious chain of argument he has decided that all living beings have had a marine origin—that is to say, that they made their first appearance in the lap or the depths of the ocean; and he maintains that there is a tendency in every animal organism to maintain its sea origin, the inner life of its cellular organisms. A description is given of one of his experiments which large numbers of readers may find a little puzzling. I repeat it as I found it stated, and it has been described as one of his earliest experiments, and yet a great victory for his theory that sea-water is liquid life itself. He took a dog and bled it to the last drop of blood in its veins, so that it lay on the operating-table to all appearance as dead as any dog had ever been. Then the professor injected into the animal's veins a quantity of sea-water equal to that of the blood lost; whereupon the dog sat up, wagged its tail, and in a very little while was running about as lively as ever, and as fully prepared to fight any other dog. It lived for four more years, and then died a natural death. The experiment was repeated with other dumb animals, and the same satisfactory result was achieved in each case. Not only did the animals come back from something very near death to full life and vigour, but they appeared to be better than they were before.

Then be it said that it is the object of the professor not to substitute sea-water for human blood, but to employ it in the curing of marasmus, infantile cholera, and similar wasting diseases of early childhood, and in checking the ravages of disease and 'even the advances of decrepitude in the aged.' By his method sea-water is injected into the circulation. It is taken from a point sufficiently far from the shore and below the surface to ensure its purity, and it is not sterilised or artificially purified in any way, but is diluted with absolutely pure fresh water, so as to make it exactly isotonic with human blood, being then injected to the extent sometimes of ten fluid ounces a day.

Whatever may be thought about some of the others, there can be no criticism of Mr Thomas Alva Edison as a thoroughly practical man, and he, too, thinks we should live far longer than we do, and for his own part is satisfied that he will reach the excellent old age of one hundred and fifty years. He says so. Whether it will be

effectual in all cases as he believes—and we hope it will be in his—his system is at any rate a practical one, based on the commonly accepted principle that we are disposed to give the human machinery too much to do, and wear it out too soon. It is natural that Mr Edison should regard the body as a machine. When the great Mr Harriman, the railway magnate, died a little while since, his friend and business associate, Mr. J. C. Stubbs of Chicago, said that the reason why Mr Harriman died at a comparatively early age was that he worked all day and thought out problems at night; and he, Mr Stubbs, was determined that he would give up work at sixty-five for the sake of himself and of everybody else. Mr Edison heard these things at the end of a week when he had worked seventeen hours a day, and one stretch of forty-eight hours, and he said, 'I can think twice as much and work twice as long as Mr Harriman did and Mr Stubbs does, and this is due to the fact that my system of living is based on (1) proper eating, (2) proper sleeping, and (3) proper clothing. Why did Mr Harriman think in bed? Because he ate too much. Most men choke their engines with too much coal. I eat just as much as I want, and that is very little, perhaps half a handful of solids at each meal. The result is that I am asleep thirty seconds after my head hits the pillow. Mr Harriman spent four out of every eight hours in bed thinking and dreaming. I am in bed for six hours, and all of it is good solid sleep. I never dreamed in my life. My physical condition is perfect. This is also due in part to the fact that I clothe myself sensibly. See!' At this point he kicked off a shoe two sizes too large, and then proceeded, 'So with trousers and shirts. Every vein and artery is thus given a chance to do its work, for none of them is ever pinched. Bacteria starve in my system. They have abandoned the job of trying to fasten Bright's disease, diabetes, and other sicknesses on me. I have worked since I was twelve, and hope to continue working until I am one hundred and fifty.'

The *British Medical Journal*, commenting on 'The Secret of Long Life,' cited an article on 'The Secret of Longevity' in our issue for 1912. The writer set forth a great many interesting facts regarding the habits of long-lived and famous men, Sir B. W. Richardson, who lived by rule and wrote much on this subject, being an exception. Victor Hugo, a great eater, lived to be eighty-three; Bismarck, a great eater and drinker, lived to be eighty-four. Sir George Humphrey, in his investigation of aged persons for the British Medical Association, concluded that 'the prime requisite is the faculty of age in the blood by inheritance; in other words, that the body has been wound up, as it were, and sent into the world with the initial force necessary to carry on the living processes through a long period; that this is the case with

every organ; and that the several organs are so adjusted to one another as to form a well-balanced whole.' When Mr Frederic Harrison celebrated his eighty-first birthday he gave to a daily newspaper 'five golden rules of health.' They were: '(1) Abstain from tobacco, spirits, made dishes, and all such dreadful things. I am satisfied with a little bit of mutton and rice-pudding. (2) Rise from a meal with an appetite. I believe people eat too much. (3) Walk every day for two hours. This I am going to do as soon as I get through a pile of letters and telegrams from Florence and Rome. I am too old to play at tennis, and golf is too slow. (4) Sleep eight hours. People cannot sleep who smoke themselves black in the face, eat too much, and have not walked enough. (5) More important than all—be content with what you have got. Take things quietly.' The late Lord Strathcona, at ninety-two, expressed approval of these rules, adding details of his own personal habits. He had not smoked for seventy years, and did not believe in smoking. He believed that most people eat too much; for many years he had only taken two meals a day, breakfast and dinner. He ate little or no meat, and the diet agreed with him. Exercise was decidedly, in his opinion, a most important factor of good health and longevity; but, like Mr Harrison, he had a great deal of correspondence to go through; hence he could not always find the time for walks. He made a point of not sleeping longer than six hours a day. Tolstoy taught that the secret of long life is to be found in the following hygienic code, which has been circulated among his countrymen: Fresh air day and night; daily exercise; moderation in eating and drinking; one hot bath weekly and a cold one daily; comfortable and not over heavy clothes; a dry, spacious, and sunny dwelling; scrupulous cleanliness; regular work, which acts as a preventive of ills of body and mind. Rest after labour, he teaches, must not be sought in distractions. Night was intended for sleep; the chief condition of good health is a life fruitful in labour and ennobled by good actions. Moltke in his ninetyeth year said he had maintained his health by great moderation in all things, by regular outdoor exercise in all weathers, good and bad, and never a whole day at home.

WORK.

So stern he seemed, and grave, and sober-wise,
This friend of serious mien and patient eyes;
I teased him oftentimes by jest and smile,
That he should be so earnest all the while.

Yet now, when life grows harsh and sad and drear,
And quondam friends grow laggard, insincere,
With him alone I find my blest release
From care—in deep forgetfulness and peace.

OWEN E. M'GILLICUDDY.

Chambers's Journal

SEVENTH SERIES

THE DOCTOR.

By E. J. EDGAR.

TO be well known throughout the length and breadth of three counties may be said to represent fame. A man may be pardoned for boasting about it, and John Harriday *did* boast, though this was due, perhaps, not so much to any feeling of sinful pride as to a firm conviction that boasting should constitute the better half of a physician's stock-in-trade.

John Harriday practised when George II. reigned. A remarkable figure was the doctor. Strongly built, of more than average height, clean-shaven, and with a studied solemnity of expression, he seldom took his walks abroad clad otherwise than in the garb of his profession: a suit of black velvet, knee-breeches, white silk stockings, and silver-buckled shoes. Add to these a flowered waistcoat, full-skirted coat, snowy ruffles and tie, and you see the doctor as his admiring contemporaries beheld him. Sometimes, the better to display his huge, full-bottomed wig, he carried his hat under his arm; while the flourish with which he used the gold snuffbox at the head of his cane was at once the envy and the admiration of every buck that witnessed it.

Amongst his cronies he unbent sufficiently to win a place in their hearts.

'Sirs,' he would say, sternly regarding them through the steam that rolled up from his punch-bowl, 'my consulting-room is no larger than would hold this table at which we sit. Yet it covers the better part of three counties between Shrove and Michaelmas.' From which the reader may infer that Dr Harriday's consulting-room ran upon wheels. Nor was his claim an idle one. There wasn't a fair throughout the counties referred to where his caravan had not, at some time or other, formed one of the principal attractions.

Amongst all his successes, however, there were few to which he afterwards referred with such pride as when speaking of his maiden appearance at Inglewood.

The fair at Inglewood was relatively unimportant. But to the doctor it was fresh ground, and he had decided to create such an impression there as should leave his name a household word in the district until he came again.

Behold him, therefore, on a certain warm afternoon in late summer, making his first

appearance at Inglewood. The weather was perfect. Light fleecy clouds drifted lazily across the sky. Crowds of men and women, boys and girls, townspeople and rustics, all rigged in their holiday finery, swarmed the ground. Farmhands in their clean smocks, mechanics in brown homespun and gray worsted stockings, merchants and clerks in smarter array—all had rolled in from the villages around, intent on having a good time.

At the bottom of the hill, its red roofs and quaint gables mellowed in the haze, the town of Inglewood lay.

'Tis as fine a city as any I have visited,' John Harriday was assuring his audience, 'and I have journeyed much 'twixt London and Barbary.'

The delighted provincials cheered loudly. Open-mouthed, they stared at the impressive figure before them. For was not his car radiant as the sun? And did not the light, flashing back from giltwork and brass, dazzle the eyes, even as might the rays from some chariot of the gods?

On a small platform that projected from one side of the caravan, a girl, bespangled and gay, enlivened the proceedings with a dance. Behind her, resting from an exhibition of weight-lifting, the doctor's second assistant sat. Perspiration streamed down the girl's face; she was panting heavily. But her whirling limbs only came to rest when the doctor, satisfied with the size of his audience, motioned her imperiously to a seat.

'You are to observe, my masters,' he began then, adopting his most professional attitude, 'that the humours consequent upon exertion in the heat of the day require most urgently to be dispersed. I see before me some of such full habit as might, with advantage, be taking the waters at Bath—a costly proceeding. But I come amongst you bringing a healing that will not empty the pockets of the worthy poor. 'Tis my pleasure to apply such vast experience and learning as are mine to the comfort and relief of those fortunate enough to meet me here this day. Wherefore, behold!'

With which modest introduction, the doctor, whisking a phial into view, waved it triumphantly above his head. For a full half-minute he remained thus, statuesque, what time the onlookers gazed in respectful silence.

The phial contained a reddish liquid, distinctly

attractive in appearance. Other phials, neatly arranged on shelves at the back, held mixtures whose colours ran the whole gamut of the rainbow—a truly impressive sight. And these, together with the skeleton of a monkey suspended from silken cords, two snake-skins, some jars of white powder, and a few terrible dental instruments, filled in the background. The effect was completed by a huge tome. And in all the doctor's stage management there were few details that acted so potently as did his skilful disposal of this ancient volume. Flung, with apparent carelessness, upon an oriental table, its Greek title—plainly visible to the gaping crowd below—went far towards dispelling any lingering doubts that might have hovered in the rustic brain.

But the doctor was speaking again.

'Scammony squills are here,' said he, waving a nonchalant hand along the shelves, 'and mithridate and Venice treacle—forty-six ingredients in one, sixty-two in the other. But'—here he turned to thrust the phial impressively forth—'here we have an elixir. 'Tis but half the price, and is guaranteed to rectify and maintain the body, clarify the blood, surfeit the cheek, perfume the skin, tinct the hair, and lengthen the appetite.'

Which long list of virtues so far affected the crowd that three simpering maidens became customers on the spot. Others followed. Shyly at first, but with growing confidence, men, women, and girls brandished their money aloft, until quite a respectable business had been done.

Then came a reaction. In vain did the doctor, producing other articles, loudly proclaim their virtues. In vain did he guarantee 'the rounding of wasted limbs.' Vain was the wildest dancing of the girl; the almost crippling efforts of the strong man fell flat. Even a reference, ponderously made, amongst the pages of the Greek tome, left the audience unmoved. The fringe of the crowd was drifting away.

With a serene countenance the doctor reached for his cane. He opened the lid in the golden knob thereof, and flourishingly partook of snuff. The next instant he had snapped the lid to again and was leaning excitedly forward.

'By'r leave, there!' he cried earnestly; 'give the man room and air!'

Every eye turned in the direction of his glance.

'Tis an urgent case!' roared the doctor again, pointing to where, on the outskirts of the crowd, a huge man swayed ominously to and fro. 'Pray, you lusty fellows, lift him up and bring him to me right quickly!'

The man had pitched forward and rolled over on to his back. His eyes were closed, his limbs twitched horribly, whilst his groans—like those of a wounded animal—sent the more squeamish hurrying from the spot.

'By'r leave, there!' commanded the doctor. 'By'r leave! Make a way!'

Two rustics staggered forward, breathing hard under the weight of the sick man. Lifting their burden on to the platform, they loosened his muffler, then blushing backed out of sight.

In an instant the doctor was kneeling at his patient's side, oblivious to everything save the matter in hand. The crowd had surged back again, morbidly curious. What ailed the man? Was he dying? Would the doctor know what to do? What was he doing now?

Elbowing, tiptoeing, whispering excitedly, the onlookers waited. They saw the doctor rise slowly to his feet; they saw him press one finger thoughtfully to his brow. Then, with a brisk movement, he turned to his shelves.

'We have here,' he announced presently, wheeling sharply about, 'that which may be well called the Powder of Life. 'Twas brought me by a traveller out of Barbary, and is the sole remedy employed in the palaces of such Rajahs and Begums as occupy those parts. 'Tis miraculous in that it revives, soothes, comforts, and keeps the old alive. Observe!'

With a flourish he shook a small quantity of whitish powder from the elaborate jar held in his right hand. When a few grains of the powder had been dropped into a tumbler, water was added, and, effervescing slightly, the mixture was forced between the sick man's lips. The result was marvellous. Almost immediately the man's eyes opened; his limbs relaxed; a peaceful sigh escaped him. Then he sat up—and smiled! And such a storm of cheering broke out as brought fresh crowds hurrying to the spot.

Before the enthusiasm had died down again the patient was on his feet. 'Ye've saved my life, doctor!' he cried in a powerful bass voice.

And the doctor beamed his satisfaction. 'It hath been said,' quoth he, 'by our immortal Shakespeare, that there is a tide in the affairs of men, which, taken at the flood, leads on to fortune. And I would add that we have here an elixir which, taken even at the eleventh hour, leads on to perfect health and happiness. The price—'tis ruinous to me, but I hold that a physician hath ever a duty to his fellows—is but threepence. Who'll buy?'

A dozen eager hands went up on the instant. So striking an object-lesson as that smiling man—snatched, as it were, from the very jaws of death—carried conviction to the most sceptical. The dozen hands grew rapidly to two, three, four dozen. And such prodigious quantities of elixir, pills, 'angelic snuff,' electuaries, and Gascony wine changed hands that the doctor had to send to his inn for fresh supplies.

Later in the evening, his day's work done, his caravan locked up for the night, Dr Harriday lounged easily in his private room at the 'King George.' Near his elbow, its steam rising gratefully to the oaken rafters, a small bowl of punch awaited treatment. For the doctor took his liquor 'like a man.'

'Tis a fruitful soil,' he mused, staring down at the blazing logs on the hearth, 'and one that should pay well for the cultivating. Faith, and I esteeming it a village scarce worth the visiting! 'Tis a mine unworked! 'Tis a virgin field! Ay, 'tis such'—

A sudden rap on the panel of the door brought his soliloquy to an abrupt termination.

'Come in!' cried he, turning lazily to glance over his shoulder.

A spruce maid put her head in at the door. For a moment she hesitated, curtsying. Then, 'By'r leave, doctor,' she began, 'a gentleman—a man—to see you.'

The doctor frowned thoughtfully. 'A plague on it!' he muttered; 'and a plaguy time for visitors! Have you his name, girl?'

'If it please you, sir,' answered the maid, 'tis one Master Higgins.'

'At your very good service!' came a rough voice from the doorway.

And, without more ado, the man—a burly, red-faced individual—brushed by the maid and lurched into the room. He was dressed in workman's attire, having a brown waistcoat with long sleeves, gray worsted stockings, heavy shoes, and carrying a battered three-cornered hat under his arm. His tangled mop of hair, falling to the level of his shoulders, was tied with a greasy ribbon. And he grinned an aggressive, familiar grin.

Fearful of the consequences of her act in allowing the stranger to enter, the maid retired hurriedly, closing the door after her.

Mr Higgins nodded his approval. 'Faith!' said he, lurching confidently forward and laying his dirty hat upon the table, 'but ye have cosy quarters here, master.'

Without a word, the doctor, leaning easily forward, lifted the hat on the point of his snuffers. For a moment he surveyed it at arm's length, marked disapproval on his face. Then he tossed the battered object daintily into the blaze.

Mr Higgins lost his temper. 'Wither ye!' he snarled, leaping forward to retrieve his dismal headgear. 'What a pox d'ye mean by it?'

The doctor smiled thoughtfully. 'Tis a fellow with no manner of restraint,' he observed, speaking to himself. Then addressing Mr Higgins, 'It hath ever been my wont,' he went on, 'to preserve my food table as a thing quite apart from the midden. Unavoidable pestilences we have ever with us—the plague and Saint Anthony's fire, to wit. In this instance, however, we have a purifying medium to hand—the fire; and, I pray you consider, what more natural'—

'A plague upon such windy prating!' Higgins broke in. 'I came not hither to listen to such!'

'In which case,' observed the doctor, rising slowly to his feet and approaching the door, 'a remedy of the simplest doth offer itself;' and, flinging the door wide, he pointed with the stem of his churchwarden into the passage beyond.

For a moment Higgins trembled on the verge of apoplexy. A dull purple tinge surged over his face and neck. His clutching fingers wrenched at the dirty hat in his hand. His breath came thickly. 'D'ye know who I am?' he demanded, hoarse with fury.

'Nay,' answered the doctor, 'we had not completed our introduction; 'twas a small formality which would appear to have been overlooked in your impulsive joy at finding me in such—cosy quarters, I think? Doubtless, however, if you again present yourself to the maid—you should find her below—she will bring you to my door, there to acquaint me with your name and pleasure.'

Higgins, having somewhat recovered from his first blind rage, stammered something about having that to say which should quickly bring the doctor to his senses.

'Maybe,' came the answer, cutting him short, 'but until such time as our little formality hath been observed we will exchange not another word. For if ye hasten not to the maid, then must I, forsooth! hasten to the landlord.'

With which pronouncement the doctor opened the door still wider, and made as if to pass out. Before he had taken two steps, however, Higgins was hurrying from the room. And Harriday, having first of all closed the door, allowed his thoughtful features to relax into a smile.

'La, la, la!' quoth he, listening to the creak of the stairs as Higgins descended, 'but 'tis as clumsy a knave as ever practised blackmail, and one much lacking in finesse. How saith Horace? "*Odi profanum vulgus et arceo*"!'

He was back at the table again, hastily fumbling over a small packet which he had taken from his pocket. A whitish powder trickled from the corners of the packet, and the doctor allowed it to dribble into the glass from which he had been drinking. But he had resumed his place at the hearth, his legs planted well apart, hands deep in pockets, before a renewed creaking of the stairs announced that Mr Higgins was returning to the attack.

'Come in!' cried the doctor, in answer to a nervous rap on the panels; and again the door opened to admit the head of the maid.

'If it please ye, sir,' she began, more nervously than before, 'tis a person to see ye; but'—

'His name?' demanded the doctor.

'Iggin,' came a growl from outside.

'Higgins, if ye please, sir,' repeated the maid; and the doctor, pausing deliberately to help himself to a pinch of snuff, requested that Mr Higgins be shown in.

Then a deep breathing made itself heard; a clumsy footstep crossed the threshold; and Higgins, glowering darkly, lurched back into the Presence. The maid closed the door.

'So art Master Higgins?' queried the doctor, his head tilted thoughtfully to one side. 'Master Higgins, forsooth! And yet, good lack-a-day!

y' have the advantage. Had I the pleasure of meeting ye before?'

'Ye'll know me soon enough!' answered the man, his former truculence in some degree reasserting itself.

'Capital!' said the doctor, rubbing his soft hands appreciatingly. 'I warrant 'twill be interesting to know one so charming. Come, sir, we have here a chair and a fire. Be seated, pray.'

With old-world courtesy he set a chair near the blaze, and Mr Higgins, after a moment's hesitation, sat down. The doctor resumed his seat at the table.

'Ye cured a friend o' mine at the fair to-day,' said Higgins, coming straight to the point. 'An' ye cured him plaguy quick! D'ye see?'

He leered playfully into the thoughtful face before him.

The doctor smiled. 'It is to be observed,' said the man of medicine after a pause, 'that your friend hath a double measure of good fortune: firstly, in that he hath secured the friendship of such a one as yourself; secondly, in that he hath been cured of his distemper—plaguy quick, as you say.'

Higgins frowned again. 'Hark ye, master!' he broke out; 'I have that to say which, mayhap, had best be said bluntly! Ye cured a friend o' mine, I say, before he fell sick! 'Twas mighty effective in bringing the yokels about with their pence. D'ye see that? But 'twould be plaguy bad for your coming week's business if so be as we out with the truth!'

The doctor had just poured himself out another tumbler of punch, and he stopped with the glass half-way to his lips.

'Ye mean?' he asked quietly, setting the drink down again untouched.

The steam from the punch wafted across the table. Mr Higgins's newest smile seemed to expand under the influence. He beamed. 'Sbuds!' quoth he, rubbing his horny palms together; 'I think we begin to understand each other, master! And we'll suppose that my friend asks for a *little* more. Five shillings wasn't much, eh?'

'We'll talk this over,' answered the doctor, serious on the instant; and laying his churchwarden carefully aside, he rose to his feet, stepped quietly to the door, opened it, glanced out, then returned to his seat at the table.

Mr Higgins appeared to have completely recovered his composure. With both hands thrust deep into his pockets, his feet stretched out to the blaze, he was leaning well back in his chair. His nostrils, too, expanded gratefully at the steaming punch; his eyes had taken on a greedy expression.

'We'll talk this matter over quietly,' said the doctor after a pause.

'Faith!' sneered Higgins, 'that's what I come for. Though there's little enough to say, and 'tis soon said. Now, master, I doubt not

but that ye count your reputation—both here and elsewhere, mark ye!—worth ten guineas, eh? 'Tis cheap at the price.'

The doctor winced. Here was a rogue who went in for great things; and here was the thin end of a very fat wedge of blackmail.

'Faith!' said the doctor, 'but ye move at a great pace. And since ye try my temper, try also my punch. Come, 'twill make pleasanter business of it.'

He pushed the steaming glass across as he spoke. Higgins started forward greedily.

'I've no mind to booze myself,' said the latter gentleman with a knowing grin. 'John Higgins is too wide awake for that! But I'll have one with ye, for comfort's sake;' and tilting his bullet-shaped head well back, he drained the glass at a gulp.

'Now,' he went on, smacking his lips loudly and drawing a dirty sleeve across his mouth—'now we'll talk, master. Ten guineas to shut my mouth consarnin' my friend's sudden *cure*, eh? How say ye?'

The doctor pursed his lips in silence; he had recovered his glass, and was pouring a little more punch into it. The other waited expectantly for an answer.

'Ten guineas, master,' the monotonous undertone broke out again after a pause. 'Or shall we make it fifteen? How say ye? 'Sbuds! ye tempt me to press hard!'

Dr Harri-day rose from his seat, gently swaying the half-filled glass to and fro. Then he flung the contents well to the back of the fire, wiped the glass carefully on a corner of the tablecloth, and poured himself out a copious drink.

'Tis to be observed,' he began at length, 'that 'twixt glass and lip—ye've heard the saw doubtless? And man is but the jest of circumstance'—

'A plague on sermons!' snapped Mr Higgins. 'Ten guineas—yes or no?'

'Man is here to-day,' the doctor went calmly on, 'and gone to-morrow—as I myself, a physician, hath ample occasion to note. Let us consider your own case.'

'A pox on my case!' snarled the man, starting to his feet. 'Will ye answer, yes or no?'

The doctor looked up in mild surprise. Mr Higgins remained standing for a moment, glaring venomously. His forehead glistened under the candlelight; his complexion, so far from being heightened by the outburst of passion, seemed rather to have lost its glow. He sat down again somewhat limply.

'To consider your own case,' the doctor resumed, his white hand gently stroking the cloth before him; 'ye come a-visiting here, surcharged with health and vigour and high spirits. Yet now, alack! one would hazard his life that a distemper had come upon ye. Not, mayhap, that ye *feel* it, mark ye. Yet so it would appear to one who, like myself, is versed in the art of healing.'

Mr Higgins passed a sluggish hand across his eyes. He was staring into the fire now, licking his lips thoughtfully, and the light seemed to be fading from his eyes.

'D'ye mind me?' asked the doctor after another pause.

For all answer Higgins spat venomously into the blaze.

The doctor, sipping quietly at his punch, marked a growing distress on the pallid face before him.

For a while not a word was spoken. Then, 'A plague on it!' muttered the man, leaning forward to fold his arms across his stomach. 'Tis some passing spasm.'

'Here to-day; gone to-morrow!' mused the doctor, half to himself; and there was a world of sympathy in his tone.

Higgins looked up with a jerk. His face had taken on a dirty-gray pallor; beads of cold perspiration glistened on his forehead; whilst his lips, quivering slightly, showed unmistakable signs of distress. 'Tis an ague come upon me!' he gasped, shivering of a sudden. With hands that trembled visibly, he started pulling on his hat. A church clock, somewhere in the distance, struck the half-hour after nine. Whipped by a gust of rising wind, some raindrops pattered on the window.

'Art going so soon?' queried the doctor as the man rose unsteadily from his seat. 'Tis an evil night for a sick man to be abroad alone, unless perhaps your friend'—

With a last defiant effort, Higgins muttered something about lifting ten guineas before he went.

'Tis *medicine* you want,' came the kindly rejoinder, 'and the comforts craved by a sick man. Come, sit ye down.'

And Higgins found himself pressed gently but firmly back into his chair. Then the doctor strode hurriedly to the door.

A moment later the maids and men-servants below fairly jumped at the sound of an excited voice loudly bidding them hasten upstairs with hot-water bottles and blankets. Two steps at a time the willing helpers mounted, wondering what on earth was wrong. And presently the doctor found himself crowded for elbow-room. He was kneeling at the sick man's side, patting the clammy, dirty hands; issuing excited orders; bidding Higgins be strictly quiet, as he valued his life.

This state of things lasted for some minutes, what time the maids bathed the sick man's forehead, applied hot-water bottles to his feet, and wrapped him about with blankets. But all to little purpose. Higgins seemed to grow worse. He was most certainly frightened; the doctor's anxious face was enough to startle any sick man.

'It is to be observed,' panted Harriday, addressing the group while he paused from his exertions, 'that the humours—as we physicians say—of

the human body are of four several kinds, upon the due adjustment of which doth depend the temper or distemper of body and mind. But, lack-a-day! with this poor fellow I find it not simple to so adjust. An ague doth complicate, as we say, and 'tis most serious.'

Higgins groaned weakly. The servants gazed at the speaker, open-mouthed, awe-stricken.

'He came a-visiting me,' the doctor went on, 'strong and of good complexion, both of body and mind, howbeit choleric. Now, alack! he lies there, stricken like an ox. But silence! I must think! The suddenness of it hath unnerved me.'

Still watched by a respectful circle, the man of medicine struck an attitude as of one deep in thought, until suddenly, starting forward with excitement, 'The elixir!' he cried. 'I have some in my bedroom! 'Tis a last resource, and must be tried.'

In a few strides he was out of the room, returning almost immediately with a bottle, which he held triumphantly aloft.

Five minutes later Higgins was on the mend. Copious draughts of the mixture had been poured down his throat; the bilious symptoms were passing slowly away.

'The danger-point hath been passed!' gasped the doctor at length. 'Our friend may now be safely left to himself.'

He flung himself back into his chair with a tremendous sigh of relief, wiped his brow on a silk handkerchief, and dismissed the servants with a majestic wave of the hand.

When Higgins left, about an hour later, the doctor saw him to the street door. The sick man was almost himself again, though somewhat subdued and dazed.

As for the doctor, dismissing his patient with a cheery 'Good-night,' much learned advice, and some modest remarks concerning the virtues of a certain elixir, he retired to his room once more, intent on finishing the punch.

'Tis a great anti-bilious mixture, the elixir,' he told himself, musing before the fire over his last glass; 'and the noxious drug, dropped timely into Master Higgins's drink, hath done him little hurt.' Then he hied him to his virtuous couch, confident of the morrow.

But down in the servants' quarters his praises were still being loudly sung. Such a cure—of one so near death's door—had never before been seen at the inn.

Said the chambermaid, 'Tis surely a wondrous thing, the elixir! Would that my aunt had known of it when she fell sick of the fever! She'd ha' been with us now.'

A chorus of approbation greeted the remark.

'And 'tis only one shilling the bottle!' cried a dozen voices at once; whereupon followed more extravagant praises for the doctor—pæans that lasted until the company broke up for the night.

Next morning the subject was renewed, nor did the story lose in its telling, until half the

village was talking of last night's wondrous cure at the 'King George.'

All of which, perhaps, went far to explain why Dr Harriday's supply of elixir—to say

nothing of his powders and electuaries—gave out long before the fair came to its close.

And yet another county was ringing with the doctor's fame.

THE LUCK OF THE 'MARSEILLAISE.'

By Sir JAMES YOXALL, M.P.

OUT of a myriad music-hall songs came 'Tipperary,' elect; out of a thousand butterfly ditties soared the *Marseillaise*.

According to M. Lenôtre, in the year 1792 the Baron de Dietrich, Mayor of Strasburg, was giving a little dinner. Music came in with the dessert and the choicer wines, each guest in turn lifting a poor but plucky voice, as often in rural France I have heard such Frenchmen do. In France a good voice is rare, but each man at the Mayor's table had to pipe or gurgle a song, *à la bonne franquette*.

There happened to be present a shy little subaltern of Engineers, known to be a *dilettante* who could string original verses together and fetch new tunes out of a fiddle. And he, where other guests had sung to Bacchus or Venus in the sham classical vogue of the time, must sing of War. So, '*Allons, enfants de la Patrie*,' was how Lieutenant de l'Isle or Lisle began.

It was a period of armed patriotism; the Duke of Brunswick and a Prussian army loomed threateningly near the French frontier. Perhaps the words and tune of his 'Chant for the Army of the Rhine,' as the lieutenant called it, were improvised; at any rate, they gained a bellicose applause. 'Fine, Rouget!' 'Very good, Rouget!' 'Rouget, you must get that engraved!' cried other guests; engraved on copperplate and published, they meant; lithography had not been invented then.

As the other guests walked home that day, in more or less devious fashion, about the hour we call tea-time, they would hum the grave, *largo* measure of '*Marchons! marchons!*' more or less correctly. But on the morrow they would have forgotten it; the breath is soon out of a ballad, and songs at table in France have never been few.

Even Rouget himself forgot his musical bantling; he must have jotted down the words and notes, but there is no proof that he paid the lousis to the engraver. He could jingle rhymes and scrape out a melody, but knew that he was no musician; a *dilettante* always, in life as well as in art, he could begin fine things, half-finish them, and then let them lie about.

Some six months later he lay concealed in the Vosges; he had fought in Belgium and Vendée, but now, because his name had the 'de' in it, he was suspect of aristocracy, and must hide. Through a lacework of foliage he could see an avenue of pine-trees and a vista of meadows; down the avenue went a young peasant, who lifted up his heart in song. Rouget listened,

idly at first, but presently—what was this, *what* was this the lad was singing?—'*Allons, enfants de la Patrie*.' What was this? Rouget leapt out of his bush. He would catch the lad by the elbow. 'What is this you are singing?' The lad would scornfully regard him. 'Don't you know the *Marseillaise*!'

The butterfly had lived more than its day; the ephemeral had lasted and thrived. 'Luckiest musical composition ever promulgated,' Carlyle called it; it seemed to shine as it sounded; it was aureoled with ineffable good luck. Six hundred men of Marseilles had chanted '*Marchons! marchons!*' the while they dragged a bronze cannon to Paris, and from Paris it had marched on all over France. Yet almost the last Frenchman then alive to hear it, in its apotheosis, was he who invented and first sang it one spring afternoon at Strasburg, to the thrush-like tones of a violin.

In the year 1836 Carlyle wrote that an Idea had thus been translated 'into grim melody and rhythm, the sound of which will make the blood tingle in men's veins; and whole Armies and Assemblies will sing it, with eyes weeping and burning, with hearts defiant of Death, Despot, and Devil,' the translator being 'an inspired Tyrtean Colonel, Rouget de Lille, whom the Earth still holds.'

On a night in June 1836 Rouget de Lisle, aged and wizened, lay dying at Choisy-le-Roi. He was calm, he felt no pain, he fingered his Cross of the Legion of Honour, and he dozingly smiled at old friends near his bed. The doctor, coming in, did a thing rare in France to this day, and rarer then—he prescribed fresh air and opened a window. In came pure breath and moonlight, and a sound that made the watchers listen and thrill.

Away across the fields, between crops of crimson trefoil, there was a lift of young, proud voices; conscript soldiers were chanting as they marched, and '*Allons, enfants de la Patrie*,' was what they sang.

The eyelids that were drooping to the last sleep flickered open, and the dying man listened wonderingly, as if with an effort of memory recalling some dream. But now the chorus came across the fields, in the moonlight, in the glory of free air, and

'*Aux armes, citoyens!
Formez vos bataillons!
Marchons! Marchons!*'

was the refrain.

The dying man smiled. 'Strasburg!' he shouted, as if youth and vigour had come back to him in

a sudden ecstasy; but that was his last breath. Yet still the eyes seemed to listen proudly, after the rallying song of the conscripts had passed on toward Paris, through the cool night.

The luck of the *Marseillaise*! A few words and bars jotted down, forgotten, and revived by accident only, have gained more influence and renown in the world than any other musical composition, learned or sublime. Those thirty bars or so had the proud fortune to become not the voice of one Revolution only, but the heartening chant of liberty for every generous nation striving to be free.

Because it was a clarion of revolt, the Hapsburgs and Hohenzollerns, the various Bourbons and Bonapartes, proscribed it; but men and women dared chains and death to sing it, and it marched sounding on. Out of a France in defeat and silence again and again it has risen, France with it; it has been the talisman and health of a free and gallant France.

To-day nothing lacks to the *Marseillaise*. Rouget de Lisle sleeps near Napoleon—and never went to St Helena. The sculptured figures on the Arc de Triomphe seem to shout it; the men of the French armies cheer themselves with it to-day under hurricane showers of shrapnel and shell. Down every city street in our islands each day some lad goes whistling or singing a part of it; all western Europe chants it; at sound of it yet, more than ever, heads are bared and eyes grow moist.

Historians have written volumes on what was said, sung, and done at the Strasburg dinner-party; posterity has piously sought out the name of each guest. On some wall in nearly every French home Rouget de Lisle is pictured, standing to sing, with his hands on the chair-back, or the violin at his chin. And the last scene of all, at Choisy-le-Roi, could not end this strange, eventful history; to the organ accompaniment of cannon the *Marseillaise* still marches on.

H. M. S. 'IN CONFIDENCE.'

By CHRIS H. TICE.

IT was in the days of the *Karlsruhe's* activity in western waters, in those first startling months of the war. The writer was living on a little undefended island, seven miles by one and a half, four hundred and fifty miles from a British gun of any military use. The situation, it may be imagined, held its own peculiar suggestions of danger. To say that none of the residents slept for fear would be exaggeration, for is there not a kindly Providence specially attentive of Nature's deserted children? But at least there was a feeling of constant strain born of the continual remembrance of our helplessness. We were like marooned mariners awaiting the inevitable. To stand on a small eminence in the centre of our island home was like nothing so much as being in an open boat looking for a rescuing sail in an empty sea. The cablegrams were eagerly scanned day by day in vain endeavours to trace her whereabouts. Equally vain were the frequent map-searching meetings of anxious acquaintances.

Then came the news that an island, isolated as ours, but in the Pacific, had been raided by the *Emden*, and its cable communication destroyed. Perhaps no other place in the Empire was affected to the same degree by this piece of intelligence as we in this smallest British colony, for we too carried the till now unrealised responsibility of an intermediate cable station. Possibilities of an unwelcome visit from the famous raider, often developing into serious probabilities, loomed large in our conversations. One shell, it was agreed, though we had never seen or heard one fired, would be sufficient to give us our quietus. Grimly humorous references

were made to our 'defences,' four antiquated cannons of the 'Captured during the Crimean War' type, which stood in front of the Custom House. Some of the old inhabitants recalled the days when a section of the West Indian Regiment had been garrisoned in the island. The younger generation, however, failed to derive much comfort from the undoubted fact that there was a slight incline on the road to the cable station which was still known as 'Barracks' Hill.

Complaints there were that we should be thus left to the mercy of the first gun which troubled to point itself in our direction; indeed, in one out-land of the colony an effort towards a patriotic demonstration was met with the pointed rejoinder, 'Why, we ain't even on the map!' which was quite true. But for the most part there was a stiffening of the loyalty of all classes in the little community, finding expression sometimes in quaint remarks from the coloured people. One old fellow, after laboriously culling the meaning of the day's cablegrams, pointed to the Union-Jack triumphantly waving at the top of the Government Offices staff, and said, 'Dey can't down dat flag. And,' he added, 'as for dat ole Kaiser, we won't leave him a cock to crow on dedunghill.' Old Felix Tucker's homely words were indicative of the general attitude, despite our very insecure position.

Then came a certain Sunday afternoon, very still, but too hot to be drowsy, when a gray monster stole silently round the Point o' Reef, and stood off, for our fearful admiration, a mile from the shore, a scornful target for our rusty cannon. As for ourselves, we awaited Leviathan's pleasure. When officialdom didn't possess any-

thing more formidable than a row-boat, what could it do but wait? Groups of excited spectators stood in the front street speculating on what she would do. As yet she had given no sign. No flag fluttered from her masthead; no name was visible on her bows. She was a ship of mystery, yet tangible enough, as we knew, to thunder death into our small midst were it her will. For a few minutes she remained almost stationary, broadside to the island, watching us from just the other side of the reef. Even this self-same reef of ours was no protection from this kind of danger, though, had there been a hurricane blowing, Mystery itself would have steered wide enough of the cruel teeth on the inner side of which we lived. Then she went slowly down our whole coast length, still with those horrible guns trained on us, and those eyes searching our very vitals. At the end of the island she began to turn. An exclamation rose involuntarily from the excited watchers, 'By Jove! she's going for the cable.' But our fears proved groundless. She churned up the blue water and came right round. By this time, and in view of this grateful inactivity, a little of our courage had returned. We might have been a crowd of English south coast trippers admiring the massive proportions of some Home Fleet battleship for all the havoc she seemed anxious to wreak upon us. Slowly she returned on her course; then a tiny sloop put off from the shore and tacked toward her. Like a cork rigged with a handkerchief she appeared against the sides of the mighty vessel; but a ladder was let down to this cork, and a figure stepped from

under the handkerchief on to the bottom rung. Then it went up the side like a fly on a wall, and was taken on board.

The courage-glass on shore had been rising visibly during these operations. No one now, of course, had ever thought that she was the *Karlsruhe*. The only question which had made them shiver in one hundred and twelve tropical degrees was which British vessel she was. But wait! The cork and handkerchief are again bobbing towards the shore. All doubts will soon be set at rest. The sloop is beached after a trip during which the advantages of steam sailing were never more longed for, and the adventurous steersman steps ashore into a questioning crowd. 'Who is she?' was the loudest and most insistent demand. Vain hope! Is the whole world governed by a mighty censor? 'Who is she? Why, I mustn't say, more than that she's a Britisher. I have a communication in confidence for his Honour the Commissioner.' And all subsequent inquiries of every character as to our mysterious visitor only elicited the same meagre information, 'It's in confidence.' H.M.S. 'In Confidence' she was therefore dubbed by the islanders, and that is the name she will for ever bear in latitude $21\frac{1}{2}^{\circ}$ N. and longitude 71° W. But even a ship without a name is better protection than a ship without a gun, and in the days we again quietly went about our business, and in the evenings we rocked ourselves gently on our cool verandas, as we had done before ever we heard that his Imperial Majesty possessed a raider called the *Karlsruhe*. Indeed, we lived again 'in confidence.'

PINCHER MARTIN, O.D.

CHAPTER XV.—continued.

III.

THERE was once a German steam-trawler called the *Anna Schræder*. That was not her real name; but as she now flies the White Ensign and is known as the *Anita*, her original appellation does not matter. Hargreaves, the sub-lieutenant of the *Mariner*; Joshua Billings, A.B.; Pincher Martin, ordinary seaman; and several more of the destroyer's men, can tell you all about her, for they spent four days on board. They were four unforgettable days, and rumour says that the sub. and his braves are scratching themselves still.

From the *Anna Schræder*, too, the 'Mariners,' in exchange for sundry excellent British cigarettes and a pound or so of ship's tobacco, procured some samples of particularly noisome 'war bread' and a small female pig. The bread, they said, was an excellent 'coorio' to send home to their friends; and, having the consistency and appearance of wood, it could, with due diligence, be manufactured into photograph-frames and tobacco-

boxes. It took a beautiful polish. The sow, Annie, was retained on board as a mascot, and within a week of changing hands became quite friendly with her new masters. Inside a month she was sleeping in a specially made hammock, wore her own life-belt at sea, and ate her meals off a plate like a proper Christian. It is true that the rest of the menagerie on board—Jane, the monkey; Tiger and Mossyface, the two cats; Pompey, the goat; and Tirpitz, the fox-terrier—at first regarded her with some suspicion; but before long they appeared to have combined forces, and to have formed an alliance for the carrying on of offensive operations against any animal from any other ship which dared to come on board the *Mariner*. Annie's severest tussle was with the wire-haired terrier of the *Monsoon*, a plebeian but very conceited dog, who treated all vessels but his own with lordly contempt. She was ably assisted in the struggle by her willing allies, and for some minutes the battle raged furiously,

to the accompaniment of barks, growls, squeals, shrill yelps, and much snorting from the fighters. But before much damage had been done on either side, the engagement was brought to a sudden and wholly unexpected termination by both the principal combatants falling overboard in their excitement. They were duly rescued in the dinghy; and the contest, since they were both exhausted by swimming, was postponed *sine die*.

But all this has little to do with the *Anna Schraeder*. It so happened that at one period of the war the enemy was making himself particularly obnoxious by sinking many of our fishing-vessels in the North Sea. It was no very gallant mode of warfare; and, partly in a spirit of retaliation, and partly because My Lords Commissioners of the Admiralty may have conceived a sudden desire for some steam-trawlers for mine-sweeping and other purposes, it was determined to pay the Hun back in his own coin. The authorities were always eager to save money if they possibly could, and acquiring the necessary craft free, gratis, and for nothing from the enemy was obviously far cheaper than chartering them from British owners.

That is how it came about that the *Mariner*, many more destroyers, and several light cruisers suddenly appeared one early morning in the midst of a German fishing-fleet engaged in its occupation not very far from its own coast. The visit came as a bolt from the blue, and since there was nobody present to protect them, the trawlers had no alternative but to surrender. Twenty-three of them, I think, were captured; while several more, too ancient and too rickety to be worth taking home as prizes, were sunk.

The serene atmosphere of that calm and peaceful summer morn was befouled with Teutonic oaths and much profanity. One could not help having some sympathy for the execrators, snatched off as they were practically within hailing distance of their own coast. But every German male person of a certain age and not a cripple is *ipso facto* a soldier or a sailor, while every harmless trawler is a potential mine-layer or mine-sweeper. Most of the prisoners were young and lusty, and Fritz, Hans, Adolf, Karl, Heinrich, and many more of them had the not altogether joyful prospect of spending the rest of the war in British hands. Some of them disliked the idea intensely, and their scowling, sullen faces showed as much. Others, after making anxious inquiries as to how they would be treated and fed, expressed the opinion that things were not quite so bad after all, and that being a prisoner was far and away a happier prospect than serving in trenches at the front, whence they might never return.

It was this early morning strafe which accounted for the *Mariner's* dealings with the *Anna Schraeder*; the adoption of Annie, the pig; and the adventures of the sub-lieutenant and his merry men.

The prize crew consisted of Hargreaves, one stoker petty officer, Joshua Billings, Pincher Martin, and three others whose names do not matter; and after ten minutes spent in transferring them, their belongings, food, water, weapons, a chart, and sundry other impedimenta to the trawler, and in removing certain of the prisoners to the destroyer, the *Mariner* steamed off on her business, and left the sub. to his own devices, with orders to make the best of his way to the nearest British port.

How he proposed to get there he did not quite know. The deviation of the *Anna Schraeder's* compass might be anything, and he had no means of checking it; but the fact did not seem to worry him much. He knew that if he steered west or thereabouts he would hit the English coast in time; and, having hit it, he proposed to steam north or south along it, and go into the nearest and most convenient harbour which happened to come into sight. What harbour it was he probably would not find out until after his arrival.

He was intensely proud of his first independent command, and his first care was to commandeer all the German ensigns he could find for trophies, to hoist an enormous White Ensign at the mizzen, and to display his badge of authority in the shape of a long white man-of-war pendant at the masthead. Then, when some one had persuaded the German engineer to raise a full head of steam in the antiquated boiler, and to start the engines, one of the *Mariner's* men was put at the wheel, armed sentries were posted on deck and in the engine-room, and course was shaped for home. The men, inquisitive as usual, set about exploring the prize. She had on board more than three hundred pounds' worth of fresh-caught fish, but even the thought of this excellent food could not mollify the bluejackets for certain other things they discovered. The first complaint came from Billings, who, as the eldest A.B. on board, had been selected as a spokesman by the others.

'Beggin' yer pardon, Mister 'Argreaves, sir,' he said, having first expectorated over the ship's side and then approached the sub. with a very wry face, 'would yer mind 'avin' a look at th' quarters lately hoccupied by them Germans?'

'What's the matter with them?' asked the officer.

'They ain't fit fur 'uman 'abitation, sir; an we 'as ter sleep there.'

'Why aren't they fit to live in?'

'Crawlin', sir,' said Billings disgustedly. 'Crawlin' wi' li'l hanimals! Cockroaches I don't mind, sir, bein' used to 'em in a manner o' speakin', an' there's plenty on 'em there; but there's hother hanimals present in hinnumerable quantities—creepin' things wi' legs the likes o' which I've never see'd afore.'

'Vermin?' queried the sub. in a whisper.

'Yessir. The beddin's one mass on 'em.'

'Well, I'm determined to have the ship clean before I've finished with her,' said Hargreaves, as if he were the commander of the latest Dreadnought, 'so heave all the bedding overboard. When you've done that, collect three of the German deck-hands and make 'em scrub the place out. I'll inspect it when it's clean.'

'We ain't got no carbolic, I s'pose, sir?' Joshua queried anxiously. 'I doubts if soap an' water'll shift 'em.'

The sub. laughed. 'We brought none with us, I'm afraid. But get hold of whoever looks after the stores, and get what you can, and do your best.'

Joshua saluted and walked off. Five minutes afterwards a long line of blankets and straw mattresses were floating gaily astern.

But their troubles had only started, for a quarter of an hour later Billings reappeared with Pincher Martin, and between them they dragged the resisting figure of one of the prisoners, a small, dark man with a pair of shifty black eyes. Pincher, Hargreaves noticed, was armed with a cutlass and a revolver, and displayed the latter weapon ostentatiously.

'Good Lord!' he muttered; 'what's the matter now?'

'Prisoner an' hescort, 'alt!' bellowed Joshua. —'I brings this man 'afore you, sir, fur refoosin' ter scrub art 'is quarters when hordered, an' fur hassaultin' me.'

'And I haf von gomplaint to make,' put in the prisoner truculently. 'Von of ze sailors heet me!'

'What happened?' asked the sub. with a sigh.

'Well, sir,' Billings explained, 'it wus like this 'ere. I tells this man—'e knows Henglish just as well as I does, sir—ter start scrubbin' art, an' ter be smart abart it. 'E sezs 'e won't, 'cos 'e 'as 'is rights as a prisoner o' war, an' ain't goin' ter do no work.'

'Oh! did he?'

'Yessir, 'e did; an' I sez to 'im that if 'e doesn't hobey horders 'e'd best look art; an' wi' that 'e tries ter dot me one in the face.'

Hargreaves, stifling his amusement as best he could, scowled fiercely, and endeavoured to look judicial. 'And what happened then?' he inquired.

'Well, sir, ord'nary seaman Martin sees wot wus 'appenin', an' catches 'im one acrost th' 'ead wi' a broom-'andle.'

Pincher's bosom swelled with pride at the recollection.

'What have you got to say?' demanded the sub., turning to the German.

'My name ees Charrie Smeech, an' I haf lif in Englan' many year. I serve in Engleesh sheeps, and I say to zis man'—

'I don't want to hear all that. What d'you mean by refusing duty?'

Smith, or Schmidt, as he probably was, licked his lips. 'I say to zis man, why he treat me like zat? And zen zis man,' indicating Martin, 'heet me on ze head with ze steeck and hurt me mooch.' He pointed to a large lump on the side of his cranium.

'That ain't true, sir,' Joshua interrupted. 'If Pinch—ordinary seaman Martin—'adn't sloshed 'im 'e'd 'a got me.'

The sub. scratched his beardless chin thoughtfully, for he hardly knew what to do. 'Look here,' he said at last, addressing the culprit sternly; 'you are a prisoner of war, and have to obey orders. If I have any further trouble with you, your hands and feet will be tied, and you will be put in the fish-hold for the rest of the passage. I will also report you on arrival in England, and have you court-martialled and shot. I mean what I say, mind; but I will give you this one warning, so you had better take it to heart. Do you understand what I say?'

'I onterstan,' said Schmidt, fidgeting nervously.

'Remove the prisoner, and let him carry on with his work,' the officer ordered. 'If he offers any further violence, shoot him at once.' He winked. Billings grinned understandingly, and the hapless German was led away in a cold and clammy perspiration. They had no further trouble with him.

(Continued on page 757.)

THE LABOUR PROBLEM AND ITS SOLUTION.

By E. T. GOOD.

OUR success in the coming commercial campaign—our success in securing trade, employment, and wages, and in generally re-establishing our economic position—will depend mainly, if not entirely, upon how we deal with our labour problem.

What is the labour problem? How has it arisen? How can it be solved? The labour problem may be described as the question of

how to make workpeople reasonably efficient, industrious, and contented. Inefficiency, indolence, and discontent—our labour troubles generally—have arisen through ignorance and lack of understanding and sympathy between employers and workmen. The labour problem can only be solved by developing co-operation instead of conflict between employers and workmen, or between capital and labour. But before we can

develop or establish this much-to-be-desired co-operation we must tackle the root-causes of the conflict.

In the last ten years before the war one hundred million individual working days were lost by strikes and lock-outs in this country. We had limitation of apprentices, the 'slow timing' of machines, opposition to improvements, and deliberate restriction of output. We lost so much trade to our foreign competitors, and we so far failed to provide employment for our people, that the stream of emigration was rapidly approaching the natural increase of population. At the pre-war rate of progress—or retrogression—we should soon have been a declining nation. Capital and labour, the two prime forces in industrial production and economic development, were in conflict instead of co-operation. That was the labour problem.

After the war we shall have to meet the competition of an impoverished Europe, of a desperate Germany ready to sell goods at almost any price; and, with a big load of taxes to handicap us, we shall have to face the rivalry of the vast and naturally rich United States, a country that is securing a competitive position of considerable advantage while we and the Germans are fighting. In the new commercial competition we must obtain sufficient trade to employ our people; but we can only do so on condition that capital and labour work together. Unless we solve the labour problem we are lost!

Copartnership or profit-sharing is frequently suggested as a remedy for labour troubles and a means of securing co-operation between employers and workmen. Bills to empower limited companies to share profits with their workmen have already been introduced in Parliament; and, in view of the serious nature of the coming international commercial contest, it is not altogether improbable that an early effort will be made by legislation to compel capital to share its profits with labour, while many great employers are considering the question of establishing copartnership schemes voluntarily. In these circumstances the question, or principle, of profit-sharing merits special consideration.

Now the theory that labour would be more contented, and would work more diligently, if it were given a share of the profits it is supposed to help to create seems plausible enough on the face of it. But a moment's practical consideration will surely convince any intelligent student of industrial economics that copartnership, as a general remedy for labour discontent, is impossible. The whole idea should be dropped, and our minds turned to more rational and promising schemes.

It is worth observing, by the way, that a recent Board of Trade report showed that out of three hundred copartnership, or profit-sharing, schemes known to have been started in this

country, slightly more than one-half had failed. Probably most of the remainder are on the way to failure. When it is noted that practically the whole of the schemes have been started in special industries, or works in no way typical of the big general trades in which labour disputes are most frequent, it will be seen that the principle of profit-sharing offers little promise of solving the industrial problem. Indeed, it may be said that only in very special circumstances does the principle stand any chance of practical application. In most of the big trades copartnership would break down before it had been in operation very long, and while in operation it would prove a costly nuisance.

The big obstacle to the success of copartnership is the fact that the modern capitalist and the modern labourer stand in fundamentally different positions. The capitalist can invest in a dozen or a score of separate enterprises; he can live on the dividends from some concerns while others in which he is interested are losing money; and he can afford to take risks and sometimes wait years for a dividend. But the labourer can only work in one establishment at a time; he cannot balance losses against gains, and he cannot wait for his wages. In small special industries, in cases where the employer personally supervises his business, and where the same workmen are employed continuously, it may be possible to work copartnership schemes, though whether it is advisable is another matter. But in the big trades, where capital is impersonal; where the employer, as such, has really ceased to exist, and where we now have investors, directors, and managers; where employment fluctuates, and men are often dismissed, or suspended, and fresh ones set on, copartnership is impossible.

If we take any big industry—engineering, for instance, or coal-mining—we can at almost any time find some firms making large profits, some making moderate profits, and others making losses, being obliged to draw on their reserve funds in order to keep going. These differences may in no way be due to differences in labour—differences in the efficiency of the workmen. In all probability they are due to differences in management, to good or bad contracts, or market uncertainties. Such being the case, what sense would there be in paying the workmen of the successful firms large bonuses, or dividends, on top of their standard or minimum wages, while the men of the unsuccessful companies received only the bare standard? Such an arrangement would promote neither efficiency nor peace. A firm may make large profits for a few years, then lose money for a period, and finally meet with success again. The shareholders are not vitally affected, for they have investments in other companies. But the workmen would be vitally affected under a scheme of copartnership. Sometimes they would be drawing large bonuses,

plus their wages. At other times they would have only the standard, or minimum, wage; and, obviously, if the men were to share in the profits they would somehow have to bear a share of the losses, and that would mean, no doubt, that the minimum would have to be fixed comparatively low. In other words, sometimes the workmen would be having abnormal earnings, wages and dividends together, and at other times wages of a starvation character. That would not do. When it is observed that the same men are not always employed, and that the men working for low wages in the bad years might have gone, other men being employed in the good years, the absurdity of copartnership will surely be apparent.

Take the mining industry, for example, for if any trade is in need of measures to abolish discontent and strife it is this. A colliery company is formed to work a certain block of coal, the lease being, say, for thirty years. It may take five years for boring, sinking, and equipping. During that time no coal is got. There are no profits. But labour is employed and paid. During the next five years there may be no profits, though coal is being produced. Unexpected difficulties or faults are met with, and more expensive machinery has to be purchased and employed. Ten years may pass without any dividend for the shareholders. But wages have to be paid all the time. Then, the difficulties being surmounted, dividends of 10, 20, or even 30 per cent. may be paid during the second ten years of the 'life' of the mine. Again, in the last ten years the dividends may vanish, the workings having become remote from the shafts, and the operating costs having become heavy. Shareholders take all this as a matter of course. Under copartnership the men, however, would be in an anomalous position. Some of them, those employed in the best years, would be passing rich on big bonuses or dividends, plus wages; while those working in the worst years would complain about their starvation pay. Besides, if capital is not to have high profits in some years, but is to share them with labour, where are reserve funds for bad times or surplus capital for new enterprises to come from? The bed-rock fact is that the average capitalist and the average workman occupy such entirely different positions that it is not possible to devise any fair-and-square partnership between them. But it is possible to promote good understanding and co-operation, as we shall see in a moment.

By the way, however, it may be pointed out that this modern development of industry—this elimination of the individual employer, with his personal knowledge of and contact with his workmen—and the creation of the investing capitalist, who is a stranger to the workmen, and sometimes even a stranger to the works in which his money is invested—this development

of impersonal capitalism, while the workman remains, and must always remain, a personal or individual unit—this circumstance which renders copartnership impractical as a solution of the labour problem is also the chief factor in the creation of the problem. The employer or capitalist and the workmen have become strangers. The employer or director has little knowledge of the conditions under which the men live and work and form their opinions and policies; little knowledge of their thoughts, feelings, and grievances. On the other hand, the men know little of the employers' difficulties, of the finances of industry, of foreign competition, and such matters.

Meantime, while employer and workmen have been drifting farther apart, mistaken economic doctrines have been propagated, representing what is called the capitalist system of production for profits as a gigantic scheme of robbery. It has been represented that, on a rough average, the workers, comprising nine-tenths of the population, only receive about one-third of the national income, while the capitalists, forming only one-tenth of the community, get the remaining two-thirds. This, of course, is a preposterous exaggeration; but it has been so persistently preached, and allowed to pass uncontradicted, that the working classes have come honestly to believe they are being robbed of about two-thirds of the products of their labour. No wonder we have discontent, restriction of output, strikes, and mischievous agitations. We need, above all things, understanding between employers and workmen. If the workmen understood the employers' real position, and the principles of industry, finance, and trade, we should soon enter a new era of industrial peace, progress, and prosperity. How is this understanding to be brought about?

My suggestion is that in all our large industrial establishments we should form what I may term consultative committees. The committees should consist of elected representatives of the workmen and an equal number of foremen, managers, directors, or shareholders. They should meet regularly and freely discuss all matters affecting the works, the men, and the trade. By these means not only would valuable improvements often be proposed, but misunderstandings on both sides would be cleared up, and many grievances remedied before they could develop into disputes.

Next I would have industrial district councils, jointly composed of representatives of our chambers of commerce, employers' associations, trade unions, and friendly societies. These bodies could smooth out local labour troubles, promote good feeling between the labour and capitalist organisations, and give advice and assistance to the municipal, educational, and other authorities.

Finally, I would suggest the formation of a

national council of industry, composed of labour leaders and representative employers. This council, besides acting as a supreme tribunal in such labour disputes as failed to be settled locally, could conduct inquiries and make reports and recommendations upon general industrial, commercial, and social questions, supplying workmen, employers, and statesmen with information necessary to a correct understanding of the problems of labour and industry. It is not by such artificial devices as copartnership, and not by Government interference or arbitration,

that we can reasonably expect to solve the labour problem, but by the spread of knowledge and by voluntary co-operation between employers and workmen. We have already got organised labour and organised capital—trade unions and employers' associations. Let us have labour and capital jointly organised. It is not sufficient that the labour leaders and representative employers should only come together on the occasion of disputes. We want them to work together constantly, and in combination, for the common good.

CARELESSNESS.

CHAPTER III.

FEELING a trifle dazed, Joe Rudge stumbled out into the sunshine. Although for so long a professional burglar, he had some proper pride, and that pride had received a severe shock. He had come to the Queen's House on the strength of the statement that he was a gardener, but he had stayed at the Queen's House because he had proved himself a gardener. Reclaiming sinners was all very well for the committee, but with Angus MacNair the gardens travelled first class, and the sinner's welfare fourth; which meant that Guard MacNair carried no passengers who couldn't garden. If Joe Rudge had proved inept he would have received his *congé* from MacNair at the end of his very first week, the philanthropy of the committee notwithstanding.

Joe, then, had made good. He had proved himself a gardener and worthy of his wages. He liked to think of himself as a gardener, and to forget that he had ever been a burglar. And what must this precious committee do but as good as tell him that a man with his record couldn't afford to be particular about the woman he married! He burned hot at the thought. Not for a moment would they have dared to make such a proposal to Nick Portch, or any single man at all with nothing against him. But Joe Rudge, the ex-convict—he couldn't afford to quarrel with his bread-and-butter! They had given him a job. Now they proposed to find him a wife—of a sort. Some servant-girl who'd got to be made respectable!

Thank you, but Joe Rudge, ex-convict though he might be, wasn't going to be made a convenience of in that way! He came to that decision five minutes after he got out of the committee-room. Why, as he stood in the yard, carefully untidying himself preparatory to commencing work again, this occurred to him: they hadn't even offered to let him have a look at the girl! Thoughtless and careless, was she? He could picture her—red-cheeked, loose-mouthed, splay-footed, and thankful to be taken notice of by any sort of chap. It was obvious she was a country girl; those sort were always taken advantage of sooner

than the cautious town ones—silly cuckoos, most of them.

Joe was no ladies' man. When he had been surveying a likely 'crib' he had never made up to the servants. Handsome Jack was the boy for that. Such a way he had 'with the wimmen.' Two or three wives—or sort of wives—Jack had, and it bore hard on him being in quod, he with such a liking for the petticoats. Here, there, and gone to-morrow was Jack; and when he was quodded there would be half-a-dozen girls crying their eyes out, each thinking she was the only girl he cared about! Himself, he had only liked one woman in his life. He had thought of her all the time he was doing his seven years' stretch, only to find her married and with a pack of kids when he came out. Altered she was, too—nothing of the old saucy look left. And yet Joe felt he might still think about her if she were left a widow—which wasn't so unlikely, as a policeman was sometimes deliberately tracked and laid out by coves he'd got quodded, when they were released.

He had decided to let the committee's proposal stay where it was. If they didn't hear from him they would conclude there was nothing doing—that is to say, that he didn't want the cottage on the conditions named. Then they would look out for another husband for the girl. The cottage wasn't a bad bait. Natty little place, with a fair piece of garden where a handy man could raise a nice crop of 'veges' for which he could command a ready market in Broken Cross. Perhaps one of the commissionaires in the house would take it on. No doubt they'd find a cove who wasn't fastidious.

So Joe let the week go, and the week had gone into nine days when he again found himself addressed by Mr MacNair.

'Well, Rudge, how about the lassie?'

It was seven o'clock in the morning, and Joe had just started work. Even Handsome Jack, it may be conjectured, did not feel exactly ardent at seven o'clock in the morning, and only a Scotsman would have begun to prattle

on love matters at such an hour. And garden hands, equally with kings, are apt to be surly at this time of the day.

Joe, who was engaged in the unsentimental job of forking manure on to a mushroom-bed, looked round at his chief with a grim countenance. So Mr MacNair had known the committee's mind on this matter from the first! Hence the inquiries as to his lodgings and so forth. Joe understood now. But the present question was as blunt as it could be, as tactless as the leading-up part had been diplomatic.

'What the gentlemen spoke about?'

'Ay. They've been looking for your answer.'

'There is no answer,' said Joe, plunging his fork into the manure.

'Steady with that tool,' said Mr MacNair.

'Bide a wee, ye ken, for I'm speaking to you on the matter.'

Joe left his fork in the manure and turned to listen. His attitude was respectful enough, but his expression was lowering and dogged.

'The gentlemen,' said Mr MacNair, 'have made you an offer, and I'm surprised a chap like you hasn't jumped at it. It's not an offer every chap like you would get. D'ye think yourself too guid?' demanded the chief warmly.

'I think when I want a wife I'd prefer to look for her myself,' replied Joe.

'And would you hand her a list of your convictions at the beginning or the end of your courtship?'

A dull glow stole into Joe Rudge's face. A flush smack between the eyes from the overseer's clenched fist would have hurt him less. 'Speak to me like that again, you red Scotsman, and I'll put that fork through you!'

The words came with a wolf-like snap from between his hard fangs.

Chilly it is, even in August, at seven in the morning. As the narrow, watchful gray eyes of the ex-convict held the starch-blue orbs of the northerner, the latter seemed to feel the chill of the air. His sturdy shoulders contracted a little. But he did not wince. Yet they were alone in a corner of the vast gardens. The other men were working at a distance. And it was the chill early morning, when men move slowly.

'Once of that ought to be enough for you,' MacNair responded steadily. 'Get on with your job, and I'll speak to you again later.' He turned his undefended back on the man who had done seven years for manslaughter, and walked away with his customary measured step.

Joe spat. 'That's put the lid on it,' he thought. 'But I've learned the red Scotsman something.'

All day he worked with that lowering look on his heavy jowl. He'd have the sack now. He was certain of it. But he didn't care. It would mean the old game again, for who'd employ a gardener who couldn't give a reference? For

gardening takes you close up to houses, and houses have pretty things in them.

He paid little attention to the talk of the other men, discussing the great topic of the day. Royalty was coming to Broken Cross to open the new Town Hall, and afterwards would drive out to see the Queen's House and its famous gardens. In consequence, the staff were to have the half-day off. With the others, his manuring done, Joe was set to tidying up. The paths were swept; falls of fruit were picked up; the lawns were newly mown. It was a busy morning. The men weren't done by their dinner-hour, and it was nearing two when they finished. Royalty was due at the Town Hall at two-thirty, and at the Queen's House at four. The men hurried off to witness the arrival of the Great Ones.

So to Joe, knocking off at his leisure, fell a job which should rightly have been Nick Portch's, he being the junior of the staff.

'I want ye to wheel a barrow of tubers down to the Mayor's house,' said Mr MacNair, coming into the yard as Joe was putting on his coat. 'It is this side of the town, so ye won't come agen the crowd. Ask for it, will ye?'

Slowly Joe took off his coat again and loaded up a barrow with seed-potatoes, Mr MacNair directing him.

'Call for the barrow in the morning,' added the head-gardener.

Then Mr MacNair walked out of the yard to deck himself in his festive best. It was a great day for Mr MacNair. He personally would conduct royalty through the gardens; he would receive its congratulations on the evident care and skill he had lavished upon this celebrated pleasance. He would have his name in the papers, and likely his photograph.

As Mr MacNair decked himself in his best, Joe Rudge, with his old coat—and it was a very old coat—flung across the tubers, was wheeling his barrow along the dusty road leading to Broken Cross. And while Mr MacNair planned to invite the attention of the Great Ones to the roses with which he had taken First Prize at the All-England Rose Show, Joe Rudge was also planning something. He was planning to go. This day he would go. In any case he'd have the sack, so why wait? Yes, he was, after all, in the opinion of these people, these clergymen and the lady, and the red Scots gardener, still but an ex-burglar, on whom could be dumped a servant-girl who sadly needed a 'Mrs' to her name.

So he was going. He had some pride left still, and he was going without waiting for his wages. But he could not go pockets empty. So—the old blood was stirring in his veins—he knew where to fill them. That little house, where the old ladies lived, would be empty to-day. Careless, were they? Well, their carelessness would be a bit of good for Joe Rudge. Empty? Yes, of course these old

tabbies would be in the town to see the royalty, and the servants wouldn't be left at home. Catch them staying at home with such doings abroad! So there'd be nobody about. Rest Harrow. That was the place.

Joe chuckled. *He'd rest a while there. It was as soft a job as a chap could tackle; so soft that, but for his need, he'd have been almost ashamed to crack such a crib.*

His pace slackened as he approached Rest Harrow. He had to go cautiously. Peril and risk, brushes with danger, generally harden a man's nerve and make him ready. Rudge had grown a little rusty during his two years' probity. And it wants some nerve to walk into a house in broad daylight and take what doesn't belong to you.

There wasn't a soul about. Everybody had crowded into the centre of the town to see the royal folk. A little later, and this dusty road would be having the afternoon of its life. The people living along here would hurry back to watch the Great Ones return from the Queen's House. Police would be dotted along the road at intervals, and mounted men would precede and follow the royal equipage.

Now, if ever, was the moment. He felt he had never looked more innocent—a man in shirt-sleeves toiling behind a barrow of seed-potatoes. No one would give him a second glance. And these very seed-potatoes would make a splendid covering for whatever he got. Quick out with the stuff under his coat, or possibly in a sack if he could find one. Then to his lodgings—his landlady was just the sort of body who would be gaping at the royal folk away down in the town—and, the stuff concealed, back to the Mayor's house with the tubers.

Here he was at the house. Well, he was surprised it had never been entered before. It stood by itself, without a neighbour fifty yards on either side or opposite. And they'd never lost a silver spoon!

Joe's tongue clicked. It seemed a sad waste of opportunity.

Nonchalantly he dropped the handles of his barrow, pushed open the wicket-gate, and, walking up to the front-door, gave a pull at the old-fashioned bell. Receiving no answer, he rang again and knocked. It never did, as experience had taught him, to hesitate or appear at a loss when engaged on these daylight jobs; and, having, as it would appear to an onlooker, business at the house, and failing to obtain attention at the front-door, he did what most gardeners would have done—he tried the back-gate, a flimsy thing of trelliswork.

Carelessness! Why, it wasn't even bolted at the top, which, except that it would keep out small boys, was as good as not being bolted at all, as it was quite easy to slip your fingers through the trelliswork and pull back the bolt.

He walked down an orderly path into a garden that was the last word in spick-and-spanness. A regular old ladies' garden—lawn in the middle, fruit-trees, and nice old-fashioned beds of flowers. He stopped and gazed round. 'Eavens! The kitchen window was down an inch at the top.

At his mercy—that was what Rest Harrow was. Do as he liked with it.

Click! Every nerve in Joe Rudge's body suddenly became tense. Somebody *was* about. A latch had dropped. His eyes were riveted on an outhouse made of boards painted black. There was somebody in there.

'Anybody about?' he called.

There was no response.

But he was sure there was somebody about. He felt it. Outwardly cool, though his heart was beating just a trifle faster, he walked up to the outhouse, lifted the latch, and opened the flimsy door. He stepped back with a slight exclamation; for standing amid a pile of tools and baskets and boxes, odds and ends generally of house and garden, was a young woman. She was a comely young woman, brown-haired, clear-complexioned, and deep-chested. She had some kind of bundle in her arms, and there was a look of alarm, even of guilt, in her eyes, which otherwise were good and level-set under a smooth, white forehead.

'Oh, please,' she said, 'I'm doing no harm! I just walked in. I'll go out now, at once, gardener. I'm not doing any harm, really.'

'No one said you was, miss,' replied Rudge civilly. 'I'm lookin' about for somebody who can tell me which is the Mayor's place.'

'It's the big house with the white gates, quarter of a mile farther on.'

'Thank you, miss. I'm from the Queen's House, an' have got a barrow of seed-pertaties for the Mayor's gardener.'

'Oh, yes,' she said flutteringly, but hardly following. 'Well, I'll show you where it is. It's on my way—back.'

'I'll be obliged to you,' said Rudge, wondering at her perturbed air. Was she—could it be—was she on the same racket as himself? Been a slavey here, and come to pinch something when the mistresses were out?

Her hasty concealment of herself in the outhouse gave colour to his suspicions. But why had she brought a babby—for he saw the bundle move—when she would require her hands for the work? Then he saw light. That innocent-looking bundle would be a splendid place to conceal anything that she saw fit to pinch.

Perhaps she noticed the appraising look in his long, narrow, shrewd eye.

'I'm really doing no harm here, sir,' she repeated, 'though you may think it. Please—please don't mention to the Misses Gill that you saw me here! They'd be so angry, after saying they'd have nothing more to do with me.'

'Why would they not?' asked Joe abruptly. For he was a reader of character, and he was sure now—could read it in her face and tones—this girl wouldn't do harm to anybody.

She gazed at him with eyes that had become misty.

'This,' she said, with a little inclination of her chin toward the bundle; and then, dropping on to an old box, she bowed her head over the bundle and wept.

Joe stood by her in silence. Women he had never understood. But he felt he hated the old tabs who'd turned this girl off because of her shame. Jealous, they were; since it wasn't likely any man had ever looked twice at them.

'Don't you take on,' he said, with rough kindness. 'You ain't the only one who ain't gone quite straight. You cheer up an' put a bold face on it.'

She rose suddenly, sweeping the tears from her eyes. 'Then you won't tell them?'

'Course I won't. I don't know 'em, an' I don't want to know 'em.'

She looked relieved. 'They let me come out for a walk to-day, and, knowing the mistresses would be out—they're great ones for sight-seeing—I couldn't help just taking a peep at the old place—just for once.'

'Quite reasonable,' said Joe. Then, after a pause, 'Who's "they" that's let you out?'

'The matron at the Union. She said, "Well, Mary, we're not going to keep you here till doomsday, though we must keep the child till you can find a home for it, so you'd better look up one or two of your friends and see if they can put you in the way of getting work."' She stopped, her lips quivering. 'But it's hard for a girl—it's hard. They do look at you.'

But Joe was hardly listening.

'Was the chap you knew a sojer?'

Her face flamed. 'Why, how d'you know?'

'They was about here last year, that's all. Likely you wasn't the only one.'

'He said'—she began, and then, knowing it was useless to explain, she buried her face in the shawl that enclosed the child.

'She was spoony on him,' thought Joe. 'I'd swear she ain't bad.' He cleared his throat. 'Well, miss,' he said, very civilly and quietly, 'if you'd walk down the road with me an' point out the Mayor's 'ouse'—'

'That I will,' she said readily; and, she leading, they went out of the outhouse and down the side-entrance to the front of the house, Joe carefully shutting the door of the outhouse and both gates after them.

She seemed to find it a relief to talk to him, he was so plain-spoken and quietly sympathetic. She waited for him, in fact, while he delivered his load of tubers at the Mayor's house and came down the drive barrowless.

'I'm going to see a woman who does charing

at the Misses Gill's,' said the girl. 'She lives in Endeavor Street.'

'That's a turnin' out o' mine,' replied Joe, 'so I'll bear you company if it's to your likin'.'

'I'll be glad,' she said.

Joe, first thing next morning, having returned the barrow to the yard, sought out Mr MacNair. 'I've come to say, sir,' he began, not at all easily, 'that I'll be obliged if you'll look over what I said so 'asty yesterday.'

'That's all right, Rudge,' replied the overseer, in a prime good-humour over the nice things royalty had said to him about his garden. 'I touched an old spot up, and perhaps I shouldn't have done that. But the gentlemen and lady, they'd been fussin' me a bit to get at you about the cottage, and I put the thing plainly in your interests, my mon.'

'Well, sir,' said Rudge, 'I'm thinkin' over of it.'

'Do so,' said Mr MacNair. He gave Joe's sleeve a pull. 'She's not a bad-lookin' body, as you'll be thinking when you see her. Don't be keeping the gentlemen waitin' longer than next committee day, ye ken.'

'I will not, sir,' said Joe.

And as he went to his work he drew a long breath. He had never thought to be back here again. But for her, he would now be a felon again, lurking in a hiding-place, an outlaw, his hand against every man's.

'Make her respectable.' Nay, 'twas the other way about—the other way about!

So, humbly, as one seeking a favour, as it should be, Joe Rudge entered upon his courtship.

THE END.

DRY!

AN AUSTRALIAN PICTURE.

Dry! Is it dry? Say, Englishman, try
To turn the hard furrow again.
It is dust, not vapour, that darkens the sky,
The dust of the wind-swept plain.

Dry! Is it dry when the creeks won't run,
And the dams are down to the mud;
When the fiery glow of the autumn sun
Is drawing the country's blood?

Rain! Ah yes, the south gales sweep
Over the saddened land;
But the pitiful tears the gray clouds weep
Are lost in the shifting sand.

Rain! Go seek in your motor-car
For rain on the western plains,
Where the dim mirage still beckons afar,
And the depth of silence reigns.

Idly the teams stand waiting the plough,
Vainly the lowing herds moan;
From the deep ravine to the mountain brow
It is dry as an altar stone.

NEVILLE BOSWORTH.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

WHAT person is of the greatest importance in the world? To the problem we add a special proviso that the importance must be of what we may call the positive and beneficent order. The ultimate good of the world is what we have in mind. Some might say that the British Prime Minister, being the chief of government of the greatest state in the world, the most populous, the most extensive, is the most important man; but we know that in this case very much depends upon personal strength, that while the man may be little without the office, even with the office he may still be short of greatness; and, again, such is our system of government that, save in very special circumstances, individualism is minimised, scheme, initiative, direction, and responsibility are spread over a number of persons, and importance is averaged among them. There were moments when some might have urged, and not without reason, that Lord Kitchener was that most important man; many might suggest that General Joffre has a claim for place in these considerations. There is the Pope. Has not the autocratic Czar of Russia a mighty influence upon the destiny of many millions of people that are awakening to a new life, and, with full vigour and enlightenment, may very likely be a major force in the civilisation of the western world? But when we think not merely in terms of the present moment and this generation, and maybe the next, but of the development of mankind, its fast transformations and its plain tendencies and directions as we see them now, another office, with the name attached to it, comes instantly to the mind. Therefore, without asserting it and insisting upon the supremacy, one has the boldness to suggest that the most superior office upon which we are making the conjectures of this problem may be that of President of the United States.

* * *

The tendency of life and action is more towards the New World now than ever it has been, and more again will it be immediately after the war. In wealth and in various phases of consequence the people of the United States, a slowly mixing blend of other races from afar, are being raised above the others. Business and money, business and money, they count for all, or seem to do;

and with its business and its money, accompanied by that measure of culture which this new-comer has had time to develop, the United States goes forward now among the Powers of the world. Its own country, considered in a single and domestic way, is one of vast consequence, making in itself, for its share in the development of mankind, mighty responsibility for the presidency; but it is not this alone. However separate Canada may be from the States, and with the blood-fastening of its tie with the mother-land that has been so splendidly tightened in this war, the two are next to each other on the American continent; and in that half of the New World there is Mexico, also with its riches and its possibilities. In southern America there are the many and highly important republics, increasing in consequence every year, which, with a full independence, yet receive a certain gentle patronage, as one might say, from the powerful state in the north. Indeed, it is neither patronage nor protection; but there is a little of both in the reality of affairs, and this is delicately suggested by the Monroe Doctrine, which, weakening as it may be under the pressure of the times and changing circumstances, is yet a system for American conduct and progress. All the American countries have the great common interest that their lands are rich; that they are of the New World, standing for a new life and a new view of its possibilities, as they are unshackled from customs and traditions that have been hurting humanity for long ages past; and that they are being fed by emigration in a ceaseless stream from every part of the Old World. So there are many circumstances in common, and it is natural that the importance of the office of President of the United States should be enhanced by them. More than this, the war has made such a vast upheaval in world affairs and arrangements that, possibly against her will, the United States has to come into closer political relations with the rest of us than before. She can no longer, if she wished it, remain in the sort of lofty independence she has so far enjoyed. If she would keep free from the European entanglements, for which she has no affection, these entanglements spread out towards her and catch her. And there is Japan.

Indeed, as thoughtful Americans might say, there is Japan. So the old days of youthful happiness and contentment and carelessness, the splendid independence that the Atlantic and the Pacific seemed to give her, the unconcern as to what Europeans might do at home with their steel and their explosives—those halcyon days have gone for ever. Mortal trouble will not cease until the world has reached its climax, and that is not nearer to the view than it was many thousands of years ago. The Americans, when they had settled their Civil War, thought that then they were to be happy and undisturbed for ever. But the world is of a piece, and peoples cannot detach themselves from it. Now we hear of the United States—abhorring war as it instinctively does, even though it was made in war—creating armies and navies on the grand scale of the old, much-troubled world; and we know in Europe that when that begins there is not to be expected a peaceful end. It is whispered that she will seek alliances, or that, if she does not wish to seek them, she must. She prepares for defence; she wishes only to protect that which she has, and does not covet the dominions of others. She knows that she dare not be too proud to fight; there is too much danger in such disdain. The old concert of Europe comes to be the concert of the world, and the United States is in it. This is now the fourth great epoch of the history of the country. First there was the foundation and the slow establishment, with many vicissitudes; then there was the War of Independence, and the creation of the free and independent State, with the fine growth that followed it; next there was the Civil War, and the new cohesion and complacency that it yielded; and now there is the entry in full measure into the affairs and politics of the world, the more formal assumption than hitherto of the position and responsibility not only of being a world Power, but of being a leader among the Powers, with all the material and human strength that qualifies for leadership. And though this is a government by republic, and the government is shaped and conducted on the democratic plan, and the President is responsible to the people, and remains President only while they are satisfied with him, and rarely for more than four years at a time, still, as we have seen in the last two years, he enjoys—if that is a fair word for the case—a considerable liberty of action when once the office is laid upon him. It is his duty and his bounden necessity to seek to interpret the will of the nation, and thus to serve its best interests and desires, and to act accordingly. In emergencies he has almost upon his sole responsibility to act thus in matters of the most vital concern. When the people, with their conventions and their colleges and their various elections, gave him the presidency, they thus signified that they regarded him as the most capable man in the country to repre-

sent it and to conduct its affairs both great and small. They trusted him to act for America. For all these reasons, and for many others, the more we consider the possibilities and probabilities of the world at present, and the various shades of responsibility that are cast upon the leaders of the great national communities of civilisation, the more do we come to feel that the office of the President of the United States is the most important of all in these modern and most anxious times.

* * *

Here in my fingers are two little tokens of a great occasion when an important chapter was being added to the history of the world; when, indeed, what was being done had, if it had been known at the time, some mighty consequence upon those tremendous events with which we are dealing now. One of them is a little silver thing with a buttonhole attachment, and it represents a strong-limbed beast crowned with a great mass of horns. It is the likeness of a bull moose, the fiery, powerful, and adventurous beast to which Mr Roosevelt, in one of his inspirations, by inference likened himself and his campaign. It fears little, and goes crashing through. The other token is a little claret-coloured button or favour with the name 'Wilson' across it in white letters. These, of course, were election favours, tokens of the candidates at the last presidential election, which was four years ago. I was in the United States at the time, and saw much of the delirium of this greatest of all national contests, saw the real fever to which the citizens work themselves on this great occasion, observed their efforts to see the issue and its values clearly through the frantic excitement to which they were submitted; looked on the marvellous organisation of the parties and their tremendous noisiness and energy (and saw faintly traces of what some people might call bribery and corruption), watched with amazement the most wonderful platform activities of their candidates, who would cross the States from New York to San Francisco, and make speeches at intervals all the way from the observation platforms of their railway trains; and special speeches at the overnight stopping-places. Here, indeed, was oratory in the flood. It was said once of a candidate that such were the demands upon him that he had three set speeches which hardly ever varied; and his black cook, who accompanied his party on these long and far-away expeditions, became so accustomed to hearing them that one night, when master was making his big speech in the leading public hall, the cook surreptitiously delivered it to a considerable black audience in another part of the city. The black rendering was a splendid success; and, whereas it had been customary, when this speech was delivered by its maker to small and very special audiences of cowboys on the prairie, for these cowboys

to signify their approval by firing their pistols in the air, the blacks who listened to the fervid eloquence the cook imparted to his stolen sentences were so much overjoyed that in their ecstasy they gave themselves up to the cakewalk. I saw something of this election in various places—at New York, Boston, Chicago, and the capital, Washington—and realised indeed that in its nature and effects it is certainly the biggest election on earth.

* * *

From first to last the processes of this election endure for little less than a year, and that election which seems now to reach its climax in this month of November will not, as it were, be finally consummated until 4th March of next year, when the President now elected will begin his term of office—or renew it—at the White House at Washington. The President of the United States, then, is elected every fourth year, this fourth, as it happens, being each leap year. It is decreed in the constitution that each state shall appoint, in such manner as its legislative body may direct, a number of electors equal to the whole number of senators and representatives to which it is entitled in the Congress, but no senator or representative, or person holding an office of trust or profit under the United States, may be appointed an elector. In practice, the electors allotted to the state are chosen by direct vote of the citizens on a general ticket. Then, according to the constitution, the Congress may select the time of choosing the electors, and the day on which they shall give their votes; but the day must be the same for all the states throughout the country. The electors are chosen in the various states on the Tuesday after the first Monday in November, and the presidential election is virtually decided at the same time; for the elections having been conducted, of course, on party lines, and those who are elected being definitely pledged to the support of certain candidates for the presidency, the ultimate result is obvious. Therefore, when this presidential electoral college is established by the votes of the citizens on the Tuesday after the first Monday in November, the fate of the presidency for the next four years is sealed, and we know who will be the next President. The electors, big with the responsibility of their trust, enjoy it for several weeks, and do not meet to give their votes at the respective state capitals until the second Monday in January next following their appointment. Even then there is some further delay, and the little secret, thin as it is, is not finally dissolved until the second Wednesday in February, when the votes of the electors are opened in the presence of both Houses of Congress. Then, indeed, the new President may be proclaimed at last, long as he may have been known; and, as we have said, on the 4th of March he ascends to the formal

possession of his office. It is decreed by the constitution that no person except a natural-born citizen or a citizen of the United States at the time of the adoption of the constitution (long since dead are they all, of course) shall be eligible for the office, nor any person who shall not be so much as thirty-five years old, and have been for fourteen years a resident in the United States. The President of the United States, by virtue of his office, is commander-in-chief of the army and navy, and of the militia in the service of the Union. He enjoys an annual salary of seventy-five thousand dollars, with an additional allowance of twenty-five thousand dollars for travelling expenses. That makes a hundred thousand dollars in all, or the equivalent of about twenty thousand pounds. He has heavy expenses, but the allowance may be sufficient. It is less than is paid to monarchs, but it is a more handsome sum than the servants of republics get generally for even the most distinguished services. Yet, it may be mentioned, the President of the other of what we may call the two first-class republics of the world, that of France, receives six hundred thousand francs for general allowance, and a like sum for his expenses, meaning twenty-four thousand pounds in each case, or forty-eight thousand in all. But then France has great traditions, monarchical as well as others. Though these things are mentioned in passing, it is, of course, beyond question that, soaringly ambitious as they are, and should be, covetous of honour and undying fame, the Presidents of such republics as these must necessarily belong to a high order of great men; they must first of all be patriots, and seek only for the betterment of their country, with such sacrifice of self as may be demanded.

* * *

If you look through the list of the American Presidents from the beginning, only a little more than a score of names being on it, you will realise on a short contemplation the greatness of the office and the greatness of many of the men. There is George Washington at the head; and in the history of modern times there is no man who had a finer sense of right and wrong, of justice and liberty; none with a character of greater strength for determination and action, or of sweeter human simplicity in its general relations toward mankind. Indeed, George Washington was not only a patriot most superb, but he was a great man in his fine humaneness, fulfilling splendidly the condition of loftiness in a man that in his full maturity and power he should retain the meekness and the tender feelings of the little child. Do you remember that George Washington might perhaps have prevented the Republic from ever being established, and might himself have become King of America? That seems an odd idea to us—King of America! But at the time of the War of Independence,

when organisation, management, and even energy and sincerity were by no means what they should have been among the political leaders of the new state that was coming into being, there was deep discontent in the army with the politicians at headquarters. The army was badly cared for; it had many just grievances; and in those times of upheaval it was disinclined to bear them beyond a point. In General Washington, who led it, the army had the greatest confidence; it revered him, loved him, as one might say, and trusted him. And at the height of the discontent the officers wrote a letter to Washington in which they appealed to him to take the sovereignty of the new state. His answer, if it seems sometimes a little overlong, too protesting, was a splendid thing. He rebuked them severely, asked what in him had ever given them encouragement to believe he could for a moment permit himself such an ambition, and pointedly said that the matter should pass from his mind and be forgotten if he were given no cause to remember it. That appeal of the officers out campaigning with Washington for freedom was a great moment in the history of the world; though, had America at that stage chosen a king—which is difficult to realise—it is certain that she would soon have reverted to republicanism. In that gallery of famous Presidents there is fifth on the list James Monroe, who laid down the famous principle, or doctrine, as it has come to be called, which, reduced to the simplest language and most essential meaning, declared that America, north and south, was a New World to itself, that it did not wish to interfere unduly with the old one, and that it would not permit the old one to interfere with it; the United States, as being the principal state of the hemisphere, letting it be understood that, carrying this principle through, she would not view with indifference European interference with any of the other states. That is a broad rendering of the famous principle that seems now about to be shaken more utterly than ever before. The New World can remain in no sort of political independence any more. But after Washington—and only after him in the sense of time—Abraham Lincoln was the greatest of Presidents, and he took the States through a terrible trial in its history. Unless you wander in America, and come close to the sentiments of the thinking people, you do not realise how finely is the name of this great man revered, and how he again was great in governing and in the strength of man, and gentle to the full possibility of human kindness. Wherever you would expect to find an emblem of great America you will see a portrait of Abraham Lincoln. I have a good remembrance of a large portrait that hangs on the walls of the secretarial offices of the Board of Trade at Chicago—the institution that embraces the famous wheat-pit, and which in a considerable sense may be said to stand for the very heart of productive

and commercial America—and of the sincere and quite unconscious reverence with which Secretary Merrill, as he looked upon it, pressed upon me some of the points of the greatness of that man.

* * *

Some may think and say of Mr Woodrow Wilson, who seeks that now rare distinction of being President for a second term, that he appears thinly among the great Presidents of his country. They think that he is weak of will, timid, liable too much to procrastination, faint-hearted in the prosecution of ideals, too materialistic, and so forth, and that in his hands the reputation of America has suffered. They think of his many Notes to our enemies, of his fine speeches and slight performance, and of that ill-judged declaration which will certainly stick to his name for long after the present time—that there is such a thing as being too proud to fight. But it is very easy for belligerents to fail to comprehend what measure of right and justice there is in the standpoint of neutrals, especially such a neutral as the United States. We here are in flaming Europe setting to right the most hellish wrongs that have ever been perpetrated, and saving the world for civilisation and right and good and human happiness, and we are saving it for America at least as much as for ourselves. We know that this is so; it does not admit of any argument; and the situation with the United States standing across the sea with its arms folded, drawing only new wealth from our dripping blood, is aggravating to the uttermost. But if he who contemplates were on the other side of the Atlantic, whither he had gone long ago to escape from the wrongs and shackles of what may be called the European system, hating such remnants of feudalism as still remain—more than remnants, as they are, in some places—and above all hated the thought of the war for which for generations past the whole of Europe has obviously been preparing, would he then inevitably feel when the dreaded thing occurred that he must go back to it as a full participator? One does but ask the question to suggest the possible feeling and point of view of much of America, and not by any means to suggest an answer for ourselves. We here are not in America, and we are too apt to think of the United States still as a nation of pure British descent instead of a conglomeration of nations slowly blending, with much of the blood of our enemies in the mixture. I, who know the Americans well, and have bided with them in their American homes, know surely that in heart they are with us in this fight; they long for our victory, and they will rejoice with us in it. We find in America that sometimes they shout for American intervention, and themselves chide their President for his pusillanimity. But the Americans, for all their materialism, are an

emotional and a sentimental people, and it is the great business of statesmen to be above and beyond emotion and sentiment; and certainly the United States does not want to be in this war. Rightly or wrongly—let us leave it at that—Mr Wilson has considered it his duty to keep his country out of it if he can; and, though he has played too much with Notes, he has accomplished a task of almost superhuman difficulty with great skill. Nor is it a weak man who has gone through with his policy while facing the obloquy of the world and his own people as he has done. He is not a weak man, but yet he is not like Roosevelt, or Lincoln, or Washington either. He is dry, cold. In him there is none of that human sweetness which we have found in other men greater than he is, and of greater achievement. Meanwhile it is a deeply interesting election.

Mr Justice Hughes, the opponent of Mr Wilson, is a man of the academic temperament like himself, one who stands aloof from the great political machine, one who has no pretensions to being a public man of the old kind, or a mere politician. He is instead a scholar and a man of keen reason and intelligence. So the issue in the great election is hardly between politicians as we know politicians, but between two men who are more independent of politics as they are generally understood. Now is not that a very remarkable thing? It is the first time it has occurred anywhere, and it seems to be a sign of the times for other countries as well as America. We need a new style of leader; we have had too much of politics. And, for the last, they say in the United States that for Mr Hughes, a man of fine qualities, there is nobody—but the people.

PINCHER MARTIN, O.D.

CHAPTER XV.—*continued.*

HARGREAVES was no fool, and, being fully aware that idleness only breeds discontent and bickering, took very good care to keep his prisoners busy. They were not treated with undue severity, and received exactly the same food as their captors; but they experienced for the first time the rigours of British naval discipline. All day long they were kept hard at work in scrubbing and scraping the *Anna* to a state of hitherto undreamt-of cleanliness; while at night all of them—except the cook and the man on watch in the engine and boiler room, who perforce had to be allowed a certain amount of liberty, but were kept under constant supervision—slept in the stuffy little fore-castle, with an armed sentry standing guard at the door.

Nothing on earth would induce the bluejackets to poke their noses inside the place, much less to inhabit it. They preferred to snatch what sleep they could under the stars; for, though—thanks to the energy instilled into the unwilling Germans—the fore-castle had been scrubbed far cleaner than it had ever been before, its cleanliness was merely superficial, and it was still well infested with 'hanimals,' as Billings called them.

'Them bugs is pisenous German bugs,' he had remarked, wrinkling his nose in disgust. 'Maybe them 'Uns is used ter 'em. I ain't, an' I'll watch it I don't go ter sleep in a place wi' wild hinsects a-suckin' o' me blood. It ain't fit an' proper, an' I sleeps on deck.'

Incidentally, it was the cook who gave Hargreaves one of the finest frights of his life. At midnight on the night they had come on board, the sub., leaving Billings in charge as officer of the watch, with orders to steer west and to call him at once if anything happened, retired to rest in a small compartment under the wheelhouse

which had evidently been used as a charthouse, cabin, and storeroom all rolled into one. It was innocent of insects other than cockroaches, and had a cushioned locker at one side; while the rest of the space was filled with nets, cordage, canvas, paint, oil, and a quantity of food. Dependent from hooks in the ceiling were several dried fish, two bloated sausages, and a large raw ham. The place was stuffy and odorous; but Hargreaves was tired, and so, swathed in a blanket, he soon settled off to sleep on the locker, with the door wide open.

Towards two in the morning some slight sound caused him to wake up with a start, and on opening his eyes his blood nearly froze in his veins. There, in the door, clearly silhouetted against the flood of moonlight beyond, was the dark figure of a man peering into the room in an attitude of rapt, listening attention. He was the German cook, from the shape of his bullet-head, and in one hand he held a murderous-looking knife with a long and glittering blade. He could only be there for one purpose, and his knife could only be intended for Hargreaves's throat.

The sub.'s first impulse was to shout for help, for an armed sentry should have been on the deck outside. Then he scouted the idea as impracticable, for the man would be upon him the instant he raised his voice; so he lay still, hardly daring to breathe. Then, with a feeling of great relief, he suddenly remembered the loaded automatic pistol under his pillow. He withdrew it softly, cocked the hammer without making a sound, and then, with the weapon poised, his finger on the trigger, and his nerves tingling, made up his mind to fire on the first sign of aggression.

The cook, treading stealthily, entered the room and looked round to the right and left. He next came towards the locker on which the sub. lay, and seemed to be examining the ceiling intently. Then he raised his knife for the blow.

The muzzle of the pistol went up and followed his every movement, but an instant later the sub. dropped the weapon with a chuckle of amusement. . . . The German was busily cutting a couple of inches off a particularly succulent sausage hanging from its hook.

When Hargreaves laughed his visitor dropped the knife with a chatter, and leapt from the room like a rabbit. The sub.'s mirth overcame him completely.

'Is everything orl right, sir?' queried the anxious voice of Pincher Martin, who had been just outside the door the whole time.

'Yes,' spluttered the officer; 'there's nothing the m-matter.'

'Beg pardon, sir; only th' cook jumped art o' this 'ere door as if 'e'd see'd a ghost, sir. 'E seems a bit scared like.'

He was, poor man, badly scared, nearly as frightened as the sub. himself had been a few moments before; but he never quite realised how very near death the cravings of his stomach had led him. After all, no ordinary person is in the habit of making a hearty meal off a pungent, onion-flavoured sausage at two o'clock in the morning! All's well that ends well, but cookie escaped sudden death by the skin of his teeth.

Hargreaves never suffered his discipline to relax, and all through the second day of the passage the work of cleaning the ship went on. Even the German skipper, a very fat person, was pressed into service, and, since nothing else could be found for him to do, he volunteered to spend the morning in scrubbing out the wheel-house.

'I hope onter-see 'boot com' an' tak' us all back to Germany!' he remarked feelingly in very bad English after half-an-hour's hard work on his hands and knees.

'If one does I'm afraid you won't get there,' retorted the hard-hearted sub-lieutenant with a wicked twinkle in his eye. 'If we sight a German submarine all the prisoners will be thrown overboard in life-belts, so that she'll have to stop to pick you up. Then, while she's doing it, I shall ram her at full speed.'

The German believed him implicitly. The brutal British were capable of anything. 'Ach!' he exclaimed, sitting up on his haunches and wiping the drops of perspiration from a very scared face, 'dey vill nod pick us op. 'Ve shall be drown!'

'But surely your own countrymen won't stand by and see that happen?' said Hargreaves with pleasant curiosity.

'I do not know. Bot efen ef dem pick us op, you dry do sink der onter-see boot, so ve

drown anyhow's! I haf wife an' childrens, capitan,' he added agitatedly; 'many childrens. Von, do, dree, four, fif, six childrens. I doo old do fight. Ach!' he suggested with an oily smile, 'you safe me an' drown de ozzers. Dey not marriet. Dey not care!'

The sub. shook his head. 'I'm sorry,' he said; 'war is a very terrible thing.'

'I hope ve do not see onter-see 'boot!' murmured the other. 'Ach!' he nodded, noticing Hargreaves's grinning face; 'you choke, as et nod?'

'I beg your pardon?'

'You make fon, hey? You no drown der prisoners?'

'Depends upon how you behave yourselves,' came the non-committal reply.

The skipper fell to with redoubled energy.

The weather was fine and the sea calm, but the *Anna's* engines and boiler were long past their early youth, and they had steamed across the North Sea at a speed of barely seven knots. It was a heart-rending performance; and though Coggins, the stoker petty officer, exhorted the German firemen to shovel coal on the furnace until he was purple with passion and they were limp with weariness, the steam pressure to the engines dropped and dropped.

Shortly after noon on the second day, by which time they were on the Dogger Bank, with not a vestige of another vessel in sight—there is not much fishing done in war-time—the climax came. It was not exactly due to the boiler, though the propeller had been revolving more and more slowly; but all of a sudden there came a peculiar grinding sound from the engine-room, and the screw refused duty altogether.

A moment or two later Coggins, breathless and blasphemous, appeared at the top of the hatch. 'It's no good, sir,' he wailed; 'it's no — good. I've done me best to tinker up they damned henges to get 'em to 'eave round, but now the metal's bin and run in the cross-head, and they won't 'eave round no more.'

'Is there nothing we can do to it?' queried the sub.

'I ain't seen nothin' aboard we can patch 'im up with, sir. Them henges—them — henges—ain't fit to crack nuts, let alone be aboard a ship!'

The sub. bit his lip, for there they were, well out of sight of land, the ship helpless, and nothing in sight. But he had been trained as an engineer himself, and was better at the job than some people imagined.

'I'll come and have a look at it,' he announced. 'We must do something. I can't sail the damned ship home, and there's nobody here to tow us!'

Eventually, after three hours' hard labour, they succeeded in repairing the damage with a piece of sheet-brass filched from somewhere else. It is doubtful if any fully qualified engineer

would have passed the repair as either safe or satisfactory; but by the time they had finished, and were black, bad-tempered, and greasy, the engines were persuaded to produce the revolutions for four knots without running very hot. Even four knots was better than drifting aimlessly about the sea with the prospect of being bagged by a submarine or dying of thirst and starvation.

The next thing which refused duty was the boiler itself. It gave out at eight o'clock the same evening, and once more Coggins, looking more like a demon from the nethermost pit than a respectable stoker petty officer of his Majesty's Navy, a ribid teetotaler, a strict chapel-goer, and the father of four children who attended Sunday school regularly, arrived on deck in a state of incoherent vituperation.

'And what's the matter now?' Hargreaves inquired.

'The biler, sir. 'E ain't bin cleaned for eight months, them Germans says. The uptake and toobes is all sooted up, and we can't get no steam to the hengines no'ow!'

The sub. sighed. 'How long's it going to take to clean it?'

'Bout six or seven hours, sir.'

'Well, carry on with it at once.'

In ordinary circumstances a boiler is cleaned when it is stone-cold and the fires are drawn;

but Coggins, in some miraculous manner unknown to any one save himself and his victims, goaded the Germans into such a state of frenzied activity that they swept the tubes and uptakes in five hours. They did it with the fires damped down but still alight, and what they suffered from the heat only they themselves knew. But the job was done somehow, the firemen were revived with neat navy rum, and by one o'clock the next morning the *Anna Schröder* resumed her journey at the exasperating speed of 3.75 knots.

They eventually arrived in a certain harbour late the same evening without further mishap; and Hargreaves, after seeing the prize and the prisoners turned over to the responsible authorities, and his own men comfortably housed and fed in the Sailors' Home, retired to an hotel, ate a hearty meal, had a hot bath well impregnated with Jeyes's Fluid, borrowed a suit of pyjamas, a razor, and a new toothbrush from the manager, and then turned in and slept for nearly twelve hours.

Little more remains to be told, for the next morning they left by train to rejoin their ship, taking with them sundry mementoes from the prize. They have passed through many vicissitudes since, but neither the sub. nor his men will ever forget the *Anna Schröder*.

(Continued on page 776.)

INLAND BIRD-LIFE IN EARLY AUTUMN.

AUTUMN has been well described by Keats as the 'season of mists and mellow fruitfulness,' and even before the mists of October fill the valleys one realises that a new phase of bird-life has begun. To those who live on the low ground the sudden appearance of numbers of missel-thrushes which have passed the summer on the higher ground is one of the first signs that summer is drawing to an end. The ring-ouzel also descends from the high ground before crossing the sea, whilst curlew and golden plover are to be seen passing, probably on their journeys to the coast. At this season the lapwings congregate in large numbers, and golden plovers are often to be seen mingling with them. Wagtails, though seldom gathering into actual flocks, abound on grass-lands and by the margins of rivers, streams, and pools. In stubble-field and hedgerow chaffinches are numerous, whilst the kestrel may often be seen hovering overhead.

A special feature of bird-life in autumn is the tendency to congregate in parties. Starlings pack together, and often roost in surprising multitudes where reed-beds or shrubberies afford suitable shelter. The wild duck may be seen on their evening flight in parties which often assume the well-known V-shaped formation.

Books and daws, gregarious at all seasons, gather in autumn into very large flocks; whilst the daws and starlings may sometimes be seen assembled in one field.

The arrival of the foreign woodcock generally begins late in September or early in October, when it is probable that the far smaller numbers which have bred in England and Scotland move off to the south or west.

With the advent of autumn nursery cares and duties have come to an end, and the period of moulting is over; consequently a bird's vitality is keen and joyous, and there is a renewed miniature burst of song, which is especially noticeable in the case of the robin and the wren. The song-thrush, too, sometimes sings in the autumn months, the blackbird seldom or never.

The tits are seen in every acrobatic posture, whilst redpoles twitter as they pass overhead; and so far the food-supply is as good as in early summer. Peace and plenty reign in the bird-world during the month of September.

The great migration has yet to be faced by many of our birds; but swifts, sandpipers, and flycatchers have already winged their way to the far South. Towards the end of September or early October the swallows will leave our

shores, and a host of our summer migrants are either going or gone.

October is probably the month which sees the largest part of migration, especially for depar-

tures. Once November is here bird-life turns to its winter phase.

How swiftly have the hours run by amid *les plaisirs d'automne, plaisirs qui passent si vite!*

A HUNTING BEWITCHED.

A STORY OF THE WILD.

By F. ST. MARS.

IT has been said that everything in the world likes rain except the spider; but that is not liking wet.

The rain came down with a set and steady melancholy swish that is only possible in these north-western isles. The cart-ruts beside the fields were full, and shone like long lines of steel. The grass looked a different colour from usual, as if Nature had sponged it. The trees were peculiarly black and glistening. The dead leaves, many of them, along the hedge became brilliant blotches of yellow-ochre, which they had not been on the dry yesterday. There was no horizon. Nothing doing. Silence, but for the rain's eternal swish, and once the thin *wheet-wheet* of a wet meadow-pipit. Nobody about, save for one black rook tacking and beating up slowly against the wind.

Then there was swift, furious action, and the whole scene became suddenly wildly alive, proving that because creatures had not been on view it did not follow that no creatures were there. First came a winking flash of white, and a rabbit went down the hedge-ditch, splashing and pell-mell. Another flash, and a second bunny had dived through the hedge, and was straight away like a hunted fox on the far side. Another, and two rabbits popped up from nowhere special, and, shooting apart as if each suspected the other of carrying the plague, merged into the landscape. An unsuspected wren, somewhere in the mysterious maze of the hedge, all at once set up a steady worrying *tttrrr*. The voice of a blackbird suddenly began shouting from nowhere special, *twet-twet-tet-tet, twet-twet*; and a till then invisible blue-tit at that instant let out a running fire of pin-point curses. A wood-pigeon burst upwards with a far-reaching *clap-clap-clap-clap* of wings; and a cock pheasant, with his neck stretched to the uttermost, raced away through the wet grass like a frightened fowl.

And out of the hedge-bank, down it, into the water, over and over and over, rolled two very small beasts, or one bigger white-and-brown beast, or several. But there, it was impossible to say which, or what, they were, or what they were at. It was either one beast in agony or some beasts fighting like electrified devils.

The blackbird nearly went off his jet head

with excitement. The stump-tailed wren almost 'bu'st.' The blue-tit hung and yelled upside-down; and half-a-dozen other birds, that seemed to have been evolved by spontaneous generation on the spur of the moment—two wine-red chaffinch cocks, a rusty-red robin, a low-browed tree-sparrow (in nowise to be confounded with a house-sparrow or a hedge-sparrow), a hen blackbird in worn-out black, and a gaudy stone-chat—collected to see the thrill, or revile the thrill or thrillers, or both.

One particle of a second's pause revealed the fact to the human eye that there were two beasts fighting in the water at the bottom of the ditch, and that they both had their lives for sale. The next found them apart, and one quite visibly hopping about in the wet after the other; but the other? Oh say, have you ever seen sheet-lightning play in a summer sky, or a silvery trout hunted by a pike? It was like those. Also, it was quite indescribable really—the quickest thing in animate movement you ever saw, darting from side to side of the ditch in one flickering streak, and then nowhere. It had gone, snapped off, flashed out, shot into spookland—what you will; but, anyway, was gone. And the other beast was standing up to his belly in wet, mired from head to heel, and bleeding badly from the back of the neck, looking for it. That beast was a rat—one of those gaunt, raking, great, mangy old calamities on four legs that you seldom see, but often, especially from the henwife, hear about.

'It,' however, was calmly licking a torn and crimson flank twenty yards away in the other hedge across the other corner of the field; and how on earth it had got there in the second or so intervening between then and its evaporation from the ditch I know not. It was there, anyway, and, in being there, revealed itself as a weasel. What! just a common or garden weasel, after all? Oh no. Oh dear me, no. There was nothing common about that weasel—the *Mustela vulgaris*—nothing common at all, at all. Mind, I grant you he had a body quite ten and a half inches long, counting the two-and-half-inch tail, and huge ears quite five-eighths of an inch long; and I'll allow that from the tip of his nose to his ear was well under two inches, and that he turned the scale at the

enormous weight of five ounces three drams; but—well, he was white, white as driven snow from tip of nose almost to tip of tail; and not white in winter only, as you know weasels and stoats too sometimes turn, and become ermine in addition to vermin; but really white, white in summer as well as in winter. In short, he 'just grewed like that,' and if you needed any proof you would have seen that, when he turned and glanced out into the field, the eyes of him—the little, wicked, cruel, insolent, brazen, sharp eyes—were pink, which is a hall-mark of unfadable white all the wild over.

He had been amusing himself on this dull, wet afternoon in bolting rabbits from their burrows, when the old accident of a rat got in the way, and, considering himself a match for any weasel—as indeed he may have been for aught I know—refused to get out of it. Five minutes later that weasel, a ghastly red sight in the light of day—for brother rat chops with his teeth wolf-fashion, you know—climbed the hedge slowly, till he came upon a wren's deserted nest.

He was too much occupied with stopping to lick the blood clear of his carmine-soaked flank every foot or two to notice a small body of a nondescript brown, and a long thin tail, that sneaked out of the nest and silently round it to the other side. And when he had crawled in, and curled himself up, he did not see that small figure, possibly thanking Heaven for the luckiest squeak it ever had in its life, go sneaking away from the nest with equal silence, and on tiptoe, as it were, down the hedge. It was a wood-mouse, and it had been curled up asleep in that deserted wren's nest when the clamour of the birds awoke it.

The weasel was soon asleep, with the beautiful ease of a wild creature, and it was full night when he awoke. A pale moon was playing hide-and-seek in and out among swiftly gliding clouds, and the world gleamed wet and cold beneath. And out into that world of pale light and dark shadows he was going—must go, in fact, for hunger drove him.

He got up and stretched. A bird's deserted nest, by the way, is as comfortable a home as any other, more comfortable than many. His flank was stiff, and he chattered a little angrily under his breath as he felt the pain of it; but he was a weasel, and about as full of pluck as you could cram into eight inches of nickel-steel muscle and iron-hard constitution. Moreover, he hoped that the bite of the rat, which is the unclean one of the wild, and whose touch is pollution, would not poison and kill him, as it often does.

Then he stepped out, half-way out, and—'froze.' Make no mistake about this, for very few stones move less than he moved during the next minute. 'Freezing' is an art; no mere

man, and not every beast, can master it. In the weasel it was a fine art.

Below him, standing beside the hedge, and looking upward, not quite at him, and so close that the weasel could have jumped into his face, was a *man*! What was he doing there at that hour, anyway? Looking for roosting pheasants outlined against the moon, perhaps. Slowly his head turned, till, with the light full on his white features and staring eyes, he was looking straight at the weasel.

But the man had only begun to move his arm when the little weasel flashed to action on the instant, or before it. Fact—who hates to be ignored—said that he jumped nimbly down from twig to twig; but how tame! The eye said that, though visible, he went from sight through sheer rapidity of movement; that, in fact, he became a blur merely, like the spokes of a spun wheel, and that the man's stick, suddenly striking and furiously slashing and hitting, was at least a foot behind him every time.

The weasel reached the ground under a little shower of falling twigs, and vanished instantly into a side-entrance to one of those apparently public underground tunnels which run the length of almost every hedge.

He met first a shrew, who promptly, if I may be pardoned for saying so, stank the place out and fled; next an 'all-black' water-shrew—they are black on top and white below usually—who did likewise, and took to the half-filled ditch outside, *via* a side-tunnel; next a wood-mouse, with a very long tail, who also quitted up a side-tunnel, and climbed thence up the hedge, out on to such slender twigs that even the weasel could not follow, though he tried to, and hung, upside-down, like a salmon on a trout-rod; next a field-vole—or mouse, if you like—with a very short tail, who evaporated out into the field and a maze of field-vole burrows, where it would be hopeless to follow him; and, finally, a house-mouse—I don't know what it was doing *there*—who would certainly have become a meal for the weasel if it had not raced blindly into the open and become a meal for a long-eared owl, whose mewling cry our weasel heard only just in time, and turned.

After that the tunnel became empty of all save himself and a beetle, which he ate. I imagine that the sight of a weird white ghost galloping through the dark was too much for their nerves, and that that underground promenade became unfashionable among the little folk for some time.

Therefore he came out into the open again; but soft mewings in a tree above, and bitter knowledge born of hectic experience, telling him that it did not need the eyes of that long-eared owl, who evidently had not yet gone away, to pick *him* out on a night like this, forced him underground again into a rabbit 'bury.' To judge by

the noises, the rumblings, thumpings, drumming, and hollow knocking that could be distinctly heard from the outside, he and his ghostly coat had started a young volcano on his own account down there. But what had really happened, I fancy, was that the sight of that white little pocket-fiend dancing through their tunnels had sent the rabbits frantic, and that in their efforts to get out there had been some shocking scrambles. Be that as it may, several rabbits had bolted into the moonlight and the shadows, when two old buck rabbits popped from opposite holes and apparently collided. They both shot up in the air, and dropped again. One went away in a dazed and blundering sort of fashion; the other remained, with a dislocated neck.

A minute later the weasel, driving a young rat—who had no business in that place, anyway—before him, appeared, and standing up on his hindlegs—he used his tail as the third leg of a tripod—to get a better view, saw or smelt the dying rabbit, and galloped toward him. There was no need for a second shot, so to speak; the quarry was dying cleanly where he lay; but the weasel, who is pretty much of a sportsman as a general rule, drove his keen little canines in just behind bunny's ears and a fraction on one side, and bunny was quite dead before you could say 'knife.'

That was clear enough. What followed was not.

There was a rustle in the grass behind, and something hit the weasel from the rear such a blow that he flew clean off his legs and landed in a heap on his side, with all the wind knocked out of him. There had been no warning sufficient for him to get out of the way. Moreover, nobody said anything, or was saying anything now for the matter of that. There was just the silence, and the inky shadows, and the wet glare where the moon shone, and a patter of drips where the breeze blew the wet from the branches.

Very slowly the weasel picked himself up, shook the wet from his pale coat, and sneezed audibly several times. He was a bit groggy on his feet at first, and stared about rather blankly.

The wind blew from the weasel to the dead rabbit. The weasel's nose told him nothing, his eyes told him nothing, and his ears told him less than nothing. All seemed clear and above-board; but—but—well, the bruise that was beginning to come up in the 'small' of his back didn't make itself; something must have made it. What?

At last he began to move forward gingerly, and with that caution which comes with a stiffening lacerated flank and a badly bruised back. At least, he took exactly two and a half strides. The other half-stride he did not take—not then, anyway—but remained with his right forepaw suspended, staring as one who has seen a ghost.

He had not done that, of course; he had seen his wife, and that same was a giantess at least eight and a half inches long, and turning the scale at quite one ounce nine drams. She, this vast-pocket monster, without possibly seeing him, was cautiously stalking the dead rabbit. At any rate, that was what he thought till he looked at the dead rabbit. It was still there, for, though he could not see it exactly in the piebald light, he could see its white belly-fur as it lay turned upward.

But that was not the point. The point was that which stood over the rabbit, a shape dark, motionless, silent—unmistakably another rabbit. It was that precise and particular buck rabbit which had collided with the first and broken the latter's neck, and had gone off himself, stumbling.

We can merely presume that the collision with his compatriot and rival did something, or something else, to the strange brain of this buck rabbit, checked the sense of direction, made him lose his memory, caused him to be reckless beyond the wildest recklessness of his kind, forced him, for some blind reason we can not understand, to return to where the collision had taken place, or drove him to run in circles, if he did run at all. Anyway, it seemed to have eliminated, by some strange freak of the nature of the accident—perhaps it was a clot of blood forming on the brain—that one most marked weakness of the rabbit folk—fear. I know not, but I have seen a wounded hare act in even a stranger fashion.

Be all these things as they may, there was the dead bunny, there br'er rabbit squatting over him, and there, unaware of her husband's presence, was Madam Weasel, and, equally without doubt, it was this second rabbit that had come up behind friend weasel and kicked him, punched him into the middle of next week.

The white weasel laid himself out as flat as he possibly could, and that, as you can imagine, was snake-flat, and in this position moved forward. He was not one to be hit in the back for nothing, I can assure you.

The female weasel advanced quite openly, but, being ordinary mahogany-brown, was very hard to see, and her size, or lack of it, did not make her easier to behold.

The live rabbit never moved, just sat there, looking blankly into space, as rabbits do. The dead rabbit, of course, did not move. And it was a weird scene, all dappled and blotched with the shifting, restless, treacherous moonlight upon the glistening wet grass in the damp, cold stillness. It was as if, not the beasts themselves, but ghosts of the same, had chosen that moment to act some terrible drama there.

Nearer and nearer closed in the weasels, the white and the brown, moving in at right angles, till they were, so the female guessed, near enough for the rush. The white weasel

didn't rush; he lay low still, and watched his wife. He saw her gallop forward, a wavy, thin streak, a something, a line drawn across the moonshine. He saw the buck rabbit start up when she touched him, as one who awakens from a dream, and shoot away as if the touch had pressed some invisible spring. Just touch and—gone!

Then she turned—with an air that said plainly, 'And that is the end of him'—to the dead rabbit, and must have at once smelt where her mate had been before her, for she instantly became greatly excited, and stood up on her tail to look round, as if trying to see him.

She did not see him, for he was lying as flat as a rolled ribbon, possibly jerked into an unnatural caution by the blow on his back and the pain in his flank. But he saw her, and something else behind her.

Like some lost wraith, and as quietly, the form of the buck rabbit slowly, mystically, grew like a smoke-puff out of the dark and shadowy surroundings, moving slowly, very slowly, and as silently as a spook, back to the spot whence he had started. Doubtless he had run in a circle. The moon, as she moved, shone upon his eyes, and they were blank and staring, and as meaningless as ever. Heaven knows what lay in the injured brain at the back of those eyes!

On he came, straight, slow, unswerving, and silent, till he stopped, almost with a jerk of sudden surprise, right at the back of the female weasel, a large bulk beside her, overshadowing her, and if the wind had only been the other way she must have smelt him.

She was still looking for her mate—making of herself a sort of lookout tower, since from her position, on all-fours, her vision would have been too circumscribed—when the blow landed. The rabbit hit out straight from the shoulder, somewhat like a boxer, *bat-bat*, and the tiny weasel sailed quite her own length through the air before she landed. This she did beautifully on her back, rebounded, and whipped round, in a position of instant readiness to fight or fly that was amazing—all in the snap of a finger, mark you.

But her mate was not looking. He was creeping on again with that infinitely minute care in the stalk which the wild folk alone can accomplish. As wild folks go, he was not a patient creature, but he was very much more patient than a man.

And then, without a hint of a warning, without sound, without hesitation, he delivered his ultimatum. It was a marvellous exhibition of swift movement. He just ceased to be in the place where he had been, and was on the back of the buck rabbit. He may have got there by leaping, by galloping his sidelong gallop, by a quick rush; no one could tell. He was there, that's all, and his mate ran in to help him to finish

the job. But they both reckoned without their host.

The touch of the weasel seemed to have again set instantly into action some galvanic battery or something within that buck rabbit, as before. He shot forward, as if fired from a trench mortar, at goodness alone knows what speed. He met the female weasel half-way, and never checked, and she went over backward. When she picked herself up, which she did by rolling over once and straight up on to her feet, she must have wondered what had happened. When she viewed the scene that spread before her she must have wondered still more.

The rabbit had not gone. He was still there, going round and round and round, like a runaway merry-go-round, at stupefying speed, in a circle about three yards across.

The male weasel had hung on for a space, his hindlegs and tail flying gaily and on their own in the air. Then a briar had caught and touched up his wounded flank, and he had dropped off, chattering obscenely. A couple of seconds later the rabbit stopped too, halted dead in his stride, and as instantly sat crouching, staring, as before, a mad enigma in the moonlight.

The white weasel left off chattering, and again launched an ultimatum. He got as far as the rabbit's hindleg before the rabbit again shot into wild, circling life. He hung there, and cannoned against his wife, knocking her sideways, while the rabbit tore round in his circle twice. Then the fur of the rabbit gave way and the weasel went rolling into the bushes. The rabbit stopped, and fell into his hunched crouch of blank meditation. This was awful! impossible!! a thing never heard of! What, in whiskers, was to be done with this rabbit who had gone crazed and lost the sense of fear and direction?

Finally, the rabbit, with a quick scurry, got back to his dead companion, and stayed there, looking, so it seemed, into the next world; certainly not into this.

The white weasel sat down to lick his flank. The brown one hopped into the air and returned upon herself. I think it was her way of showing off her temper.

Presently they began again, closing in. But you would not have noticed it. Apparently the last thing in the world they were thinking of was opening hostilities afresh. Now and again they whisked out of sight among the undergrowth and the shadows of the trees and bushes. Hard it was to spot them when they were in sight, harder still to guess what they were doing when not. Now the female would appear in an anemic moon-bar, scenting the grass; now the male in a patchwork of beams, licking his flank; now a long, low, dark form crossing a sword of light stabbed down through the branches; now a white one, sudden and ghost-like, on end and at gaze. Sometimes they even played, for your weasel is ever young. But the net result, though

unnoticeable, by this very method, could be measured; they were nearer the rabbit at the end of the next fifteen minutes than they were at the beginning of it. That was the object in view.

Their attack was wonderful in its suddenness, in its unexpectedness, in its quickness. Of course, there was no warning; nothing but a swift rustle from either side, no more, through the inky shadows, and they were beside the rabbit.

But, hey! the rabbit was gone. No, he was sitting hunched a yard away. No, he was tearing round and round like an emancipated catherine-wheel, and anybody who got in his way must look out for himself. No, he was motionless again beside his dead friend, or rival, or both. No, he was—— Now, where the dickens was he? Gone! Gone away straight as a well-aimed arrow, and the sodden leaves whispered, gradually to fading-point, under his flying pads.

As for the weasels, who had performed every other kind of acrobatic feat known in the last minute, in the endeavour to get, *and keep*—they did get—hold of him, they could go look for him if they liked. And they did like.

Ah, but it was a strange hunting, that which the cynical, cruel moon saw in streaks, as it were. First, a mad rabbit going like the wind, and almost as straight; next, a tiny, tiny weasel, running about here and there with nose down, then racing on, to pause and dart hither and yon again, to dart on once more straight again, followed by a white and black-red weasel, whose pink eyes shone strangely in his flat, wedge-shaped head as the moon caught them, doing exactly the same thing; and next, why—well—here was our rabbit again, coming round in his flying circle at racing speed till he passed them and went on.

That, you will believe, was enough to confuse any hunters stiff; but it didn't confuse the weasels. They scarcely looked up even; but, having once set their keen, cruel little noses to the trail, never left it, and, so it seemed, never would. The joy, it appeared, was in the hunting, not in the completion of the chase. So you will see hounds hunt, and ants.

By all seeming, that lunatic pursuit bid fair

to keep up indefinitely all night; but it was not so. Even a mad rabbit, or one temporarily or permanently off his balance, cannot run for ever, and the weasels, it appeared, could. At least, they never once left off doing so.

Finally, they—it was the male who, being the taller, by making a watch-tower of himself upright on his tail, got the first view—came upon bunny, looming large and strange in the mist, close to the hedge. They went in at him quick and quiet from opposite sides, and—he jumped into the hedge. I mean literally into it, and started climbing up that hedge. What's that? Yes, a rabbit climbing up a hedge is right. He got about four feet up, mostly by leaps, the weasels, miles too excited now to have left off if an army corps had come to watch them, joyously after him; and there he stuck. At least, he didn't go any farther up, but he went every other way, and the manner of his doing it was fearful. His struggles and his kicks, his writhings, buckings, plungings, leapings, buttings, were awful to behold. It was the frenzy that comes to no merely sane beast, even in death; and how on earth he did not break his head, or every limb or every bone in his body, a dozen times is to be explained only by explaining that law which looks after the mentally afflicted, the drunk, and the very young.

The weasels, at any rate, had a bad time enough. The white weasel leapt for the neck-hold, and got a hedge-stump in the jaw; the female got her hold, and the wind nearly driven out of her by the back-lash against a branch. A dozen times they had to let go, bruised, or take chance of holding on in pieces. And the thorns!

The rabbit was not fighting. He was Berserk, and, presumably, killing himself as much as his foes. But never was there such a rabbit; and when at last, in one final, perfectly diabolical flurry, he tore himself from the hedge, and flashed into the night, the weasels just staggered out, panting, and lay down.

An hour later they followed the trail once more, and back it led them, back, this time, in a rigid straight line to the body of the first rabbit, and here they found the crazy one stiff and still and stretched out, dead—dead as a door-nail, beside his friend, whom he had (accidentally or not, who can tell?) killed.

THE MONTH: SCIENCE AND ARTS.

CELLULOID FOR SURGICAL DRESSINGS.

ONE of the latest of the many interesting and novel developments pertaining to the surgical treatment of wounds received upon the battlefield is the utilisation of the celluloid dressing. This device, in addition to protecting the injured part, prevents the bandages from adhering to the wound. Ordinary bandages are apt to cling to

it, thus not only rendering their removal difficult, but also inflicting unnecessary pain on the sufferer, and, if the adhesion is pronounced, appreciably retarding the process of healing. With the celluloid device, however, these disadvantages are entirely obviated. The dressing, though reminiscent of the shield employed for protecting the arm in vaccination, is of a special shape and thickness, and is freely perforated

with small holes, thus closely resembling a finely meshed sieve. After being treated antiseptically, it is placed over the wound, and then the ordinary bandages are applied in the usual manner. Owing to the perforations in the celluloid sheathing all pus is able to effect its escape, and is absorbed by the surrounding cotton-wool. When the bandage is removed the celluloid sheath falls clean from the injury, which thus escapes all aggravation. Results have demonstrated that wounds so protected assume a cleaner and healthier appearance than those treated in the ordinary way, showing that the use of the shield accelerates the process of healing; it also affords a considerable measure of comfort and relief to the patient, who is not compelled to resort to certain positions to escape pain from pressure upon the injury, for the celluloid sheath is sufficiently strong to act as a guard. The use of celluloid as a surgical dressing is virtually in its infancy; but, owing to the complete success which has attended its employment, it is likely to be extensively adopted in the immediate future. It has been found to be an ideal dressing for use in the process of saline irrigation, which is now enjoying an increasing vogue in the treatment of wounds.

A NEW DOMESTIC SAFE.

The preservation of foodstuffs is one of the most important problems incidental to domestic life. The wooden safe, although extensively employed, is far from being satisfactory, as it is difficult to secure the necessary low temperature by its use, while it demands frequent vigorous scrubbing to keep it sweet and clean. A decided advance has been made by the substitution of slate for wood, the latter material being either entirely eliminated or used only sparingly. Slate is an excellent heat-resisting material, and thus the temperature of the air within the receptacle, even in the hottest weather, is always below that of the air outside. The safe is so constructed as to give the minimum of weight with the maximum of efficiency. The top and bottom, the walls and the shelves, are all fashioned from slabs of slate securely fastened together; and, as the material is nicely faced, a smooth, clean, and non-absorbent surface is presented, which can be thoroughly cleaned without any great effort. The door is fitted with perforated zinc or some other finely meshed fabric equally serviceable, thus admitting air, but offering an impenetrable barrier against flies. The walls are also freely perforated and covered in a similar manner, with the result that there is a constant circulation of cool and refreshing air throughout the receptacle. When kept in a shady spot, the safe serves the same purpose as an ice-box, but at much less trouble and expense. Where ice is difficult to obtain, it is, indeed, preferable to an ice-box. It is an excel-

lent addition to the household possessions in hot climates, as the material resists the ravages of such pests as insects and small rodents, and has the distinct advantage of being practically unbreakable.

A MILITARY SLEEPING-BAG.

Among the many recent accessories to the officer's equipment for active service, special attention has been devoted to the production of an efficient sleeping-bag to protect him while sleeping upon wet ground, possibly in the open air. Waterproof ground-sheets certainly fulfil the necessary conditions, but unfortunately they are both bulky and weighty, so that their conveyance upon the field is attended with difficulty. But, unless some form of ground covering is used, the officer runs grave risk of contracting rheumatism or some other equally serious malady which may leave permanent traces, and contribute to the wrecking of his health. An officer who has been invalided out of the army owing to severe rheumatism, the direct result of sleeping upon wet soil without adequate protection, has now devised a simple sleeping-bag. When fully extended it resembles a threefold wallet. The central section is fitted with a kind of pocket at the lower end to receive the feet, while the upper end is provided with a waterproof bag which may be inflated to serve as a pillow. After one has made one's self snug in the central section the flaps on either side are folded over and secured, so that the sleeper is completely protected against the elements. When packed, the sleeping-bag makes a small, compact parcel, measuring about twelve inches in length by ten inches in width, and weighing only eight pounds. It can be attached to the belt, in which position it lies flat across the bottom of the back, out of the way, and offers no impediment to the wearer's movements. When carried thus, the bag cannot go astray, and it is always available for instant use. Moreover, the officer is able to stretch himself out to sleep even upon the most sodden and uninviting ground without the slightest apprehension concerning his health.

RUBBER SOLES FOR BOOTS AND SHOES.

One outcome of the Government's requisitioning of leather has been to render the repair of civilian footwear an expensive matter. The prices have increased rapidly, and the tendency is still upward. As a result, commendable efforts have been made with a view to producing an effective cheap substitute. Rubber is an obvious alternative, and when one bears in mind the wear and tear which this material, in the form of cycle and motor tires, is able to withstand, there seems to be no reason why it should not be extensively adopted for boot-soleing purposes. Indeed, rubber soles are already on the market, but the general method of attachment is not

free from disability. Recently a Belgian inventor has made a marked advance in this connection. The sole, shaped and sized ready for immediate attachment, is specially prepared; and is fastened to the existing leather sole by the aid of a special cement. This method of soling has hitherto been open to the objection that the attached rubber may fall off under varying climatic conditions. But the new cement is said to resist all climates and all weathers. The inventor states, as a result of prolonged experiments, that once the rubber sole is attached it cannot be removed except when renewal becomes necessary. The fact that the sole can be satisfactorily attached without recourse to pegs, nails, or stitches is a decided advantage, because it dispenses with the necessity to hand over the boots to the cobbler. It is claimed, too, that a rubber sole, when properly made, as in this particular instance, is extremely durable, its life being equivalent to four or five ordinary leather soles. It also ensures the footwear being thoroughly waterproof, so that the grave perils incidental to damp feet are completely avoided. Rubber is certainly an ideal boot-soling material, owing to its resiliency. Not only is it silent, but it neither shrinks nor expands with heat or wet, and is extremely comfortable to the wearer, for it prevents the transmission of shocks to the body, as the wearers of rubber heels will testify. Indeed, if we bear in mind the widespread success of rubber heels, there appears to be no valid reason why rubber soles should not experience a similar vogue, although the conditions to be fulfilled are somewhat different. In the case of the heel, rigidity is required, whereas the sole of the boot must be flexible, to afford the natural bending movement of the foot full play.

TWO-FUEL ADAPTER-VALVE FOR MOTOR-VEHICLES.

One effect of the petrol restrictions has been to turn the attention of the motorist to the fuel possibilities of paraffin and cognate low-grade fuels. But as the shortage may prove to be only temporary, many motorists hesitate to incur the expense of having paraffin or two-fuel carburettors attached to their cars. To meet this situation there has been designed and placed upon the market an interesting and effective two-fuel adapter-valve, by the aid of which motorists may employ their existing carburettor to the best advantage. As is well known, a mixture of petrol and paraffin may be used when once the vaporiser is able to draw from the engine the requisite supply of air heated to the critical temperature. The greatest difficulties in the use of paraffin are to start up from cold and to adjust the mixture to the needs of the engine. The latter difficulty can be solved by trial, but the process takes time, and even then is not completely satisfactory, as the conditions are liable to fluctuate widely. With

the new attachment, which is of a simple description, the problem of the maximum amount of paraffin permissible can be determined quickly. It enables petrol to be used for starting up, and the change to the heavier fuel to be readily effected at the critical moment. Ordinarily an admixture of from 10 to 30 per cent. of paraffin may be used with the majority of carburettors without adjustment of the vaporiser. By adjusting the latter and the air-supply, this proportion can often be exceeded. The new device is extremely simple. It comprises a cross-shaped hollow casting, with a control-cock in the centre. The petrol-supply is connected up to one arm of the cross, and the carburettor to the other, while the paraffin-supply enters at the top. The lower part, which is fitted with a tap, serves as a drain, whereby the carburettor can be cleared of either fuel as desired. The handle of the control-cock is connected by Bowden wire to a sector set on the steering-pillar. This sector is provided with a small adjustable lever and a graduated scale. As the engine, started up on petrol, warms to its work, the paraffin-supply can be gradually admitted by slowly moving the adjustable lever, the movement continuing until the supply has been raised to the maximum which the engine will take. A few minutes' experience suffices to enable the motorist to determine this factor, and, once it is determined, it is a simple and rapid operation to feed the engine in the most economical manner, and to reserve the petrol for starting purposes. Provision is also made whereby the fuel, if desired, may be completely shut off by a definite movement of the lever, the engine then being only able to draw in air, which cools it down, saves fuel, and exercises a more efficient braking effect. This device is not merely experimental in character. It has been employed in the United States, where the motor-fuel problem is just as acute as in this country, for many months past, and has proved eminently successful.

A NOVEL TROUSERS STRETCHER AND CREASER.

The well-defined crease being recognised as 'the mode' in connection with masculine nether garments, interest may well be taken in a recent ingenious device to ensure the dictates of fashion being observed, especially among those who are compelled to travel extensively. The new stretcher and creaser is essentially portable, for when packed it occupies a space measuring twenty-one and a half inches long, three inches wide, and two inches deep, thus permitting it to be slipped into the popular suit-case; while it weighs only twenty ounces. It belongs to the skeleton type of presses. Front and back creases are produced, while transverse pieces at each end of the side sections provide the means for stretching the garment. Its portability has caused it to meet with wide appreciation among

officers, who find the usual form of press too bulky, cumbersome, and heavy for inclusion in their kit. When fixed with the garment in position, the press may be hung up in the wardrobe or upon a hook.

FERTILISER FROM TOBACCO-ASH.

In a recent instalment of the 'Month' we dwelt upon the fertilising value of banana-stalks due to the proportion of phosphate contained in the ash resulting from incineration. Another chemical experimenter, Mr B. A. Burrell, F.I.C., has recently drawn attention to the value for fertilising purposes of tobacco-ash, which is also rich in this constituent. According to his investigations, the amount of potash contained in the ash from a pipe, cigar, or cigarette is 6 per cent. of the original weight of the tobacco. He points out that at present this valuable soil-feeding material is completely wasted, and emphasises the urgent necessity of husbanding all our resources of this description, because kainite, which in pre-war days was sold at forty-seven shillings and sixpence per ton, rose rapidly in price after the source of supply—Germany—was cut off, and to-day is absolutely unobtainable. He suggests that we should complete an organisation to avoid the present enormous waste. With a little combined effort the ash and odds and ends of unburnt tobacco could be collected from the smoke-rooms of clubs, restaurants, and other institutions. This refuse would command a sufficient price to defray the cost of collection, while the manufacturing chemist or artificial manure-maker would find the task of preparing the fertiliser highly lucrative. According to this authority, our total annual consumption of tobacco amounts to forty-four thousand five hundred and twenty-nine tons, from which might be obtained two thousand six hundred and seventy-two tons of potash. As kainite contains only $12\frac{1}{2}$ per cent. of potash, the lost tobacco-ash is thus the equivalent of twenty-one thousand three hundred and seventy-six tons of kainite, which at the pre-war price would represent fifty-one thousand pounds in value. To-day the value of this yield would be nearer one hundred and fifty thousand pounds. Tobacco-ash also contains, to the extent of about 5 per cent., another valuable fertilising ingredient—namely, phosphoric acid. From tests which Mr Burrell made in connection with the systematic collection of the waste, the following results were recorded. From the smoke-room of a club nearly ten ounces of ash and unburnt tobacco were obtained during eight days; four days' collection from the lounge of a fashionable hotel weighed thirteen ounces; forty ounces were secured from a large restaurant during ten days; while the yield from one-tenth part of a music-hall at one performance weighed four ounces. When one recalls that this waste is taking place throughout the country every day, one may easily realise that, if only we were

sufficiently far-seeing and industrious, we might be able to establish upon a firm footing a very prosperous industry. Indeed, in combination with the systematic collection and scientific treatment of vegetable residue, we might be able to render ourselves independent of the Teutonic sources upon which we shall have to fall back after the war, unless we help ourselves in the meantime. We have not yet realised the incontrovertible fact that Germany achieved such an advanced stage of prosperity partly because she mastered the problem of the scientific disposal and treatment of waste.

AGRICULTURAL ENGINEERING.

In the course of the recent annual meeting of the British Association for the Advancement of Science, an interesting announcement was made by Sir Sydney Olivier, the Permanent Secretary to the Board of Agriculture and Fisheries, to the effect that the Government had decided upon a new and far-reaching movement in the interests of agriculture. This is the establishment of agricultural engineering institutions throughout the country to facilitate the dissemination of the best advice on engineering in its relation to farming. This country's agricultural progress has been seriously handicapped by the absence of definite information relating to the best forms of engineering so far as it affects the farmer. Individual experiment is necessarily too costly to be prosecuted except in rare instances, the result being that the man on the land has been blundering from ignorance; whereas, had the necessary technical assistance been forthcoming, he might have been able to get more out of his land. The collection of definite knowledge concerning local soils, animals, plants, and other cognate factors would enable us both to extend the area of the land under cultivation and to increase the yield per acre. During the past twenty years the migration from the land to the cities has constituted one of our gravest dangers. Far more real wealth is to be won from the scientific exploitation of the land than is to be derived from manufacturing industry. But there has been a lack of Government assistance in the dissemination of rural information. If the problem is attacked in grim earnest and along the right lines the land will be invested with a revived glamour, and we may confidently expect a welcome growth of the race of keen, healthy, and industrious yeomen for which these islands have ever been famous. Other countries have developed this range of activity to a high standard of perfection. Experimental agricultural stations are to be found here, there, and everywhere. They ungrudgingly extend every assistance to the farmer, unravel any problems which he presents to them—in short, exercise every legitimate influence to encourage him to exploit the soil to the utmost advantage, thereby rendering agriculture one of

the most attractive and profitable fields in the whole range of human endeavour.

NOVEL USE OF THE PERISCOPE.

Although the periscope has become familiar to the general community chiefly from its association with submarine and trench warfare, it has been put to a distinctly novel and beneficial use in a wholly peaceful pursuit. One of the railways serving the city of Chicago has a sharp and dangerous curve, of which, until the recent completion of a huge building, the signalman had a clear and uninterrupted view. The obstruction caused by the building rendered the signal-box apparently useless, and its removal was being contemplated, when the engineers determined to make a novel experiment with a view to avoiding this expense. They built a large periscope, twelve feet in height, extending upward from the roof of the cabin. In this way it was found possible to peep over the intervening building. The eyepiece is placed conveniently near to the signal-operating mechanism, and as the picture is produced upon a large scale the signalman has a clear and unobstructed view of the approaching trains during their negotiation of the curve. By this simple expedient several hundred pounds were saved, while the signalman experiences no more difficulty in performing his work than he did before the offending building came into existence.

A POCKET HISTORY OF OUR REGIMENTS.

In these strenuous war-days of universal newspaper reading most people feel the need of a handy record of facts regarding the founding, history, and services of our gallant regiments. Every family in the land is more or less interested in our brave defenders, and nothing could be handier, or more to the purpose, than *A Pocket History of the Regiments* (Oliver & Boyd), which has been prepared by Lieutenant Charles Lamb, Adjutant, Scottish Command, School of Instruction for N.C.O.'s. A practical soldier himself, in the regular army, Mr Lamb has gone to the best authorities for his facts about our various gallant regiments, and the 'honours' are reproduced by permission from the *Army List*. The Army Flying Corps has first mention, and receives due credit for its daily deeds of bravery, phenomenal progress, and unparalleled services to the army at the front. Next in order we have the Cavalry, beginning with the First Life Guards, followed by Artillery, Royal Engineers, Foot Guards, Infantry, and the Army Service Corps. Of the R.A.M.C., Mr Lamb justly says we owe much to these brave, indefatigable men who have tended our soldiers in peace and war so creditably, 'and in the struggle now raging the admirable organisation of the service and the skill of the surgeons and assistants are recognised and appreciated by all.' A timely and useful little book.

THE ORIGIN OF THE KHAKI APRON.

Of the thousands of gallant soldiers who have worn the khaki apron over the kilt, and of the millions of people who have seen it worn, probably few know the story of its origin. It will, we are sure, interest our readers to learn that the inventor of this device was one of themselves, for the originator of the idea, Lieutenant-Colonel Gostwyck Gostwyck, late 91st Argyllshire Highlanders, has been a subscriber to *Chambers's Journal* for forty years. During the early stages of the Boer war, the exceedingly great 'visibility' of the sporrans and tassels of the kilted Highland regiments was responsible for many casualties, and it was to obviate this danger that Lieutenant-Colonel Gostwyck Gostwyck, in a letter to the *Inverness Courier*, dated 5th November 1899, suggested the apron. Five days later he forwarded his suggestion to Lord Lansdowne, then Secretary of State for War; and on the following day he was informed that Lord Lansdowne had submitted the proposal to the military authorities, with the result that the apron had been adopted for immediate use, and a telegram to that effect had been despatched to South Africa. Fifteen days later the Black Watch were wearing the apron at Naauwpoort. That this device has been the means of preventing the loss of many valuable lives is shown by the testimony borne by a colonel commanding in the Boer war. 'Your idea of the khaki apron,' he writes to the inventor, 'must have saved thousands of lives. I remember in South Africa what a regular "bull's-eye" the sporrans made, and how when the apron was taken into wear the effect was immediate.'

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

WITHHOLD YOUR HEART.

YIELD me your lips, that I may kiss them gently;
Withhold your heart, lest I its trust should slay.
Short-lived is love, like violets in April
That die in May.

Love if we will; but dream not love is constant,
Lest when we wake the truth should bring distress.
Waves of the sea that increase in a moment
Decrease in less.

G. H. BROWNING.

. TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

JANET ARMSTRONG.

By JOSEPH LAING WAUGH, Author of *Betty Grier*, *Robbie Doo*, *Thornhill* and its *Worthies*, &c.

CHAPTER I.

'AY, Mr Crosbie, you're a young man, an' it's no to be expectit that ye can see eye to eye wi' me, for I'm mairchin' eighty; but, tak' my word for it, efter a's said an' dune, it's the simple common things in this world that coont. Dootless, noo, you're thinkin' that my green kail an' savoy cabbage are no in it wi' Daniel Hotson's coddled flooer-hoose plants—his waxy cameelias an' his dooble fuchsias. Mebbe they're no. But, dod, sir, juist because o' them my broth-pot will be a richer yin than his when winter's snaws cover the yairds, when wark's scarce, an' anxious faithers pu' their middle strap a hole tichter. No that I despise the bonny flooers—God bless the denty gems! He kens I love them, an' everything in His gairden is worthy o' oor care an' keepin'; but Daniel pits his nose in the air when he looks ower the dike to my vegetables, coontin' them, as it were, aneath his notice, an' forgettin', puir man, that the clesp o' a chacket haun' can sometimes convey an unco warm welcome, an' that it's the drink o' common cauld watter, an' no the wine o' richest vintage, that steadies the he'rt in it's dyin' throb. Ay, sir, there are lots o' life's lessons ye canna learn frae books, but only frae experience.'

Many years have come and gone since that September afternoon when I sat with old Robert Douglas in his Shinnel garden. But his words, and the trend of his philosophisings, I always remember; and time and experience have in the main proved them true. He it was who first turned my thoughts to the ordinary and unassuming, and directed my steps into the unfrequented byways, where are the common oddments—the harebell, the speedwell, the trefoil, and the eyebright—of little account to the careless, and unworthy of admiration, but to the loving and observant veritable jewels of God's own fashioning, resting on the perfect setting of Nature's kindly bosom.

Thus it is that 'the modest daisy on the lea' is to me a consolation and a sermon, and the pink-and-white briar rose festooning the tangled bank of more account than the Gloire de Dijon which, even as I write, is proudly nodding to me in the autumn sunshine from the trellis round my study window.

No. 310.—VOL. VI.

And thus also it comes about that I am writing of Janet Armstrong, my housekeeper, when I might be chronicling the sayings and doings of Sir Somebody This and Lady That, or other notable members of my congregation—all worthy enough people, without whom, I dare say, my subscription lists in particular and Edinburgh society in general would be poor indeed. But to me—and I say this with due deference—these people are the tended, cultivated plants of Daniel Hotson's rearing, while Janet Armstrong stands for all I appreciate in Robert Douglas's common plot, for the neglected ragged robin and woodruff wasting their sweetness and blushing unseen 'mong the wayside grasses.

Janet and I are old friends. She was maid at Carfrae House, where, as a guest of my aunt Margaret, I spent many a pleasant school holiday. And as the friend in need she was the friend indeed, for many a time and oft did she surreptitiously hand to me the 'jeely piece' which took the keen edge off the appetite the bracing Lammermoor air had whetted. 'Hide it in your pooch, Davie,' she used to say. 'Ye maunna squeeze it hard, or the jeely'll slitter oot; dinna let it bulge; an' for guidness' sake steer clear o' the mistress, for she disna believe in giein' bairns by-bites. Eat it, like a wee man, in the byre, in the faur-away stall; ye'll be quite safe there.'

My word, those *were* sweet tit-bits. I often think of them; and even yet, when a cow turns its big liquid eyes upon me, those early Carfrae House days come back to me, and I see a big brown-and-white Ayrshire in a roof-lit stall which mooded low and mournfully as I ate, as if she, too, grudged every mouthful of the soda-scone and gooseberry-jam I was hurriedly munching.

It was Janet, too, who one day lent me the key of the garden gate and directed me to where the largest gooseberries grew. That same evening she rendered me first-aid, telling me 'no to yell sae lood, or the mistress'll hear,' and assuring me that the cold-water cloths she was applying to my back and the piping-hot poultice she was placing on my stomach would soon allay the pain; for, as she put it, 'the cauld yin'll push an' the het yin'll pu'.'

[All Rights Reserved.]

NOVEMBER 4, 1916.

Later, when at college, I remember the box which at regular intervals reached my humble lodgings from Carfrae House. That it was sent at my aunt's direction I knew, but it was at Janet's instigation; and often did I bless her name when I was unrolling fresh 'gouey' butter from between green cabbage-leaves, new-laid eggs from carefully selected pages of the *Christian Age*, and soda-scones pinned in a spotlessly white face-towel—which, by the way, I was always instructed not to return with the empty box, as 'toon's towels were unfeel and often unco scrimpit.'

And when, for the first time as an ordained minister, dressed in the orthodox habiliments, and doubtless wearing the set-apart, superior smile which the young cloth sometimes affect, I visited Carfrae House, it was Janet who brought me to earth. 'Davie, my man,' she said with her kindly hand on my shoulder, 'away up the stair an' tak' aff that collar. I wonder ye've the cheek to wear it. Whae gied the Glenburnie jeuks loaf-bread soaked in whisky, an' lauched at the puir, staggerin', waddlin' sows till his nose bled? Whae pit a slate on the lum-tap o' Bogha' kitchen, an' nearly kippered the wricht's bedridden mither-in-law? An' whae, micht I ask, put souter's rosset on the seat in the precentor's box in Jinglekirk, an' was the first to lauch when the puir man couldna get up to lead the praise o' the Lord in the openin' psalm? Wi' thae claes an' that collar on ye'll dootless no can tell me. Weel, weel, I could. But never mind. When my e'e gets used wi' ye ye're a' in keepin', so keep your collar on, an' away ben the hoose an' see your auntie, for, puir body, she canna rise to see you noo.'

Janet was woman-muckle, as they say locally, when I was a schoolboy on holiday at Carfrae House. Her father and mother, though long settled on the Glenburnie hirsell, were Liddesdale folks, with the strong, agile, supple frame of the Armstrongs, and the keen, calculating wit and independent nature of the old Border rievvers of that name. And she inherited all her parents' characteristics. These traits I became acquainted with later; but, young as I then was, I was not blind to her stature, her strength, and her suppleness, and I used to think that Janet, in her height and easy swinging gait, and with long, white bib-apron, was a figure more impressive and commanding than that of my tiny, austere aunt in her lace collarette and best satin gown. I often thought it strange, too, that she wasn't married and mistress of a house of her own. On one occasion I broached the subject to my aunt, and with boyish inquisitiveness asked why. 'Hoots, Davie!' she said, 'Janet knows when she's well off and in a guid, comfortable hame. Mair than that, she's not one o' the marrying kind.'

My aunt's explanation was accepted without question, and I dismissed, as unreal, dimly defined

memories of my first visit to Carfrae House—memories of Janet and a fair-haired young man sitting very close together on the long kitchen settle, and of two tall figures, one very much like my aunt's maid, sheltering from the rain under a black-and-white checked plaid in a nook on Soonhope Burn.

With my aunt's death there was a snapping of the only link which bound me to Lauderdale. For over a year afterwards I lost sight of Janet, and it wasn't till after I had been settled in Shinnel that she was again brought to my ken.

One afternoon in late October, Tom Reid, the Moniaive carrier, with much 'chickin' and 'whoain', backed his lorry into the manse courtyard. And there, seated on a kenspeckle kitchen settle, surrounded by grocery-boxes andorra parcels, and with an eight-day clock lying cross-wise on the vehicle, was Janet Armstrong.

I saw her from my study window, and suddenly summoned memories of other days warmed my heart and gave wings to my feet to welcome her. But before I got outside with a kitchen chair to make easy her descent she was standing on *terra-firma*, with one hand behind her clenching her purse, and with the other gesticulating in front of Tom Reid in an argy-bargy over the amount of his charge.

'But it's no the wecht o' the settle an' the clock, my woman,' I heard Tom say; 'it's the room they've taen up, an'—an'—weel, I've cairted you an' them for the feck o' seven miles, ye maun mind.'

'But I sat on the settle,' Janet chimed in; 'an', mair than that, I jamp off an' walked up a' the braes.'

'Weel, I'm no chairgin' a fare for you,' snapped Tom.

'Hoo d'ye mak' it five-an'-six, then? Bless me! fower shillin's, or fower-an'-six at the maist'—

Janet's back was towards me; the carrier was facing me, and, looking past her, he caught my eye. I signed acquiescence, and Tom at once understood.

'Weel, weel, fower-an'-six be it; but, by my faith, my woman! I needna advise you no to sell your hens on a rainy day. Ay, ye ken that withoot me tellin' ye, I'm thinkin', he added *sotto voce*, as he dropped the coins with a jingle into his long corduroy purse.

With the happy smile of triumph still on her face, she turned and saw me. Without a word we shook hands, and it wasn't till after the two cumbersome pieces of furniture were safely deposited in the kitchen that she explained to me the reason of her visit.

'They were baith left to me in your aunt's will,' she said, looking from the long settle to the upstanding 'knock,' 'so I can dispose o' them juist as I think fit. Efter the burial I took them up to my faither's at Glenburnie; but the kitchen flae was ower thrang for the yin,

an' the ceilin' ower laigh for the ither; so, efter keepin' them a' thae months in an outhouse, I made up my mind to bring them to you. You're the only manbody that I ken o' left o' the family name, so you've the best richt to them. In a way, I'm sorry to pairt wi' them, for I've listened to the chappin' o' that knock since I gaed, a lass o' thirteen, into your aunt's service; an' as for the settle—weel, there's yin that yince sat on it'— She hesitated for a moment, then rose from her chair and looked vacantly into the kitchen-garden.

In a flash my thoughts went back to that first visit to Carfrae House, and again I saw her and a fair-haired lad sitting side by side in the ingle-nook. The scene was real, then, and didn't exist in my imagination only. But I said not a word.

She continued looking through the window; then, after gently closing the back-kitchen door, where my young maid was at work, she came forward to me. 'Ye'll juist tak' them frae me in a present. I'll hardly ever need them for a hoose o' my ain; an'—that's a'—eh, Davie? But, mighty me! I maunna ca' ye by that name noo that ye're a placed minister an' in a manse o' your ain; an', by the same token, I'm positively dyin' for a cup o' manse-masket tea.'

I was new to the parish, the people around me were strangers, and the old manse, with its long, echoing lobbies and its low-ceilinged rooms, had still a lonesomeness and fremitness that often made my heart sore. But Janet's presence that night under my roof was as a whiff of bracing homeland air; the walls lost their bareness, the atmosphere its heaviness, and my study fire burned with an unwonted cheerful glow which radiated all around me. And of a surety her visit was a timely one, for domestically I was at the mercy of an inexperienced servant-lass sent me from Wanlockhead by the Moderator of our Presbytery. My housekeeper—whose services I had secured through a Dumfries registry—had been with me nearly a week, the last three days of which she had been abed with an indisposition to which she would give no name, and to combat which she would not allow me to call in a doctor. I was painfully conscious of the neglected, uncared-for appearance of the house, and I knew Janet's quick eye would take in at a glance every dusty corner, every untidy curtain hanging; so, before retiring for the

night, I unburdened my mind and told her how unfortunately I was placed.

As I expected, I found her most sympathetic and helpful.

'The young lassie in the kitchen's a' richt,' she said. 'She's mebbe young, but that's a fau't that's aye mendin'; an' she's wee, but she's a' the nearer her wark. An' she's licht o' foot an' quick i' the uptak', an' gin she's willin' an' honest she's the makin' o' a guid servant. As for your hoosekeeper, I'm surprised ye dinna ken what's wrang wi' her. Have ye been up to see her?'

'No,' I said; 'I didn't care to intrude. The girl has been our go-between.'

'Imphm! juist so. Weel, that same girl's the go-between your hoosekeeper an' the licensed grocer. I hadna been an' oor in the hoose till the bit lassie telt me a' about it, an' I'm glad you yoursel' broached the subject, for I wanted to tell ye, an' I didna like to interfere.'

My heart sank within me. 'Then, Janet, it is'—

'It is,' she promptly replied. 'Juist that, nae less. Imphm! a bad complaint in a man, but a waur yin in a woman; but I'll see ye through.'

She was as good as her word. Next morning, before I got downstairs to breakfast, my registry paragon was on her way to Thornhill station, and a wire had been despatched by Janet to Glenburnie for her box. The housekeeper's removal had been conducted with so much tact and secrecy that no scandal got abroad in the parish, and often in the subsequent quiet days which passed in the manse I thanked God for sending my old friend so opportunely to my Shinnel home.

I had it in my mind once or twice to ask her to take up the duties permanently; but, not knowing how she was placed, or what her prospects and arrangements were, I didn't do so. However, when her box arrived, and when from its size I argued it contained her all, my mind was relieved on this point. Not a word passed between us about any engagement or wages except when I was paying her at the end of the first month.

'It's faur ower much,' she said. 'I'm no worth the hauf o't; but if you're pleased, so am I. I like the hoose; it's easy throughgaun wark; an' then I can still listen to the auld knock chappin'. But, dearie me, what a terrible job I ha'e to keep frae ca'in' ye Davie!'

(Continued on page 786.)

THE APPROACH OF OLD AGE.

Grant to life's day a calm unclouded ending,
An eve untouched by shadows of decay.

WE may arrive at old age like a tortoise by the mere lapse of years; we may arrive at old age in spite even of a misspent life, though this is rare; but to become old wisely, honourably, and usefully, to be a guide-post

and not a danger-signal, should be our aim and hope.

We ought never to look on old age as necessarily a time of disease and decay, but rather as a time of peaceful rest; as a time when we can take stock of ourselves and of the world, and as a time for our experiences to bring forth

the fruits of knowledge and of wisdom ; but the attainment of this happy end must in a great measure depend on the life that we have led.

To prepare for old age throughout our whole life is a policy of perfection that one can hardly expect from busy, sanguine youth ; but still it should be their wisdom and to their interest to face the consequences of their life's actions and conduct.

This is a hard saying, but one that must be heard and be believed—namely, that for all the sins we commit, moral or physiological, for all the sins known or unknown, intentional or unintentional, nature will send in a bill, and a bill that sooner or later will have to be paid. A merciful God not seldom takes off a liberal discount, but—the bill comes in.

After all, it is not a very hard road that we are asked to travel. It is only to live soberly, purely, and honestly ; to do justice and mercy ; and to give to mankind our best, whether it be of bodily or of brain work and achievement ; and if we do these things we should, with God's help, live to a healthy old age, and find peace at the last. There are, of course, accidents and certain accidental illnesses in our lives that we can never guard against, such as the infectious diseases, the diseases brought on by unavoidable exposure to privations and chill, and the dread but so far unexplained cancer ; and there are certain diseased conditions that we may unfortunately inherit, but against which, nevertheless, we can make a good fight.

Leaving these out of the question, we may say with a fair amount of certainty that our health is our own, and that the diseases that may come on us as life advances are more or less our own fault, and are due to the breaking of physiological laws. In the great fight of life it may be our misfortune to be knocked out in the middle rounds ; but we must all strive and hope to fight to the end, to fulfil our destiny, and to leave a record of some good work behind us.

Habitual intemperance and the grosser sins of life are contraventions of the moral law, and they carry their story and fate for all to see. But what we should all try to learn and to follow are the laws of health that come into action in our daily life and employments, in our eating and in our drinking, in our exercise and in our rest ; we must learn to read these laws reasonably and to apply them to ourselves individually, for no régime can be applicable to all alike.

An amusing story is told of an American lady who came over to London to consult one of our diet specialists for chronic dyspepsia. He, without taking the trouble to hear her own personal experiences, and with more learning than wisdom, proceeded to lay down a very rigid rule of life. With characteristic and national smartness, she turned on him and said, 'Say, doc, are you running this stomach, or am I?'—a very just and

fair criticism, for we must certainly run our own stomachs. The air we breathe and the germs we inhale may be beyond our control, but our 'wittles and drink' belong to us alone.

I think that any fairly educated person should be able, without much difficulty and in a short time, to learn the primary physiological laws that govern our circulation, our respiration, and our digestion, and to apply them, as I have said before, to his own individual life. We should study what foods agree with us, and what cause indigestion ; what amount of exercise we can take without over-fatigue, and what amount of rest we need ; in short, what conduces to the best output of work and to our general well-being. A wise man, as he is getting on in life, will then, I think, consult his physician, and between them they should be able to devise a reasonable and successful rule of life. But, doctor or no doctor, we have got to work out our own salvation thoughtfully and on scientific lines.

There is an old Abernethian story, a chestnut probably, but *bien à propos*, that I cannot resist quoting. An old lady went to him and said, 'Dr Abernethy, I have such a pain in my shoulder when I do like this,' giving it a peculiar twist. 'Then why the deuce do you do it, ma'am?' was the characteristic answer. The plain moral of which is that, knowing the way of righteousness and continuing in our transgression, we must get what comfort we can from the kind and sympathetic words of the great physician.

Now, when we have worked out our own method of salvation with thoughtfulness and humility, we are too apt to try to work out our neighbour's salvation with pride and cocksureness, forgetting that what in ourselves may be a physiological virtue may be in him a physiological sin. This ambition to prescribe for our neighbour is very human and kind, but is often very embarrassing to both the neighbour and his doctor. A very dignified old clergyman once addressed a fussy lady who had been doctoring the poor of his parish, fortunately with very weak homœopathic medicines, but in serious cases with much loss of valuable time, thus : 'Madam, knowing no more of the human form than you do of the angelic, you yet presume to treat diseases of which you know nothing with remedies of which you know less.' A crush courteous but complete. The ready-made tablet, which we are all so fond of taking and giving, is a two-edged weapon, and is not a panacea for all ills.

I cannot refrain here from telling this story of Thomas Carlyle. I think it is true, for it was told to me by the lady to whom he presented the bottle. His old friend Sir Henry Taylor was ill, so Carlyle rode over on his old white horse to inquire for him. He sent for Miss Taylor to come to the door. There was Carlyle sitting on his horse, and he said, 'I am very sorry, my dear, to hear your father has been so

ill. I don't know what is the matter with him, but I have brought you over a bottle of medicine which has done Mrs Carlyle a great deal of good.' One hesitates to criticise the great philosopher, but one cannot help feeling that there is somewhere here a lapse from true philosophy. He appears to have been ignorant also of Russell Lowell's great primary law:

Thet saunce for goose
Ain't jest the juice for ganders.

But, to be serious again. Temperance in all things, and self-denial, must be the rules of our life, combined with an intimate knowledge of our own idiosyncrasies. Then, as age approaches, and as our energies show signs of failing, we must never let ourselves rust in mind or in body. The physical or bodily dangers of old age, nowadays, lie rather in the direction of over-activity. Elderly people can do a lot of really good work, but they must learn to do it quietly and slowly. 'The pace that kills' is a proverb that applies far more to old age than to youth. The thought has often struck me, during a long experience, what a number of elderly people there are who die, if I may use such an expression, unnecessarily—that is, before their vitality and strength are really exhausted, and before their work is done. Hearts that are able to meet efficiently all the ordinary demands of life are suddenly called upon to make some big effort of strength or of endurance, and the result is sudden death or permanent damage to that vital organ.

There are three things which old age must religiously avoid: hurry, excitement, and, last but not least, anger. Indignation we cannot help feeling often; but we must never let ourselves go in explosions of anger. If our hearts and arteries are not quite sound, heart failure or apoplexy may easily result. 'Be ye angry and sin not' has always seemed to me an unfortunate translation of St Paul's words to the Ephesians. It is really a repetition of the words in the Fourth Psalm, 'Stand in awe and sin not,' and of these words there can be no misinterpretation. To go a little more into detail, age with its lessened physical work needs less strong and stimulating food. The output of work should, in reasonable measure, regulate the intake of food. The neglect of this law is the source of most of the diseases and disorders of old age. We lessen our exercise and general activity, but we seldom deny ourselves the pleasures of the table; indeed, many try to whip up their failing energies with more stimulating food and drink. The stream of life, which is practically the stream of our arterial blood, should be kept moving quietly and regularly, and all the excretory organs of the body should be kept in good working order by moderate and gentle exercise, and by not giving them too much to do. These organs are the scavengers of our

complicated system, the removers of our dust-heaps and of our waste products, and are absolutely essential to life and well-being. When they are unable to carry out the work demanded of them disease and death are not far distant. To sum up, temperance must go hand in hand with knowledge, and self-denial with personal experience.

The mental disorders to which old people are most liable are selfishness, and—to use Jane Austen's happy alliteration—pride and prejudice. We take a pride in our own work and achievements which a strict valuation would hardly warrant, and which posterity would probably ignore; and this pride naturally leads on to the prejudging of the newer questions of the day, and so inevitably to a crystallisation of our ideas and faiths; and when this crystallising process is complete, where do we stand? We can still do work, and fair work, with our old tools, but unknown to ourselves we have joined the ranks of the 'men who were.' How can we improve on Cicero's words?—'We must stand up against old age, and make up for its drawbacks by taking pains. We must fight it as we should an illness. We must look after our health, use moderate exercise, take just enough food and drink to recruit but not to overload our strength. Nor is it the body alone that must be supported, but still more the intellect and the soul; for they are like lamps—unless you feed them with oil they too go out from old age.'

To revert to the first danger of old age, selfishness. This oftentimes creeps on us insidiously; our children spoil us, perhaps, and we unconsciously slip into the habit of thinking that the tit-bits of life belong to us as a right; or, living alone, we arrange our lives on a mildly luxurious plan, and then think ourselves very hardly used if circumstances break into the monotonous order of our comfortable existence.

'The true wisdom,' as Stevenson says, 'is to be always seasonable, and to change with a good grace in changing circumstances. To love playthings well as a child, to lead an adventurous and honourable youth, and to settle, when the time arrives, into a green and smiling age, is to be a good artist in life.' Think of these two pictures: old age crabbed and selfish, hating the noise of children and laughter, scorning all opinions but those of himself and of his contemporaries, and sinking into the grave unloved, with no faith in the inherent goodness of humanity, and with but little in his God. And the other picture, a lovable old face over which experience and humility, wisdom and unselfishness, strive for the mastery. Such an example is a living evidence to all that righteousness makes for happiness and peace.

The pride of old age is too often shown in our attitude towards youth. We often set an undue value on the wisdom that is supposed to come from years of experience, and we expect

youth to accept our valuation as a true one; whereas we old people have on the whole more to learn from the young than they from us. Our failures and disappointments have inevitably blunted the keen edge of our courage; while we are weighing chances and seeing all the obstacles, youth, with its fresher knowledge and blinder pluck, will often arrive.

'Let not him that girdeth on his armour boast himself as he that putteth it off;' and let not him that putteth off his armour boast of his wonderful past and of the great things he hath done, but rather let him help his sons and successors to put on better armour and to fight a better fight.

The *laudator temporis acti*, the man who says, 'The country, sir, is going to the dogs,' is generally a bore, and to be this is no longer the privilege of old age, though it is still one of its great temptations. The habitual bore has practically outlived his usefulness. He is like a long, dreary sermon, whose power for good is in inverse proportion to its length. To quote once more Stevenson's inimitable words: 'In short, if youth is not quite right in its opinions, there is a strong probability that age is not much more so. Undying hope is co-ruler of the human bosom with infallible credulity. A man finds he has been wrong at every preceding stage of his career, only to deduce the astonishing conclusion that he is at last entirely right.'

Let us, then, sink our selfishness and pride, and help on the succeeding race by encouragement, by advice very gently given, and by occasionally but very silently putting on the brakes; and let us never forget that, in the words of the Irish bull, 'their future is all in front of them, while ours, alas! is behind us.'

Now, as we cross that ill-defined boundary line that marks the advent of old age, we must not make ourselves miserable. Remorse we must have, most of us, for things done, and regrets, all of us, for things left undone, and for all those great ambitions and hopes that have gone astray; but the morbid analysis of the 'might have beens' leads nowhere and solves nothing.

Though we can no longer be in the fighting-line, we are still soldiers in the great army of the living. If we cannot ride with the guns or charge with the bayonets, we can still hold the fort, and by cheerfulness, endurance, and unselfishness can do much to help those who are fighting the great battle of life. Listen to Cicero once more, who puts these words into the mouth of Cato, then eighty years of age: 'My wisdom consists in the fact that I follow nature, the best of guides, as I would a god, and I am loyal to her commands. It is not likely, if she has written the rest of the play well, that she has been careless about the last act, like some idle poet. For after all some last was inevitable, just as to the berries of a tree and to the fruits of the earth there cometh

in the fullness of time a period of decay and fall. A wise man will not make a grievance of this. To rebel against nature, is not that to fight like the giants against the gods?'

That was written two thousand years ago, and I hope my readers, if such there be, will pardon me for quoting Robert Louis Stevenson again, that great and kindly philosopher of our own time, who, though he died young, seemed to have grasped the prophetic vision of all ages: 'Indeed, by the report of our elders, this nervous preparation for old age is only trouble thrown away. We fall on guard, and after all, it is a friend who comes to meet us. After the sun is down, and the west faded, the heavens begin to fill with shining stars. So, as we grow old, a sort of equable jog-trot of feeling is substituted for the violent ups and downs of passion and disgust. The same influence that restrains our hopes quiets our apprehensions; if the pleasures are less intense, the troubles are milder and more tolerable; and, in a word, this period for which we are asked to hoard up everything, as for a time of famine, is in its own right the richest, easiest, and happiest time of life.'

Let these cheering words of these two great philosophers help us to march bravely and cheerfully on, and to use for ourselves and for others the very best that remains to us of life and work.

To some of us may come that great trial, the loss of sight or of hearing, losses which seem to cut us off, to a great extent, from the joy and intercourse of life, and which, to some extent, paralyse our usefulness; but even then we must fight on and train the remaining senses to compensate for what is lost. As a comfort to these I must quote the prayer from Whittier's beautiful poem 'My Birthday':

And if the eye must fail of light,
The ear forget to hear,
Make clearer still the spirit's sight,
More fine the inward ear.

Be near me in each hour of need,
To soothe, or cheer, or warn,
And down these slopes of sunset lead
As up the hills of morn.

When, for each one of us, the sun begins to set, and the long day closes; when the fear of death—that phantom born of faithlessness and doubt—stands over us, we must steadfastly look through him and beyond him to the Better Land and to the Light that never fails; for this is not our home. Let us have no dread of the so-called pains of death. They are a chimera. Death comes kindly and gently in unconsciousness, in coma, or in sudden failure of the heart. During the last three centuries in Britain and America the outlook on the future life has been to very many coloured by the teaching and doctrines of Calvin. I doubt if two good men ever, unconsciously of course, did more to blur the true idea of God as an all-loving Father

then did Calvin and John Knox. The aspect of religion they presented has now, thank God, nearly died out, but it has left on many minds an indelible mark. To those of us who were brought up in this stern sub-section of the Christian religion, to those who for fear of death were all their lifetime subject to bondage, emancipation has been very difficult. But, looked at honestly and squarely, this fear of death implies a great want of trust in our God.

Compare these harsh Calvinistic beliefs with the happier faith of Dante, who says: 'In this age the noble soul tenders itself unto God, and awaits the end of this life with much desire; and to itself it seems that it goes out from the inn to return home to the Father's mansion; to itself it seems to have come to the end of a long journey, and to have reached the city; to itself it seems to have crossed the wide sea and to have returned into the port.'

Finally, I would humbly say this. If the old Greek philosopher could look on death as his last and best friend, if the Buddhist can calmly wait for it, and if the Mohammedan can fearlessly welcome it, surely to the Christian death should be the apotheosis of his existence, the *Janua Vitæ*, the very gateway into knowledge and eternal life. Listen to Whittier again:

Far off, and faint as echoes of a dream,
The songs of boyhood seem;
Yet on our autumn boughs, unflown with spring,
The evening thrushes sing.

The hour draws near, howe'er delayed and late,
When at the eternal gate
We leave the words and works we call our own,
And lift void hands alone.

For love to fill, our nakedness of soul
Brings to that gate no toll;
Giftless we come to Him who all things gives,
And live because He lives.

PINCHER MARTIN, O.D.

A REALISTIC STORY OF THE INNER LIFE OF THE ROYAL NAVY.

By TAFFRAIL, Author of *The Bad Hat*, *The Decoy*, *An Eye for an Eye*, &c.

CHAPTER XVI.—MINOR INCIDENTS.

I.

[The reader is cautioned against accepting this story as an official narrative of the great war. The incidents described have actually happened; but, for obvious reasons, it has been necessary to give them fictitious colouring.]

'SIGNAL just come through, sir,' said Rosser, the signalman, thumping on the door of Wooten's cabin at half-past one in the morning.

The skipper grunted, sat up, switched on the light, and blinked. He was used to sudden calls and excursions in the middle of the night, and knew instinctively from the tone of the man's voice that the message was urgent.

'Read it out,' he sighed, throwing one leg out of the bunk.

'*Menelaus, Monsoon, Mariner, and Minx* raise steam, and report when ready to proceed.'

'I thought so. What's the weather?'

'Very dark, and blowing a bit, sir,' said Rosser cheerfully, the moisture from his dripping oilskins forming a nice little puddle on the skipper's carpet. 'It's been raining hard this last half-hour.'

Wooten groaned. 'Right! Tell all the officers, and ask Mr Thompson to let me know how soon he'll be ready. And on your way forward tell Spry I want him.'

Spry, able seaman, was the captain's body-servant and general factotum.

Wooten threw open the small scuttle over his bunk and looked out. It was as black as pitch, the wind whistled and moaned mournfully, and a wave of moisture smote him in the face. It

would be a wild and wet night at sea. Altogether a depressing night, there was not the least doubt about that. 'Ugh!' he grunted, slamming the scuttle to and drawing the bed-clothes up to his chin.

Enter Spry.

'Usual sea-gear,' his master murmured.

The man nodded. He knew exactly what was wanted.

'We're in for a dusting, Spry.'

'We are that, sir. Will you 'ave your blue muffler or the white one?'

'The blue one, and the clean sweater.'

'You can't 'ave 'im, sir,' said the bluejacket, busy opening drawers and cupboards and pulling out clothes like a juggler. 'E's at the wash.'

'At the wash?'

'Yessir; and so's most of our flannel shirts and stiff collars. If we're to be away long I'll 'ave to wash some shirts out, and you'll 'ave to wear them soft collars of yours.' Spry was always a pessimist in the small hours of the morning. 'Is there anything else you'll be wanting, sir?'

'No, thanks. Nothing bar the cocoa.'

Spry took a vacuum flask from a cupboard, and left the cabin to fill it. This also was a matter of routine; for cocoa, a cushion, and a rug were always put in the charthouse every night for Wooten's use when the ship was at sea.

The skipper clambered out of his bunk, lit a

pipe, and dressed. This operation took him quite ten minutes. First came his ordinary garments, and a heavy woollen sweater and blue muffler; then a pair of thick socks; next a pair of fisherman's white woollen stockings worn over his trousers and reaching well above his knees; over them, a pair of rubber sea-boots. Next a uniform jacket, a lammy coat, another muffler, and an oilskin on top of everything. It was wet, and the weather was cold, and Wooten did not intend to be chilled through to the marrow if he could help it. His apparel was completed by a sou'-wester and a pair of glasses slung round his neck; and, thus arrayed, he clambered slowly up the ladder and waddled forward along the deck to the charthouse. It was too dark, and he was too bloated, to proceed briskly.

Hargreaves, the sub., yawning his head off, was already up there sorting out his charts.

'Morning, sir. D'you know where we're going?'

'Haven't the vaguest notion. The *Menelaus* is the boss, and will get the orders. She may tell us when we get outside.'

'How long are we likely to be away?'

'Don't know. Last time we left in a hurry we didn't come back for a fortnight. The time before, we were away for six weeks.'

'What'—

'If you ask me any more questions I shall be peevish,' Wooten interrupted. 'It's high time you knew that I'm not fit for polite conversation at this unholy hour of the morning.'

'Sorry, sir. I forgot.'

Half-an-hour afterwards, by which time steam had been raised, and the fact had been reported, Wooten climbed the ladder on to the bridge.

'Signal for destroyers to slip, sir,' came from Rosser a minute or two later, as a lamp winked frenziedly in and out in the darkness about a mile away. 'Form single line ahead; speed ten knots.'

'Let go forward!' went the order to the first lieutenant on the fore-castle.

There came the splash of the end of the wire as it fell into the water, and a moment later a hail from MacDonald. 'All gone, sir!'

'Half ahead port. Half astern starboard. Helm hard aport.'

The engine-room reply-gongs clanged, and the *Mariner* began to turn on her heel.

'Slow astern starboard—Stop starboard—Half ahead both—one-eighty revolutions,' in succession. 'Helm amidships. Steady!'

The four destroyers, falling into line astern of each other, groped their way down the congested harbour like wraiths in the night. Wooten glanced at the dark shapes of the other ships as they slid by. 'Lucky dogs!' he murmured. 'You've got a lie in. I envy you. This is not a night for poor old Peter to be at sea.'

He was right. By the time they reached the

entrance the rain was coming down in sheets, and the wind had increased. Then the bows lifted to the first swell, and a dollop of spray flew over them, and rattled against the bridge-screens.

'It's going to be wet,' Hargreaves observed glumly, securing the top button of his oilskin.

'It is,' the skipper agreed; 'damned wet!'

In ten minutes, by which time they were clear of the harbour, and speed had been increased to eighteen knots, the ship was prancing and curveting like a frisky pony, and the spray was flying over in sheets. Five minutes later the seas were coming in green over the upper deck.

'Oh hell!' the captain grouched, stowing away his useless pipe after vainly endeavouring to relight its sodden contents; 'this is the limit!—Look out, sub.,' he added, glancing at the next ship ahead, whose dim shadow danced through a welter of spray a cable and a half in front. 'Shove her on a bit. You're astern of station, and dropping fast. Lord!' he added, 'I wish I knew where we're off to.'

His prayer was not answered until daylight, by which time they were far to the southward, and the *Menelaus* informed them of their destination. They were going to the warmest spot most of them had ever known, though they were not aware of it at the time. Warmth can come from the Huns as well as from the sun.

II.

The intermittent rumble of heavy guns had sounded continuously all through the night, and with the approach of dawn and the commencement of the usual 'early morning hate,' the intensity of the dull reverberations increased. The *Mariner* and her consorts were within about twelve miles of the spot where the long line of opposing trenches debouched into the North Sea; but even at this distance they could see the brilliant illumination caused by the star-shell as they burst. The dark-blue sky above the horizon to the south-east was never free of them.

'Lor!' said Billings in an awed whisper, watching the blue-white flashes as they burst suddenly out in the air, hung for a moment, and then waned slowly away, to be replaced by others; 'some poor blokes ain't arf gittin' it in the neck!'

There was a romance and an interest about the spectacle which it is rather difficult to define. For one thing, it was the closest they had ever been to the front; but here, on board the ship, everything was going on in the same old way, and the men went about their business as usual. But there, a bare twelve miles off, the deep-throated murmur of the guns showed that men were striving to kill each other, while the star-shell must have been flooding the closely packed trenches with unwelcome light. It seemed a little difficult to realise it, somehow.

The morning was cloudless and calm. The light increased, and as the sun neared the horizon a band of pale rose-madder and dull orange slowly began to encroach on the dark blue of the upper sky to the eastward. Before long they could see the hostile coast itself as a thin, blue-gray streak punctuated here and there by the spires and houses of the coast towns, magnified out of all proportion by the deceptive light. Hanging in the air, and all but invisible to the naked eye, was the bloated, caterpillar-shape of a German observation balloon. It looked ominous and menacing, and the Hun in the basket suspended beneath it was evidently going aloft to see whom his guns might devour for breakfast. The coast was reputed to bristle with weapons, some of them of prodigious range, and the men in the destroyer hoped fervently that they might not be victims of his wrath.

Then, quite suddenly, the dull blue above the broadening band of colour began to twinkle and sparkle with little spurts and splashes of bright yellow flame. They did not appear in ones, twos, or threes, but in batches of twenty or thirty at a time. The rumbling of the guns started afresh, for the flashes were the bursts of the enemy's anti-aircraft shell, fired at a swarm of allied aeroplanes making an early morning bombing attack; and, from the look of things, somebody was getting a tolerably hot time. More killing! It was rather like watching a gladiatorial combat in the arena; but it was a fine sight, and the 'Mariners' would not have missed it for worlds.

Presently, when the rosy light of the dawn had mounted up into space, the thudding of the distant guns ceased. The attack was over, and the bombs had evidently been dropped; but the clear sky over the shore was still flecked and stained with hundreds of smoke-puffs slowly dissolving on the gentle breeze. They showed blue and purple against the vivid contrasting colour beyond.

Air raids, and their subsequent reprisals, were a speciality of this locality. They took place nearly every morning and evening the *Mariner* was there; and as the visiting machines had a comparatively short distance to travel before reaching their objective, they were carried out by too many aeroplanes, and with too great a frequency, to be pleasant.

In the French town within reach of the aerial Hun business went on as usual; but at the first wailing of the warning hooter the inhabitants bolted to earth like rabbits to their burrow. Every house which possessed a cellar showed a small red flag over the doorway, and any one who cared to claim admittance was given shelter. Trams stopped and disgorged their living freights. Adipose tram conductors, elderly women dragging frightened children, ancient male civilians, *poilus* in their slate-blue uniforms, any one and every one, made a bee-line for the nearest symbol of a

cellar and safety. It was a wise precaution which must have saved many lives; for, though the Hun may be given the credit of only wishing to damage places of 'military importance,' and to kill members of 'the armed forces of the enemy,' his bombs, as often as not, were liberally sprinkled upon the residential and commercial portions of the town. Added to this, every anti-aircraft gun in the neighbourhood—and there were many of them—sent its shell hurtling skywards to drive the invaders away. The bits had to fall somewhere; and if a jagged morsel of steel weighing one ounce falls on the head of a human being from a height, say, of ten thousand feet, there is nothing for it but a funeral and mourners. So it is wise to keep indoors in any case, wiser still to repair to somebody else's cellar if you do not possess one of your own.

But after the raids, when the inhabitants emerged from their burrows, the small boys and girls collected splinters and sold them as mementoes. The trade was very brisk, and prices sometimes ran high. Bomb fragments—and one could not help suspecting that many of these were manufactured at home in the quiet intervals—commanded fabulous sums. I still treasure a fleeting vision of a British army captain in khaki, flourishing five-franc notes, pursuing a sky-blue *poilu* down the street in the midst of an air raid. The Frenchman hugged to his bosom the dangerous remains of an aeroplane bomb, a wicked-looking affair painted bright yellow, and filled with some devilish compound guaranteed to kill or to cure. The Englishman wanted it badly, and, being the faster of the two, eventually overtook his quarry, and obtained the relic for fifteen francs. What he did with it I cannot say. One can hardly think that it was received with gratitude by his loving parents, or that it occupied the niche of honour in the hall of his rich but nervous aunt.

But whatever we may have said about bombing attacks at sea, air raids on a town are not the least bit amusing until afterwards. The whistle of a descending bomb is the most uncanny and unpleasant sound it is possible to imagine, far and away nastier than the howling and screeching of a passing shell. Moreover, in an air raid on a town the visitors can hardly fail to hit some one or something, and it may possibly be us.

III.

'The Secretary of the Admiralty announces that an action took place yesterday afternoon between British and German destroyers. The enemy suffered considerable damage, and were forced to retire. Our casualties were insignificant.'—*Daily Press*.

It is rather galling to find one of the most eventful and crowded hours of one's existence disposed of in four lines of cold print, not even the name of a ship mentioned!

It made the ship's company of the *Mariner*

feel very small and insignificant, and the puffed-up, proud sort of feeling they had when they came out of their first real action oozed from them like gas from a punctured Zeppelin.

Sailors are peculiar animals. They long to frustrate and confound the Hun—that goes without saying; but, having done their best in this direction, they are equally desirous that their friends and relations shall be aware of the fact. Most of the men expected at least to see the *Mariner's* name in the newspapers. A good many of them, though they would not have admitted it, would have been highly flattered had their likenesses appeared in the *Morning Mirror*. 'A naval hero who has been doing his bit' would have sounded well as a superscription, though perhaps a trifle fulsome; while further photographs of the 'naval hero's' wife and family, his father and mother, the schoolmaster who had taught him, and the public-house which he sometimes patronised would also have been suitable to the occasion. But unfortunately the newspapers took no notice of the affair; and, since the censorship of naval news was strict, they probably never even realised that such a ship as the *Mariner* existed. It was a pity, for, from the point of view of the men and their friends, anything and everything which appeared in the Press must, of necessity, be a fact. If a man went home and said he had been in an action which had never publicly been announced, it was possible that his immediate neighbours might believe what he said. It was more than probable, however, that 50 per cent. of outsiders would treat his story *cum grano salis*, and think that he had exaggerated. Corroborative evidence is always useful.

To Pincher Martin the recollection of his first action at sea is still a vague and shadowy impression of mingled fact and fancy. He had kept the forenoon watch, and on going below at noon had consumed his usual midday meal with great relish. Then, with a satisfied feeling of repletion, he stretched himself at full length on a hard and very uncomfortable mess-stool, and went off to sleep. He was not the only one; but he had kept the middle night watch also, so there was some excuse for him.

Towards three o'clock he was suddenly brought back to his senses by the prolonged and irritating jangle of an electric alarm-bell. 'Gawd!' he murmured, sitting up with a start, and rubbing his sleepy eyes; 'wot's the buzz now?'

He was not long in finding out, for at that same moment Petty Officer Casey put his head down the hatch. 'Below there!' he howled cheerfully. 'Tumble up! Enemy in sight! General Quarters!'

His words were punctuated by the sound of men running along the upper deck and the rumble of a gun. The report was faint but unmistakable, and it did not come from the *Mariner*.

Followed by various of his messmates, Pincher darted for the hatch, clambered up the steep ladder, and ten seconds later appeared at his gun on the fore-castle breathless and inquisitive.

'Wot's up?' he queried, more by instinctive curiosity than because he really wanted the opinion of any one else.

'You stan' by to 'ump them projectiles!' grunted an A.B. 'This 'ere ain't the time to git askin' stoopid questions!'

Pincher obediently placed a lyddite shell in the loading-tray and waited.

Three British destroyers were in single line ahead, the fourth being away on some business best known to herself. The *Mariner* was the centre ship, and she quivered and shook to the thrust of her turbines; while, from the sensation of speed, and the great mass of white water heaped up under the stern of the next ahead, Pincher guessed they must be travelling at about thirty knots. Three or four miles away to port, rather difficult to see against the gray background of shore beyond, were the lean shapes of three other torpedo-craft. They also were steaming at high speed, and left a long white trail in the water astern of them, and seemed to be steering on approximately parallel course. They were German, of course, and as he watched a ripple of bright flame and a cloud of brown smoke leapt out from their leading vessel. They were firing, and at him. He felt rather frightened, and suddenly became possessed of a bitter resentment against the enemy who were striving to kill him and his shipmates. He had done them no personal wrong, so why should they try to take his life?

He held his breath and waited for the shell to drop; but the pause seemed interminable. Then he heard the sound of the reports, and saw three or four whity-gray splashes in the water between him and the enemy. The shell were fully six hundred yards short, and harmless. He breathed again.

Some order came through a voice-pipe to the gun; whereupon the sight-setter twiddled a small wheel, and peered anxiously at a graduated dial, while the gunlayer, breathing heavily, applied his eye to the telescope. The muzzle of the gun began to move up and down in the air as the sights were kept on the enemy.

'Train right a bit, Bill!' came a smothered remark. 'Train right, damn yer eyes! That'll do! Keep her like that!'

A bell rang somewhere. A moment's pause, and then, with a sheet of flame and a crash, the weapon went off.

When once the business really started Pincher felt better. The anticipation, that awful period of suspense between the time of the enemy being sighted and the first shot being fired, was far and away worse than the actual fight itself. The noise and excitement acted as a sort of anæsthetic. They had a deadening effect which

dulled the finer workings of his mind, and did away with most of his previous and poignant mental agony. He realised in a vague sort of a way that he might be killed; but the process of being under fire, when once it had started and the enemy was being fired at in return, was not nearly so bad as he had imagined it would be.

He had the task of placing a projectile in the loading-tray every time after the gun had fired, recoiled, ejected the spent cylinder neatly to the rear, and then had run out again and had been reloaded. He did it almost automatically, and without having to think about it. Time became an unknown quantity. Seconds sometimes seemed like hours, and hours may have dwindled to minutes for all he knew. All the sensations he was really conscious of at the time were a supreme desire to keep up the supply of shell, an overwhelming hatred for the enemy who dared to fire upon him, a most unpleasant feeling of heat, and an intolerable and raging thirst. The acrid taste and smell of the burning cordite may have produced the thirst; but after five minutes of firing, Martin would have bartered everything he possessed for a mug of really cold water.

Incident succeeded incident with such rapidity that he could not concentrate his attention on any one particular thing. He saw great white splashes in the water, some of them perilously close. The noise of the *Mariner's* own guns overpowered every other sound, but between their reports he heard the fainter thudding of the enemy's weapons, the peculiar whining drone of hostile shell as they hurtled through the air, and the fiendish whirring and whizzing of their fragments as they burst. There came a jar and a metallic crash which told him that the ship had been hit somewhere close. He had no time to look round, but waited anxiously for the missile to pulverise; waited for what seemed minutes for the flame and roar of an appalling detonation and a shower of splinters which would sweep him to eternity. They never came. The

shell had passed through the forecastle, and out again through the side of the ship, without exploding.

His own gun was firing very fast, and he could not see much, but in the rifts between the sheets of flame and clouds of smoke caused by its discharge he caught occasional glimpses of the enemy. They were still steaming fast, and seemed rather closer than before, and from the sea round about them spout after spout of spray leapt into the air as the British shell pitched. The brilliant gun-flashes still twinkled up and down their sides as they fired; but he was glad they were having a hot time.

The next time he saw them they seemed to have turned shorewards, while the British, still firing heavily, steamed in pursuit. Then, in the after-part of the middle German destroyer, the one the *Mariner* was firing at, he suddenly noticed a wicked red flash and a cloud of oily black smoke. A shell had gone home. He could have shouted in glee had he not been so breathless.

The long-range action lasted for a full fifty-five minutes, with both sides blazing away merrily the whole time. What damage was done to the enemy it was impossible to say, but it was clear that they suffered considerably, and that they were forced back to their own coast. As regards their numbers, guns, size, and speed, the opposing craft were pretty evenly matched; and if the action had taken place in the open sea it would have been fought to a finish at close range, or until one or other of the combatants retired post-haste from the contest. In this eventuality, given average luck, it would not have been the British; not because the German is any less brave than his antagonist, but because he has fewer ships to risk, and is supposed to have orders not to give battle unless he has a good chance of winning. But man proposes and God disposes, and the fight was more or less a drawn one.

(Continued on page 791.)

DIAMONDS IN SOUTH-WEST AFRICA.

By H. A. BRYDEN.

WHEN General Botha conquered German South-West Africa last year in so masterly a fashion, he gained for the Union of South Africa, in addition to a huge territory of more or less valuable pastoral and agricultural possibilities, two very important assets in the valuable copper and diamond mining industries, both in a fairly well organised condition. The copper deposits are found at present at the Otavi Mine in North Damaraland, a region rich in this ore and long known to the natives, as well as at the Pot Mine on the Swakop River, the Matchless Mine in the Komass Hills, lying west

of Windhoek, and at the Hope and Garob Mines in the Namib district of Great Namaqualand. These mines yielded an export in 1913 of the value of one hundred and fifty-six thousand one hundred and six pounds, a marked increase on the one hundred and eighteen thousand two hundred and twenty-eight pounds of 1912. The Otavi Mine produces the great bulk of this output, and is now connected by rail with the coast at Swakopmund. There can be no doubt that other important deposits of copper will be found in the future in various parts of South-West Africa. Tin and gold have already been

discovered, and very large deposits of good marble have been opened up in the Karibib region.

But the richest and by far the most important mineral discovery so far made in South-West Africa is that of diamonds. Until the year 1908, although there had been rumours of these precious stones in various parts of the territory, and desultory explorations had been carried on, no actual discovery had been made. The first find was not quite so romantic in character as that of the first Cape diamond, which was picked out in the year 1867 by a wandering trader and hunter named O'Reilly from among a handful of pretty coloured pebbles spread on the rough table of a Boer farmhouse. These pebbles had once been the playthings of a bushman's child on the Orange River, and had been taken over as toys by the Dutchman's children.

In April 1908, however, a 'Cape boy' who had once worked for the De Beers Company at Kimberley, while engaged on the German railway line at Kolmanskop, in the Lüderitz Bay district, picked up several stones which he knew to be diamonds. These stones, the forerunners of a great and important discovery, were acquired by a railway superintendent and contractor named Stauch, who in the previous year had accurately gauged the possibility of the discovery of a diamondiferous region behind Lüderitzbucht. He had thereupon taken out prospecting licenses, and told native labourers on the railway line to bring him any curious stones found in the course of their operations. August Stauch was quite right in his theories. Within a fortnight after telling the natives to keep a lookout for stones, the first diamond in the Lüderitzbucht district was brought to him by the 'Cape boy.'

Stauch now pegged out claims, and declared his find at Swakopmund, where the Government geologist, Dr Range, at once confirmed him in the importance of his discovery. Then ensued the usual 'rush' to a newly discovered diamond-field, and the barren sands of the desert east, north, and south of Lüderitzbucht were covered and explored by hundreds of eager folk, all burning to make a rapid fortune. Most of these early adventurers were soon driven from the scene by the desert and waterless nature of their surroundings, and by their own ill-success in finding stones. At that time (1908) there was little transport, and water and food were extremely scarce commodities. The single prospectors were soon squeezed out; but various companies which were rapidly formed had better fortune, and presently two very important fresh finds were made. These were the discovery of the Bogenfels diamond-fields far south of the first field, and another and even more important discovery in the Pomona district by Stauch and Professor Scheibe, of the Berlin Mining Academy. This latter opened up a diamondiferous area of

great wealth, and the stones discovered were found to be of a much larger and more valuable type than those hitherto brought to light. In the course of their explorations Professor Scheibe and Stauch found diamonds as far as one hundred and fifty kilometres south of Lüderitzbucht, near the coast in the vicinity of Sinclair Island. The diamondiferous area hitherto discovered is quite a considerable one, extending from Conception Bay, one hundred miles south of Swakopmund, southward as far as Angra Juntas, some sixty miles north of the Orange River. The total length is about two hundred and fifty miles, and the diamond-bearing strip ranges, with many intermittent breaks, from two to twelve miles in width.

The northern parts of the field have hitherto not been so successful as those farther south, and under German rule the heavy Government taxation—one-third per cent. of the proceeds of sale, plus *régie* and other profits—proved an almost impossible handicap. On the other hand, water is somewhat more abundant, and under the rule of the Union Government of South Africa it will probably be found that these fields may be made payable to the companies or individuals owning them. The water-supply of the southern fields may be described as originally *nil*, for the country is sheer desert, with almost no rainfall. Wells have been sunk, which here and there provide a brackish liquid unfit for human consumption, but just drinkable by animals. For drinking purposes water is produced from condensers on the coast; and this is carried in carts and small tanks borne by pack-animals to the localities where it is required. At the Kolmanskop field, where twenty million pounds' worth of diamonds are believed to be now 'in sight,' sea-water is obtained from Elizabeth Bay, seventeen miles away; and here a big pumping-station has been set up for the purpose. Electricity for lighting and power purposes is supplied from Lüderitzbucht, or was before the war, to various mining companies.

The diamonds thus far have been chiefly found in a deposit of sand and gravel, varying in depth from six inches to fifteen feet. The raging trade-winds which blow periodically in this region have carried the smaller and lighter gems to the sand-dunes, characteristic of Great Namaqualand; but the heavier stones and a layer of other particles are often left in rich pockets, where many of the gems may be found together. As a rule the stones are much smaller than those found at the Kimberley and Vaal River diggings, going some six or eight to the carat; but some large stones are occasionally found, the heaviest yet discovered attaining thirty-four and seventeen carats respectively. They run in all colours—pure white, yellow, lemon, pale pink, dark red, and even in bluish, greenish, and blackish tints. Of a parcel of one thousand five hundred and fifty-eight diamonds, however,

no fewer than eight hundred and nineteen were clear white, or had only a trifling yellowish tinge. It will be remembered that very many of the Cape diamonds are characterised by this pale-yellow tint. These precious gems are found among sand and gravel, including minute fragments of banded agate, red garnet, milky quartz, yellow chalcedony, red jasper, white felspar, epidote, magnetite, and specular iron, often accompanied by particles of granite and gneiss.

The diamonds of South-West Africa have a character of their own. They are said to resemble Brazilian stones, and can readily be distinguished by experts from the Kimberley and Vaal River gems. Not long since some natives produced in Cape Colony certain small diamonds which they pretended to have found in the Vaal River alluvial diggings. But the experts detected them at once. They were not Vaal River stones, but had been stolen in German South-West Africa. The puzzle to all geologists and diamond and other experts—a puzzle at present completely lacking solution—is how these diamonds of South-West Africa got into the torrid, waterless, and forbidding sand deserts in which they are found. Dr Wagner, author of *The Diamond-Mines of Southern Africa*, after discussing and dismissing various theories, states his belief that they are derived from a primary deposit or primary deposits which now lie buried in the sea somewhere off Pomona, one of the principal fields, where the heaviest stones are found. Dr Marloth states that among the prospectors 'the belief is quite common that Pomona diamonds came from some volcanic fissures that occurred there.' Another authority, Dr Versfeld, believes that the diamond-bearing gravel is not of marine origin, but débris from diamond 'pipes,' which has been concentrated by strong winds, and that the stones may have been thus transported hundreds of miles. He is of opinion that the discovery of diamond-bearing pipes 'much nearer to the Lüderitzbucht deposits than those at present known seems well within the bounds of probability.' It is worth stating that 'pipes' and dikes resembling the Kimberley formations

have been discovered in the Keetmanshoop, Gibeon, and Bethany districts, much farther east of the new fields; but these, singularly enough, contain no diamonds.

How valuable the diamond industry of South-West Africa is to the Union of South Africa may be gauged by the following figures:

DIAMONDS PRODUCED IN SOUTH-WEST AFRICA.

	Carats.	Value.	Value per Carat.
1908 . .	39,762	£53,842	27s. 1d.
1909 . .	519,190	704,123	29s. 0-5d.
1910 . .	792,642	1,015,779	25s. 7d.
1911 . .	766,465	968,418	25s. 3-1d.
1912 . .	992,380	1,408,738	28s. 4-7d.
1913 . .	1,470,000	2,953,500	40s. 1-9d.
Total .	4,580,439	£7,104,400	

These figures are from Dr Wagner's *The Diamond-Mines of Southern Africa*, and they are worth pondering.

In 1911 the total value of the diamond output in the Union of South African territories was eight million seven hundred and forty-six thousand seven hundred and twenty-four pounds; in 1912, ten million sixty-one thousand four hundred and eighty-nine pounds; and in 1913, eleven million three hundred and eighty-nine thousand eight hundred and seven pounds. These mines have been established and at work some forty years; and the output of South-West Africa for 1913, close on three million pounds, after a mining life of five brief years only, makes by comparison quite a formidable showing. Some very wonderful dividends have been paid by German mining companies on these fields. Thus in 1912 the Koloniale Bergbaugesellschaft paid its shareholders 3800 per cent.; in 1911 the dividend was 2500 per cent. In 1913 the Pomona Company paid a dividend of 175 per cent. The German Government, by taxation, *diamant régie*, and in other ways, derived very large profits from this industry; and it may be expected, therefore, that as the mines develop the Union of South Africa will prove to have done a magnificent stroke of business in the acquisition of these fields alone, as a result of General Botha's remarkable conquest.

THE ROMANCE AND PATHOS OF TRENCH AND HOSPITAL LIBRARIES.

By CLIVE HOLLAND.

DURING the first fifteen months of the conflict nearly a million and a half of books (mostly works of fiction) had been despatched to the troops in France and at the other theatres of war where British soldiers are fighting for the Empire and for the ideals of freedom and civilisation. And how welcome these books have been! Returned soldiers, whole and sick,

whom we have met have told us that but for the solace of reading they would have been badly off indeed for recreation and amusement in the gloomy dug-outs, the trenches, and the huts which afford them some sort of shelter. In these, often by the light of a candle stuck in a bottle or upon a piece of wood with a nail driven through it, the war is happily for

a brief respite driven from the mind by the glamour of some romance or 'the magic carpet' provided by some book of travel.

Letters received by those who have been privileged to be connected with the organisations for supplying the troops and seamen with 'something to read' give many interesting insights into the life of the trenches and hospitals. Here is one from a correspondent 'somewhere in France,' that official and non-committal phrase which often covers a tragedy in being: 'You cannot imagine with what pleasure I received the parcel of books. There is a small library attached to one of the huts not far away; but now I've started a lending department in our trench. It would amuse you to see the volumes in the improvised bookshelf made of a sugar-box. Perhaps it may surprise you to know that some of the older books are first favourites. Lots of chaps will take Dickens or Scott before some of the much-boomed writers of to-day. But we all like W. W. Jacobs, Pett Ridge, and Conan Doyle, to mention a few of the best. I have just been reading *Thirty-Nine Steps*, and I nearly got caught by a "Jack Johnson" whilst doing so. I have lent it to B., who has just returned it. He says: "Hang it! I wish the chap who wrote it had made it sixty-nine steps, if it would have meant a longer book." This is a compliment that John Buchan will doubtless appreciate. It is difficult, however, to tabulate favourites; for our armies in the field are such cosmopolitan bodies that every taste seems represented.

An officer lately returned from the front told us that he picked up in one of the trenches near Ypres a copy of *Sophocles* in Greek, well thumbed and water-stained, and within a few yards a copy of a popular threepenny sensational novelette! 'Both,' he remarked, 'had been well read. The latter emanated from a large firm of cheap literature providers, and the former from one of the oldest publishing houses in London. The *Sophocles* was stamped with the arms of Haileybury School.'

But in cheap editions even the lesser-known and second and third rank writers of to-day are having a run such as they never enjoyed before. There is not, perhaps, much money in it for them when they have parted with sixpenny or sevenpenny rights for a ten-pound note, but they have the satisfaction—and it should not be a small one—that they have passed away many a weary hour for many a war-worn man or invalid.

Strangely enough, we have been told over and over again that Kipling is not a great favourite with soldiers. Many, indeed, dispute the 'atmosphere' and truth of some of the 'Barrack Room Ballads;' and although we have met with enthusiastic readers of several of his animal stories, and admirers of *Stalky & Co.*, the impression and weight of evidence seems to be against the

assumption that he is immensely popular with the men in the trenches.

It may surprise many—though it should not do so—that there has been a great revival in the works of Thomas Hardy. Over lunch recently we were talking of books with a returned corporal belonging to the Somersetshire Light Infantry, when he said, 'Some one sent us out a parcel with several of Hardy's books in it; and a lot of chaps I'm with have asked me to bring back some more if I can get hold of them. They bring back their homes to them, and the folk they know, though of course they are Dorset characters, and not people of our own county. The copy of *Under the Greenwood Tree* which we had was literally worn to rags, and much to our regret a "Jack Johnson" wiped it out at last, as it was buried in the mess kicked up by the shell. Unfortunately,' continued the speaker, 'the chap who had put it down was blown almost to bits by the same shell.'

Doubtless Mr Arnold Bennett would have been pleased to hear of a man of the Staffordshires discussing the relative merits of the trilogy of novels into which critics are of the opinion that he has put some of his best work. 'I don't think he does some of the folk at home [in the Potteries] fair justice,' exclaimed my friend from the trenches home on leave, and speeding thither in a L. & N.-W. express. 'But he's a wonderful chap is Bennett for all that, and I've to thank him for many an hour's amusement. How he'd laugh, to be sure, to see me in my "Ritz Hotel," reclining on a wooden shelf, and hoping to Providence that the bit of candle I had got hold of would last out till I'd finished the chapter.'

No one will wonder that Charles Garvice is popular. 'I like stories of girls, and fellows of a cheerful blighter sort,' said one reader from the Neuve Chapelle sector. 'I've met 'em myself, old friends most of 'em, and am glad to meet 'em again. He don't give you problems, and cross-purposes which lead to miserable endings. I like his stuff, that I do.' And the speaker evidently did. We heard much the same sort of thing from a correspondent who wrote: 'If you want to know the sort of books we like out here, send along a few of Garvice, Stanley Weyman, Percy White, and Max Pemberton. If you've got a Mary Johnston to spare, throw it in.' Stevenson, too, is a prime favourite. How he would have rejoiced! We know of quite a number of copies of his *Inland Voyage* which have crossed the Channel, and are now in hospitals and dug-outs; and *Treasure Island* is exercising its immortal spell in Flanders, as in every other part of the globe where Britons have gone, and where the English tongue is spoken.

It is, indeed, almost impossible to believe that any one who has read much fiction, who is between the ages of fourteen and five-and-twenty, has not been enthralled by that wonderful yarn

of Pew and Jack Silver. But at least one young fellow—a public school boy, too—had not read it. 'Thanks ever so much for *Treasure Island*,' came a letter home. 'I've often meant to read it, but never have till now. I am deep in it, though the Boches just recently have been giving us a worrying sort of time. . . . I only hope that I shall not be done for before I find out whether the treasure is found. I fancy Pew had the true Hun spirit.' Alas! the young writer never found the secret of the pirate's treasure in Stevenson's absorbing romance. He was killed by a bomb ere he could finish the book. But by a deed of conspicuous gallantry he has left to his family a treasure of honour greater than that of gold ever interred in Bahama Cay or pirate isle.

We were shown not long ago a copy of one of Anthony Trollope's once widely read novels reissued in handy but substantial form in Bohn's Library. Penetrating four-fifths of the way through it was a hole the size of a cedar pencil, or perhaps a trifle larger. The owner of the book said, 'This saved my life. That hole is a German Mauser bullet-hole.' And then he laughed, adding, 'When I received the book and commenced reading it I wrote home: "Thanks for the novel of Trollope's. It's a bit hard reading, and plenty of it." Luckily for me, there was!'

Most readers must have heard of Mrs Hegan Rice's book, *Mrs Wiggs of the Cabbage Patch*. Many humorous stories have centred round it. One at least has its origin in the trenches. In the spring of last year several of the men of a certain unit in Flanders who had gardening instincts set about making a garden both for flowers and vegetables no very great distance back from the firing-line. Some one mentioned that there was a book called *Mrs Wiggs of the Cabbage Patch*, and it was decided that one of the enthusiastic gardeners should write home for it. 'It must have something about other things than cabbages in it,' said one of the company, and doubtless visions of 'timely hints for timely crops' came before the enterprising one's eyes. When it arrived it was not what they expected. But they all enjoyed reading it, and now *Mrs Wiggs of the Cabbage Patch* is a standing joke.

One of Sir Gilbert Parker's novels is a treasured possession in a certain West of England family. The copy is only a sevenpenny. The cover is stained and discoloured, so that it is difficult at first sight to decide upon its original shade. In it are written several comments by the boy (he was little more) to whom it belonged. Against one incident of courage and splendid valour is inscribed: 'This is the real thing. I wish that I may have my chance and do as well.' He had his chance, and did as well. But the laurel-leaves had to be placed upon a lonely grave, and not upon a youthful brow. Who knows but that incident inspired the dauntless

courage which has gilded his name with the gold that no time can dim!

There have been many romances connected with the war, and some at least with the books that have found their way to the battlefield. Not long ago there was married in an Essex church to a charming girl a young private who before the war had been one of the idle well-to-do. Between the pages of a novel which was given out to him from a box of books that arrived at the front he found the photograph of a remarkably pretty girl, and in the book itself the name and an address of the owner. He fell in love with the photo, and wrote to the owner of the book. In the letter he told of the finding of the photograph, and asked whether the original was unmarried, and known to the person whose name appeared in the volume. A reply was sent to the young private (now a Lieutenant) to the effect that the girl in the photograph was a cousin and a great friend. Other letters followed; and at last, when certain inquiries had been made by the girl's father regarding the young fellow, he was given her address. Soon afterwards he obtained five days' leave, came home, called upon the young lady, and was engaged ere his leave expired. Six months at the front passed, with two short leaves in between, and the marriage took place quite recently.

There are humorous, pathetic, and romantic incidents connected with the libraries which have been formed for the use and entertainment of the wounded at the various hospitals in France and elsewhere. Here, more even than in the trenches, the cheerful book is in demand. The happy ending, if not a *sine quâ non*, is at all events much more appreciated than the sad or unsatisfactory one. And who can wonder?

The lighter type of fiction, good biography, travels, and poetry are very popular; and the works of women writers who can tell a good cheerful and natural story are in great demand—for example, those of Mrs Henry Wood, Rhoda Broughton, 'Rita,' Mrs Hungerford, the Baroness Orczy, Gene Stratton-Porter, and Madame Albanesi; and those of such diverse writers as Jane Austen, Marie Corelli, Mrs Humphry Ward, and 'Frank Danby' are very popular. Among the men writers (in addition to those we have already mentioned), we have found A. E. W. Mason, H. G. Wells (especially his *War in the Air*, *Bealby*, *Kipps*, and *Tono Bungay*), Rider Haggard, Seton Merriman, 'Q,' Cutcliffe Hyne, W. J. Locke, and Eden Phillpotts in great demand. Among the older authors, Thackeray, Dickens, Meredith, Fenimore Cooper, Clark Russell, and Jules Verne are having quite a run. In one hospital we recently visited we found men reading Macaulay, Stephen Phillips, Austin Dobson, Tennyson, and that great popular American poet Whittier.

The demand for a happy ending to a story is

sometimes very pathetic. A nurse told us of a serial in a monthly magazine that had been perused by two of her patients, and how one of them was depressed for a whole day because the heroine died. 'I wish, Sister, I had never read it,' he exclaimed. 'I got to like that girl, and if I could have found one something the same when I got out and about again, I should have married her if she would have had me.'

By a strange chance a lady novelist, one of whose stories was running in a magazine recently, paid a visit to a large base hospital in France. The men heard she was there, and one poor fellow asked that he might speak to her. When she came to his bedside he said, 'I don't think I'm likely to pull through this bout, ma'am—I've had two turns before in hospital—but I'd like to thank you for writing that jolly yarn. It's cheered me up a bit, and shown me that there's some good in suffering.' We fancy that no more touching or splendid testimonial has been received by any writer during the war. But perhaps we are mistaken.

From one of the base hospitals near Dunkirk was forwarded home a leaf torn from a popular work of fiction, upon which had been inscribed the last message of the unfortunate young fellow who had been reading the book. Round the page, in straggling letters, ran the words which told how he had lain for two days with a fractured thigh and a wound in his shoulder. On the third day he traced: 'I shall die of thirst. As yet no one has been able to reach us. The contents of my water-bottle I shared two days ago with Lieutenant J., who died the same night. I have little hope of being picked up alive.' Then came the last words: 'I can see to write no longer. Good-bye, mother and Monica (the girl to whom he was engaged); all is coming over dark. There is nothing save the fresh roar of the guns. I can see a light. Good-bye.' Then followed a succession of irregularly formed X's. One can imagine the passing of that poor lonely soul. Let us hope that the light he saw in that great hour of agony and death was the beautiful garment of that Comrade unseen by the living, in whose touch there is healing and rest.

It may be that some readers have books which they can spare and would like to devote to the amusement and solace of our soldiers and sailors at the front, on the sea, or in the hospitals. These may be handed in at any post-office, from which in due course they will be forwarded free of charge. At one time one hundred and forty thousand items of literature were being sent weekly to the Camps Library; but there was a shortage of one hundred thousand a week, as two hundred and fifty thousand a week are required. Books and magazines will also be welcomed by hospitals and the Y.M.C.A. huts.

The Germans have their system of field libraries. A war correspondent in the *Times* notes that the books are mostly paper-bound volumes about six

and a half by four and a half inches in size, thin enough to be slipped into the pocket. They are printed in clear type, so as to be easily read in indifferent light, and contain chiefly short stories and the like. The books are packed in boxes of a regulation pattern, in shape and size much like the wooden boxes that one sees on confectioners' shelves. These boxes are carried on the field kitchens, and pass through the army from one company or battery to another. The books are stamped on the title-page that they belong to the Field Library. Men draw a book at a time, sign for it, and when it has been read exchange it for another. It is, in fact, an ordinary but very extensive official circulating library system, wherein the process of circulation is not confined to the individual volumes, but the whole library unit circulates from troop to troop. The literature is generally good work by standard authors. Judging from the 'finds' in some of the dug-outs, however, neither the outburst of German nationalism, the writer says, with its effort to expel the use of all enemy languages, nor the official providing of other literature, has succeeded in killing the German officer's liking for French novels; and, judging from samples seen, the correspondent thinks his taste in them is—well, dubious.

GOD'S ANGELS.

BROTHER, the way is dark,
Dark by the river Somme;
But, list to yonder lark
Singing of home!
Singing of home and rest,
High o'er thy war-worn breast,
The lark goes soaring west—
Singing of home!

Yea, joy is in the song,
Heaven's glory fills the bars
With ecstasy, and shadows long
With gleaming stars—
With stars that float on high,
Like angels passing by,
They gem the dark'ning sky—
Those shining stars.

So, 'mid the storm and stress,
Bidding thy heart rejoice,
Love gives to fearfulness
An angel's voice.
An angel's voice that sings,
A lark on soaring wings,
That heavenward, homeward flings
His angel voice.

The stars that throb and burn
In those expansions fair,
Wait for thy soul's return,
Upshining there—
There by a way of gold,
From whence the mists have rolled,
God and the stars unfold
An entrance there.

GILBERT RAE.

Chambers's Journal

SEVENTH SERIES

PATMOS.

By CAROLINE P. INGRAM.

IN these troublous days, when there is war over all the world, it is good sometimes to turn in thought to the time when there was peace on earth and goodwill toward men, and when one could go to see the most interesting parts of the world without fear of bombs falling from Zeppelins or assaults from murderous torpedoes and submarines. So this little record of a part of a cruise taken a few years ago may recall to memory the pleasant days that are no more.

It is not given to all to be able to say, in the words of St John the Divine, 'When I was in the isle that is called Patmos.' It was, however, our privilege some few years ago to spend a short time in this Holy Isle, as it may well be called. It was after a visit to Constantinople, that gorgeous City of Palaces, of glorious colouring and artistic brilliancy, that we came to this abode of peace and simple life. Before leaving England we had looked in an old *Universal Gazetteer*, dated 1815, which professed to give a concise description of all the known world, with the 'governments, manners, and customs of the inhabitants.' Certainly the account given of Patmos as it was then differed greatly from our experience of the ways of the inhabitants. They are represented in our old book as being of a ferocious character, pirates and murderers, cowardly and cruel. 'They never fail to massacre the crews of the vessels that fall into their power, and after plundering them they sink the captured ships, so that not a trace of their outrages may be left.' So much for a description of the island written when our great-grandparents were attending school.

To return to our own experiences. When we landed at the port of Scala, on a lovely morning of early October, we were not attacked by any cowardly brigands, but we were welcomed by the gentle and courteous inhabitants. They are a handsome, dark-eyed people; and with their kindly, cheerful countenances they looked as though the loving spirit of St John still dwelt amongst them; and certainly the old Italian saying, '*La fisionomia è lo specchio dell' anima*,' is true in their case, for nothing could exceed the gentleness and kindly courtesy they showed to us.

There are no wheeled vehicles in the island, and all carrying is done either by men or by mules. So mules were soon ready for us, and

we rode up to the Monastery of St John, which is at the summit of a hill some six hundred feet high. Here the monks received us, and showed all the treasures of their noble library—all, I should say, except one, the best, the priceless manuscript of the Gospel of Mark, written in the sixth century after Christ. One manuscript which we saw—the Book of Job with a commentary—was very beautiful with gold lettering on purple vellum; this was said to date from the seventh or eighth century. After wandering through rooms and courtyards and corridors, all clean and white, devoid of all ornament save only a few sacred pictures and a crucifix, we came to the refectory, where we were offered the usual refreshment of a spoonful of quince jam and a glass of ice-cold water from the famous well of the monastery. In the chapel is a silver shrine, the tomb of St Christodoulos, the founder of the monastery. The monastery looks like a great castle stronghold, with its many towers and projecting battlements, from the topmost of which there is the most lovely view of Patmos itself, the blue sea round it, with the smaller islands glowing like jewels in the sunlight. The deep-toned bell gives out its sonorous sound, hanging clear in an open turret on the highest point of the building. The small houses of the people are clustered round the monastery so closely that it is hard to tell where the village ends and the monastery begins. The people all seemed gathered under the shelter and care of the monks; and these, with their long beards and their reverend appearance, seemed like the patriarchs of old watching over and caring for the whole community.

We returned by a mountain road and bridle path, through low-growing vines and bushes which shelter numerous birds, quails and partridges, the latter possibly the descendants of the tame partridge which, as tradition says, was the companion of St John in his exile. The legend runs that the bird wandered with him on the hillside, and did its utmost to solace him by its love and companionship. So we got down to the most interesting spot in the island—the lower monastery, which is built over the cave where St John is said to have lived so many years in exile in the reign of the Roman Emperor Domitian, and where he wrote the Book of the Revelation. This lower

monastery is on the side of the hill ; and on our passing through a doorway in the surrounding wall, the way leads down several steps into a small courtyard, where, as almost everywhere in the East, a garden is made in all the shady corners in and out of the houses, myrtle-trees and aromatic plants scenting the air. Then down still more steps to the right, and one comes to another little courtyard, from which is entered the chapel of the monastery, the traditional dwelling-place of the apostle. On the wall to the right of the altar is a cross carved in the wall to mark the place where his couch was laid. From the entrance to this cave we look on the same scene which must have been before his eyes. We could see the everlasting hills as he saw them,

the sea and the sky, all the most beautiful works of God.

We lingered a space, and then went on our further journey full of the quiet peacefulness of Patmos, never, I think, to lose the impression made on us in that abode of love and devotion.

Thence we journeyed to Crete and Knossos, and the throne of King Minos, going farther and farther back in history, even to the time of two thousand years before Christ, and almost a hundred years before Abraham. Yet, though so remote in time, their history is better known to the world of to-day than that of the little island which we have tried to describe as we saw it, 'when I was in the isle that is called Patmos.'

JANET ARMSTRONG.

CHAPTER II.

AS a rule, in estimating any one's age I am wide of the mark. In Janet's case, however, I had data to go by, for I remember my aunt in her will made mention of 'the twenty-six years Janet Armstrong has been my faithful maidservant.' And as she herself had told me that she had listened to the striking of the eight-day clock since she was a lass of thirteen, it didn't require a university training to bring out her age as forty or thereby ; but her step was as quick and light as that of a girl of eighteen, and her hair as black as when first I saw her in the yellow-ochred kitchen of Carfrae House. She wore clogs at her morning work, footgear perhaps not of the smartest ; but on Janet they seemed neat and becoming, for they were always well polished, and her feet and ankles—well, I hesitate to particularise on such points, but all the same they didn't escape the notice of the parish, for I once overheard Bargain Bob muttering to himself at the manse gate, after a passage at arms with Janet over the purchase of the manse calf, 'Ay, by my sowl ! she's a warrior ; kens the price o' beas' to a shillin', an' 'll no budge a bawbee ; sherp woman, weel-tongued, an' wad wile the bird fra the bush ; an' she'll be a guid singer too—the comely queen—for she has legs like a canary.'

The bargaining faculty was certainly her forte. Than my aunt Margaret no keener buyer or pawkier seller breathed Lauderdale air, and in Janet she had a pupil worthy of her teaching. And as Janet became a 'permanent,' I unconsciously did not a little to encourage and create a scope for this faculty ; for at the following Whitsunday term I began to farm the glebe instead of letting it as formerly. I stocked the old grass parks with Cheviot hogs, wintered store cattle, ploughed, and sowed corn, in all of which she was my adviser. I also bought an extra cow, and erected an extensive hen-run ; and soon,

between butter-making and butter and egg selling, she had the time of her life.

All our surplus produce went to Toon o' Scaur—to Andrew Hair the merchant. He was not of my parish, was a Dissenter and a Scaurbrig Cameronian to boot, and I incurred no little ill-will among my parishioners by patronising one outside the Kirk. But he was the first cadger to call at the manse after I came ; and, though he had many peculiarities, he was honest enough, and I continued to give him my custom. No money passed between us. It was a case of giff-gaff, he receiving butter, eggs, chickens, and sometimes vegetables, and giving us their value in bread, groceries, feeding-stuffs, and seeds. And with a factotum of Janet's capabilities, my interests were duly safeguarded. Not a single opportunity did she miss of turning the penny to advantage ; and to listen to her in a troking encounter with Andrew Hair at the manse back-door was a weekly entertainment, to which, I blush to confess, I looked forward with more pleasure than to my Wednesday night prayer-meetings.

As a rule, the preliminaries were conducted on both sides with a cordiality and an affableness which to a stranger might well be an augury of an easy, agreeable chaffering. But no sooner were the weather and the crop prospects discussed, and local news disposed of, than, with a long-drawn 'Imphm-m !' Janet's lip tightened, and Andrew cleared his throat, put the top button in his coat, and began to spit-spit on the causeway.

'Ay weel, to business, Maister Hair. I've fifteen dizzen eggs here—my faith ! eggs are eggs the noo ; can hardly be got, they tell me. Fifteen-pence a dizzen I hear they're gettin' ower at Dalmakerran, but to you I'll say yin an' tippence ; an' fifteen dizzen at yin an' tippence is—let me see noo'—

'Hoots, hoots, Miss Airmstrong ! there's eggs

galore in the country, mair than I can buy, an' I'm giein' only a shillin' an' a penny.'

Janet, busied in mental calculation, and with an upturned eye to the gable rhone, paid no heed.

'Fifteen at a shillin' is fifteen shillin's, an' fifteen tippences is twae an'—ay, that'll be eichteen shillin's a' but sixpence a'thegither. What's that ye say about eggs galore, an' yin an' a penny a dizzen?'

'I say I can get as many eggs as I can cairt, an' their worth to me is yin an' a penny.'

'There was yince a man ca'ed Ananias, an' you, bein' a Scaurbrigger, will dootless ha'e read about him. He was in the egg line likely—I'm no juist sure; Maister Crosbie could tell us—but at ony rate he cam' to a deplorably sudden end, Maister Hair, through'—

'Juist so, Miss Airmstrong; but we're no pointin' morals. I'm buyin' eggs, an' I say yin an' a penny.'

'Speak low when ye mention a price like that, Maister Hair. I'm feart the hens'll hear ye, an' I dinna want them to be discouraged. Imphm! Sic a wark ower a penny! I wunner ye can waste breath on't. An' ower eggs like thae. My word! look at them, man, an' dinna staun' fuffin' an' spittin' there like an adder. Look at them, I say; no a wee yin among them, an' a' as fresh as new-kirned butter. Saw ye ever eggs like them?'

'They're richt eneuch—nocht wrang wi' the eggs; but I get as much for a wee yin as a big yin. I dinna sell by wecht. Mair than that, my mither used to say there wasna a teaspoonfu' o' difference between a wee hen-egg an' a big yin.'

'That may be. Your mither may be richt; an', withoot askin' what your faither said, I'll juist tell ye this: let a Toon o' Scaur wife wale her ain egg purchase in your shop an' she'll tak' Shinnel manse yins every time. Deny it, an' you're nae credit to the Scaurbrig eldership. Yin an' tippence's my price, an' oot o' here they'll no gang for less.'

'Then I doot ye'll get them to keep.'

'Dinna worry, Maister Hair; I needna keep them hauf-an'-oor. The Shinnel grocer wad gie his finger-taps to be in here, an' he'll no grudge the price.'

'Imphm! eh, mercy, Miss Airmstrong! you're a hard, hard troker.'

'Nae harder than you're yoursel', Maister Hair.'

'Say yin an' a penny ha'penny, then—that's splittin' the difference—an' let's ha'e dune wi't.'

'Yin an' tippence, Maister Hair, or no at a'; an' ye maun mak' up your mind, an' no keep me idlin' here, for I've a Presbytery dinner to get ready.'

'Weel, weel'—and Andrew's breath came and went in a sough of despair—'ay weel, I'll juist ha'e to say your money. It's a black bargain for me; but ye'll ha'e to let me ha'e next week's layin' at the same price, even though the market's risin'.'

'Weel, we'll see what next week brings roon',

Maister Hair. Noo, let me see! I've ten cockerels here, an' I'm askin' twae shillin' a-piece. Fine, firm, weel-fed birds they are; twenty weeks auld come Friday.'

'Ay weel, they might be guid, but they're no bonnie.'

'Oh, they're no bonnie—imphm! I wasna aware that beauty o' feature was a point in a cockerel.'

'Auch, dash it, Miss Airmstrong! I mean they're a' legs an' neck.'

'Noo, Maister Hair, ye canna judge a chicken by lookin' at it. Grip it, an'—'

'Imphm! ay, bane, Miss Airmstrong—a' banes'—

'An' what were ye expectin'? My man, when ye hear o' a breed o' chickens withoot banes let me ken, an' I'll sell my Paisley shawl to buy a settin' o' the egga.'

'Yin an' tenpence a-piece is juist about'—

'Away wi' you an' your yin an' tenpence! Twae shillin' is little eneuch, an' feedin' dear. Imphm! a weel-faured, wise-lookin' man like you, wi' a guid-gaun business, hagglin' like a fishwife ower tippence. I wonder at ye; in fac', I'm ashamed o' ye, an' very little wad mak' me open an accoot wi' the Shinnel grocer. We'll juist say twae shillin'; an' then I've—let me see, I've— Oh, ay, I've twenty-three punds o' butter; an', though it's on the rise, as I've nae time to argy, I'll juist say for this the same price as last week. Noo—eh!—we need Indian corn. What price are ye askin' for that?'

When it came to this stage Andrew Hair's whole being changed. As a buyer he was sharp, to the point, and never wasted words. But when he was seller he dilly-dallied, spiced business with a grain of religion, and lingered over his subject, maybe to give him time to make the most of his chance of adding gear to gear.

'Ay. Indian corn ye say, Miss Airmstrong—imphm! Juist so noo. We—we dinna sing hymns in oor kirk—we're gey particular hoo we praise oor Maker—but there was yin I learned when I was a boy at the schule. It said something about "Fra Greenlan's icy mountains, fra India's coral strand;" an' d'ye ken, Miss Airmstrong, when I hear Indian corn mentioned, that hymn aye comes to my min'. Strange hoo the blessed truths spring frae what is o' the earth, earthy. Ay, God's gold dust often shines among the dirt o' business. Hoo much corn are ye askin', for the price depends on the quantity?'

'I'm kind o' feared to mention a quantity. If I said a ton you'd mebbe gang off in a sudden dwam, an' I wad ha'e to bring ye roon wi' whisky, an' I ken you're terr'le set against drink.'

Andrew was known to take a dram—a big one at times—but always, as he thought, on the sly. His weather-beaten face reddened. 'Ay, Miss Airmstrong,' he said thoughtfully, "'wine is a mocker, strong drink is ragin', and whosoever is deceived thereby is not wise." Timothy,

puir chiel, got a bit license at times, though, and there are mair o' his kind than you wad think; but ye may say a ton o' Indian corn, and I'll keep guid grup o' mysel'.

'Ay, I may say a ton; but what's your price?'

'Weel, Miss Airmstrong, to you it'll be—oh, let me see noo—it'll be— Whoa, Sally! what are ye brainin' at? Ye'll ha'e that guid graith a' shaken to bits.—Eh, my word, but she's fond o' this manse gress! Mebbe it'll be sweeter than the ordinar', for dootless the Lord mak's it grow richer roon' the dwellin'-places o' His servants. When the labourer is worthy o' his hire He sees to it that the hire is o' the very best—even to the gress, an', for an Auld Kirk minister, Maister Crosbie is as worthy as you can expect; at least, so they tell me. We'll say seven pun' ten a ton, then, Miss Airmstrong.'

'Juist so, Maister Hair, juist so; it's a dreich business gettin' a price oot o' ye, but you're bauld when it comes to the namin' o't. I'll no think o' takin' a ton in the meantime; but ye may send ower eicht stane—that's a hunnerwecht—an', accordin' to your price, that'll be seven an' sixpence.'

'Ay, imphm! but—but that's at ton rate.'

'Exactly, juist that noo, at ton rate.' And Janet made haste to change the subject. 'An' we're needin' sugar an' meal, an' we wad be nane the waur o' some'—

'Ay, but—but hover a blink, Miss Airmstrong. If ye tak' less than a ton the price'll be mair. I couldna afford to gie a hunnerwecht at seven an' sixpence. I've a shop rent to meet, a hoose to keep gaun, a horse an' cairt to keep on the road. Listen to me, Miss Airmstrong—be reasonable. I maun live, woman—I maun live.'

'I dinna see ony partecular necessity, Maister Hair; but at ony rate you're no to live off me, an' not a penny mair than seven-an'-six will ye get.'

'Sirce me, Miss Airmstrong, but that's queer! D'ye ken, ye said that awfu' like my puir auld mither—juist the same drunted, dried wey. She was glib when she was in fettle; she had to be, for my faither was sawney an' donsie, an' she often had baith ends o' the stick to haud. Ay, it was her that set me up at the stert—thirty-three years gane Candlemas—wi' forty pun' o' tea an' a second-haun' carpet-bag. She bocht an' I selt, an' the first week I cleared twae pun' three. What a gift o' prayer she had! An' for her grip o' the Epistles—oh, Miss Airmstrong, a mair gifted woman never praised the Lord in Scaurbrig—yin o' the elect, the chosen. Imphm! I miss her to this day, an' it's five-an'-twenty years since she des't. Ay, faith, I miss her; but "the Lord gave, an' the Lord taketh away; blessed be the name of the Lord." Say ye a hunnerwecht at eicht-an'-six, Miss Airmstrong?'

'Puir body, an'—an' what age was she when she was ta'en away?'

'Oh, she was weel on, Miss Airmstrong; ower eichty a guid bit, hoo faur exactly we didna

ken; but she was auld—gey auld. I peyed the rent, though, to the very last—never grudged it, though at the time it seemed like flingin' siller doon a coal-pit; but I was strengthened by His assurance that for what I was daein' my days wad be lang on the land, an' that bread cast on the watter wad come back efter mony days. Eicht-an'-six did we say, Miss Airmstrong?'

'No, Maister Hair, seven-an'-six; not a penny mair even for your puir auld mither's sake.'

'Imphm! I—I wonder gin I had the minister's ear, wad he no bargain mair to my likin' than you?'

'Mercy me, man, are ye daft? If the Reverend David Crosbie kenned that I gie you a' oor trade he wad—guidness kens what he wad dae, for the Shinnel grocer's a member o' oor ain congregation. Him an' the minister are unco pack, an'—'

'Auch, damn the Shinnel grocer! I'm aboot sick-fu' hearin' ye haudin' him up as a bogey-man to me. Oh Lord, forgie me for swearin'! I'm a puir weak vessel efter a'; but really, Miss Airmstrong, ye wad provoke a saint. Still, I should beware, for the Word says, "Be not hasty in thy spirit to be angry, for anger resteth in the bosom of fools," an' we'll juist say eicht shillin's instead o' eicht-an'-six for eicht stane. Hoo d'ye stan' for tea?'

'Ay, that's weel minded noo; we're needin' tea. Send a ten-pund chest, same as last; it masks weel, an' it's deep i' the colour.'

'Noo ye're speakin' sensibly, Miss Airmstrong—something like yoursel'. Imphm! Wad ye no think o' takin' a twenty-pun' chest? There's some talk o' a new Budget, an'—'

'There ye go noo, Maister Hair! never content or satisfied. But hoo comes it aboot that grocers are a' terrible anxious to sell tea? Have ye mair plunder off it than sugar?'

'Plunder! Losh, Miss Airmstrong! that's a queer word. No mony grocers'll ken the meanin' o' that yin noo. Plunder! Megstie, d'ye think we're in the 'pothecary line, Miss Airmstrong? Wae's me, there was a time, though—juist efter I first sterted—when we could coont on what's ca'd a margin o' a shillin' a pun'—wecht I mean, ye ken—on tea; but, losh! nooadays between taxes an' cairrage, a' the profit we ha'e is the tin-foil that lines the inside o' the chest. Ay, I may say o' tea what Phinehas's widow said o' Israel, "Ichabod, the glory is departed." I've some nice kippers comin' in the morn. I'll send ye ower three pair into your bargain; an' if that's a', I'll say guid-day, Miss Airmstrong.'

One morning, after a more than usual protracted argy-bargy, and when the rumbling of Andrew's cart-wheels was echoing down the loaning, I went into the kitchen. Janet was slowly and thoughtfully drinking a tumbler of water.

'I don't wonder you're thirsty, Janet,' I said; 'you've had a long sederunt with Hair to-day.'

'Ay, it's been driech, but I think I ha'e scored. Andra needs watchin'. Yin's e'e maun be skinned when yin's dealin' wi' a Scrip-quotin' cadger.'

'But is it worth all that haggling, Janet?'

She made no reply till she had rinsed and thoroughly dried the tumbler.

'I canna say that it is,' she said, as she stood

with her hand on the open cupboard door; 'but priggin' an' bargainin' is juist the breath o' my nostrils; an' mebbe it's juist as weel, for when a woman's turned forty an' unmairret she's a' the better o' a hobby.'

And I went ben to my study laughing and wondering.

(Continued on page 802.)

BROOCHES.

NO relics of antiquity are more deserving of study than personal ornaments, and of all personal ornaments perhaps the brooch is the most important, as affording an insight into the character of the people by whom it was worn.' So says Mr Romilly Allen, that great authority on Celtic ornament; and perhaps a few notes on some ancient brooches may prove of interest. Practically, a brooch is a contrivance for fastening together any two points of a garment, a development of the pin, which was the first and simplest method of fastening, probably evolved from the sharp thorn plucked by our arboreal ancestor to hold a few leaves or a skin together. First of all, you have a pin—wooden, bone, or metal; then its head is thickened to keep it from slipping through the hole it has made in the stuff; and then the brooch is evolved, a pin which bends round to a catch, thus holding the cloth without the possibility of its slipping.

The Celtic brooch is penannular—a ring with a break in its continuity, and the pin is longer than the diameter of the brooch. The method of fastening this in the garment is as follows, again to quote Mr Romilly Allen: 'The long pin is inserted in the fabric at two points close together in such a manner that the apex goes right through it, and appears again above the surface; the pin is then forced through the break, and the ring is given a turn through a right angle in the plane of the fabric, thus fixing the brooch.' The long point was usually worn upwards to avoid injury from it. These brooches were most important parts of the dress, as they are to this day in the dress of a Highlander, and a precious brooch is enumerated among the customary insignia of a chief.

The finest specimen of the ornamented brooch of the early Celtic type that we possess in Scotland is the Hunterston Brooch—so called because it was found at Hunterston, near West Kilbride, in Ayrshire—now kept in the Antiquarian Museum in Edinburgh. The date ascribed to it is the tenth century. It is of silver worked over with interlaced patterns in gold filigree, and set with amber, and on the under side has an inscription in Runic characters. Some antiquaries claim it as the brooch of King Haco himself, lost at the battle of Largs!

Another Scottish brooch of somewhat the same type is that known as the Glenlyon Brooch, also silver, and set with stones on claws and on raised pyramidal bosses alternately, with a centre bar also inset with stones and decorated with wire interlaced work. On the lower side the names of the three kings of Cologne are inscribed in black-letter—Caspar, Melchior, Balthazar—a favourite talismanic inscription on medieval amulets. These two brooches are purely personal ornaments; but some of the other brooches of an early date are known as reliquary brooches, and bear as their centre ornament a round polished rock-crystal, under which was usually a receptacle for a small piece of sacred relic. Of these perhaps the best known is the Brooch of Lorn, which 'is of silver, of very curious form and ancient workmanship,' a round centre boss bearing the crystal globe, surrounded by round pyramidal bosses with jewels on their summits, the whole outlined by a battlemented edge. The picturesque legend concerning this brooch is well known: how the Bruce, close pursued by his enemies, and overpowered by numbers, was retreating into the fastnesses of Argyllshire. Directing the retreat of his men through a narrow defile where but one could pass at a time, Bruce himself, on horseback, guarded the rear, beating back the desperate attacks of the pursuers. Three of the clansmen of Macdougall, the Lord of Lorn, seeing the havoc wrought in their ranks by the Bruce's mighty strokes, vowed they would either kill him or take him prisoner. All rushed on him at once; but by the exertion of almost superhuman strength the Bruce grappled with and slew all three assailants, though he could only free himself from the tenacious dying grasp of one Highlander by unclasping the brooch that held his cloak and leaving it and the cloak behind. Thus the brooch fell into the hands of the Lord of Lorn, and is still in the possession of his descendant, Macdougall of Dunolly. It was long treasured at Dunolly; but in the seventeenth century, when Dunolly was burned, it disappeared, and was supposed to have been carried off by the enemy. About the middle of last century, however—the story goes—it was seen and recognised by a friend of the Macdougall's in a jeweller's shop in London. He purchased the brooch and

presented it to his friend, and so, after all its adventures, it returned to its own place again.

The Lochbuy Brooch is of similar style, and is now in the British Museum, though a model of it may be seen in the Antiquarian Museum in Edinburgh. It is said to be made of silver found on the Lochbuy estates in Mull, and to have been fashioned about the beginning of the sixteenth century by a travelling tinker or artisan, one of those 'cairds' who wandered over the country turning their hands to any job of metal-working that came their way.

The Ugadale Brooch is of the same type, and has been treasured in the Macneill family since the day that 'good King Robert' bestowed it upon their ancestor in acknowledgment of shelter and assistance rendered him in his wanderings on the wild moors of Cantire.

Another beautiful brooch is of a different design, star-shaped, with a large central crystal, and on the silver points scroll ornament and a shield bearing the Campbell arms, the owners of it being the Campbells of Ballochyle. This Ballochyle Brooch was much esteemed as a talisman.

The art of engraving metal and using tools was part of a liberal education in these countries from the twelfth to the fourteenth century; thus in the twelfth century an Earl of Orkney described among his accomplishments the ability to 'engrave Runic letters and use the tools of a smith.' Martin, writing in 1716, comments on the dexterity of the Highlanders in engraving designs on bone, horn, or wood with merely a knife. In John Lane Buchanan's *Travels in the Western Hebrides* he also remarks that the people 'are wonderfully ingenious; they make hooks for fishing, cast metal buckles, brooches, and rings for their favourite females.' I fear a good deal of that dexterity has gone; but there are signs every here and there of a revival of the work and of interest in the old designs, which are so beautiful and so well adapted for personal ornament. In the island of Iona Mr Alexander Ritchie has a studio from which he turns out beautiful specimens of Celtic work in silver and other metals.

In the thirteenth, fourteenth, and fifteenth centuries circular brooches were made and engraved with animals and ornament inlaid with niello, and inscribed in black-letter. These talismanic inscriptions were in Latin, and those most frequently found were: 'Jesus Nazarenus Rex Judæorum,' or the abbreviated form of 'Jesus Nazar,' or 'Jesus Na,' and 'Ave Maria gratia plena,' or simply 'Ave Maria,' or 'Maria.' Less frequently the brooches are inscribed with the names of the 'Wise men from the East'—the three kings, Caspar, Melchior, Balthazar. These names acted as charms 'to cure the bites of serpents and other venomous reptiles, as well as particular diseases,' and we find that brooches, rings, &c. were sold to the pilgrims who came

to their shrine at Cologne; and thence no doubt the use spread to different countries.

In the sixteenth century the knowledge of Latin seems to decrease, and also the care with which the inscriptions are rendered, and they gradually become so barbarously distorted as to be unintelligible, and descend into mere ornament resembling black-letter; and later still there is nothing but purely ornamental decoration, and the idea of the talismanic value is lost.

On many silver brooches we find engraving and niello, on the brass ones engraving alone. Niello is a kind of metallic enamel made of silver, copper, lead, and sulphur, and when prepared was stored in goose-quills, and applied in the same way as glass enamel. Liquefying at a lesser heat than is necessary for ordinary enamel, it was simpler and easier to work with, and could be managed with less apparatus. These brooches were originated, designed, and executed in Scotland, chiefly in the Highlands, and were probably the handiwork of people who fashioned them at their leisure, working at them lovingly and slowly in the long winter nights when they were cut off from outside work; and their roughness and the signs of lack of technical skill in the working of metal are due to this. The taste and idea of the design are generally better than the power of execution. Even the more important brooches are supposed to be the work of those wandering workers in metal the 'cairds,' the ancestors of the tinkers of to-day, whose handiwork is now confined to mending pots and kettles.

In the eighteenth century and beginning of the nineteenth, silver brooches with an anchor pattern in niello were made and carried about for sale in central Perthshire by a 'caird' of the name of Ross. These were also sometimes spoken of as Glasgow brooches, as some of them were made there. About the same period or earlier small silver heart-shaped brooches were in common use in Scotland, and were in great demand, being worn to ensure protection against witchcraft and enchantment. They were fastened in the clothes of children, stuck in the chemise or petticoat. Sometimes they bore inscriptions, more often not. In one district a circular iron brooch fastened into a child's frock was an efficacious expedient for averting the evil eye, 'where it remains for many years,' and on Speyside an old woman was found who had worn 'a large brass brooch in the form of a circle fixed on her clothes above the left hip' for more than fifty years for the same purpose.

The silver heart-shaped brooches were sometimes engraved or set with jewels, and sometimes the heart was crowned or entwined with another, as in the design known as the Queen Mary Brooch, supposed to have been given to her by Darnley. They are known as Luckenbooth brooches, from having been made and sold in the Luckenbooths which in those days surrounded St Giles' Kirk, Edinburgh.

PINCHER MARTIN, O.D.

CHAPTER XVI.—continued.

AT length there came the time when the enemy could be pursued no longer, on account of the proximity of the shore. So close in had they steamed that some one in the *Mariner* even declared that he was able to count the windows in the buildings and the tiles on the red roofs; and though the tile part may have been an exaggeration, the window-counting certainly was not. The yellow, wave-lapped beach, with the turf-covered sand-dunes beyond it, looked strangely calm and peaceful; but concealed in those dunes were guns of almost every imaginable size from fourteen-inch downwards, some of which were reputed to be able to pitch their shell on a sixpence at a range of fifteen miles. The *Mariner* and her consorts were a long, long way inside this distance, and there was nothing for it but to discontinue the action, and to beat a hasty retreat.

Brother Boche, with his guns in among the dunes, was no fool. He was merely waiting for a good opportunity to open fire, and his chance came at the precise moment when the British helms went over and the destroyers started to steam seawards. Then the whole line of coast suddenly began to sparkle from end to end, and before one had time to think the shell were pitching. The fire of the destroyers, both as regards its volume and its accuracy, had been as nothing to this. Great white-water fountains seemed to spout up everywhere at the same moment—ahead, astern, and on either side. How many projectiles fell within a few feet of the ship during the next ten minutes it is impossible to say. The shooting was very accurate—indeed, far too accurate to be pleasant. It was extremely unpleasant.

Words can convey no conception of the breathless sort of sensation caused by those falling shell. They howled like wolves and screeched like express trains passing through wayside stations. They fell into the water with heavy liquid plops, detonated in gigantic upheavals of water and with roaring concussions compared with which the reports of heavy guns faded into insignificance, and sent their jagged-edged fragments whirling off into space with the humming and buzzing of angry hornets. It was a sickening, uncanny feeling to see a fifty-foot geyser-like spout spring into the air a bare fathom off the stem, to notice the black patch at the spot in the water where the shell had burst as if one had emptied a bucket of ashes, and then to steam through the descending spray, and to smell the horrible, reeking stench of the explosive. It was more alarming still to see a bouquet of four or five such splashes jump into the air within a few feet of the stern or the side of the ship. If a single one of these projectiles drove home the *Mariner* would

probably be brought to a standstill, in which case her subsequent demolition and the slaughter of her crew would only be a matter of time. If three or four shells struck at once she might possibly founder immediately.

It is one thing to be fired at by a similar vessel, and to be able to fire at her in reply; but it is something quite different to be subjected to the individual attention in broad daylight of a heavy ship, or many shore batteries, when there is no possible chance of retaliation. It leaves one breathless and cold; and though, perhaps, men may not actually show their fear, they would give much to be elsewhere. It is only natural.

Shell from modern heavy guns can drive their way through the armoured sides of a battleship, but they will pulverise a destroyer into mere powder. There are no bombproofs, no funnels, no armour, not even a conning-tower—not that it would be used if there were. The officers and the men at the guns and torpedo-tubes are all on deck and in the open, while those below in the engine and boiler rooms have nothing between them and the deep sea but a steel skin barely thicker than a substantial biscuit-tin. Moreover, the greater portion of the hull is crammed with machinery, ammunition, and explosives; and, however much of a safeguard a destroyer's speed and small size may be, she must always seem very vulnerable to those who serve in her. I say 'seem' advisedly, for it is surprising how much hammering the tough little craft can withstand without being knocked out; while, as any gunner who is used to the game will tell you, she is not a very easy target to hit. But, for all that, one lucky shell may do the trick, in which case every man-jack of her crew will be killed or drowned. There is never much chance of escape if once the ship goes, and any man who says he relishes being under heavy fire in a T.B.D. is either a born hero or an Ananias. It is easy to make light of things after they have happened, but no words can adequately portray the inner feelings of the ordinary mortal while the ordeal is still in progress. They are indescribable.

But by some miraculous intervention of Providence the *Mariner* and her sister-ships escaped practically scot-free. According to people who witnessed the withdrawal from a distance, people who well knew the range and accuracy of the coast guns, the odds were a hundred to one that they would never escape, for at times they were hardly visible in the spray fountains leaping up all around them. They were literally buried in the splashes, but still they came on—and escaped.

It was not until afterwards that the men

thoroughly realised how lucky they were. At the time, whatever they may have felt in their hearts or minds, there were no suggestions of fear in their faces, no trace of nervousness in their demeanour. They behaved just the same as usual—jeered uproariously when a shell fell a few feet short and deluged them with spray, and made facetious remarks when projectiles from 'Fractious Fanny,' as some one adroitly christened a particularly obnoxious 11-2, lumbered gracefully over their heads and exploded merrily in the sea a hundred feet or so beyond them. Perhaps they were a little more talkative than usual; perhaps their laughter was sometimes a little forced; but, for all that, they behaved as British bluejackets always do.

'I wouldn't 'a missed that there show fur a lot,' said Pincher Martin after supper the same evening.

'I reckons we kin think ourselves lucky ter git outa it,' Billings murmured with his mouth full. 'It's orl right lookin' back on it w'en once it's orl over; but it takes a bloomin' 'ero not ter 'ave a cold feelin' in 'is stummick wi' them there guns a-pluggin' at 'im.'

'Did you 'ave a cold feelin' in yer inside, Josh?' M'Sweeney queried anxiously.

'Course I 'ad. I wus cold orl over. I ain't no bloomin' 'ero. But, orl the same, Tubby boy, I reckons it's done us orl good ter 'ave a bit of a shake up like this 'ere. Makes us a sort o' understan' 'ow every bloke aboard 'as 'is own job ter do; don't it?'

Joshua's way of expressing himself may have been crude, but M'Sweeney quite understood what he meant.

The engagement, short as it had been, had given the men confidence in themselves, each other, their officers, and their ship. It had banded them together in some extraordinary and quite inexplicable manner which no years of peace training could have done. Together they had been tried and had not been found wanting; and now, more than ever, they had become 'we few, we happy few, we band of brothers.' They felt themselves inspired with a new patriotism and a new ardour, and it was that very feeling which, on 21st October 1805, had helped their forebears to win the battle of Trafalgar.

CHAPTER XVII.—THE DAY.

I.

ALL through the peaceful night of 30th May 1916 British squadrons were at sea steaming steadily eastward. Fighting-ships of almost every class were represented—great battle-ships and battle-cruisers, armoured cruisers of an older type, new and very fast light cruisers, the ubiquitous destroyers in their dozens, all converging silently towards the area on the other side of the North Sea which was presently

to become the scene of the mightiest and most terrible battle in British naval history.

The Commander-in-Chief and the Admirals in command of squadrons may possibly have known that something unusual was in the air; but it is doubtful if any subordinate officers or men had the least inkling of what the next day would bring forth. They knew that a battle was always possible, and were ready and anxious for it. Off and on for nearly twenty-two months they had scoured the gray wastes of the North Sea, and had explored its grayer fogs, always hoping that the next dawn would bless their tired eyes with a view of the far-flung battle-line of the enemy stretched out across the horizon before them. But morning after morning the sun had risen to display the same bare and monotonous vista of sea and sky.

Sometimes the ocean was calm and peaceful, the sun shone undimmed, and the blue sky towards the horizon was piled high with mass upon mass of mountainous white cumulus. Sometimes they had fogs, when they could see barely a hundred yards; sometimes the prevailing North Sea mists, in which the visibility alternated between two and five miles. At other times the wind howled, and the leaden sea was whipped into fury by gales; while the sky became overcast with dark clouds, and streaked with the white, frayed-out streamers of mares' tails. They had come to know the vagaries of their cruising ground by heart; but whatever its aspect the sea was ever innocent of the one thing they all wished to see—the German High Sea Fleet.

Their wistful longing was just as acute as that of the men in the storm-battered ships of Columbus when straining their eyes towards the western horizon for the first dim blue traces of the new continent; and now, through sheer disappointment, not a few of them had come to believe that the chance they all prayed and longed for would never come.

Daylight on 31st May found the *Mariner* and many other destroyers still steaming eastward in company with the battle-cruiser fleet under the command of Vice-Admiral Sir David Beatty in the *Lion*. Certain light-cruiser squadrons, acting as scouts, were stationed some distance ahead of the heavier vessels. The morning—which had broken beautifully fine, with a calm sea—passed without incident, and it was not until shortly after half-past two in the afternoon that the advanced squadrons reported the enemy in force to the eastward.

It is impossible to give any idea of the thrill of excitement which passed through the officers and men of the ships when the facts became known. The bugles blared, and they hurried to their action stations. 'Enemy in force!' Did it mean that they were in touch with the High Sea Fleet? Had their chance come at last, the chance for which they had

all been hoping ever since that fateful 4th August 1914?

Men looked anxiously at their neighbours to see how they took the momentous news; but nowhere did a face show signs of fear. On the contrary, their expression and demeanour testified to their implicit and unshaken confidence in themselves and their leaders. They laughed, jests passed from man to man and from group to group, and they went about their business with an intense keenness born of a new hope.

The big battle-cruisers swung rapidly into fighting formation and increased speed, their wash churning the calm sea into great waves. They presented a magnificent spectacle as they steamed into action with the smoke curling from their funnel-tops, white ensigns flying at each masthead, and the huge guns in their turrets pointing their lean muzzles skywards.

At two-thirty-five P.M. a considerable amount of smoke was sighted to the eastward, and a little less than an hour later the gigantic shapes of five hostile battle-cruisers were looming up over the horizon.

'All guns, load!' came the first order from the control positions. 'Salvos by director! Guns—ready!'

Inside the turret a burly A.B., clad in flannel shirt and trousers, spat solemnly on his hands, stretched out a hairy, tattooed arm, and moved a small, brightly polished steel lever. Instantly a clattering hydraulic chain rammer uncoiled itself like a snake, and an enormous shell weighing three-quarters of a ton was pushed bodily out of the loading-tray to vanish into the open breech of the gun with a smack and a thud. The rammer was withdrawn, another man manipulated a handle, and two cream-coloured, sausage-shaped bundles with red ends rolled into the space just vacated by the projectile. They were the cordite charges, swathed in innocent-looking silk coverings, the red extremities being the muslin bags containing the powder-igniters. The silk, somehow, seemed strangely out of place in the gun-turret of a battle-cruiser. It reminded one irresistibly of the counter of a drapery establishment; but for many a long year artillery experts have known that a silk-covered cartridge leaves little or no burning residue in the breech of the gun when the weapon is fired. Hence its use.

Again the hairy, tattooed gentleman moved his lever, and the rammer, darting forward, propelled two quarter charges into the yawning breech of the gun. The operation was repeated, while a man fiddled for a moment with the lock, and then the great steel breech-block swung to with a clang.

'Right gun, loaded!' some one bawled, as something slipped into place with a click.

'Right gun, ready!' from another man.

The gunlayer watched a dial, and the gun's crew stood tense and expectant, while the huge

breeches of the weapons moved ponderously up and down, with a wheezing and a groaning of the water through the hydraulic machinery. The turret twitched slowly to the right, stopped, and then moved again. Ammunition-cages containing more shell and cartridges ready for the next round came clattering up from the loading-chambers.

The officer in charge, a lieutenant with absurdly pink cheeks and curly hair, was stationed at his periscope, one end of which protruded through a hole in the armoured roof of the turret, and gave him a view of the surrounding sea.

'Can yer see anythink, sir?' some one asked in a hoarse whisper, his curiosity getting the better of him as the officer bent down to wipe the eyepiece of his instrument with a gaudy bandana handkerchief.

'Yes,' he answered cheerily; 'five battle-cruisers, some light cruisers, and a good many destroyers! Stand by. It'll be starting in a minute.' He replaced the handkerchief in his pocket, and applied his eyes to the periscope again.

The loading number of the right gun, he with the hairy arms, was busy with a piece of chalk, and the other members of the gun's crew who had nothing particular to do watched him with some amusement. 'To HUNNY, WITH LOVE FROM BILL MASON, A.B.,' he traced out laboriously on the sleek, yellow-painted side of the huge lyddite projectile. He stepped back to survey his handiwork with a little chuckle of glee. 'That'll tickle 'em!' he remarked, winking solemnly.

The men tittered.

The lieutenant at the periscope suddenly held his breath as a muffled, whistling shriek and the roar of an explosion from outside brought the men's heads up in eager, listening attention.

'Garn!' said Mason with a grin; 'that ain't gone nowhere near us. 'Ave another go, ole son!'

'Stand by, men!' cautioned the officer, who was the only person who could see what went on in the outside world.

Mason licked his hands and rubbed them unconcernedly on the seat of his trousers.

Wheee-w! wheee-w! B-o-o-m! from the outside again, followed by the sound of another detonation and a slight jar, which showed that the ship had been struck somewhere.

The gun's crew looked at each other. The turret moved slowly to the right, and went on moving. The breeches of the guns began to see-saw gently up and down in rhythm with the movement of the ship. Then a bell rang, and with a roar and a thud the right gun suddenly went off, and recoiled backwards along its slide. It ran out again with a wheezing, sucking sound, and the massive breech-block flew open with a metallic crash.

'Left gun, ready!' came a shout.

The turret became filled with the warm, acrid smoke of burnt cordite. There came the swishing sound of the washing-out apparatus, and the clatter of the chain rammer.

The bell rang again. B-o-o-m! roared the left gun. The great battle had begun.

II.

It is impossible for any single spectator to describe a naval action as a whole from his own personal observations and experiences, particularly a battle which divides itself into many different phases, lasts intermittently from about three-thirty in the afternoon until the same time next morning, and is fought over many miles of sea.

The *Mariner* and various other destroyers were present with the battle-cruisers throughout the first shock of the engagement and the running fight which ensued. Some of them, the *Mariner* included, assisted to repel the attacks of hostile torpedo-craft during daylight, and delivered their own attacks on the heavy ships of the enemy during the afternoon and night; but though Pincher Martin saw a great deal of the fighting, he had no very clear conception of how the engagement went as a whole or of how the time passed.

When he first saw the enemy they appeared as a row of immense gray shapes stretched out across the horizon. They were battle-cruisers; he knew that from their build; and though they must have been fully ten miles distant, they looked grim and menacing. With them were several light cruisers, looking absolute pygmies alongside their overgrown sisters; while on the farther side he saw, or thought he could see, a swarm of destroyers. They reminded him of a colony of ants. It was now about three-thirty p.m., and the weather was quite clear.

The *Mariner* was stationed close to the line of battle-cruisers, and between them and the enemy. She occupied one of the best seats in the house, the front row of the stalls, so to speak, a position from which, but for the clouds of smoke and masses of spray flung up by the falling shell, those on board her would have seen practically everything that happened. But the billet was not exactly a comfortable one. Indeed, it was most unpleasant; for when the firing began the shot from both the British and the German guns whistled and thundered overhead, while there was always the chance that the destroyers would receive the benefit of hostile shell falling short of their intended target.

Pincher watched the enemy with a certain amount of fascinated apprehension. They seemed to swing into a single line, and then, quite suddenly, he noticed five or six tongues of bright orange flame and clouds of brown smoke leap out from the side of their leader. There was a lengthy pause, followed by a terrifying

crescendo of howling and screeching as the giant projectiles came hurtling through the air. They fell in a bunch a bare fifty yards short of one of the battle-cruisers and exploded with a roar, the great upheaval in the sea almost completely shutting out all traces of the ship beyond. The British guns instantly flashed out in reply, and the next moment the engagement became general.

From this time forward the whole affair seemed ghastly and unreal, an awful nightmare in which it was quite impossible to remember exactly what had happened. The air shook and trembled with a turmoil of ear-splitting sound, in which one heard the deep booming note of the British guns as they gave tongue, the shrill whistling or droning of shell as they passed overhead, and the sharper concussion of the hostile projectiles as they fell and burst.

Looked at from a distance, the huge hulls of the German ships seemed literally buried in a spouting maelstrom of shell fountains rising from the sea all round them. At times a shadowy gray mass, sparkling with wicked-looking gun-flashes, slid slowly into view behind some great upheaval in the water, to disappear the next instant as another salvo of shell fell and burst. The British guns seemed to be making very good shooting, but it was impossible to note exact results from the low deck of the destroyer.

Pincher glanced at the *Lion* and the other ships, and the spectacle held him spell-bound and made him feel almost dizzy. They were enduring a veritable tornado of shell, and the sea all round them leapt and boiled until at times the rushing shapes of the great vessels, close as they were, seemed actually hidden in the turmoil of flung-up water. Some of the shell were going home, too, for here and there in the rifts in the spray and smoke he saw the deep-red flash, a cloud of oily smoke, and a shower of flying debris as they struck and exploded. There were a few ragged holes in the gray steel sides; here and there the symmetrical shape of a ship's superstructure was marred by a twisted and distorted mass of steelwork, and pierced funnels vomited forth their black contributions to add to the already smoke-laden atmosphere. Star-shaped splashes of yellow and white showed where shell had struck armour, had exploded, and had failed to penetrate; but it seemed nothing short of a miracle how any ships built by human agency could withstand such a terrific hammering without being battered to pieces. It was an awesome sight.

It was well for the *Mariner* and her neighbours that the German shooting was so accurate. The hostile fire was concentrated on the battle-cruisers, and every shell seemed either to strike or else to fall within a few yards of them. The destroyers in their precarious position were untouched; but, for all that, the experience was

nerve-racking, and Pincher had a feeling of intense relief when he saw the brilliant flashes and rolling clouds of brown, rapidly dissolving smoke from the British guns. They were firing fast, and it was no small consolation to think that the enemy were enduring the same terrible ordeal themselves.

One of the most awful incidents of that eventful day was the blowing up of the *Indefatigable*. The catastrophe, utterly unexpected, was appalling in its suddenness. At one moment the huge, nineteen-thousand-ton ship was steaming bravely along with her guns firing; the next, a salvo of five or six shells seemed to strike her simultaneously amidships. There came the splintering crash of the explosions, some spurts of flame, and upheavals of yellow, brown, black, gray, and white smoke. The great ship seemed literally to be divided in two, for both the bow and the stern reared themselves out of the water at the same moment. The thundering, shattering roar of the explosion made the nearer ships dance and tremble. The report seemed to compress the air until one's ear-drums threatened to burst, and masses of debris, large and small, were precipitated skywards, presently to come raining down into the sea in all directions.

The smoke-cloud spread and rose into the air to a height of three or four hundred feet. Soon it completely blotted out the scene of the disaster, and hung there impalpably, wreathing and eddying in thick, rolling masses. Then some freakish air-current caused another cloud of brown vapour to rise and overtop the first, until the whole mass looked for all the world like some gigantic, over-baked cottage loaf sitting squarely on the sea.

Within two minutes the ship had disappeared for ever, taking with her her gallant crew of nearly eight hundred officers and men. Barely a soul was saved, though destroyers, hurrying

to the scene at imminent danger to themselves, searched the flotsam-strewn area for survivors.

The *Queen Mary* met a precisely similar fate. Again there came the terrible roar and flare of an explosion, followed by the cloud of smoke, in which the great ship sank almost instantly to the bottom. It was an awful moment; but one of the most magnificent spectacles of the battle was the sight of the great three-funnelled *Tiger* steaming at full speed through the pall a few moments after her unfortunate sister met her fate. At one moment she was in full view; the next her bows disappeared, then her midship portion with its three great funnels, and finally her stern, until the whole enormous length of the ship was completely swallowed up in the mass of brown vapour. Then her sharp stem with its creaming bow-wave emerged into sight on the other side of the pall, to be followed by the rest of the vessel as she drove clear of the scene of the catastrophe with her guns flashing defiance and her glorious white ensigns fluttering. It was an inspiring sight, but of the gallant crew of the stricken *Queen Mary*, comprising nearly a thousand souls, only four young midshipmen and under twenty men were rescued.

The loss of these vessels was a sad blow, but still the battle raged furiously. The hostile shooting, however, seemed to be becoming erratic, a fact which told its own tale, while ours steadily improved. Indeed, the next time Pincher was vouchsafed a fleeting glimpse of the enemy, two of their largest ships seemed to be badly on fire, while a third had quitted the line and was some distance astern of her consorts. But it was with a feeling of intense relief that the sorely tried British saw a welcome reinforcement of four battleships approaching at full speed, firing heavily as they came.

HUMOURS OF A LATIN-AMERICAN REVOLUTION.

By JOHN D. LECKIE.

MANY persons are incapable of seeing a Latin-American revolution from any other than its humorous side. The following paragraph, culled from a comic paper, illustrates this standpoint. 'I hear that X. has been in seven wars.' 'Impossible! He is only about twenty years old.' 'Yes, but he has lived two years in South America.'

It cannot be denied that Latin-American revolutions have their comic side; but they have their tragic side also. The writer speaks from personal experience of more than one revolution in these countries. At the time of my writing these lines Mexico is in the throes of an internal strife that has lasted four years, impoverishing the country, to the accompaniment of incredible outrages. It has been said, and truly, that a revolution of the

worst type is worse than a war; it combines all the horrors of war with all those of anarchy. The century which has elapsed since the countries of Latin-America achieved independence has been in their case a sad record of turmoil and internal wars; the crimes and outrages committed during that period have called loudly, but in vain, for redress. Yet in the writer's opinion, the result of long experience, these subsidised revolutions could to a large extent be prevented or their evil effects mitigated by organised philanthropic action much more easily than international wars can be prevented—if they can be prevented at all—by so-called peace societies. If Mr Ford, with his shipload of philanthropists, had betaken himself to Mexico instead of to Europe, his voyage might perhaps have been productive

of better results. But the tragic aspect of the case has been dealt with in other articles by the present writer, and the object of this one is to look at the matter from its humorous side.

Rabelais has truly said: 'It is better to write so as to make one laugh than so as to make one cry, for laughter is the peculiar attribute of man.' Even outrages may have their humorous side, as the following example will show. As is well known, during every revolution of any duration, the disturbed state of the country results in the formation of bands of marauders, who infest the outlying districts and sometimes even the towns; and the regular soldiers are at times scarcely any better. One day a lieutenant, with a band of his braves, met a countrywoman going into town with a basket of home-made cheese, by the sale of which she intended to procure the necessaries of life for her family. 'Hallo, old woman!' he cried, 'let us sample your cheese;' so saying, he took her basket and 'confiscated' the lot, distributing it among his followers, who laughed at the matter as an excellent joke. Meanwhile the poor woman, knowing that it was worse than useless to protest, tearfully returned home minus her wares. But retribution followed this incredibly mean action. The countrypeople, who had already been victimised more than once by the same bully, now dubbed him 'Lieutenant Cheese,' and the nickname stuck to him ever after. It often happens that the breast that is callous to the sense of honour is keenly sensitive to the shafts of ridicule, and so it was with 'Lieutenant Cheese.' He never imagined that his spoliation of a poor woman would be advertised in such a manner; but thereafter it was not safe to mention the word 'cheese' in his presence, for he always took it as a personal allusion.

Such acts of spoliation were too common to attract much attention when even great crimes could be committed with impunity. The writer himself was plundered, not for the first time, his horses being forcibly seized, without payment it is needless to say. One of these horses was recovered after the close of the revolution. He was in a pitiable condition, and during the time he had been in the possession of the bandits (they were nothing else) he had acquired a rather bad habit, for he now insisted on stopping in front of every public-house that he passed, much to the embarrassment of his teetotal owner.

It is well known that during a revolution business is often unusually brisk in the larger towns of the affected area. For example, when a revolution is raging in Uruguay, Montevideo (the capital) may be gayer than usual. Shopkeepers will tell you that business has never been better; at the hotels you can scarcely get accommodation owing to the influx of guests; the theatres are filled every night with a well-dressed crowd. A sign of prosperity, you may say. Nothing of the kind; the very reverse.

The fact is, Uruguay, like most other Latin-American republics, is mainly pastoral and agricultural. But in the country districts during a revolution there is little security for life and property; hence the *estancieros* and farmers come into town for a long stay, bringing their families with them. Thus the towns are crowded with refugees, and the money they spend among the tradespeople creates a temporary and fictitious prosperity, to be followed by a reaction later.

In these disturbed times much powder and shot is wasted with very little result. Both the contending parties often show much strategy in avoiding an encounter. When one of the parties gets tired of doing nothing it will perhaps make an expedition into the open country and consume a large quantity of *caña* (native rum) and ammunition, the latter being fired into the surrounding ant-hills; after which these valiant men will return to the townspeople (who meanwhile have been terrified at the distant sound of firing) with fearful accounts of a desperate battle, in which the enemy were defeated with great slaughter.

On one occasion the general in command of the Government troops had to proceed with his men to a certain point. He received information that the rebels had taken up a position in a dense wood which skirted the railway line along which he would have to travel. As it would never do to leave the enemy in a position where they could take him in the flank while they themselves lay concealed and in safety, it was necessary first to dislodge them from their point of vantage. For this purpose artillery was brought up, and the bombardment of the enemy's hiding-place commenced. It was a brilliant victory for the Government troops, according to the general's account; the enemy retreated, leaving him master of the situation. Though he was unable to produce any proofs of his victory in the way of killed, wounded, prisoners, or booty, he stated that, 'from the tracks of blood which he saw,' the enemy must have suffered severely. It afterwards transpired that there was not a soul in the wood the whole time the bombardment was going on!

On another occasion two hostile forces lay facing each other, each unwilling to take the initiative of attacking. One general (whom we will call Gomez) occupied a small town with a diminutive force; the other general lay in wait for him along the only road which led to it. The latter (we will call him Pando) learned that Gomez's men were in sore straits; and though some of them had deserted to him, the desertion was not on a large enough scale to satisfy Pando, so he hit on the following plan of hastening the process. He caused it to be known that he would pay a bonus of two pounds to every man of the enemy who deserted to him, and he made it a condition, as a guarantee of *bona-fides*, that each deserter should bring with him his Mauser rifle

and full quota of ammunition. Gomez's men now deserted almost in a body; at least a thousand (about the whole force) found their way to the enemy's camp. Gomez thereupon quietly evacuated the town at night, and next morning Pando marched in with all the honours of war, without firing a single shot.

'A clever idea,' some reader will exclaim; 'but did not Pando pay rather dearly for his whistle? A thousand men at two pounds each—that would amount to two thousand pounds, which Pando would have presumably to pay out of his own pocket.' Not so, dear reader! Pando was not that kind of man. As he paid for the rifles out of his own pocket, he claimed them as his property; and when his party got into power, as they did soon after, he sold these Mausers back to the Government at eight pounds each, a profit of six pounds on each rifle, or something like six thousand pounds on the whole transaction. Yes, Pando understood how to kill two birds with one stone.

As a stroke of business, this was perhaps capped by the action of another rebel leader. On his march through the country he commandeered and killed as many cattle as possible. Cattle belonging to the enemy were fair game, but he was not particular about the ownership; from one *estancia* (large cattle-farm) alone he is said to have carried off some twenty thousand head. But all these cattle were not required for the support of his handful of men; they were simply killed for the sake of their hides. A hide was as good as a bank-note, easily saleable in any town; so when he arrived at the town of X. he disposed of the lot to a trader for spot cash. Thus were the rebels able to replenish their exchequer. Let us say twenty thousand

hides at two pounds each—total, forty thousand pounds—quite a respectable amount of plunder; and as the rebel leaders also allowed their men to plunder on their own account, it was quite unnecessary to pay them, so the whole of the proceeds were net. But the rebel chief was not satisfied with this. No sooner had he sold the hides and received cash in payment than he 'commandeered' them. He also commandeered all the carts in the neighbourhood, and their owners, these being employed in carting the hides to the railway station, whence they were to be sent out of the country to a neighbouring republic and sold a second time. It was a good stroke, and might have succeeded but for the fact that the hides were captured by the Government troops before he was able to get them across the frontier.

Let it not be supposed that everything commandeered by the Government troops or by the rebels (whichever of the two happened to have the upper hand temporarily and locally) was required for military purposes. The shops were requisitioned for such things as sewing-machines or ladies' apparel, which the soldiers then distributed among their female friends. The officer in command of one of these plundering expeditions did rather a good thing. He sent many wagon-loads of the commandeered goods to a hiding-place in the depths of the forest; but his *cache* was discovered by the *montoneros* (independent freebooters, always in evidence during a revolution), who in their turn commandeered it.

Such are a few brief aspects of a revolution from its comic side; but there is nothing comical about it to those who, like the writer, have seen one and suffered from it, as many British subjects have done.

REAL VIOLIN ROMANCES.

PAGANINI'S MAGICAL GUARNERIUS.

By W. C. HONEYMAN, Author of *The Violin: How to Master It, &c.*

WHEN Paganini was just seventeen his marvellous playing attracted the attention of Parsini the painter, himself an accomplished violin-player.

'He can play anything at sight that man can write,' said a friend to Parsini.

'I do not believe it,' said Parsini, and for days he was invisible. Then he approached Paganini, carrying in one hand a grand violin by Antonio Stradivari, and in the other a violin concerto of extraordinary difficulty which he had written, but could not himself perform.

Said the artist to Paganini, 'If you play that at sight I will give you my violin.'

'Then you may bid farewell to your fiddle,' was the confident reply of the violin wizard, who played the piece without an effort.

Shortly after he nearly lost this violin through his passion for gambling. 'Watch, jewels, rings, and medals, all had gone,' he afterwards related, 'and my money was reduced to three francs. A prince had offered me two thousand francs for my violin, and I needed money to take me to St Petersburg, where I was engaged to play. I threw down the three francs as my last chance to keep my violin, and won one hundred and sixty francs! I was saved, but renounced gambling for ever, as contemptible to all right-thinking men.' Earning money so easily, however, he was careless, and was soon again in straits, and had to place his violin in pawn at Leghorn as security for money borrowed. Then he found himself without either money or a violin.

'I cannot play to-night,' he said to M. Livron,

a merchant and distinguished amateur violinist. 'I have no violin.'

'Play upon mine,' was the eager response; 'there is not a violin equal to it in the whole world.'

Paganini played that night as he thought he had never before succeeded in playing, and naturally gave part of the credit to the violin, and somewhat sadly returned it to its owner. But Livron had been at the concert, and more deeply thrilled than any one else there, and he handed back the violin to Paganini, with these words, '*Je me garderai bien de profaner des cordes que vos doigts ont touché; c'est à vous maintenant que mon violon appartient*' ('I shall take good care never to profane the strings which your fingers have touched; it is to you that my violin now belongs').

The violin thus nobly bestowed and eagerly welcomed was made in Cremona in the year 1743 by Joseph Guarneri; and Paganini, with one exception, played upon no other till the day of his death, as he could always get a more robust and penetrating tone from it in large halls than from any violin by Stradivari, and was thus the first to draw attention to the grandeur and beauty of Guarneri's works. More than that, this magical violin seemed to be a mascot to him, for from the time that he took it to his heart his fortunes never looked back, and gold poured into his pockets ceaselessly. It answered every call of his passionate nature, and even then seemed to have a reserve of power not touched. With that magic violin he conquered Europe. It was thought to be a demon violin, and all kinds of monstrous fables were heaped upon it and its owner, in spite of his dignified protest. Paganini was also accused of meanness, and was described as keeping a concert audience in London waiting while he took shelter from the rain rather than pay for a cab to take him to the hall. The writer of this calumny forgot that for a stranger in London to go out into a down-pour of rain to hunt for a cab was a sure way to get wet to the skin, while to remain in shelter was a sure way to keep dry. Paganini's health was never good, and even then (1831) he was suffering from the affection of the throat which carried him to the grave. The life of a delicate man is worth more than the convenience of many concert audiences.

All London rushed to hear the demon violin, and to announce a concert with Paganini was a sure way to have any hall filled to overflowing, though for each concert Paganini alone received two hundred pounds.

The news of this extraordinary success reached a poor widow in Brighton, who was struggling hard to support herself and her young family by teaching music, and she conceived the bold idea of asking the wizard violinist to perform at a concert in Brighton, and wrote to him asking his terms. To her surprise, she received a reply

to the effect that Paganini would be pleased to play at her concert for one-half of his usual fee—namely, one hundred pounds. The concert duly took place, and the widow's little son, named George Augustus Sala, then a child of seven, heard Paganini for the first and only time. The concert, however, barely paid expenses, and Mrs Sala, with a sad heart, realised that when all were paid she would have hardly a shilling left. Next forenoon Paganini called for his money, and was paid. Mrs Sala had thought of appealing to him for some reduction; but one look at his grim face scared the thought away, and she quietly conducted the great artist to the door, where the little G. A. S., in a shabby velvet suit, already had posted himself.

Paganini patted the boy on the head, said, 'Good child!' shook hands with the widow, and disappeared.

Mrs Sala turned away with tears in her eyes; but the boy cried out joyously, 'See, mamma! See the pretty picture he gave me!' The 'pretty picture' was a bank-note for one hundred pounds.

Once only was Paganini induced to use another violin than the magic Guarnerius, and that was about a year after his visit to Britain (1832), when, run down in health, he was staying and resting in Paris. Instead of hanging up a stocking at Christmas, as we do, the French place a wooden sabot on the hearth; and some one who thought Paganini rather niggardly with presents sent him a sabot almost big enough for a cradle, taking care that this sabot should arrive when he was entertaining a large company, the intention of the sender evidently being to sneer at Paganini as more ready to receive presents than to give them.

The maid who brought in the queer present was almost the only one in the villa with whom the invalid exchanged words, and he was surprised one morning to notice that her eyes were red with weeping.

'What is wrong with my little Nicette this morning?' he asked; whereupon, with fresh tears, the girl told him that her sweetheart had drawn the black number, and had to go away as a conscript to the war then impending.

Paganini sat at a table diligently carving a piece of ivory for the handle of a dagger, with his beloved Guarnerius and the wooden shoe near him, and his eye travelled from his work to these.

'Could your Adolph not be bought off?' he gravely asked.

'Yes; but fifteen hundred francs is the lowest price for a substitute,' answered the girl, 'and we have not saved the quarter of that.'

'I wonder what that shoe could do,' thoughtfully observed Paganini; to which Nicette made no reply, as she feared that the kind *maestro* must be going mad.

Paganini, however, was skilled in the use of edge tools, and he secretly thinned down the

wooden shoe from within, fitted it with a table of thin pine, fastened a neck to it, with pegs and strings, and, lo! the sabot was a violin—of a kind. He then announced a concert, for one hundred people only, at which he would have the pleasure of playing five pieces upon a sabot. Every ticket was eagerly bought, and when the evening of the concert arrived Paganini appeared with his beloved Guarnerius, and fairly electrified the audience by playing as he had never done before. Then, as a second part, he brought on the uncouth shoe-violin, and began to improvise some of his strange romances in music. It was soon clear to the listeners what that weird music represented. It was the life of a conscript: his drawing of the black number, the grief of his sweetheart, his departure, the bustle of the camp, the tumult of battle, the shouts of victory, the return of the conscripts, and the joyous pealing of wedding-bells.

Behind the scenes stood Nicette in tears, knowing too well what the music meant—the loss of her lover, and the possible blighting of her whole life; but, to her surprise, Paganini called her to the front, and said, 'My little Nicette, here are two thousand francs which the old shoe has earned for you; that is five hundred more than you need to buy off Adolph. And here also is the old sabot; perhaps some one will give you a few francs for it.'

Somebody did, for when it was put up for auction 'a mad Englishman' gave six thousand francs for it, and sent Nicette away home almost fainting with joy.

Needless to say that Nicette till her last day on earth never forgot Paganini's goodness; and when he died, eight years later, there was not in the whole world one who mourned for him more sincerely than did she.

Once more Paganini was tempted to divide the love of his magic Guarnerius, when, a year later (1833), he became the owner of a grand viola by Stradivari. The viola, or tenor violin, is a little larger than a violin, and goes one-fifth lower. It has a deeper tone, of a more pensive quality, and requires long fingers and great power in the performer to bring out its best effects. Paganini fancied that here was a chance to astonish the world with new effects, as the viola is seldom used for solo-playing; and as he was still ill, he asked Hector Berlioz, the greatest composer after Beethoven, to write a solo for him. The idea, however, 'ran away' with the composer, and the solo expanded into that great symphony known as *Harold in Italy*, in which the solo of the viola streams out like an angel's song above every other instrument in the orchestra.

Paganini, however, was away from Paris for three years, in the vain search for health, and so he did not hear the wonderful symphony till 1838, when Berlioz, broken in health, in deepest poverty, and borne down with the load

of his wife's debts, produced it at a concert which he had got up in the faint hope of retrieving his fortunes. Paganini was thrilled, as Berlioz thus relates:

'The concert was just over; I was in a profuse perspiration, and trembling with exhaustion, when Paganini, followed by his son Achilles, came up to me at the orchestra door, gesticulating violently. Owing to the throat affection, of which he ultimately died, he had already completely lost his voice, and unless everything was perfectly quiet no one could hear or even guess what he was saying. He made a sign to his son, who got up on a chair, put his ear close to his father's mouth, and listened attentively. Achilles then got down, and, turning to me, said, "My father desires me to assure you, sir, that he has never in his life been so powerfully impressed at a concert; that your music has quite upset him; and that if he did not restrain himself he should go down on his knees to thank you for it." I made a movement of incredulous embarrassment at these strange words; but Paganini, seizing my arm, and rattling out, "Yes, yes!" with the little voice he had left, dragged me up on to the stage, where there were still a good many performers, knelt down, and kissed my hand. I need not describe my stupefaction. I relate facts, that is all.

'Going out into the bitter cold in this state of white-heat, I met M. Armand Bertin on the boulevard. There I remained for some time, describing the scene that had just occurred, caught a chill, went home, and took to my bed more ill than before. Next day I was alone in my room, when little Achilles entered, and said, "My father is very sorry to hear that you are ill, and if he were not so unwell himself he would have come to see you. Here is a letter he desired me to give you."

'I would have broken the seal, but the child stopped me, and saying, "There is no answer; my father said you were to read it when you were alone," hastily left the room. I opened the letter, and read as follows:

"MY DEAR FRIEND,—Beethoven is dead, and Berlioz alone can revive him. I have heard your divine composition, so worthy of your genius, and beg you to accept, in token of my homage, twenty thousand francs, which will be handed to you by Baron de Rothschild on presentation of the enclosed.—Your most affectionate friend,
NICOLO PAGANINI."

'Then only did the truth dawn upon me, and I must have grown quite pale, for my wife, coming in at that moment, exclaimed, "What's the matter now? Some new misfortune? Courage! We have endured as much before."

"No, no; quite the contrary."

"What, then?"

"Paganini has sent me twenty thousand francs."

"Louis! Louis!" cried Henrietta, rushing distractedly in search of my son, who was playing in the next room, "come here! Come to your mother! Come and thank God for what He has done for your father!"

'And my wife and child ran back together, and fell on their knees beside my bed, the mother praying, and the child, in astonishment, joining his little hands beside her. Oh Paganini! what a sight! Would that he could have seen it!'

Of the music which Paganini produced from this magic Guarnerius, the brilliant pianist Kennedy, of Dublin, who heard it in that city in 1831, said to me that 'no human being could conceive of its wondrous power without hearing it. It was Paganini first, and every other violin-player nowhere. He had fingers long and thin as pipe-shanks, and so could reach from the bottom of the finger-board to near its top without shifting his hand, and thus could play a rapid run of tenths more easily than an ordinary player can play a run of octaves, and his octaves were so true that they sounded like a single note.'

R. B. Stewart, who was one of the orchestra of the old Theatre Royal, Edinburgh, when Paganini appeared in that city, and who had heard every great violinist between 1814 and 1885, said that not one of them approached Paganini, in whose hands the violin seemed not a mere instrument but a living personality, speaking things never spoken before and never heard since.

Paganini seemed to have a contempt for the low musical pitch of that day, which is now known as 'French pitch' or 'continental pitch'; for, while the orchestral accompaniments of his solos were written in E flat, he, with his violin tuned half-a-tone higher, played the solo in the much opener key of D major, so much more suitable for getting easy chords, harmonics, and pizzicatos. For the same reason his *Carnival de Venise* was arranged for the orchestra in the key of B flat, while Paganini, with his violin tuned half-a-tone higher, played the solo in the more brilliant and open key of A major. That curious trick puzzled many skilled musicians; but R. B. Stewart had an eye that could bore into you like a gimlet, as I can personally attest, and he detected the trick, though Paganini never allowed the band parts out of his sight, and carried them away after every rehearsal and performance.

The extraordinary magnetic power poured through that magic Guarnerius brought Paganini a constant stream of gold, and gold is supposed to command all that the world contains or a man desires; but, alas! it could not bring him health. Nature runs long accounts, but exacts heavy interest. The excesses of youth had left their mark on this great genius, and he was a physical wreck at the age when most men are at their best. Change after change he tried in vain, and at length landed at Nice, the air of which had

always agreed with him. He grew weaker every day, and seldom left his couch. One evening he seemed more kind and patient than usual, and, after a short slumber, whispered to his son, 'Draw back the curtains, *caro mio*; the moon shines on the sea.' It was done, and he raised himself and gazed long and earnestly upon the restless sea, so suggestive of his own life; and then the whispering of the wind among the trees or the distant murmur of the sea seemed to suggest to him some melody or harmony, and he feebly stretched forth his hand for his magic violin. A few sweet tones he was able to draw forth, and then, with a deep sigh, he gently laid the violin down. 'Ah! I could once'—was all he said. Then he lay back, and allowed his eyelids to droop. 'I will sleep now,' he whispered, with a smile upon his lips, and then he gently drifted out into the Great Beyond.

The magic violin, it was found, he had bequeathed to his native town, Genoa, with the fatal request that it was never to be played upon by any other, which, alas! was simply signing its death-warrant. A peculiarity of wood is that as long as it is handled and used it lives, and wears but little; but whenever it is laid aside it immediately begins to decay, and become the prey of insects. This magic violin, for which ten thousand pounds was offered and refused, and which might have thrilled the world for hundreds of years to come with its heart-searching tone, is becoming worm-eaten in its grand glass case in the Municipal Palace of Genoa, and will soon be a little heap of worthless dust. So passeth away the glory of the world.

A NOMAD'S DAY.

BANKED, black, the clouds that mask the coming dawn

Hang sullen, shroud-like in the eastern sky,
Seeming to cheat last even's parting glory
Into a last good-bye.

But in the farther lands the sun is wakening;
Rifting, reluctant wreathes the gloom away,
Gray pearl, pearl rose, rose pink in turn enchanting,
And then an upflung ray.

Now o'er the desert's cast a blaze of wonder,
And tender green of palm and gold-lined sand
Contrast with deepest blue of heaven's vaulting
To glorify my land.

On! happy foot, o'er scenes for ever changing,
Aimless or urgent as the night-dreams rule,
Sating a soul in joy till flesh grown weary
Welcomes a shady pool.

Splendour of couching sun to-night is waning,
Whisp'ring the wings of sleep the palm-fronds
sway,
And bear in soothing strain the farewell blessing
Of freedom's happy day.

Chambers's Journal

SEVENTH SERIES

GERMAN NAVAL TRADITIONS.

By LUKE HARRUNEY.

SOME years ago, when the writer was living at Wilhelmshaven as English tutor to the naval officers there, the numerous portraits and paintings with which their Casino is ornamented used to interest him very much; for the portraits were almost entirely those of officers who had lost their lives in the numerous accidents that befell the ships, first, of Prussia, and, later, of the newly founded German Empire. The first *Fräuenlob* sank in 1860, the corvette *Amazone* in 1861, the battleship *Grosser Kurfürst* in 1878, and the corvette *Augusta* in 1885; and many of the portraits were those of the officers drowned in these ships. A worse fate than shipwreck befell Germany's first battleship, the *Deutschland*, which was built for the Bund, or North German Confederation, in 1848; for, owing to its doubtful sea-going qualities, it ended an inglorious career by being sold by auction.

After this German battleships were built in England, the last English-built vessel being the *Kaiser*, launched at Poplar in 1874. The *Kaiser* was, for those days, a formidable ship of seven thousand four hundred tons, and at the lunch following the launching ceremonies Count Munster announced that this battleship gave Germany 'naval predominance over all other nations.' After this date all German ships were built in Germany; but Count Munster's remark may be taken to exemplify the unspoken thought then, as now, uppermost in German minds—namely, that, given the ships, German sailors would prove themselves superior to those of all other nations. No one has any right to complain of this; but the characteristically German method of expressing the thought is, to say the least, ridiculous.

From this belief sprang Germany's solitary great naval tradition before the war. The tradition is a curious one, decidedly uncomplimentary to Britain; and the visitor to Wilhelmshaven will still find plenty of evidence of it all over the town, in the numerous oleographs and engravings exposed for sale of Roechling's picture, 'The Germans to the Front.'

In June 1900 Admiral Seymour's little band of two thousand men retreated from Pekin in order to join the Allied Army sent to his relief. Seymour's force contained four hundred and

sixty German sailors as well as nine hundred and fifteen British, so that, on June 22, Seymour ordered the Germans to take their turn at the front. This order at once gave rise to the assertion in Germany that the German sailors saved the whole force; that without their leadership all would have been lost. Ernst Mayer, in his spiteful pamphlet, published at the time, entitled *Los von England*, at once wrote of 'Seymour's cry for help;' and Roechling's picture, showing the German sailors rushing forward with their naval flag at their head, and the sailors of other nations cheering wildly in admiration in the background, merely records on canvas that all the honours of the expedition, according to German people, fell to the German sailors, and that the British played a cowardly part!

With this tradition before us, it is not difficult to realise the absurd claims now being made on behalf of the German navy. An instance of these is furnished by the amount of literature which the career of one of the writer's old pupils has given the German people. This was Von Weddingen, of the U 9, now acclaimed in Germany as 'one of the greatest naval heroes of all time,' and still more ludicrously as the man 'who gave Germany the command of the sea.'

Kapitän-Leutnant Otto Eduard von Weddingen was a native of Westphalia, born at Münster in 1880, the youngest child of a merchant of Herford. He was the best type of German naval officer—a sportsman, destitute of the unpleasantly arrogant manners common among his Prussian comrades. He became *leutnant-zur-see* in 1904, *oberleutnant* in 1906, and *kapitän-leutnant* in 1912. Thus far his career had been undistinguished, and calls for no remark. Soon after the war broke out, in August 1914, he married Fräulein Irma von Prencke. On 22nd September 1914, more by luck than anything else, his submarine, the U 9 (to which he was appointed in 1912), sank the three British cruisers *Aboukir*, *Hogue*, and *Cressy*. When he returned to Wilhelmshaven at noon on the following day the scenes that followed, according to the *Wilhelmshavener Tageblatt*, almost beggared description. The town broke out into bunting everywhere, all the church bells rang, the streets were thronged with cheering crowds

long past midnight, and enough beer was drunk to float a battleship. Poets all over Germany at once set to work—the writer has the results of their labours before him in the shape of a volume of verse; and the Kaiser naturally conferred the Iron Cross upon Weddingen himself, and decorated every member of his crew.

Fortune again favoured Von Weddingen on the following 13th October, when the U 9 sank the *Hawke*. This time decorations literally rained upon him. The Kaiser gave him the Red Eagle, and every state in Germany followed suit with one or other of its orders. Nothing less than the destruction of the entire British fleet was now hoped for from the German submarines. Von Weddingen was the hero of the day, 'one of the greatest sailors of all time.' So high did enthusiasm run that the city of Münster actually affixed a marble tablet to the house in which he was born, informing the world in general that it was the birthplace of Von Weddingen, 'Sea hero.'

In March 1915 Von Weddingen was given the command of the finest of the new German submarines, the U 29, and great things were expected as a result. But by this time submarine warfare was better understood. Von Weddingen was compelled to confine his exertions to commerce raiding. On 11th March he sank the French steamer *Auguste Conseil*, and on the 14th four small British vessels. Justice was done in this country to the courtesy and

humanity of these closing acts of his career, for he caused no wanton loss of life, and was considerate in every way to the crews whom he compelled to leave their vessels. At the end of this month the British Admiralty announced that the U 29 had been destroyed, and that all on board were lost. Thus ended Von Weddingen's career.

But in the cafés and beer-halls of north Germany they are still singing Alexis Moskowski's 'Song of the U 9,' according to which Britain no longer sings 'Rule Britannia,' 'for quite otherwise now is the text of the song.' And, after depicting the dismay of the great English villain, Sir Edward Grey, the chorus of Moskowski's ditty winds up:

U 9! U 9! U 9!
Eternal glory is thine, is thine,
And thine is the sea, Germania!

Certainly, we are far distant from the days of Prussia's first great naval commander, Benjamin Raule, the Dutchman whom French writers unkindly term a pirate, who was hired by the Elector Frederick William for four months, at the price of one hundred and thirty-five thousand florins, in order to attack Sweden; and nowadays Von Weddingen and others have a more honourable claim for remembrance. But it is not the custom of other nations to spoil the laurels their heroes have legitimately earned by bombast and falsehood.

JANET ARMSTRONG.

CHAPTER III.

I WELL remember the May morning when the call came to me from my present city charge. It wasn't altogether unexpected, as I had had an inkling from an Edinburgh friend how matters were tending; but when I sat, letter in hand, in the quiet of my little study, with the ripple of Shinnel in my ear and the May morning sunshine in my heart, I own to a feeling of surprise at once pleasant and painful, and before God I felt humbled.

Since coming to Shinnel I had looked upon it as my settled home, not as a stepping-stone to another and a more responsible sphere; and the quiet, uneventful years I had spent in the glen had forged links in a chain which bound me lovingly to its grassy hills, its birchen shaws, and true, warm-hearted, kindly people. To break my connection with it now, to end a period of peaceful, contemplative study and soul-satisfying, appreciated work, somehow seemed to me as savouring of broken trust, of discontent, and a useless striving after a vain, fleeting show. Still, after all, it was a limited sphere of usefulness; and there was that within me, a consciousness of strength and equipment, calling for—nay,

demanding—more opportunity, more outlet, and a larger, busier vineyard. So, recognising this call as the tide in my affairs, after much heart-searching and consideration I accepted.

That same evening I told Janet. Not a word did she say till I had finished, and had pointedly asked her if she would accompany me to Edinburgh as my housekeeper.

Of a sudden she had found much amiss in my room demanding immediate attention, for she adjusted the window-curtains, dusted the mantelpiece with her apron, and blew with her breath soot-smuts off the crimpily tinsel in the grate. The silence became oppressive.

'We've been guid freens for mony a lang year, Davie,' she said at length; 'an' for yince I mak' nae excuse for ca'in' ye by the auld name. I'm—I'm rale prood o' ye; so wad your aunt ha'e been had she been leevin'. Ay, it—it'll be a gey rive leavin' a' about this place here, which, I daur say it, I've got to love; but if you can put up wi' leavin' it, so can I; an' I'll be gled to gang wi' ye, an' continue makin' your hame mine. Ay, an' this turn-up'll mean a displenishin' sale; an', wi' the markets sic as

they are, it'll be an unco chancy business. Is the—the what I may ca' the pey—is it as guid where ye're gaun as ye ha'e here? But mebbe that's an impident question I'm speirin'!

'Not at all, Janet,' I said; 'not at all. The salary, or stipend, as we call it, is more than I have here by nearly four hundred pounds.'

'Megstie me! fower hunner pounds. Oh losh, fower—hunner—pounds! That's—let me see—nearly echt poun' a week. Mercy, think o' that! That's a ca' fra the Lord; sure as death, a lood, lood ca' I wad say, an' I'm thankfu' ye heard it sas glibly. A toon's life'll no be like this; but—fower hunner poun'! Weel, that's no gaun stravaigin' aboot every day for chance gruppin'. Oh, faith, I'll gang wi' ye. An' what aboot the wee Wanlock warlock, as I ca' her—Aggie—ben in the kitchen there? Have ye asked her?'

I assured her she was herself the only person as yet who knew of my contemplated change, told her I didn't wish it to become parish talk; but, all the same, I was wishful Agnes should come with us. 'You know, Janet,' I said, 'my home atmosphere here—thanks to you—has been all I could wish it to be. If at all possible, let us carry it with us.'

And in this, as in other things, Janet didn't fail me.

Much took place at this time which, if written down, might make interesting reading; and, being naturally reminiscent, I am sorely tempted to go into details. However, I will restrain myself, for I am not writing my autobiography. I am writing of Janet Armstrong, and therefore must confine myself to a recital of those events with which she was personally and more directly associated.

Concerning our waygoing, all I will say is that, contrary to Janet's prognostications, there was no necessity for a dispenishing sale. She sold our stock of sheep privately to a Dumfries dealer, a little, podgy man, with two beady eyes, no neck to speak of, and a large, round face, every inch of which seemed to be in need of shaving. Somehow I think he won't forget Janet, for he sold the lot at Thornhill mart the following Saturday, and to a penny got just his own money back.

My old friend Glenhead was keen to have the two cows and our young quey. Goodness knows, I am no troker, nor have I the bargaining instincts; but, even to me, Glenhead as a buyer seemed to be stupidly anxious. I was surprised, as I gave him credit for knowing the game; but probably he considered a manse deal demanded no dissembling. When he called I left him entirely to Janet's tender mercy; and after much noisy bickering, and a good deal of what sounded to me perilously allied to blasphemy, he jumped into his trap, and left without coming in to wish me good-day.

Janet just laughed when I asked her the

cause of all the rumpus. 'I wad tak' Glenhead,' she quietly said, 'to be yin o' thae kin' o' fouk that wad teach his gran'mither to catch fleas. You'll mebbe hear mair the morn.'

She was quite right; for, after breakfast, Glenhead again drove into the courtyard, and for two hours thereafter the birds seemed to stop singing. He came in and had dinner with me. When Janet entered with the soup-tureen he eyed her from crown to toe with a look that spoke volumes.

'Maister Crosbie,' he said after she had closed the dining-room door, 'I've bocht the bees, but at a ransom price. As for that greyhound o' a hoosekeeper o' yours, by my faith, sir, she's a Tartar! Ony yin that rides ahin' her sits dam—eh, dashed—near the tail; mind, I'm tellin' ye, Maister Crosbie.'

Andrew Hair was very much disappointed at not getting our hens. They were all distributed gratis among the more deserving of my parishioners, and Janet superintended the apportioning with a happy resignation strangely out of keeping with her calculating, mercenary disposition.

One warm July day, about a year after I had settled in my city charge, I was sitting in my little summer-house writing a report of the doings of a committee of which I was secretary. My manse garden, bordered to right and left by shimmering saughs, slopes gently down to a rippling burn, along the farther bank of which runs a low, ivy-covered wall forming the boundary between my grounds and the Hermitage glen beyond. Save for the intermittent sounds of traffic—low-rumbling, and mellowed by distance—there is little in my surroundings to denote proximity to a busy, bustling city, and often my heart responded with a thrill to nature's offerings, as my eye wandered lovingly from the fragrant flower-beds beside me to the grassy slopes of the distant Pentlands before me, where, through a glimmering, veil-like heat haze, Allermuir and Caerketton lay bathed in July sunshine.

I had finished my work, and was leisurely filling my pipe, when, chancing to look through the open window, to my surprise I saw two large hands clutching the ivy on the top of the wall. Then a head, half-buried in a soft gray hat, cautiously came to view, followed by a bulky body and two long legs, stiffly and with evident difficulty raised from the other side. And there, half-lying and half-astride the copestone, was Andrew Hair, the grocer from Brig-o'-Scaur!

Making siccar his position, and balancing himself carefully, he took a slip of paper from his vest pocket. 'Number five—imphm!' I heard him mutter. Then he cast his eye along to the end of our short terrace, counting the houses and nodding his head as he mentally ticked off each number.

I was too astonished to speak; but as he complacently settled himself, and mopped his perspiring face with a large red handkerchief, surprise within me gave place to curiosity, and I was just on the point of calling the challenging word, when, with an agility creditable to a much younger man, he vaulted from his perch into the garden.

A screen of laurels hid him from my view; but, just as he landed, a text came most opportunely to my mind; and, remembering one of his little peculiarities, I called aloud, "Verily, verily, I say unto you, he that entereth not by the door into the sheepfold, but climbeth up some other way, the same is a thief and a robber."

There was silence for a moment, then a rustling among the branches of the laurels, and a very scared, astonished man stood before me.

'Oh, it's you yoursel', Maister Crosbie!' he said with a catch in his breath. 'I juist didna ken the voice, though I was by-ordinar' familiar wi' the text. Ye quote it a' richt, but ye dinna gie your authority. It's—it's in the Gospel o' Saint John, the'—

'Don't worry about chapter and verse, Andrew Hair,' I said, 'but tell me why, when you visit me, you don't come to my house by the door.'

Andrew looked very shamefacedly at me, not knowing whether I was angry or badgering in fun. 'The fac' is, Maister Crosbie, you're takin' me at a disadvantage. I didna expec' to meet ye like this. It wasna you I cam' to see; it was Miss Airmstrong.'

'Oh, it's my housekeeper you've come to visit! Just so. But I'm sure Janet wouldn't like to know of any of her friends scrambling over walls and'—

'Yes, yes, Maister Crosbie; but, ye see, on my roon's wi' the cairt I'm aye used ca'in' at the back door. Fouk in my line o' business maun be discreet. We micht tak' the liberty wi' a cot-hoose, but at a faceable, dooble-storey yin we wad never presume to gang to the front. Sae far as I can see, ye've nae back entry here, an' I should ken, for I've been hingin' aboot, keekin' here an' keekin' there, for the feck o' an 'oor an' a hauf.'

'But there's a side gate to the kitchen door, Andrew.'

'Ay, I ken; but it's at the front too. Od, it seems a desperate queer thing to build a hoose without either a back door or a back road. Hoo ye get yer coals in or your shunners oot without fouk seein' ye beats me; an'—an' keepin' a soo'll be fair oot o' the question. But I'm deavin' ye, Maister Crosbie?'

'Not at all, Andrew; you're not deaving me. But come away into the manse. You'll be tired and hungry; and if Janet's expecting you she'll be'—

'Eh, but, one moment, Maister Crosbie; she's—she's no expec'in' me. Will ye juist hover

a meenit, if ye please, till I compose mysel'?' He sat down on a stump of a tree at my summer-house door, and his face wore a worried, perplexed look. 'Maister Crosbie,' he said after a long pause, 'I must confess I didna expec' to see you the day. As I've telt ye, I cam' to ca' on Miss Airmstrong to—to—in fac', to ask her a question. But noo that we've met I micht as weel tell ye my errant. Have ye a—a meenit to spare?'

I assured him I had; and, after helping himself to tobacco from my pouch and a match from my box, he began: 'Ye see, it's like this, Maister Crosbie. I lost my wife shortly efter you left Shinnel, an'—an' we've the Word for 't that it's not good for man to be alone. I'm missin' a womanbody in the hoose, an' if I dinna get settled doon it'll sune no be worth while, for I'm gettin' on in life. There's a wide wale in Toon-o'-Scaur, but there's a scarcity o' what I judge are the richt kind—they, ye ken, wi' a weel-faur'd face, a workin' haun', a level heid, an'—an', abune a', the grace o' God in their he'rt. Noo, I've often thoct o' Miss Airmstrong; she's o' a desperate knacky business turn, has a by-ordinar' guid appearance for ahin' a coonter, an', havin' been sae lang aboot a manse, she'll dootless be staunin' fast i' the faith. This is a Toon-o'-Scaur holiday; it's a cheap trip—only five-an-ten return—so it struck me that, instead o' writin'—which in the ordinary wey is kittle—I wad juist tak' the day aff an' speir at her mysel' by word o' mouth. Ye unnerstaun', Maister Crosbie? Ye—ye follow my drift?'

'Yes, Andrew, I understand, quite. I take it you have come here to-day to ask Miss Airmstrong to be your wife?'

'That is so, sir. You've struck the nail on the heid.'

'But, Andrew, is it not usual to—well, to court a woman before asking her in marriage?'

'Weel, I wad say it is, Maister Crosbie, when—when yin has the chance; but it's a faur cry fra Toon-o'-Scaur to Embro', an' in that wey I've been what you wad ca' handicappet. Still, I ken my ain mind on the maitter; an' as for Miss Airmstrong, though she's younger a hantle than me, I wad judge she's past the cooin', cushie-doo stage, an' will sensibly consider this chance o' a guid doon-settin'.'

'Just so, Andrew,' I said thoughtfully. 'And has she ever given you cause to think she would be agreeable to what you propose?'

'Weel, sir, I—I juist canna exactly say she has; but mair than yince she's telt me that I was a weel-faur'd, faceable man; an' that's nae little to hing by. Of course, we were talkin' business then. I was a mairret man, an' nocht mair was said. But I'm wastin' guid time. I maun get the business settled within an 'oor, for I've to be in Toon-o'-Scaur the nicht.'

'Well, Andrew, there's the kitchen door,' I said, pointing up the walk. 'I dare say I ought

to wish you luck ; and I do, if not with Miss Armstrong, with some other suitable party. I'll be here for some time yet. Come back and give me an opportunity of congratulating you.'

I waited till long past my tea-hour, but Andrew didn't return. The time slipped quickly past, however, for I was busy in thought. Somehow I couldn't imagine Janet as Andrew Hair's wife, mending his mealy clothes and serving behind his counter. All the same, I couldn't

shut my eyes to the fact that she had changed lately, in what respect I couldn't very well say ; but she was observing the fashions to the same extent as she had previously ignored them, and there was a happy gleam in her eye I had never noticed before. Since hearing Andrew's story I was inclined to associate these changes with the reason of his visit ; and, in spite of Andrew's assurance that he wasn't expected, I put it down to cause and effect.

(Continued on page 827.)

THE WORK OF LOBWORMS.

By CHARLES DAVISON, Sc.D., F.G.S.

AS the tide retreats from a sandy beach, the lobworm or lugworm, the common bait of fishermen, throws up its castings on the sand. The worm, which is about a foot long, burrows head downwards in the sand freshly soaked with the sea-water. After swallowing the sand and taking from it what nutriment it possesses, the worms throw up the waste sand on the surface in small heaps, which are strikingly similar, because formed in the same way, to those ejected by earthworms on our lawns.

At first sight, the castings seem to be thrown up somewhat capriciously. In one spot they may be scattered with a fair approach to uniformity ; but patches of sand, apparently in no way differing from the rest, occur in places without any castings. When the surface is covered with broken shells they are also rare or altogether absent, unless the sand is much ripple-marked, and then the fragments of shell collect in the hollows, while castings are piled up on the intervening ridges. Impure or clayey sand, such as that which lies above or near a submarine forest, is altogether, I believe, avoided by lobworms. The castings also vary much in size in different parts of the same beach. They are largest on sands where the water is smooth and retires gently and continuously ; but if again surrounded by incoming waves they sink down and lose much in size, if they do not entirely disappear.

So closely are castings sometimes collected that from a little distance the beach looks as if covered with a rash. In no place that I know of are they so large or so abundant as on the broad stretch of sand, three miles wide, which at low water separates the west of Holy Island from the opposite coast of Northumberland. Some years ago, when staying on the island, I endeavoured to estimate roughly the number of castings thrown up in a given area, and the weight of the sand contained in them. The implements required were few and simple—a good measuring-tape, a small shovel with a sharp edge and flat bottom, and a few wide-mouthed jars and oiled silk to cover them. Selecting a

stretch of sand where castings were clustered with a fair approach to uniformity, and neither more nor less abundant than in surrounding parts, I marked out with a stick a triangular area with sides about four or five yards in length. The three sides being measured and the number of castings within the triangle counted, data were obtained by means of which the average number of castings per acre or square mile could be readily calculated. To determine the weight of the sand contained in the castings, some of average size, as many as would go into a jar were collected, and the sand was taken home, and afterwards dried and weighed.

Altogether, nineteen triangles were so measured on the Holy Island sands, and, as might be expected, the average number of castings per acre varied rather widely. In none was it less than thirty-nine thousand nine hundred and thirty-five per acre ; but in the majority it was far higher, rising in one case to two hundred and three thousand two hundred and seventy-two. Taking all the areas together, the average number of castings per acre was eighty-two thousand four hundred and twenty-three, equivalent to more than fifty million per square mile ; so that, from one of the higher parts of the coast, or from one of the refuges on the route to Beal, it is not impossible that a spectator might include within his view as many worm-castings as there are inhabitants in the world. And when we reflect on the enormous number of castings thus thrown up within a very limited area, and remember also that as the tide advances they are all obliterated, only to be renewed as the water again retires, the vastness of the work accomplished by the myriads of lobworms on our sandy beaches will be readily apparent.

The measurements described above were made during one week in August. Whether the number continues uniform throughout the year—that is, whether lobworms tend or not to die off during the winter months—I am unable to say. But I imagine that they are not much affected by the cold ; for once, after a night of intense frost, and while the sea-water left higher

up the beach was a sheet of ice, I found castings on a patch a mile or two north of Sunderland quite as numerous as at Holy Island, the number within a small area being equivalent to eighty-seven thousand five hundred and nine per acre.

Some of the Holy Island castings, when dried and weighed, contained not more than half-an-ounce of sand; others, perhaps less abraded by waves, as much as two or three ounces. If we suppose that the same number and weight of castings were formed on an average after each of the seven hundred and five high tides of the year, the measurements made on Holy Island sands show that the total weight of sand yielded annually by lobworms was in no place less than four hundred and forty-nine tons per acre, while in two cases it was as much as three thousand one hundred and forty-six tons per acre. The average amount was one thousand nine hundred and eleven tons per acre, an amount which, if spread out over the whole area, would have formed a layer thirteen inches thick. Thus, area for area, lobworms accomplish considerably more than a hundred times the work of their brethren on the land.

The depth to which lobworms burrow is, of course, very limited. They keep near the surface, in order to deposit their castings upon it, and thousands must be dug up every year for bait. Carpenter gives the depth as from twelve to eighteen inches, and Johnston about two feet. Taking the latter estimate, it thus follows that on the Holy Island sands the layer of sand inhabited by lobworms must on an average pass through their bodies once in less than two years.

With these figures before us, it would be difficult to overestimate the work of lobworms. We have seen that over an acre nearly two thousand tons of sand are brought up by them in the course of a year and deposited on the surface. The distance through which it is carried is small, but it is carried in the direction opposite to that in which gravity acts. The surface sand must frequently pass through the bodies of the worms, and in this way the particles must become slightly worn. But of still greater importance is the fact that fresh sand is being continually introduced by lobworms to the grinding action of the waves.

PINCHER MARTIN, O.D.

CHAPTER XVII.—*continued.*

IT was at about this time that some signal was hoisted in the *Lion*, and before Pincher quite realised what was happening, the *Mariner* and most of the other destroyers swung round and steamed for the enemy as hard as they could go.

'Gawd!' he whispered breathlessly; 'we're goin' in to attack!'

It seemed a suicidal sort of business, another charge of the Light Brigade, as the ship, quivering and shaking to the thrust of her turbines, drove on at full speed into the very jaws of those belching guns. They were between the lines, and the screeching and howling of the heavy projectiles as the two squadrons fired at each other became fainter and more distant. They drew nearer and nearer to the enemy. They were travelling at something over thirty knots—fifty feet a second, one thousand yards a minute.

'Lie down!' came a sudden order to the guns' crews, for in another moment the enemy's secondary guns would be opening fire. The men flung themselves to the deck and watched.

It was at this moment that Pincher first saw a cloud of enemy destroyers and some light cruisers appearing from behind the line of German heavy ships. They came out at full speed to ward off the British attack, perhaps to deliver one of their own; but, whatever happened, they were too late, for the British small craft, swinging round, turned to meet them.

'Guns' crews, close up!' came an order.

'Load with lyddite!' The men scrambled to their feet and waited.

'Enemy destroyers bearing green four-five,' came through the voice-pipe. 'Rapid independent! Commence!'

For the next few minutes Pincher was so hard at work cramming shell into his gun that he could hardly see what was happening, much less understand it all. He realised that the ship was being fired at, for there were splashes in the sea all round, and he could hear the shrieking whistle of the shell-splinters; but the roaring of the *Mariner's* own guns drowned every other sound. It was glorious to think that his own gun was firing at last, and somehow he did not very much care what happened so long as the enemy suffered.

It was an exciting experience. The hostile flotilla appeared as a drove of rushing gray shapes in the midst of a turmoil of shell fountains, smoke, and gun-flashes. There were so many of them, and they were so closely packed, that it was unnecessary to single out any one particular vessel as a target, and the British guns merely fired into 'the brown,' with the almost absolute certainty of hitting something.

Nearer and nearer they came—four thousand yards, three thousand five hundred, three thousand. In numbers the two forces were about equal, but the effect of the heavier British guns soon made itself felt, for before long two of the enemy seemed to crumple up and vanish.

in a cloud of smoke and steam. A bare thirty seconds later another shared the same fate; while a fourth, badly hit, lay nearly motionless on the water and very much down by the bows, with a storm of shell spurting, foaming, and bursting all round her. The hostile attack was beaten off, for after a very sharp close-range action the enemy's flotillas turned tail and scuttled back to the shelter of their heavier ships.

Then the British flotillas, with the ground cleared, charged on again to press home the attack on the German battle-cruisers. The moment they came within range they were fired upon, and within a few seconds all the enemy's lighter guns came into action in a furious and frantic endeavour to drive them off. The gray shapes of the hostile vessels scintillated with gun-flashes and became shrouded in smoke, and once more the sea started to spout and boil angrily. But the destroyers were not to be denied, and after the gigantic shell fountains of the earlier portion of the battle, these smaller splashes, alarming as they might have been in ordinary circumstances, seemed puny and insignificant. Indeed, they came as a positive relief, and nobody worried his head about them.

The little craft still drove on under a heavy fire, and the *Mariner*, following round in the wake of her leader, turned and fired two torpedoes in rapid succession when she came within range. Others did the same, some ships arriving within three thousand yards of the enemy to do so. Some of the torpedoes must have gone home; but before they reached the enemy the attackers had turned about and were steaming hard to get out of range.

The *Mariner* had been hit by only one small projectile, which burst aft, but did no damage to speak of except inflicting slight flesh-wounds on two men, much to their subsequent satisfaction. Other ships had not been so lucky, and Pincher noticed one destroyer which had been struck in the engine-room and could not steam. The last time he saw her she lay motionless between the two fleets, enduring a terrible fire from every German gun which would bear. The greater number of her men must have been killed and her deck converted into a reeking shambles, but her colours were still flying.

The action between the opposing battle-cruisers had continued with unabated fury, both forces steaming to the southward on roughly parallel courses; but at four-forty-two the German High Sea Fleet had been sighted to the south-eastward from the *Lion*. Sir David Beatty thereupon swung round to an opposite course to lead the new-comers towards Sir John Jellicoe, who, with the battleships of the Grand Fleet, was somewhere to the north. The enemy's battle-cruisers, maintaining their station ahead of the High Sea Fleet, conformed to the movement of the British shortly afterwards.

The Fifth Battle-Squadron, under the orders

of Rear-Admiral Evan Thomas in the *Barham*, with the sister-ships *Valiant*, *Malaya*, and *Warspite*, were now approaching from the north, firing heavily as they came on to the head of the hostile line; but shortly before five o'clock they swung round into line astern of the battle-cruisers, coming under a heavy but more or less ineffectual fire from the leading German battleships as they did so.

Up to now the weather conditions had been favourable alike to both sides, but at about four-forty-five a thick mist and a great mass of dark cloud settled on the eastern horizon, and blurred the outlines of the enemy's vessels until they appeared vague, shadowy, and indistinct. To the westward, however, the sky was still quite clear, and the British were plainly silhouetted against the horizon, which gave the Germans the advantage in so far as the light was concerned.

Between five and six P.M. the action continued, Sir David Beatty's force, with the four battleships astern of it, gradually drawing ahead of the enemy, and concentrating a very heavy fire on the battle-cruisers at the head of his line at a range of about fourteen thousand yards. The hostile battleships, meanwhile, farther astern, could do little to reply, and ship after ship of the enemy was badly battered, while one of their battle-cruisers, terribly damaged, was observed to quit the line.

At about six o'clock the leading British battleships were sighted to the north from the *Lion*, and at this time Sir David Beatty, to clear the way for them to come into action, altered course to the east and crossed the enemy's T, reducing the range to twelve thousand yards as he did so, and inflicting terrible damage with his heavy fire. At this time only four hostile vessels were in sight, three battle-cruisers and one battleship, the others being obliterated in the mist.

Twenty minutes later the Third Battle-Cruiser Squadron, commanded by Rear-Admiral the Hon. H. L. A. Hood, joined Sir David Beatty. The reinforcement was ordered to take station ahead, and steamed gallantly into action at a range of eight thousand yards. It was then that Rear-Admiral Hood's flagship, the *Invincible*, subjected to a concentrated fire from every hostile gun which would bear, was sunk.

Previous to this, between five-fifty and six P.M., Rear-Admiral Sir Robert Arbuthnot, with the older cruisers *Defence* and *Warrior*, had steamed in to attack the enemy's light cruisers, and the two vessels, with their 9.2 and 7.5-inch guns, sank or inflicted severe damage upon their opponents. But in doing so, unaware, on account of the mist, of the immediate presence of the enemy's heavier ships, they suddenly came within easy range of monster weapons against which their comparatively light armaments were impotent.

An awful fire was concentrated upon them.

The *Defence*, to use the words of an eye-witness, was 'blown clean out of the water' by a salvo of shell. The *Warrior* was hit repeatedly by heavy shell, and suffered terrible injury, for before escaping from her unenviable position she had arrived within a range of about five thousand four hundred yards of two hostile battle-cruisers.

The ship was little more than a battered wreck. A distance of five thousand four hundred yards is nothing at sea. It is point-blank range, and may be compared with using a rifle at fifty yards. Her casualties in killed and wounded had been very severe. The engine-rooms and stokeholds were flooded through shell striking and penetrating below the water-line, while she was blazing furiously aft, and was making water fast. The whole vessel was pierced and perforated until she resembled a gigantic nutmeg-grater, and as time went on she settled lower and lower in the water. Certain of the survivors tried to quench the fire with hoses, while the remainder set to work to build rafts, practically all the boats having been demolished. The conflagration was eventually subdued, and then came the piteous and gruesome task of identifying the dead, while the wounded were brought on deck in case it should be necessary to abandon the ship.

For over an hour she lay there helpless, and we can imagine the relief of officers and men when, later in the evening, the *Engadine*, a cross-Channel steamer converted into a seaplane depot ship, arrived on the scene and took her in tow. The energy of every soul on board was then concentrated on keeping the ship afloat; and, as the steam-pumping arrangements were useless, the exhausted men were at the hand-pumps all through the hours of darkness.

But it was not to be. The weather during the night grew rapidly worse, and when dawn came the wind and sea had risen, and waves were breaking over the quarterdeck. The cruiser could not last much longer. She was sinking fast, and there was nothing for it but to abandon her.

One by one the wounded were passed down into boats and were ferried across to the rescuing vessel. They were followed in turn by the remainder of the ship's company, the officers, and finally the captain; and when last seen, between nine and ten in the morning, the *Warrior* was sinking by the stern. But she had upheld her name. She came to a noble end, for she had fought valiantly against overwhelming odds until she could fight no more, and her name, together with those of other brave ships lost on that eventful day, will never be forgotten. Her heroic dead did not sacrifice their lives in vain.

Of the gallant work of the *Engadine*, which towed the cruiser for seventy-five miles between eight-forty P.M. and seven-fifteen A.M. the next

morning, and was instrumental in saving the lives of her ship's company, we need make no mention here. The exploit occupies its deserved position of prominence in Sir John Jellicoe's official despatch.

III.

It was immediately after the destroyer action between the lines that the *Mariner* first sighted another body of ships looming up to the southward. The new-comers, about sixteen large ships accompanied by many smaller vessels, came on at full speed towards the scene of action, and at first the men in the destroyers imagined them to be the battleships of the British Grand Fleet. Their spirits rose accordingly, for with the arrival of these powerful units the enemy's battle-cruisers, cut off from their base, could not escape annihilation. But a few minutes later, when the great ships had come nearer, their unfamiliar shape and unusual light-gray colouring proclaimed them for what they really were—the battleship squadrons of the German High Sea Fleet.

Some of the destroyers which were favourably placed at once dashed in to attack with torpedoes, retiring as soon as they had fired, and before very long most of them had rejoined the heavier vessels.* Their next chance of doing something was to come after nightfall.

From about six-fifteen onwards it is very difficult to give a comprehensive account of what occurred, for with the arrival on the scene of the British Grand Fleet, the German main squadrons turned and retired to the southward. Sir John Jellicoe chased at full speed; and, as he says in his despatch, 'the enemy's tactics were of a nature generally to avoid further action,' while he refers to his own ships as the 'following' or 'chasing' fleet. Moreover, in the engagements which ensued, the enemy were favoured by the weather, for banks of heavy mist and smoke-clouds from the hostile destroyers reduced the visibility to six miles or less, and periodically screened the opponents from each other's view.

The fighting between the opposing battleships, which began at six-seventeen P.M., seems to have resolved itself into a series of ship to ship and squadron to squadron encounters rather than a formal fleet action; but, while our vessels remained in their organised divisions throughout, the enemy, soon after the fight began, seem to have become more or less scattered, and to have had a trail of injured ships struggling along in rear of their main body.

A hostile vessel would suddenly loom up out of the haze a bare eight or ten thousand yards distant, to be greeted with salvo after salvo of shell as the British battleships drove by. She

* That is, those destroyers attached to Sir David Beatty's squadron.

would reply to the best of her ability; but, whereas our vessels had just come into action, and their shooting was very accurate, the German firing was not good, and had little or no result. Ship after ship of the enemy appeared through the murk to be fired at heavily for three, four, or five minutes, then to disappear in the haze, badly hammered and perhaps on fire.

To give some idea of what took place during this period it is advisable to quote largely from the official despatches of Sir John Jellicoe and Sir David Beatty. There was the battleship *Marlborough*, which, with the First Battle-Squadron, came into action with the retiring enemy at six-seventeen P.M. at a range of eleven thousand yards. She first fired seven rapid salvos at a German vessel of the *Kaiser* class, then engaged a cruiser, and again a battleship, doing them all serious injury. At six-fifty-four she was struck by a torpedo, the only one which took effect out of the many fired by the hostile destroyers; but, though damaged and with a considerable list to starboard, she remained in the line, and opened fire again at a cruiser at seven-three P.M. Nine minutes later she started to fire fourteen rapid salvos at another battleship, hitting her badly and forcing her out of the line. Her firing throughout was most effective and accurate, and this in spite of the injury caused by the underwater explosion of the torpedo.

The First Battle-Squadron closed the range to nine thousand yards, and wrought great havoc with its fire; but only one of its vessels, the *Colossus*, was struck, despite the hail of shell from the enemy.

The Second Battle-Squadron was in action with other German battleships between six-thirty and seven-twenty P.M., and also with a battle-cruiser which had dropped astern seriously injured; while the Fourth Battle-Squadron, with which was Sir John Jellicoe's flagship, the *Iron Duke*, engaged two battleships, as well as battle-cruisers, cruisers, and light cruisers. The vessels of the Fourth Light-Cruiser Squadron remained ahead of the British battleships until seven-twenty P.M., when they moved out to counter the attack of hostile destroyers, and successfully drove them off. They did it again an hour later, in company with the Eleventh Destroyer Flotilla, and came under a heavy fire from the enemy's battleships at ranges of between six thousand five hundred and eight thousand yards. It was then that the *Calliope*, flying the broad pendant of Commodore Le Mesurier, was hit several times, and suffered casualties, but luckily escaped serious injury. In the course of these attacks torpedoes were fired at the foe, while four hostile destroyers were sunk by the British fire.

At seven-fourteen Sir David Beatty, who, with his battle-cruisers, was apparently separated

from Sir John Jellicoe, sighted two battle-cruisers and two battleships in the mist. He promptly engaged them, and, setting one on fire, so damaged another that she was forced to haul out of the line. The enemy's destroyers thereupon emitted dense volumes of gray smoke, under cover of which the enemy turned away and disappeared.

But they were very soon relocated by the British light cruisers acting as scouts, and between eight-twenty and eight-thirty-eight P.M. Sir David was once more in action at ten thousand yards. During this period the *Lion* forced one of the enemy, badly on fire and with a heavy list to port, out of the line; the *Princess Royal* set fire to a three-funnelled battleship; and the *New Zealand* and the *Indomitable* caused another vessel to leave the line heeling over and blazing furiously. The enemy then disappeared in the mist, and were no more seen.

These various semi-isolated actions, and particularly the performance of the *Marlborough*, which fired at no fewer than five different ships between six-seventeen and seven-twelve, show only too well how the mist aided the foe; but in spite of it, the German losses were very heavy.

At nine P.M. darkness was rapidly approaching, and at about this time the British heavy forces retired temporarily from the immediate neighbourhood to avoid hostile destroyer attacks, remaining, however, in positions between the enemy and his base from which the battle could be renewed at daylight. At the same time the light cruisers and destroyers were ordered in to do what damage they could.

To those in certain of the destroyers which were present during the latter part of the afternoon and evening, and happened to be unengaged, the sensation was a most uncanny one. Their area of vision was bounded by a narrow circle of four or five miles radius, but all round them until nightfall the air resounded and shook with the distant rumble and the nearer thudding of big guns as the heavy ships engaged each other. The uproar never ceased. Fighting seemed to be furious and continuous; but though the vessels of the *Mariner's* flotilla were steaming to the southward with their guns ready and torpedo-tubes manned, it was not until after darkness had fallen that they were vouchsafed another chance of using them. But they saw many signs of the battle. At one moment they would catch a glimpse of a huge British battleship vomiting flame and smoke as she engaged some invisible opponent. She would fade away in the mist, to be followed presently by a fleeting vision of two light cruisers, one British and the other German, their sides a quivering spangle of gun-flashes as they mutually hammered each other. They also would disappear, swallowed up in the haze; and a British destroyer, steaming at full speed, would dash across the horizon on some errand of destruction,

with smoke pouring from her funnels and an immense white wave piled up in her wake.

They passed the bows of a sunken enemy light cruiser standing up out of the sea like some gigantic spearhead; and once, just before dark, they sighted what remained of a sorely wounded German cruiser. She was sinking fast. Her guns were silent, and she lay over to an alarming angle, with a blaze of orange and cherry-coloured flame leaping and playing about her

from end to end. The whole interior of the ship must have been a raging furnace; and a mushroom-shaped pall of dark smoke, its underside stained a vivid carmine by the flames, hung over her like a canopy, and added its contribution to the thickness of the atmosphere. The sea was strewn with wreckage, masses of debris, and floating corpses wearing life-belts.

And so the night came.

(Continued on page 820.)

ARTIFICIAL FOODS.

By CHARLES COOPER, Editor of the *Epicure*.

ECONOMICAL considerations, induced by the present high cost of living, have lately directed increased attention to various artificial preparations, designed to serve as substitutes for the more costly food articles to which we have been accustomed, with the result that in at least one instance tardy justice has been done to an artificial product that had long been regarded with suspicion.

Foods made, or invented, by the chemist come under two denominations, the distinction between which, all-important as it is, is perhaps very imperfectly appreciated by the general public. There is first the imitation food which has nothing but some particular trait in common with the article it parodies, differing from it essentially in chemical constitution and food value. Substitutes of this character may have a value of their own commercially and in domestic economy; often they are produced for fraudulent purposes only; or, again, may be merely scientific diversions of chemical experimentalists.

Altogether different is the synthetic food. Synthesis is the reversing of analysis. Analysis is the resolving of a compound body into its elements; synthesis is the combining of elements into a compound. All our foods are made up of various constituents, combined and developed as the results of animal and vegetable growth, and the chemist, having analysed these and ascertained their constituents, has been able to recombine them, and, putting them through processes somewhat analogous to those of Nature, has produced laboratory-made articles which conform exactly by analysis and in food value to the original models set by Nature herself.

What the food-chemist has done in this direction is sufficiently wonderful, although his powers are by no means illimitable. He is able to make a great many things; but meat and starch he cannot make. The analysis of starch and of meat-albumen is easy enough, but their synthesis has hitherto baffled all the men of science. In the days before the war German chemists did not despair of ultimate success; latterly their activities have been diverted into other channels. Where starch

and albumen occur in a synthetic food, therefore, they are the natural products. Given a laboratory equipped with seventy elements, plus starch and albumen, the chemist can make up most of the foods on our ordinary bill of fare. Not that the majority of such experiments have any domestic or commercial significance, their production involving no economy of means. While they are often of great interest to the student, they offer no money-making or money-saving possibilities to the manufacturer or householder. I have heard of a laboratory-made dish of mashed potatoes, which in appearance and flavour would have imposed upon a Parmentier; but the potato itself would be very much cheaper than its synthetic substitute.

Some there are among synthetic foods which have proved of immense commercial and domestic importance. Of these margarine may be regarded as one of the greatest triumphs of food science. By certain processes, known only to Nature, the fatty tissues of the cow are transformed into milk; the milk is drawn from the animal; the fat-globules are separated, compressed, and make their appearance as butter. The chemist, by a scientific short cut, takes the fat direct from the tissues of the animal, and, in margarine, produces an article so exact to butter in chemical composition and nutritive value, and so closely resembling it in taste and appearance, as to be indistinguishable to the eye or the ordinary palate. The very fidelity of the resemblance was the undoing of margarine in the first instance. Its cost of production being about one-fourth of that of butter, the temptation to the dishonest trader to foist the cheap article upon his customer in place of the more expensive one proved irresistible. Its retail sale has, in the past, been attended with more dishonest practices than probably that of any other single article of consumption. It was made the subject of special legislation both in Britain and America, and found constant employment for an army of vigilant food-inspectors and public analysts. The result was the creation of a prejudice that for a long time barred margarine from domestic use, although it was enormously

used in the production of shop goods and factory-made products. Latterly there has been a very welcome change in the public attitude. Margarine is now advertised and sold under its proper designation, and is bought and used on its merits. The employment of a large proportion of nut-butter in place of animal fat reduces the cost of manufacture, and makes the article a profitable one for the seller, while it supplies the user with a cheap and perfectly wholesome and nutritious article of diet.

That remarkable vegetable the soya bean has been successfully employed in the production of a synthetic milk, which can be retailed at about half the present price of ordinary milk, to which it conforms exactly in appearance and analysis, with no very marked difference in flavour. This subtlety of flavour, which is one of Nature's own secrets, is one of the things which often evade the art of the food chemist. On the other hand, he can frequently claim an advantage over Nature in the greater reliability of his products. Cow's milk, for instance, is apt to vary in quality, even when taken from the same cow, from day to day. The synthetic product, being made to a standard prescription, never varies.

A milk-like emulsion prepared from sanātogen is an example of an imitation, as distinguished from a synthetic food. It is like milk in appearance; but while it has a value of its own as a nutritious article, it differs essentially from milk in its constitution, and cannot be employed to replace it.

Glucose is another synthetic article which, although not sold in the grocers' shops in place of sugar, is extensively employed in manufactures. Nature, by some occult system of her own, produces sugar in many plants, notably in the sugar-cane. Physiologists discovered that sugar taken into the stomach is converted into glucose by the digestive acids before the system can assimilate it. The chemist finding that the same article, glucose, can be produced by boiling starch in a weak solution of sulphuric acid, the acid being subsequently neutralised by lime, the result has been the creation of an industry the magnitude of which it is hardly possible to estimate. More than a quarter of a century ago it is said that Germany alone had fifty factories at work, turning out thirty thousand tons of starch-sugar annually. Glucose is sanctioned by the law, and being practically identical with cane sugar, no objection can be raised to its use. It crystallises less readily than cane sugar, and golden syrup prepared from it is more favoured by buyers from its presenting a brilliant transparent appearance; and jams in which it is used keep soft for a long time. It must be borne in mind that, as glucose is to some extent a pre-digested food, it is absorbed more readily than cane sugar, and may be apt to overload the system more easily. It also undergoes fermenta-

tion more readily. The manufacture is nowadays conducted with great care; otherwise the elimination of sulphurous acid has at times been far from complete, and a catastrophe happened some years ago through the customers of a northern brewery being poisoned wholesale by the arsenical contamination of the glucose employed in place of malt. The alarm that this created and the precautions instituted are the best guarantees against the recurrence of such a danger.

While glucose is a perfectly permissible substitute for sugar, the same cannot be said for its other rival, saccharin, which is an imitation pure and simple. Its discovery was one of the romances of the laboratory. Over thirty years ago Dr Ira Remsen, afterwards President of the Johns Hopkins University, entrusted a student, who was working for his doctor's degree, with the preparation of a new derivative of toluene. Happening to taste the product, the student—now Dr C. Fahlberg—was amazed at its extraordinary sweetness, which is estimated at five hundred and fifty times that of cane sugar. Impressed with the commercial possibilities of the discovery, Dr Fahlberg threw up his work at the University and secured for himself all the legal rights in the discovery. Its results have been colossal in their magnitude. With no food value whatever, saccharin has perhaps a legitimate sphere of utility as a sweetening agent for diabetic patients, but its illegitimate commercial employment is on an immeasurably greater scale, and its effect in cheapening production has led to its extensive use in about thirty manufactures, such as children's sweetmeats, jams, jellies, marmalades, canned goods, and various drinks. Coal-tar, of which saccharin is a derivative, does not commend itself to one as a desirable food article, and it is not surprising to hear that a consensus of professional opinion has declared the habitual use of saccharin in the dietary to be fraught with the gravest danger to health. It retards the digestive transformation of foods to the weakening of muscular energy. It is diuretic, and its passage through the kidneys is liable to be attended with serious consequences, especially to those who have any tendency to disease of those organs. In America, and in all European countries save our own, its use is prohibited, or allowed only under most stringent regulations. As a great deal of it may go into very small compass, it affords excellent opportunities for indulgence in the good old-world diversion of smuggling, to which, and to its extended use, it is to be feared that the present high price of sugar may offer very great temptations.

The synthetic production of alleged fruit essences is a flourishing business, the secrets of which would be very interesting, if told, as illustrating what may be done with apparently unpromising material. I once heard a learned professor describe with much complacency how he made a delectable pineapple flavouring upon

which he particularly prided himself. The processes were lengthy and painstaking, and included the decomposing in a chalk mixture of very rotten cheese and very sour milk, and distilling the product with oil of vitriol.

About synthetic wines there might be found material for a small volume. Their production has furnished diversion to a great many experimentalists in chemistry, and a handsome living to a great many exploiters of the public. The late Mattieu Williams told of a Birmingham chemist of his acquaintance who succeeded in producing a really excellent claret, which might have passed muster in every respect save colour, which he could only obtain by the use of aniline dye. Being a man burdened with a conscience, he shrank from that, and so, as Mr Williams said, another industry was lost to Birmingham.

Every now and then we read in the papers sensational stories of the coming usurpation of the kitchen by the laboratory, and of the meals of the future which the chemist will supply concentrated into the dimensions of a lozenge. These vaticinations are but the babble of irresponsible frivolity. We have a few synthetic foods of outstanding merit, such as those referred to in this article, which have done, and are doing, important work in supplementing and cheapening our ordinary food supplies, and it is probable that the number of these may be increased as time goes on; but the majority of these laboratory discoveries, often happened upon while the chemist was looking for something else, may have a scientific interest without any practical public significance.

THE PIRATE.

By MAYNE LINDSAY.

I.

THEY were huddled on the deck of the destroyer that had picked them out of the water, a mass of shivering people, grotesque in their life-saving gear. Their attention was riveted on all that remained to be seen of their late home, a few hours before one of his Majesty's battleships in active commission, and now, keel uppermost, no more than a whale-back hardly visible, at a couple of miles distance, above the greenish waters of the eastern Mediterranean. She was being rapidly left behind, for the very good reason that the Turks had her range, and were able to make things uncomfortable for any craft lingering in her neighbourhood.

The destroyer's crew moved about, administering tots of rum.

A midshipman, whose skinny wrists and ankles belied the proportions of his inflated waistcoat, wiped a straggle of wet hair off his forehead, tossed down the rum, coughed, smacked his lips, and cheered up at once. He was a person not easily depressed.

He addressed the commander, who was muffled, Red-Indian-wise, in a blanket. 'D'you suppose we shall get leave for this, sir? I could do with a month.'

'Leave!' The commander withered him. 'Not in the least likely. Extra hands are wanted out here; a ship's company without a ship will be just the thing. Unless you are a case of shock, which you don't appear to be from the way you took your grog, I think some one will be able to find you fatigues ashore, Easton.'

There was that in his eye that made Tommy Easton retire. He melted into the crowd, and

squeezed his way to Courtlands, another midshipman, who was wedged in a warm spot abaft the forward funnel. He repeated the prophecy.

'Well, I can't be expected to take on another job until I get a pair of breeches'—Courtland was dressed in a flannel vest and an oilskin—'can I? It'll take a fortnight, with luck, to get new gear from Malta. They'll have to hush me up on the island. I shall live secluded on the hilltops with the goats.—Oh, thanks awfully!' He accepted a cigarette from a passer-by.

'I hadn't time to strip,' Easton said. 'It was my watch below. I barely tumbled up in time.'

Courtlands glanced at him. 'Get clear, all the men below?'

'Most of them.' There was a silence between the two boys. 'I see the island. Wonder where we shall fetch up. There was a fair scrum when I was here last, and since then they have dumped ashore the Lord knows how many more transports full. Tents! My hat! the whole place is tents now, seems to me.'

Tents there were, enough to shelter the shipwrecked mariners. The destroyer disembarked them, and shot away again to her station. The sun sank; the beach was chilly. The men were mustered. The Government store produced slop khaki, and a military mess invited the officers to dine off tinned courses.

Later Easton found himself tented with his brother-snotties in an encampment, a southern moon beaming between the flaps out of a still and perfect night. He nestled in his blankets. There was a little desultory talk; then quiet. The day of catastrophe was done; to-morrow would take care of itself. He had recited his

experiences to several subalterns of Kitchener's army. He was sleepy.

He slept.

II.

A few mornings afterwards Tommy Easton was frying beef and potatoes on a biscuit-tin lid, over a fire of demolished packing-case, before the door of the tent. The rigours of shipwreck had fallen upon him. The island was congested with great preparations, and nobody had yet had the time, or discovered the method, to reduce the employment of five hundred unexpected arrivals to a system. The deputy harbour-master had culled a gang for buoy-work, medical inspection had drafted the invalids into hospital, a major of Marines had weeded out the able-bodied men of his arm, and the coal-officer had detached a squad. The rest picnicked in sand, snatching the dubious pleasures of the passing hour.

Courtlands had gone on a foraging expedition for cigarettes. The other members of Easton's mess were about somewhere; but they did not happen to be on the spot when that individual, prodding the beef with a fragment of hoop-iron, perceived his late commander bearing down upon him. The commander had exchanged his blanket for the uniform of his rank; he was shaven; he seemed never to have left the world of ordered things.

'Are you the only one here?'

'Just this minute I happen to be, sir.'

'Oh, well.' Then—'Oh, you'll do. Do you see that tug? She has been lent from Malta; she has a Maltese engineer and a stoker on board. I've sent the coxswain of the captain's gig and a couple of men off to her. Go aboard and take those lighters in tow—the string that is loading from the tramp with the red funnel—and stand by for further orders.'

'Very good, sir.'

'You had better draw what you will be likely to want before you go on board. You may be any time in her. See that Hallup has the stores I told him to put in for.'

'Ay, ay, sir.'

He was gone. Easton fished a piece of beef out and ate it, rejecting the underdone potatoes. He dived into the tent and extracted his blankets. Emerging again, he encountered Courtlands, who had picked up the hoop-iron, and was engaged with the biscuit-tin.

'How filthy this stuff looks! Have you tried it?'

'M! It might be worse. Sorry I can't stop to dish up, Courty. I'm off. Kiss the boys good-bye for me.'

'Off! Where to?'

'I happen to have a command, that is all,' Tommy said with dignity.

Courtlands expressed his disbelief emphatically.

'If you won't take my word for it, I'm sorry,' Easton said. 'I'm not joking.'

'Where is she? What is she?'

Easton pointed her out. They gazed at her. She was ancient; she was shabby beyond belief; she had paddle-wheels, and was nearly as broad as she was long. Courtlands snorted; but Tommy's heart had already warmed to her.

'And I've *carte-blanc* to raid the shore pusser for anything I want. It is a bit of all right, isn't it? So long, Courty. This shore business didn't appeal to me, really. Give me the bounding blue ocean.'

'You'll end as a pirate if you aren't careful.'

'That's not a bad idea. I shall think it out—on the bridge,' said Tommy Easton.

He shouldered his blankets, and went to harry the storekeeper. Hallup the coxswain was before him, a man of resource and presence of mind, with two stout seamen to bear away the spoils. He had already put in for a fortnight's rum for all hands, for tobacco, sugar, biscuit, matches, and marmalade. He compared his housekeeping list respectfully with Easton's mental notes; and presently, heavily laden, the party left the island.

III.

Here may be considered to begin the individual career of Midshipman Thomas Easton, R.N., master of his fate and of H.M. tug *Bonny Bluebell*. His opportunities were varied, and Hallup was a coadjutor after his own heart. It was Hallup, perhaps, who infected him first with something that is stronger even in the Royal Navy than simple pride of possession—the itch for any portable property, for any berth, job, or occasion that would go to the greater glory of his command.

They began, modestly enough, by discharging the duty to hand of towing the lighters to the mainland landing. Their course was erratic; because neither Tommy nor the coxswain had handled a paddle-wheel tug before. They mastered the elements of her peculiar navigation laboriously, starting with a difference between the bridge and the engine-room, and backing the *Bonny Bluebell*'s substantial stern into a cruiser's picket-boat which was lying alongside the jetty. The picket-boat's crew fended her off with boat-hooks and hairy arms, and language horrible to hear; but after all it was only because the *Bonny Bluebell* herself changed her mind capriciously at the last moment that they escaped. If she had sat down on the jetty, as she seemed to intend, she must have sunk them out of hand. Hallup twirled the big wheel violently; and Tommy, sweating at every pore, passed on some of the comment that was aimed at him down the engine-room voice-pipe.

It was answered by a nervously amiable Maltese, grimy and voluble, who gesticulated through the skylight. 'It is not poss-eeble to

go full speed ahead ver' quickly, sar! This is a ver' old sheep, and moves with difficulty.'

'She's got to get a move on out of this, Antonio, or you'll know the reason why.—Oh, keep your hair on!' This to the midshipman in the picket-boat, who could be heard shrilly vociferating under his stern. 'Port a bit, Hallup,—for God's sake! She may answer the helm this time.

The *Bonny Bluebell* floundered in the shallow water. Spectators on the shore made demonstrations of delight. She churned for a minute, and then lurched ponderously away, leaving the picket-boat, furious and disgruntled, heaving in her backwash.

'Whe-ew!' Easton said, mopping his brow. 'We are well out of that. Now for the lighters. Stand by to pass the tow-rope. Starboard a little. By Heaven, she's done it again!'

She was bearing down on the foremost lighter, quite unmoved by his frantic efforts to head her off. She proceeded placidly to clasp it to her bosom, and bore it onward in an ample embrace until Hallup's energetic manipulations of the wheel persuaded her to disengage.

Easton spent the next hour in playing the game of catch-as-catch-can, with the lighters elusive and retiring, and the *Bonny Bluebell* as coquettish as an elephant at play. When order was restored, tow-ropes were made fast, and tug and tows were making for the open sea, he consulted again with the coxswain.

'She's so awfully broad in the beam, she ought to be a good sea-boat, oughtn't she? I wonder what speed she has.'

'Just three, I should say, sir—slow, slower, and stop. Oh, she wants a bit of handling. Might be best to give other craft a wide berth till we know exactly how to take her. And when it comes to putting these here lighters ashore'—

'Oh, that's all right,' Tommy said with confidence. 'We'll just heave 'em at the beach and let 'em rip. Keep her on her course while I go below and see if I can get them to raise more steam. That Maltese fellow looks more like a cook than an engineer. I don't suppose he understands her, really.'

He dived into the bowels of the tug, struggling to recall the engineering he had learned at Dartmouth. He was below some time, and reappeared on the bridge oily, but triumphant.

'The beggar had dirty fires. I've disrated him, and promoted the other fellow. Now we'll whack her up, and dump our tow ashore, and then we'll stand easy and have a snack.'

A beachmaster, built in with cases of stores and ammunition, mule-fodder, and petrol-tins filled with precious water, and harassed by his unceasing labours, saw the *Bonny Bluebell* pounding towards him, with the evident intention of casting herself at his feet on the incoming wave. Catastrophe appeared inevitable, when

she stopped her advance with a sudden surge of paddle-wheels, let go the tow-ropes, and then, with the aplomb born of Easton's limitless inexperience, contrived miraculously to evade the forward prance of the liberated lighters. Their way drove them at the beach, where they flung themselves ashore in attitudes of abandon. And before the beach commander, usually a fluent man, could find words to express how completely the way it had been done was the way not to do it, Easton had passed out of call, his first task fulfilled and left behind him.

IV.

Tommy Easton, it is to be noted, was a mere speck in the machinery of great operations. Where battleships are hammering at forts, and transports are pouring troops on to hard-won and hard-held beaches, a seventeen-year-old snotty may well be overlooked. It did not take either Tommy or his coxswain long to discover that in some things they were accountable to no man. They were caught up to any job that was doing, sucked dry of their last ounce of working capacity, and pushed aside again, by people who were themselves taxed to the limit. Their incomings and outgoings were nobody's business.

Hallup was the first to grasp some of the happier features of their position. He suggested roving where the victuals grew, and Tommy roved. They drew rations and rum wherever rum and rations were forthcoming, and they bartered bread and tobacco, which were to be had without much difficulty from the big ships, for tinned peaches and other delicacies conveyed by the lighters' men, who were occasionally to be found starving in the midst of plenty.

They accumulated ships' stores, too, for the rainy day. The lockers in the after-cabin bulged with canvas, and heaving-lines, and bunting, and paint and varnish—particularly paint and varnish, for which Hallup had a magpie's instinct. Some of their abundance came in ways more or less legitimate; but not all. There was a side of bacon that lost its way between a provision transport and the shore; there was a case of eggs that left a beach at dusk, never to return; there were cigarettes that might have arrived at G.H.Q. itself if there had been no elderly tug offshore at the moment. And Easton lived, like the lilies of the field, taking no thought for the morrow, at many gunroom messes, popping up out of the unknown about dinner-time, and fading into the night as mysteriously as he had come, before the steward, murmuring a formula about half-a-crown, had followed the coffee round to where he sat.

Their troubles came at nightfall. The *Bonny Bluebell* had to make fast somewhere, and it was her ambition to tie up comfortably to one of the big ships and lie snug till daylight. Sometimes she pulled it off at the first shot; but only too often she would bump into the ship's side, and

the angry voice of authority on a deck far above would drive her away. It was not so easy to find a berth, and nobody loved her. She wandered wearily, the Ishmael of the night, until she had the luck to strike some milder-mannered refuge. Tommy Easton slept on the bridge—in his sea-boots, strangely clothed and very damp, his hair uncut, his shirt unwashed—the light sleep of the mariner who is never very far away, even in dreams, from the hazards of his calling.

There came an interval when he was lost altogether to the people in charge of the distribution of freight. He vanished. One day he was at their beck and call; and the next morning he was not. They missed him, for they had lots of jobs for anything that could pass a hawser; but they were too busy to think long about him.

Far out, made fast to a newly arrived and innocent transport, Easton's command was otherwise engaged. The inspiration was entirely Tommy's; but the treasure-trove in the after-cabin had suggested it. The transport commander was possibly flattered by the confiding air with which the *Bonny Bluebell* sidled up to him as he let go the anchor. He saw an ancient tug and a curiously juvenile tug-master, and he smelled the savour of fresh paint when he peered over the side. He had been allotted the farthest berth from the beaches; but he did not connect his position with what he saw below him.

Hallup had attained the height of his desire. He had a whole tug to paint from clew to ear-ring, and as much paint as he wanted to do it with. He had hunted the booty with an enterprise that was heroic, seeing that looting a battleship's paint-store is not unlike rifling a hive with the honey-bee about. The *Bonny Bluebell* merged from rust and battered brown to the loveliest gray. Even Antonio and the stoker painted. They were not sure they knew how when they began; but after a little persuasion with a boat's tiller they learned quickly. Easton basked in the sun on the bridge, as grimy as a sweep, and re-read the last letter from home, more than a month old, in which his mother told him the second footman had gone to the war, and she was afraid there would be nobody to valet him when he came back. She wished to know if he remembered to change his socks, and whether his servant aired his pillow-cases.

The longest spell ends; and, to do Tommy justice, all that extra tots and encouragement could do had expedited the painting. He did not want to be out of the real business a minute longer than the job in hand demanded. It was done, ready to excite the marvel and envy of all beholders. Besides, the transport had been in communication with sophisticated people from the fleet, and was showing a disposition to ask questions. Easton said good-bye to her politely, and set a course for the principal landing, where

the supply craft were clustered thick as bees. There was nothing among them that had even a lick of expensive gray paint, much less the full glory of it from stem to stern.

He made for the break in the cliffs, keeping inside the line of patrols. He could see, behind the coastline, little balloon-like clouds drifting over the enemy stronghold, and he heard the boom of guns rolling across the water.

Hallup spoke behind him. 'Begging your pardon, sir, there's a tramp in trouble. He's aground, or next thing to it, too near the enemy's ridge battery to do him any good.'

Easton followed his outstretched finger. A small supply steamer was stationary below a headland. As they looked, an ensign reversed fluttered to her masthead.

'Ashore—wants assistance.' Hallup rubbed his chin.

'Our job, I think!' Easton sprang to the voice-pipe. 'Fire up for all you're worth, Antonio. If—if you monkey now I'll keelhaul you.—If she isn't fast aground we'll have her out of that before Johnny gets her range—eh? Dash it all! we ought to be able to handle anything on God's earth by this time. Hope we'll get her off before a destroyer butts in. They're so beastly officious.'

There was no destroyer at hand when the *Bonny Bluebell* arrived, thudding at the top of her speed to where the tramp was struggling, like a fly in treacle, with the shoal water round her. The tug threshed about, and backed astern to get close enough to pass a heaving-line for the hawser. Much painful experience had put Easton up to most of her tricks, and he manoeuvred her into position in the record time of her years of ungainly service.

His most urgent reason for hurry was soon justified. A ranging salvo fell, one ahead and three astern of the stranded steamer.

'Full astern starboard—ahead port!' He was backing and filling. 'Look alive with that line! Stand by to pass the hawser!'

Another salvo plumped into the sea, sending white columns leaping high into the air. Tommy wiped his eyes clear of the wind-borne spray tossed down upon him. A shell, well aimed, crashed through the foredeck of the steamer, but ricocheted overboard without exploding.

Tommy went on giving his orders, Hallup twirling the big wheel behind him. Another shell whistled over the bridge of the tug, while others fell unpleasantly close.

The *Bonny Bluebell*, putting her back into it, strained at the hawser. A mile away the black streak of a destroyer raced toward them. The hawser tightened; the tramp shivered, floated—and surged heavily ahead. Somebody on her deck raised a cheer. The Turks planted a few more shells, but in the shoal water just astern of her as she moved slowly but surely into the safe cover of the headland.

There was the roar of twelve-inch guns from a battleship off the landing, the majestic entrance of a giant into an affair of pygmies. The Turkish battery ceased firing.

v.

Late that evening a stout tug in brand-new gray crept alongside the flagship. A seaman began furtively to make her fast, and Tommy Easton, who was washing his face and hands in a bucket, speculated on what the gunroom mess might have for dinner. Then his heart sank. He could hear the voice of the commander, in whom the impulse of hospitality was only too plainly absent.

'It's no go, Hallup. We'll have to chuck our hand in, and try again somewhere else. Hades, but I could do with a real dinner!'

He dried his hands on a piece of waste, and gazed wistfully at the cruiser. The *Bonny Bluebell* slid reluctantly astern, and as she did so a big man with an admiral's lace and a monocle came out on to the stern walk, and caught the face that glimmered up at him. He looked hard at it for the half-minute before he returned to his cabin.

Somebody megaphoned from on high: 'Are you the officer in charge of that tug? The Admiral wants to see you. You are to come aboard immediately.'

'My hat!' Easton said. 'A collar—I haven't seen a collar since the old ship went. Give me a brush down, Hallup. My goodness, he might have given me time to get my hair cut! I dare say your razor would have managed it.'

Five minutes later he stood in the Admiral's cabin. It was extraordinarily clean; and the full sense of his pariah-like existence came home to Tommy Easton. There were people who still lived like this, with fresh linen, and chintzes on the chairs. He had forgotten them.

'So you have been running a dockyard tug since your ship was sunk?'

'Yes, sir. I have a topping crew, all except the Maltese; and they aren't so bad if you take 'em the right way. My coxswain is *most* efficient, sir.'

The Admiral nodded. 'I believe you towed the *Tarantula* off when she grounded inside the bluff this morning. What sort of shooting did the Turks make?'

'They were just getting the range as we cleared out, sir. They registered one hit; but their shells are pretty rotten. It didn't explode.'

'And during the time you have been in charge, how have you managed for stores and coal and so on?'

'We managed to get what we wanted, sir. We put in for 'em when we came across 'em.'

'Ah! How much paint did you put in for? I don't remember what the allowance for your tug would be likely to be.'

Easton opened his mouth, and shut it again.

He stuttered. 'Of course—of course, things sometimes h-happened to come our way, sir.'

'Quite so.' The Admiral dropped his monocle, and readjusted it. 'Ah, well, paint being barred, is there anything you still want?'

'If we could be sure of a berth at night. . . . My men are at it pretty hard in the day, and we do have to bucket about a lot when I'd like to see 'em turning in.'

'Tell the sentry to pass the word to give my compliments to the commander, and say that I should be glad to see him.'

The commander entered. The Admiral indicated Easton. 'This is the midshipman in charge of the tug you were talking to just now. He has to tie up somewhere, and he is doing sound work. I shall be much obliged if you will allow him to make fast to us when he wants to, and see that he gets what is necessary, and that he dines here when he is alongside. That all right?'

'Quite, sir.'

'Suit you too?' He wheeled upon Easton.

'Oh, *thank* you, sir.'

The Admiral held out his hand. 'That was a good piece of work to-day. I think a petty-officer will take over your tug presently; but it won't be because you haven't given satisfaction. You are the right stuff. Good-night.'

It was the end of Easton's piratical career; he knew that as he made his way to dinner. But he forgot that he was tired and hungry, and he trod on air. What a sportsman the Old Man was! What a lot of nice fellows there were in the world! The commander had sent him on his way with a friendly nod. The awful larceny of the paint had blown over; and if that little affair of the transport was guessed at—and he suspected that the Admiral knew more than he allowed to appear—it too had been inexplicably condoned.

He breathed freely, and flung himself into the gunroom, relaxing in the company of fourteen other snotties precisely like himself.

SALUTE DESTINY!

THE sun has risen! Gold and red displayed,
His banners glow above the waking earth;
Rise, too, my soul, trustful and undismayed,
Salute the daily mystery of birth.
The shadows pass from moorland, hill, and sea.
Go forth to meet thy unknown destiny.

The hour has sounded. Ringing loud and clear,
Somewhere a bugle calls, the red dawn glows.
Heroic souls! naught do they know of fear,
Each man is ready as to death he goes;
Silent, yet eager for whate'er may be—
Soldiers, saluting God and Destiny!

Now, at this great eclipse of dawn and night,
Of life and death and things memorial,
Transformed, transfigured far beyond our sight,
Is hidden the great Good, the end of all.
We stand at the Salute, and bow the knee,
Comrades, to your immortal Destiny!

C. FARMAR.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

IF it is true that this cataclysm has made philosophers of all, impelling the mind and conscience of even the most careless to some sharp and fearful consideration of the problems of life and death, and the mysterious meaning of what we see and feel, there is one class of the community upon which these matters inevitably press with perhaps a greater solemnity and import than upon any other. Now we approach the end of another year of the life of the world, and it is a way with individuals to look back upon the closing period in its particular relation to themselves. Now, rather than upon their own birthdays, do they take stock of themselves and their performances, consider their achievements, estimate their existing efficiency, and possibly come to certain decisions as regards the future. The essential fact is that another year of life has gone, not to be recalled or repeated. Each of us is one year nearer to the end of life. Most people, of whatever age or kind they may be, regret the year that soon will be completed less than any other through which they have lived. If the tide of victory has turned in favour of those who will be conquerors, nevertheless the experiences of this year have not been such as will be happily remembered. But this prime consideration apart, the fact of being a year older, each of us in his own particular history and career, is one that in general circumstances strikes with different effect upon different persons, partly in consequence of varying temperament, but more because of varying age. A certain healthy neglect of the final problem is a grand perquisite of youth. Indeed, in extreme and exuberant youth is there not often the desire that for a while the years may fly their fastest and ripeness come to this ambitious sapling? In old age, near to death, there is indifference again, but of another kind. It is the indifference of resignation and of the blessed serenity of spirit that is given to life-tossed man in reward for his labours and his struggle. In the winter of life there may be, indeed, in a keen and comforting conscience, the most perfect contentment, and the completest sense of well-being ever experienced. Those of such age have declared it. Between these two periods of satisfaction there is the most difficult

one of middle age. It is the period of achievement in nearly all work of the mind; it is the time when in most respects a man is considered to be at his best. He has still much bodily and mental elasticity, is capable of enjoyment of all good pleasures, is still of the young, and yet by experience has qualified for the councils of the wiser and older. He may seem to have all the privileges and none of the disqualifications, has a life behind him and another in front. Hope is still his friend. It still appears that destiny is within his control. For such reasons we speak of such a man as being in 'the prime of life.' He is living and being that for which it might seem his existence was ordained. This is the consummation.

* * *

The view is well enough, but admission to this period of prime is not by a golden gate swinging smoothly on oiled hinges, a path fringed with scented flowers, sounds of music in the air as of choirs of spirits chanting songs of achievement upon this great enthronement of maturity. It is not a day of sunshine and gaiety. All life does not seem to bid to laughter him who is this day gowned to his degree of wisdom by middle age. It is not like that. From the beyond, from eternity, from space, and from some unsuspected depths in his own being, it seems as if spirits with their fingers pointing rise about him in demand for accounts and for estimates, and for declarations of conscience and intention. Through leaping flames there is presented to dying youth that supreme interrogation, the Meaning of Life. The one who was young and is passing now to middle age had not thought, not suspected, not understood. Certainly he had not feared. But now he fears. The problem floods his mind and conscience like some monstrous tidal wave. He may be overwhelmed. It is hard to maintain his footing. According to his strength and conscience he struggles. Indifference, real or affected, a resolve not to think and worry, is not a virtue. This testing and improving period must not be shirked. The man who suddenly sees that happy youth of his flying fainter and more faint in the distance as he is driven into the cold and gloomy passages that give on to middle age must stand up firmly and think.

He must take his bearings. It is a clear and well-defined period in the life of every man of thought and conscience. While it lasts it is seldom in any sense a happy period; it is one that perhaps more than any other is fraught with the most tremendous consequences, because one's attitude to the rest of life, and what may be beyond it, has now to be declared and abided by; it is the final emplacement of character, the starting of a new expansion of the mind. It should do good to the man; but, again, of all the periods of his life, this short one of realisation, of crisis, and often of panic is by no means one of joy. Of all the subtle reflections of M. Anatole France upon life and the good things that are of it, that which one remembers always with most vividness is this: '*Le crépuscule de la jeunesse est l'heure la plus mélancolique de la vie. Il faut du courage ou de l'étourderie pour le passer sans trop rechigner.*' The sentiment may perhaps not, after all, be very profound, and yet here does the French philosopher seem to voice in silver phrases an unspoken thought that is hugged to our innermost beings. He reveals to us our own ideas and instincts. This time, in that inimitable way in which he writes of his friends among the intellectuals, he has been discussing François Coppée, and he says: 'He is still young, for he declares he is growing old. I do not suspect him of any affectation. On the contrary, I am convinced that he feels age coming upon him, and that he is saddened by it. What more natural? Old age is only felt keenly in anticipation. We taste its dread and its terrors before we enter upon it. The twilight of youth is the most melancholy hour of life. It needs either courage or heedlessness to pass through it without becoming rather crabbed.' *Le crépuscule de la jeunesse*!—it is truly the testing-time of life and the spirit. Youth has had its fling; now the verities must be faced.

* * *

At the opening it was said that there was one class of the community upon whom the stress of these times of terror weighed with greater severity than upon others, and, of course, it is those who are passing into 'the twilight' that are meant. If the world were good and happy, and we seemed to have crept a little nearer to the state of the Millennium, the trial would still be severe. Now it is intensified by the pervading gloom and sorrow, the breaking up of communities, and the scattering of relatives and friends, the brooding solitudes that are forced upon us all, and the questioning, louder than ever before, unceasing, ringing, echoing through our consciences, as to the meaning of life and death, the ultimate object, the supreme mystery. When the mark of forty years has been passed, and the twilight glows, there comes this period of restless wonder; and if the circumstances of the time have caused, as is suggested, some aggravation of the case,

they have lately also brought about a certain alleviation. Inevitably it happens that this time of twilight falls somewhere between the years forty and forty-five. Hardly even with a morbid or precocious temperament, or the most optimistic nature, can it be sooner or later. If by forty-five the experience has not been felt in some degree, then assuredly the subject is of somewhat careless conscience, and will escape the distemper that affects all sensitive minds and makes them deeper and better for it. What struck hard upon those who were stepping into the twilight when the war began was the discovery for the first time, sudden and shocking as it seemed, that they were too old for anything, for the biggest thing that mattered. They may have been too old for something before, but perhaps they did not think of it. If the violence of their exercises had been abated they had not noticed it. It was as a change of taste, and not caused by increase of years. But now! For the greatest work of the world that had ever required doing, they were, alas, too old! The limit of military age was fixed first at thirty-eight. A man was to be reckoned as too old to fight at forty. He was to stand aside for the younger men. He was not of their class. This condemnation or rejection was not the decision of a few or a section; it was national and official. It jerked the men who were passing to the twilight, to the full shock of their new miseries. How some of them rebelled, struck the years from them, practised a commendable deceit upon the authorities, and in some satisfactory measure, by good and arduous performance, succeeded in deceiving themselves, we know. But generally the man of forty was left to his twilight. He saw the young men march gaily by, and for the first time he realised that he was not of their class, that there was a difference between them which was felt on each side, that no complete sympathy could exist between them. There might be something a little forced in their comradeship. The lightness and the buoyancy of the young man were not to be reacquired; those who for an hour tried to attune their moods to this youthful key came to realise the absurdity and the pathos of their situation. The war, it is rightly said, is a young man's game, and the world is for him while he plays it. Seeing him gay in his khaki, the joy of everybody, the man who stands back in the twilight came to realise the tragedy of life. There was death ahead. Yet death, alas! was surely nearer to many of these gallant young, but yet they did not care, and it was different. Now came the full perplexity of the mystery, and the beginnings of personal philosophy.

* * *

But the first spasms of philosophy do not bring entire contentment. Regrets recur, as the man who is too old stands back in the twilight and sees the young men go marching by, and

the people giving cheers. He turns a critic of himself. In the mirror he may have seen gray hairs. It seemed that his limbs were a little stiff; he ran up a flight of stairs to discover if it were truth or fancy. Suddenly he realises that he has been subconsciously taking a little special care of himself in recent times, selecting his foods, examining his habits, and so forth. The happiness of carelessness had secretly withdrawn itself. He remembered that ironical old proverb that the Spaniard told him one day, '*Si quieres vivir sano, hazte viejo temprano.*' A joke indeed! Get old quickly, so that you may live healthily! Well, now, then, is the time for health! He is old. He is too old for the war. A stripling in khaki, a young kinsman from a colony, comes along to see him before passing on to Flanders. They would be happy together, and close companions. Dick is the name of the colonial lad; but— 'Why don't you call me by my Christian name?' the elder asks. 'But I wish, sir, to be respectful; you are my elder.' Yes, poor Forty, there it is. That is the cold truth. 'That remark, meant for such magnificent respect, for the very depth of veneration, was the hardest thing to bear. It was youth disavowing age, its separation of classes, its marking of boundaries. They would be respectful! Never was respect so hard to tolerate. However, it is clear we should turn away from these things of youth, and apply ourselves to our philosophies and the serious work in the twilight. These young men are about to make the world they will live in. Only a little of it will be our world. Perhaps, then, it is right they should fight most for it.'

* * *

The emotions of this period are very subtle. Stirring up the neglected contents of old drawers and boxes, we come suddenly upon some of the relics of youth. They may be sporting materials, or certain letters, or photographs. Here again we see the gulf that has been fixed; then we were not as we are now. The happy carelessness, the spring, the hope, life that was leaping! Remembering, regretting, you may look almost savagely upon that dead self with its mockery of your present state. Another thing you will notice is the peculiarly strong effect upon the emotions of the elder that little children now have. Perhaps you were always 'fond of children,' as the saying is; but this new emotion is no simple fondness. It is a passion. The beauty, the wonder, and the glory of child-life, the pathos and sublimity of its innocence, burst upon the senses. Indeed, this is one of the most splendid emotions of all human experience. The man in the twilight turns with an overwhelming joy to the company of the little child; this new passion takes the place of that of another kind which belonged to youth, and the new one seems the better thing. Again, in an old closet some garment of the long-gone youth

may be discovered. There is often nothing more poignant among remembrances than an old and long-discarded jacket. It takes us back to acts and scenes and circumstances as nothing else. It is of the old personality. Here is an old sporting-jacket; how well we remember the first time we put it on! And happy is the man who with an old overcoat in use can keep the years in even continuity. I remember how it was with a splendid friend of mine. 'It is not often,' he wrote, 'I have a sentimental attachment for articles of clothing; but I must confess an affection for my veteran uniform overcoat, inspired by its persistent utility. I find that it is twenty-three years of age, and can testify to its strenuous existence. It has been spared neither rain, wind, nor salt-sea spray, tropic heat nor Arctic cold; it has outlived many sets of buttons, from their glittering gilded youth to green old age, and it supports its four-stripe shoulder-straps as gaily as the single lace ring of the early days which proclaimed it the possession of a humble sub-lieutenant. Withal it is still a very long way from the fate of the one-horse shay.' That was Scott, of course; and thinking of him reminds one also how, on the eve of his last great adventure to the Southern Pole, he felt that twilight coming upon him, and was secretly a little troubled. He was forty-three. His age was making him wonder upon many things, for he was a man of keen temperament and deep introspection. He considered the men about him, and compared himself with them. One day, when they were living through their last winter in the polar regions, and preparing for the magnificent, fateful, tragic trek to the polar point, he wrote in his diary: 'I have had several little chats with Wilson on the happenings of the journey' (a previous journey of a local kind). 'He says there is no doubt Cherry-Garrard felt the conditions most severely, though he was not only without complaint, but continuously anxious to help others. Apropos, we both conclude that it is the younger people that have the worst time; Gran, our youngest member (twenty-three) is a very clear example, and now Cherry-Garrard at twenty-six. Wilson (thirty-nine) says he never felt cold less than he does now. I suppose that between thirty and forty is the best all-round age. Bowers is a wonder, of course. He is twenty-nine. When past the forties it is encouraging to remember that Peary was fifty-two.' Is this not a splendid thing to contemplate? Forty-three and Thirty-nine refusing to pass into the twilight shadows, but, instead, turning round savagely upon their followers in life and snapping at them, as it were, the Twenty-three and Twenty-six. It was bravely done. And there is a sequel to this which one must mention now. In those great volumes in which Scott tells his last thrilling story, one of the finest of the British race, there are two lines at the end

which for poignancy are among the rarest in all the literature of achievement, and I think their significance has never yet been noted by any friend or critic. As Scott lay dying in that blizzard-beaten tent, he wrote letters to a few relatives and dearest friends, and one of them was to Vice-Admiral Sir Francis Bridgeman, in which the hero said just this: 'I want to tell you that I was not too old for this job. It was the younger men that went under first.'

* * *

We have spoken of thirty-eight. Early in the war the Government, perceiving the dolour with which a large and important and worthy part of the people was affected, determined upon an improvement of their mental and emotional state by Act of Parliament. It raised the limit of age to forty, and thus it put back by two years the period of disqualification. So the man of forty became not too old, he was not in the shadows, he was the equal of the young men, and he was not qualified for their unwelcome respect. This was a pretty movement by the State; it was like the moving on of the hour-hand of the clock in the newly invented summer-time. It was just a nice deception. The summer-time gave us longer days; the forty limit made us young again. Our right arms were needed, and we were to march behind the drums. It was splendid of the Government. Peevishly you may say that Whitehall was not endeavouring to do any magician or good-fairy work, and cared nothing for private emotions, but merely wanted

more men. It may be, but Forty could hardly see it so. He was brought in for qualification. The State formally and officially, and with all the pomp and authority of its Great Seal, declared that he was good enough for anything, that he was not too old, that it wanted him, and it seemed to that man then that it was only yesterday that he went swinging his way to school. But these rejuvenations make jealousies. There is trouble when the line is drawn. Besides, the real twilight admittedly came when forty was just past, when those forties were beginning to take effect. Could Whitehall do nothing for the older crew? Would it be straining the powers of Government to give youth back again also to those who were even now passing through to the twilight, and were oppressed? Could not they be snatched back from philosophy and for a little while made boys again by Act of Parliament signed by the King? They have done it in France and elsewhere, and why not here in Britain? I am not pretending now. We know that for sound reasons thousands of good men hate the idea of this raising of the limit, for the upset of their lives and careers that must ensue; yet not one of them but at the first mention of it was secretly pleased and flattered for one thing. He was reckoned as a young man again. He counted. It was not desired that he should retire into the twilight with his philosophy, to consider his experiences, and to be treated with studied respect by the younger men.

PINCHER MARTIN, O.D.

CHAPTER XVII.—continued.

IV.

'And I will prepare destroyers against thee, every one with his weapons.'—*Jeremiah xxii. 7.*

THE fighting and the destroyer attacks of the night are even more difficult to follow than the actions which took place during the afternoon and evening. The British heavy squadrons had withdrawn at dark to avoid the expected torpedo attacks of the hostile flotillas; and the retreating enemy, meanwhile, damaged and undamaged ships, some singly, others in pairs or in groups of four or five, still steamed hard for their own waters. It was upon these scattered units and divisions that the British destroyer attacks presently took place.

The *Mariner* and her next ahead had somehow become separated from the others after dark, and to Pincher this desperate rush after the enemy was an awesome business. Owing to the mist and the haze, the night was unusually dark; but, though with the retirement of the larger ships the incessant booming and thudding of the heavy guns ceased, frequent outbursts of fire

from lighter weapons, sharp, blinding flashes of flame, the redder glare of exploding shell, the white gleam of searchlights, and the occasional thud of a distant, heavy explosion showed where torpedo attacks were being delivered. The night was an inferno.

It was very difficult to tell which were the attackers and which the attacked, and it was this very uncertainty, and the not knowing what was happening, which were so trying to the nerves. All they were aware of was that the German fleet, with many of its ships badly battered, was somewhere ahead of them. They all realised that a torpedo attack after dark was a desperate game at the best of times; but they had witnessed a succession of such awful scenes during the fighting of the afternoon and evening that their feelings of personal danger and the dread of being killed seemed to have gone. They felt themselves keyed up to the highest pitch of excitement, excitement so intense and so utterly abnormal that they had neither the time nor the

inclination to think of themselves and their own danger. The German fleet was somewhere in the darkness ahead of them, and it was their duty to sink and destroy what they could. Nothing else seemed to matter.

Their chance was not very long in coming. The two destroyers were steering on a south-south-westerly course at twenty-five knots, and shortly after ten o'clock a band of lighter colour began slowly to encroach on the dark sky on the eastern horizon. Ten minutes later the dense blackness from about south-east to north-east had given way to the usual indigo blue of the night; and there, some distance abaft the port beam, and dimly silhouetted against the sky, were the blurred shapes of two vessels. They were fully two miles distant, perhaps more, and seemed to be steaming slowly on much the same course as the *Mariner* and her consort. What class of vessel they were it was quite impossible to determine. But, from their position and course, they were certainly not British; while, from the background of intensely dark cloud to the south-westward, it seemed unlikely that they had seen the destroyers.

The *Mariner's* next ahead must have seen the ships at much the same time, for she suddenly increased speed and turned slightly to port until she was steaming across the strangers' bows. The *Mariner* conformed to her movements.

Wooten, gazing through his glasses, felt himself quivering with excitement. Had his chance come, the chance for which they had all hoped and prayed? He gave some order over his shoulder to a man at a voice-pipe, who passed it to the torpedo-tubes. 'Lord!' he ejaculated to the first lieutenant, still busy with his binoculars, 'they look to me like two lame ducks, No. 1; but they're big ships, whatever they are!'

'I sincerely hope they are, sir,' MacDonald replied calmly. 'It's time we had a look in at something. Shall I go down to the tubes?'

'Yes, do. And fire when your sights come on if you get no further orders. For God's sake, don't miss!'

The two great vessels were drawing rapidly nearer, and became more and more distinct. The leading destroyer was still altering her course gradually to port, until at last she remained steady on the opposite and parallel course to the enemy. The *Mariner* travelled in her wake, and the track they were following seemed as if it would take them past the ships, now nearly a mile and a half distant, at a range of about six hundred yards.

It was at this moment that the enemy first seemed to realise what was happening, for a gun suddenly boomed out from the leading vessel and a shell went screeching by overhead. Where it fell nobody saw. Almost instantaneously a searchlight flickered out, and after sweeping slowly across the water, fell full on the *Mariner's* leader and remained steady. Another

beam shone out, another, and yet a fourth, until both destroyers were illuminated in a dazzling glare which for the moment blinded everybody on board. Then the guns started in earnest.

The destroyers were steaming at about thirty knots, and the enemy at ten or twelve. In other words, attackers and attacked were nearing each other at the combined rate of about forty knots, or one and a half miles in two minutes fifteen seconds. It was the longest and most trying two and a quarter minutes that Wooten or any of his crew ever experienced, for though the speed of the approach tended to make accurate shooting difficult, the difficulty was largely mitigated by the point-blank range.

The dark hulls of the enemy were hidden in the blinding glare of their searchlights and the incessant sparkle and spurting of bright golden flame as their guns were fired as fast as they could be loaded. Filmy streamers of smoke from the discharges wreathed and eddied fantastically through the blue-white rays of the lights. The air suddenly began to reverberate with a succession of ear-splitting crashes, the screeching whistle of shell passing overhead, and the dull *plop* of others as they pitched in the water to raise their shimmering, ghostly spray fountains. There came the roaring thud of the explosions, and the same old familiar humming and buzzing as fragments drove through the air. But above the din and turmoil of the firing there was another and quite new noise: a short, sharp, metallic-sounding explosion in the air, followed by a hissing and soughing like the wind among trees—the enemy were using shrapnel.

There came a crash, and a sheet of brilliant greenish flame from aft. The ship seemed to wince, but still drove on. Another shell, bursting on the water a few feet short, sent its jagged splinters flying over the bridge and across the upper deck. Something whizzed within a few inches of Wooten's head, and there was an infernal clanging and clattering as slivers of steel drove through and against the ship's side and funnels. It was followed by the thud of a falling body, as one of the signalmen, standing just behind the coxswain at the wheel, slithered to the deck.

'Gawd!' he muttered, with an air of intense astonishment, sitting up and nursing his side; 'they've 'it me! Gawd blimy, blokes, they've 'it me!' But nobody had time to pay attention to him.

Another jar, the roar of a detonation, a burst of flame from the fore-castle, and a whining and whirring of splinters! Another, close beside the foremost funnel, and a sound of splintering and crashing as some object fell and went over-board! Something red-hot and sharp grazed Wooten's cheek. He put up his hand to brush it aside, and his fingers came down sticky and wet.

A hideous metallic explosion in the air and a fiendish rattling of bullets upon steel were heard, as a shrapnel burst and sent its contents flying on board. Willis, the coxswain, hit through the left shoulder, released his hold on the wheel and fell to his knees; but in an instant he was up again, steering the ship with his uninjured right hand.

Wooten suddenly felt a burning sensation in his left arm, as if a red-hot knitting-needle had been passed through the flesh. The shock of it sent him staggering backwards, and he gritted his teeth with the pain. His left arm seemed numbed and useless, and a little trickle of blood ran down inside his coat-sleeve and pattered to the deck. The air was full of the sickening stench of explosives.

They were very close now. The enemy seemed to be nearly on top of them, and their huge blurred shapes, almost invisible in the glare of the searchlights and the vivid gun-flashes, seemed literally to obscure the horizon. But the destroyers still drove on. They had not been stopped.

The lights of the nearer ship suddenly went out, and a column of water and smoke shot into the air at her side. It hung there for a moment, glistening in the ruby and orange flashes of the guns, and then there came the thundering reverberation of a heavy underwater explosion quite close at hand. It seemed to compress the air, and caused the destroyers to stagger in their stride. A torpedo from the leading destroyer had gone home.

Wooten instinctively looked aft, and as he did so a little puff of dull flame flickered out amidships. It was followed by a loud, snorting hiss and a heavy splash as a torpedo left its tube. Another came almost instantaneously with the first.

The enemy's fire, though still furious, became very wild; and two minutes later, with the sound of a couple more thudding explosions ringing in their ears, the destroyers were out of danger. The roaring of the guns gradually died away, and then ceased altogether.

'Good God!' muttered Wooten, trembling in his excitement.

Daylight found the *Mariner* and her leader some distance across the North Sea, steaming slowly homewards. They were battered and leaking, while the *Mariner* was badly down by the stern and listed slightly to starboard. Her funnels were riddled through and through; there were gaping holes in her side and her deck where shell had penetrated, and many smaller punctures where splinters had struck and gone through. A large projectile, bursting on the fore-castle, had torn the deck and the ship's side, and had flung the foremost gun off its mounting, killing or wounding every member of the gun's crew except one. The wardroom and one mess-

deck were open to the sea; boats were splintered and useless; and the topmast, taking with it the aerial of the wireless telegraphy, had been shorn off and had gone overboard. The mizzen-mast also had disappeared, and a brand-new white ensign now fluttered from an improvised flag-staff in the stern. It was the only respectable-looking thing in the ship.

But the surprising thing was that neither vessel was vitally injured. They could both steam, though slowly, and by dint of plugging the more serious holes and keeping the pumps going, they were still tolerably seaworthy. How they had escaped from the inferno without being blown clean out of the water was nothing short of a miracle.

Casualties had been heavy. Wooten went about with his arm in a sling and a bandage round his head; but his hurts, though painful, were not sufficiently severe to incapacitate him for duty. The first lieutenant had not been so lucky, for he, peppered badly by a shell, had been confined to his bunk with more serious injuries.

The eight dead had been buried at dawn, and now the wounded lay in their hammocks on the battered mess-deck under the fore-castle. Some of the slighter cases, with their hurts bandaged, were smoking cigarettes and talking quite cheerfully; others were asleep.

Pincher Martin was one of them. He had three neat little splinter-wounds in his back—three insignificant-looking and trivial little punctures which caused Brown, the surgeon-probationer, to purse his lips and to frown in his most professional manner when first he saw them. 'D'you feel any pain?' he had asked.

'Not unless I moves, sir,' the patient had answered with a wan smile, his tightly compressed lips giving the lie to his words.

An operation was impossible, and they dressed the wounds as best they could, and made him comfortable; but the slivers of steel somewhere inside him hurt atrociously, and it was all he could do to refrain from moaning when they touched him. So Brown, seeing how things stood, dozed him with morphia, and poor Pincher, with his young face unnaturally haggard, drawn, and very white, was presently slumbering as peacefully as a child.

CHAPTER XVIII.—CONCLUSION.

I.

'AM safe,' the telegram said tersely, in Billings's ungrammatical English. 'Martin wounded, progressing favourable.—JOSHUA.'

Mrs Billings, drying her eyes with a handkerchief, read it for the third time. 'Emmeline!' she called softly, going to the door of the sitting-room at the back of the shop.

'Yes, mother.'

'There's news, my gal!'

'News!' cried her daughter, darting forward. The elder woman sniffed loudly and held out the flimsy paper. 'Read that, my dear.'

The girl snatched it in her agitation. 'Martin wounded, progressing favourable,' she read slowly. 'My Bill wounded!'

She stood there for a moment wide-eyed and swaying ominously. Then her pent-up feelings overcame her; and, collapsing suddenly on to a chair, she fell forward with her head on the table and her face buried in her hands. Her whole body shook with sobs.

Her mother was at her side in an instant. 'There, there, my pretty,' she murmured consolingly, patting her daughter on the shoulder; 'don't take on so. Don't cry, my gal. He's only wounded.' She was crying herself.

But Emmeline refused to be comforted. 'My Bill's wounded!' she moaned again and again.

Mrs Billings leant down and put her arms round the girl's neck. 'Don't take on so, dear,' she said huskily, with the tears streaming down her own face; 'it's all right, my pet. There, there,' as Emmeline shook with another paroxysm of sobbing, 'don't fret; it's all right; he's only wounded. We've—b-both got a—deal to be thankful for.'

Mother and daughter wept together.

For the last forty-eight hours they had both been living in a state of awful suspense. First had come the tidings of the engagement in the North Sea, with the depressing information that the British losses had been very heavy. Then came the news that eight destroyers had been sunk; but no mention of the *Mariner*. They had no means of finding out whether or not she had even taken part in the battle; but both of them, with dismal forebodings in their hearts, had made up their minds for the worst.

All day and all night the two women had prayed and hoped. The agony of their suspense was almost more than they could bear, and their hearts nearly broke during that frightful period of waiting. Emmeline, pale-faced and red-eyed, went to the railway station twice a day to procure the earliest copies of the morning and evening newspapers. Together they had read them eagerly, trying to piece together some sort of a connected narrative to relieve their tortured minds. But still there was nothing about the *Mariner*. They read about the desperate destroyer attacks on the German fleet, and of the losses incurred by the British flotillas. They could not bring themselves to believe that 'no news was good news.'

Emmeline looked up with the tears still trickling down her face, and reaching for her handkerchief, proceeded to dab her eyes. 'I'm a fool,' she said, sniffing; 'I suppose I ought to be thankful he isn't killed.'

Her mother kissed her gently. 'There, there,

my dear,' she said softly; 'that's better. Be brave. It's all over now.'

The girl dried her eyes, rose from her chair, and walked slowly across to the mirror over the mantelpiece. 'Lor!' she said bravely, a little smile hovering round the corners of her quivering mouth, 'I do look a sight, and no mistake!'

II.

When the *Mariner* struggled home to her east coast port after the engagement, Martin was one of the first to be packed off to the local hospital. Then had followed an operation, and a fortnight's delay before he was sufficiently recovered to be sent to the Royal Naval Hospital at Haslar. It was here that he again saw his mother and father, who came down for the day, called him a brave boy, and inconsiderately wept over him through sheer thankfulness.

Then, at four o'clock on one never-to-be-forgotten afternoon Joshua Billings suddenly appeared. He was grinning sheepishly, and Pincher noticed at once that he wore the badge of a leading seaman.

'Allo, Josh!' he exclaimed, very much pleased to see him, and shaking his horny hand; 'ow goes it?'

'Orl right, Pinch. 'Ow's yerself?'

'Gettin' along fine, chum. They're sendin' me 'ome on leaf in four days. Wot's th' noos; an' wot's that?' Pincher pointed to the single anchor which adorned the sleeve of his friend's jumper.

Joshua looked solemn. 'I gets rated up ten days ago,' he explained; 'death vacancy. Poor ole Byles got laid out, yer remember. I'd sooner 'e wus still wearin' th' killick, poor bloke!'

He spoke huskily.

Pincher nodded. 'Wot are yer doin' 'ere?'

he asked.

'The ship's in dock, an' they give us ten days' leaf,' answered his friend. 'By the way,' he added, 'I suppose you 'eard as 'ow you'd bin rated up.'

'Wot?'

'They've made yer an A.B.'

'S'welp me!' Pincher ejaculated; 'ave they?'

'Yus, they 'ave, Pinch; an' if yer don't watch it we'll see yer a leadin' seaman afore long.'

'Yer didn't come 'ere a purpose ter tell me that, did yer?' Martin queried suspiciously.

'Ow d'yer mean?'

'Ow's Hemmeline an' Mrs Fig— yer ole woman? I've 'ad a letter from Hemmeline every day 'cept yesterday an' ter-day, an' I thought— 'Ere!' Pincher suddenly blurted out, a vague hope dawning in his heart, 'why ain't you on leaf at Weymouth?'

'We come round 'ere ter give yer a chuck up, Pincher.'

'We! 'Oo d'yer mean? 'Er an' 'er mother?'

'Yus. They're outside. I come in fust to prepare yer like.'

'W'y couldn't yer 'ave said so afore?' Pincher demanded wrathfully. 'Bring 'er in!'

'Orl right, ole son; don't go gittin' rattled abart it. Me an' my missis'll go an' see Dogo Pearson, wot's wounded an' in another ward. I'll tell Hemmeline as 'ow you'd like ter see 'er, an' me an' the missis'll be back afore long.' Joshua winked twice and went away.

Two minutes later Emmeline was sitting by Pincher's bed. Her eyes were full of tears, tears of happiness, and to Pincher she was the most adorable thing in the world.

'Oh Hemmeline!' he sighed huskily, his throat working and his fingers clutching her hand; 'oh Hemmeline!'

'Well, Bill, what's the matter?' she asked dreamily, turning her head and smiling at him through her long lashes.

'Ow I love you!'

'Silly boy!' she chided softly.

We will draw a veil over what happened next. The ward was a very public place; but the other patients discreetly turned their heads away and pretended not to see.

Mr and Mrs Joshua Billings were away for fully half-an-hour. To Emmeline and Pincher it seemed more like five minutes.

III.

The wedding, a month later, was a very quiet one.

THE END.

SOME ROYAL APPARITIONS.

By REGINALD B. SPAN.

THERE are few royal families in Europe which have not at one time or another been visited by supernatural beings or experienced weird occurrences. Just as, it is alleged, the banshee is attached to certain ancient families in Ireland, so are apparitions attached to some of the Royal Houses of Europe.

One of the most notable of these is the White Lady of the Hohenzollerns, who has appeared before the death of members of that family for several centuries. It is stated that quite lately this spectre has been seen again—portending disaster to the present family. The White Lady dates back to the fifteenth century, and is said to be the ghost of Lady Bertha von Rosenberg, who was born in Bohemia in the year 1425. Her father was Ulrich von Rosenberg, a Governor of Bohemia and commander-in-chief of the Roman Catholic troops against the Hussites; and her mother was Catherine of Wurtemberg. Lady Bertha died at the end of the fifteenth century, after an unhappy life. Her portrait is to be seen in several of the old Bohemian castles, and she is represented as wearing a white dress with a white veil, and it is in this costume that the spectre appears. Those who have seen the White Lady have stated that there was nothing terrifying about the apparition, which had a sad, gentle face and calm, stately mien. She appears before the doomed members of her family for the purpose of warning them to reflect and repent before their passing into the next world. Her first appearance occurred some hundreds of years ago at the Castle of Neuhaus in Bohemia, a castle which she herself had built during the first years of her widowhood. The apparition was then frequently seen looking out of the window of an empty turret-room. Although she has been seen so often, only twice

has she been known to speak. In December 1728 she appeared in the palace at Berlin, and acclaimed in a loud, clear voice, '*Veni, judica vivos et mortuos! Judicium mihi adhuc superest;*' which, being interpreted, is, 'Come, judge ye the quick and the dead! I wait for judgment.' On another occasion she appeared in the Castle of Neuhaus, and spoke to a certain princess. This lady was in her bedroom trying on a dress before a mirror, and turned to her maid asking what the time was, when suddenly the White Lady appeared from behind a screen and said, '*Zehn uhr ist es, ihr Liebchen*' ('It is ten o'clock, your dearest Highness'). The princess fell ill soon after, and died ten days later. The apparition has frequently been seen in the Castles of Bayreuth, Berlin, and Karlsruhe; also at the ugly, many-windowed Palace of Mannheim. On one occasion the *Ahn Frau* (as she was called) appeared by the dying-bed of the Margravine Amelia of Baden, mother of the wife of Alexander I. of Russia, in one of the great rooms of the ancient Palace of Bruchsal. She was then seen kneeling in an attitude of prayer by the bed. A Scottish gentleman who was residing at Karlsruhe before the war, and was acquainted with members of the House of Baden, states that he 'can guarantee the genuineness of the appearance of the White Lady at the Markgrafliche Palace at Karlsruhe, as he has had positive evidence.' He also personally visited the Mannheim Palace to question those grown gray in the service of the Grand Duchess Stephanie, but was unable to obtain conclusive evidence, though he was told of the appearance of the *Ahn Frau* there.

An apparition called the Red Man has been connected with the rulers of France for ages. This Red Man is said to have always appeared before any great calamity to France, and before

the death of the kings. It is a historical fact that the apparition visited Henry IV. on the night before he was assassinated, and appeared to Louis XVI. immediately prior to the outbreak of the French Revolution, also to certain members of the Imperial family before the Franco-Prussian war. Just before he was murdered President Carnot saw the Red Man, and took it as a warning of disaster or death; and, though every precaution was taken, he was unable to avert the tragedy. Napoleon saw the apparition several times, and appears to have been quite intimate with it. The best-known instance occurred on 1st January 1814, early in the morning. Napoleon had shut himself up in his cabinet, ordering Count Molé, the Councillor of State, to remain in the next room, and to stop anybody from troubling him whilst he was at his work. Shortly after his retirement, a tall man dressed all in red appeared to Molé, and stated that he wished to speak to the Emperor. The Count replied that it was not possible, and ordered him away. The Red Man, however, refused to go. 'Tell the Emperor that it is the Red Man who desires to speak to him, and he will admit me,' he said; and, awed by the imperious manner and commanding tone of the strange personage, the Count reluctantly obeyed, and with much trepidation approached Bonaparte. 'Let him in,' said the Emperor sternly. Very curious to know what this mysterious interview could mean, Count Molé listened at the door, and overheard the following conversation. The Red Man said, 'This is the third time of my appearing to you. The first time we met was in Egypt, at the battle of the Pyramids. The second was after the battle of Wagram, when I gave you full warning, and granted you four years in which to make a general peace. I told you then that if you did not obey me in this particular I would withdraw my assistance and protection from you. You have not obeyed me; so I have come for the last time to warn you that there are but three months in which to complete the execution of your designs, or to comply with the proposals of peace which are offered by the Allies. If you do not achieve the one, or accede to the other, your downfall will follow speedily; so bear well in mind what I say.' Napoleon expostulated vehemently, pleading that he could not possibly regain all he had lost in so short a space of time, or make terms on anything like honourable or satisfactory conditions. The Red Man was inexorable. 'Do as you please,' he said. 'I am not to be moved by entreaties or otherwise. I have given you my last word, and now I go.' He moved to the door, the Emperor following him and begging him to be more reasonable; but the apparition left abruptly without another word. Napoleon, appearing greatly distressed, then retired into his sanctum, and remained there for the rest of the day. Three months later the Emperor abdi-

cated. Count Montholon relates that Napoleon, when on his deathbed, told him that he had been warned of his approaching end by this same strange being. It is also alleged that Josephine appeared to Napoleon shortly before his death, and informed him that he would soon be with her.

It is not generally known that the ghost of Napoleon appeared to his mother, Madame Letitia, just after his death at St Helena; but such was indeed the case, and the incident is recorded in Mrs Fraser's work, published a few years ago, *A Diplomatist's Wife in Many Lands*. Madame Letitia, generally known in France as Madame Mère, was the last to bid Napoleon farewell on his embarking for St Helena, his '*Adieu, ma mère!*' being answered by her Italian '*Addio, figlio mio!*' About six years after that last pathetic parting, Madame Mère was sitting one morning in the drawing-room of the Palazzo Buonaparte (it was 6th May 1821), when the man-servant announced a visitor who wished to see Madame Mère alone, and immediately, as he had come with important news of the exiled Emperor. She at once gave orders for his admission to her presence, and the stranger was accordingly ushered in. He was wrapped in a voluminous cloak, and had his hat drawn low down over his eyes; but on entering the room, and as the servant withdrew, he removed his hat and drew back the cloak, which partly concealed his face, and revealed himself as none other than the Great Napoleon, her dearly beloved son. Madame Mère uttered a cry of amazement and joy, and stepped forward to greet him warmly, as she thought he had somehow managed to escape from St Helena, and had come straight to her to ask for shelter before proceeding to France. But the awful chill of contact with forces of the Unseen fell upon her, and she stopped as though suddenly paralysed, unable to move farther or speak, as the being before her regarded her with poignant solemnity, and said gravely, 'May the fifth, eighteen hundred and twenty-one—to-day!' He then stepped slowly back and retreated through the door behind him, letting fall the heavy *portière* as he did so. Recovering her self-control, Madame Mère rushed from the drawing-room into the apartment beyond, but found it empty. She then hastened into the hall, where a man-servant was seated outside the room, according to custom. 'Where is the gentleman who has just gone out?' she cried. '*Excellentissima Signora Madre,*' replied the man, 'no one has passed since I conducted the gentleman to your presence, and I have been here all the time.' It was not till six weeks later—such were the delays of those times—that the news of the death of the Emperor arrived from St Helena. He had died at six p.m. 5th May 1821, and his spectre appeared to Madame Mère the following morning at eleven a.m. In this case three servants saw the ghost

besides Madame Mère—the hall-porter, who admitted him at the front-door; a footman who was in the hall, and who offered to take his hat and cloak; and the servant who ushered him into Madame Mère's presence. But none saw him leave, though they were at their posts all the time.

The ghost attached to the Imperial family of Russia appears in the form of a 'double;' that is, the royal personage doomed to die sees his or her own spectre either walking about the rooms of the palace or seated on the throne, looking generally 'as real as life.' It is related that the Empress Catherine, shortly before her death, was sitting reading in her boudoir, when one of her ladies-in-waiting came to tell her in a breathless voice that a very strange thing had just happened. They had seen a figure exactly like the Empress enter the state-room, and were greatly mystified, as they knew her Majesty could not possibly be in that part of the palace at that time. The Empress turned pale, as she knew what such an apparition signified; but, showing no outward fear, she followed her attendant to the state-room, and there beheld, seated on the throne, a female figure the exact counterpart of herself. Passing the group of excited and awe-stricken domestics, she boldly advanced towards the mysterious being, and, addressing it, demanded to know who it was that dared to intrude thus. The figure remained motionless and silent; so the Empress turned to her guards, who were close behind, and ordered them to fire at it. They had no sooner done so than the apparition vanished. The Empress died about ten days later.

It is reported that one of the palaces of the Romanoffs has several ghosts, one of which is that of the Emperor Paul, who was assassinated. An English lady who was resident in the palace as a governess shortly before the present war declares that she saw one of these apparitions. One afternoon she had returned from a walk, and was sitting in her room before the fire, resting, when she heard a hollow cough, and on looking round perceived a tall, thin young man, clad in a green uniform, regarding her intently, as though he wanted to speak, and was unable to do so. His expression was very sad and melancholy. On seeing that it was noticed, the apparition advanced toward her, and, as the lady shrank back in fear, seemed to pass right through the fireplace and vanish. On another occasion the same figure appeared to her in the corridor one afternoon as she was going to her apartments. This time the lady was not in the least alarmed. The apparition twice opened its mouth as though desiring to say something, but was unable to utter a word. Its expression was gentle and very mournful, and betokened a soul in sorrow which was seeking for aid. On the lady saying, 'Is there anything I can do for you?' the figure vanished. A gentleman at the Legation to

whom she related this strange experience informed her that he had always heard that the palace had several ghosts, and stated that the apparition she had seen was evidently that of the Emperor Paul.

It is a matter of history that Charles I. was visited by the ghost of Lord Strafford, who warned him of impending defeat, disaster, and tragic death. It is said that at Charles's coronation there was not enough purple in the country to make the royal robes, so they were made of white. It was afterwards remembered that white was symbolical of misfortune, since heretics were usually arrayed in it for their execution. Another significant omen in connection with the tragic fate of the unfortunate monarch occurred when Bernini was exhibiting a statue of the king which he had just completed. It was placed on a pedestal in the royal gardens, and Charles was looking at it, when a hawk carrying a partridge it had just killed flew close overhead, and some blood fell on the statue in such a way that it trickled round the neck. The incident was recalled when the king was beheaded at Whitehall.

Queen Elizabeth was warned of her death by the apparition of her own double. The ghost of George III., it is alleged, was often seen at Windsor Castle. Ghosts of royalties have also been seen at Hampton Court and the Tower of London.

The Empress of Austria had a warning of her death on the night preceding the tragedy at Geneva in 1898. She was awakened in the night by the bright moonbeams which filled her room, and saw in the moonlight the face of a woman weeping bitterly. She took this apparition as a portent of impending disaster. On that fateful morning, Czateray, who went into the Empress's room, as usual, to ask how she had slept, found her Imperial mistress looking pale and sad. 'I have had such a strange experience,' said Elizabeth. 'I was awakened in the middle of the night, and saw the apparition of a woman standing near me, who was weeping. I fear it is a presentiment of misfortune, and danger is imminent.' A few hours later Lucchini stabbed her to death on the side of the lake, as she was about to embark on a steamer.

King Ferdinand of Bulgaria is said to be haunted by the ghost of his late Minister, Count Stambuloff. This apparition has been seen by his side sometimes when he was driving, and frequently when he was walking. On one occasion Ferdinand visited a certain princess, and it was noticed that both she and her lady-in-waiting seemed much perturbed. It transpired later that both saw a man 'who looked like a corpse' standing beside the king. A courtier who had known Stambuloff, and heard the description of the apparition from the lady-in-waiting, stated that it was undoubtedly the dead statesman.

Two kings of Denmark of olden times are said to 'revisit the pale glimpses of the moon' in much the same way as Hamlet's father. Abel, who reigned several centuries ago, and murdered

his brother, still haunts the wood of Poole near Sleswig; and the old Scandinavian king Valdemar IV. is said to appear at times in the great forest of Gurra, near Elsinore.

JANET ARMSTRONG.

CHAPTER IV.

I DIDN'T see her till after supper. She came up to my study and said she wished to speak with me; but she hesitated, and seemed so loath to begin that I had to break the ice myself.

'Well, Janet,' I said cheerily, 'has Andrew Hair gone?'

'Oh ay, lang syne. I didna detain him lang; and as she laughed a slight blush came to her cheek which to me seemed to impart a youthful, girlish look to her face.

'And what took place then, Janet? You know, he told me his mission, and promised to come back and—'

'Oh, he telt ye that, did he?' and she looked so confused that I was sorry for her. She covered her burning cheeks with her hands, and when she looked at me I really didn't know whether she was going to laugh or cry. 'What assurance! What impudence! My word, had I but kenned I wad ha'e gi'en him mair than he got! Fancy him thinkin' I was here like a cairt o' coals waitin' till I was lifted.'

'Then, Janet, you haven't accepted him?'

'Oh David Crosbie, M.A., d'ye want me to add a "D"? Dinna mak' me lauch. The very idea! No, no, I didna accept. Puir auld sow! he got quite reckless in his promises; said if I didna like the shop he wad retire fra business an' tak' up hoose at Scrubberknowe, where we could keep hens, an' be as happy a' day as twa cushie-dooa. Oh mighty me! juist think o't. But it's no very fair to the puir man to be tellin' ye thae things; only, you're no everybody, an'—an' the thing's dune wi'. He got away in guid time to catch his train, so we'll juist say nocht mair on the subject. Ay, an' noo that I ha'e fund my tongue I'll juist tell ye what I cam' up the stairs to say. I am gettin' mairret. No to Andrew Hair, though,' she quickly added, as she noted the look of surprise on my face.

'I wasna intendin' to tell ye juist yet,' she said after a pause; 'but I micht as weel dae sae, noo that we ha'e had sic subjects sprung on us, as it were. Kennin' me as ye dae, an' efter hearin' what I ha'e to say, ye'll mebbe think I'm baith daft and glaiket. I micht be; but I'm awfu' happy, for what has come back lately into my life has altered me amaisht ayont my ain kennin'. Let me tak' my time; dinna speak, an' I'll tell ye a' aboot it in my ain wey.

'I dare say ye'll ha'e often wondered in your ain mind hoo it cam' aboot that I had never got

mairret, an' dootless ye wad think that I never was inclined nor had the time for love-makin' an' coortin', an' sic like. To be sure, I've been keepit busy a' my days, for your aunt asked an' got whole-he'rted service. But a lass is juist gey thrang-hauden when she canna spare a bit 'oor o' a forenicht to spend wi' a lad. Ay, weel, yince—langsye—I faun' time, an' I had yin o' the best an' truest lads that ever clamb a hill-face. He was young herd at the Howe, an' I was servant-lass at Carfrae Hoose, an' juist because o' him the sweetest word in a' the world to me is the name Glenburnie. For there it was we met in the quateness o' simmer gloamin' or in winter's mirk; an', though it's years gane-by, I never, even yet, see the flush o' sunset or hear the sough o' a winter wind but his face comes up afore me, an' I think I hear his voice.

'He was aye mair blate an' bashfu' than forritsome; but at times when it wasna possible for me to get oot to meet him he wad come into the kitchen at Carfrae; an', d'ye ken this, it was when him an' me were sittin' thegither on that same settle that's doon in this manse kitchen that I first clappit eye on you. A wee, shilpit-lookin' sow! ye were, too, wi' your first breeks on, an' a leather belt roon your waist like a polisman.'

'Janet,' I said eagerly, 'I don't wish to interrupt you, but I also distinctly remember that meeting. Was your—your sweetheart tall and fair-haired?'

'Ay, yes, he was tall an' fair,' she answered in a mellow voice. 'Dear me, fancy you mindin' that noo!' she added reflectively after a pause.

'I have also a faint recollection of seeing you together up Soonhope Burn,' I continued. 'It was raining, and you and he were standing underneath a plaid'—

'Stop! oh, stop noo! What a tether o' a memory ye ha'e! We thocht ye didna ken us. Oh, I mind fine. My goodness me! hoo comes it that ye never mentioned this afore? I wad mony a time ha'e been glad—oh, so glad!—to—to talk it a' ower, for—that was a gey happy time in my life. Had I kenned ye thocht thae memories worth treasurin' I wad ha'e wrocht my fingers to the bane in your service.'

She spoke fervently and earnestly, and for the first time in my life I saw a tear coursing down her cheek.

'Ay,' she said in a low, hushed voice, 'when

there's love in the he'rt the sun's aye shinin', and, on lookin' back, it was simmer to me the hale year through. But a darkenin' cam', an' it was me that brocht it on. A young hallockit lass, wi' a' the world in front o' her, is unco apt to be thochtless and heidstrong at times, and will treat as very dirt aneath her feet a' in this life that's worth prizin' an' carin' for. She disna think that the richt chance at the richt time comes only yince in a lifetime, an' she plays at handba' wi' what she should nurse to her briest as a mither guards her bairn. It was a hasty, angry word I spoke. I didna mean it, nor yet did I feel it; an' though I kenned it cut to the bane, I wadna tak' it back. Time an' again I got the chance; but no. Oh, had I but thocht! had I but kenned! But I did neither; an' wi' pride an' wilfulness in my he'rt, an' cairret away in the senseless vauntin's o' seventeen, I gaed my wey; an'—an' efter a wee he gaed his.

'It wasna lang till I rued; but it was then ower late. He left the Howe at the next term, an' went ower into the Humble side, an' in time gaed clean oot o' my ken. But I never could think o' ony ither lad, an' I juist wrocht away, tryin', in a' I took on haun', to mak' the best o't, an' to forget hoo awfu' stupid I had been.

'This that I've telt ye o' happened when I was gaen seventeen—twenty-six years bygone; an' noo, juist when I'm turnin' forty-three, I've come into my ain again. An' this is hoo it cam' about.

'Ae afternoon, when I was doon Morningside Road on some errand o' my ain, my e'e lichted on a signboard wi' the name Herries in thin gold letters. That was my auld sweethe'rt's name. It's no very common; I never had seen it in big printin' afore, an' my he'rt juist warmed to it a' at yince. It turned oot to be a milliner's—no a big place—juist ae door an' winda, but a' gey snodly laid oot an' tidy-lookin'. Weel, I had nae need o' a new bonnet; a' the same, I lookit ower everything in that winda mair than yince, an'—an' then I went my wey along the street. Then I turned an' back I went—back to the shop wi' Herries in gold letters abune the door; an', thinks I, juist for the sake o' the name, though I didna need it, I'll gang in an' buy a bonnet. I'm no what ye wad ca' rash in sic maitters, an' I was surprised at mysel'; but "Auch," says I, "juist for yince I'll let mysel' go." Weel, I bocht a bonnet, gied the price that was asked, an' never thocht o'—oh, ye needna lauch, for it's true—I couldna haggle ower a price in a shop wi' the name Herries abune my heid, an' I paid the money to the last bawbee.

'I took no particular notice o' the shop-woman mair than that she was young an' genteelly dressed in black; but when she was gi'en me my change she happened to look at

me juist as I was lookin' at her. She smiled and said "Thank you" wi' a bit incline o' her heid. It was the voice an' action thegither. It seemed so familiar, an'—an' *the name abune the door*. A' at yince my he'rt began to stoon. Oh, I wantit to sit doon, an' I gruppit the back o' a chair. Then, juist to gain time an' get composed, I asked her aboot the price o' ribbon; an' efter buyin' some o' a colour that'll match nocht I possess, we got on the crack. She telt me the shop was her ain, an' that her faither had a big dairy ower at Liberton. Her mither had died when she was born, an' an aunt—a sister o' her faither's—had keepit hoose for them for nearly twenty years.

'I sat juist as if I was in a dream; an' then, efter a wee, as little concerned as I could, I asked her faither's name. "George Herries," says she. "That's strange," says I efter I got back my breath. "I yince kenned yin o' that name in Lauderdale; but the man was a herd, an' it's mair than twenty years sin' syne." "That'll likely be father, then," says she. "He was a herd before he took ower the dairy. He named our new cottage The Howe, because he lived there when he was a boy."

'An' then I kenned I was speakin' to the dochter o' my auld sweethe'rt. A queer oorrie kind o' a feelin' cam' ower me. I couldna speak, an' though I had bocht a' I wanted I couldna gang oot, an' I juist stood like a stookie, thowless an' donnert. Oh, I tell ye it was awfu' tryin' on me, an' she was quick to notice it; for she cam' roon fra ahin' the coonter, put her haun' aneath my airm, an' led me into her workroom at the back. In a meenit or twa she had the kettle boilin'. Then she masket a cup o' tea. Of coorse I apologized, an' refused, but she wad tak' nae denial. "It's just my usual tea-time," she said, "and we'll have cream in a—— Ah! here it comes. Father's never late."

'I heard a horse pawin' the causeway; then the ooter door opened, an' in less time than I tak' to tell ye, wi' a smile on his face an' a wee tin o' cream in his haun', there before me stood George Herries.

'I canna very weel tell ye exac'ly what took place. I was sairly enough putten aboot afore he cam' in, but I was waur efter. Everything had happened sae sudden-like an' unexpected, an'—an' there was a kin' o' mist afore my een, an' I felt oot o' place an' awkward. Oh, I tell ye, it was amaisht past endurance.

'He looked at me for a lang time without speakin', an'—an' then he cam' forrit; an' he said, "Janet!" an' the gledsome look he gied me juist made my he'rt loup like a lassie's. An' then——

She hesitated and paused for a moment. Just then the old eight-day clock downstairs gave a preliminary *hick-click* and a *whir-r-r*, and very deliberately struck ten.

Janet looked toward me. 'Ay,' she said when the echoing chime had died away, 'in the auld days when that same auld knock struck ten your aunt used to cry ben into the kitchen, "Janet, it's gaen bedtime; is the back-door locket?" Since comin' to keep hoose for ye I've aye made Carfrae Hoose 'oors manse 'oors, and it's time the doors were seen to, so I'll juist say guid-nicht. The best pairts o' a' love stories have to be experienced, no spoken aboot; so ye can juist imagine the rest o' mine.'

She had lived over again what she had been telling me, and there was a happy, youthful look on her face as she closed the door.

Three months later George Herries and Janet Armstrong were married in my manse drawing-room. I had kept a note of the profits accruing from her Shinnel Manse transactions, for which I made out a cheque and gave it to her as a wedding gift. When I say it was no inconsiderable amount I am not boasting or advertising my benefactions, and it was only after much pleading and persuasion that Janet would take it. But I had no difficulty whatever with the eight-day clock and the kitchen settle. She accepted them gladly, with tears in her eyes and a tremor in her voice which George Herries, decent, honest man, could neither account for nor understand.

THE END.

THE MONTH: SCIENCE AND ARTS.

AN INGENIOUS 'NON-SKID' APPLIANCE FOR COMMERCIAL MOTOR-VEHICLES.

SKIDDING upon a greasy or slippery, dusty road is the *bête noire* of the driver of the commercial motor-vehicle. While presence of mind and quick action are able to lessen the 'waltzing' tendency and to effect speedy recon- trol of the vehicle, there is always the danger of inflicting injury or damage upon a third party. Although the fitting of twin-tires to the rear wheels of the heavier cars of this type reduces skidding to a certain extent, this device is not completely effective. For this reason widespread interest is being aroused by a new non-skidding invention which has been evolved especially to meet the case of the twin-tired commercial vehicle, and which, as exacting tests have demonstrated, completely prevents side-slipping. The appliance, which consists of a chain of malleable iron shoes, joined by steel links, is simple in design and operation. Each shoe is solid, and in section resembles an inverted V; while from the side the chain recalls the familiar driving-belt of the motor-cycle. Its construction enables the chain to fit into the groove between the two tires, so that when it is placed in position the wheel appears to be provided with a single broad tire, the tread of which is formed by the flat surfaces of the shoes. The chain does not fit tightly, however, sufficient play being allowed to permit the shoes to rock slightly upon their bearings in the groove. The result is that, when the car evinces an inclination to 'waltz,' the edge of the shoe, by virtue of this rocking motion, is presented to the road surface, and instantly checks the skid. The slight spaces for the links between the shoes prevents the chain from presenting a continuous face to the road; the shoes themselves are roughened so as to obtain a good grip; while the chain has a creeping action over the road which conduces toward the same end. This device does away with the

danger of slipping on hills with heavy loads, facilitates restarting on steep slopes, and greatly increases the braking-power in going downhill. It will be readily seen that by giving the tire an augmented tread greater adhesion upon the road surface is secured because of the larger surfaces in contact. The utilisation of the arch between the two tires is serviceable in another direction, for it helps to preserve them. Small stones and objects of a similar nature cannot force an entry. They are either crushed or are surmounted by the wheel. Nor does the chain itself inflict any damage upon the walls of the tires against which it presses, because each shoe is composed of a malleable iron centre flanked upon each side by rubber, which forms the surface coming in contact with the tires proper. Neither are the benefits accruing from the resiliency of the tire affected in any way, because the non-skid appliance is so designed as to act in conjunction with it. The even tread which is presented is suitable for all conditions of road surface, and the appliance can be safely used in any weather without damaging the tires—a most important consideration. The presence of the chain does not affect the normal smooth and comfortable running furnished by rubber tires, for there are no protruding bars or knobs to produce bumping or vibration. One feature which should influence the use of this invention is the facility and celerity with which it may be attached and detached. There is no necessity to jack-up the wheel. The chain is merely laid upon the ground before or behind the car, and the wheel is moved forward or backward over it so as to bring the chain in the groove. The two free ends are then picked up, brought together, and linked after the manner of the endless belt of the motor-cycle. Detachment is merely a reversal of this process, and either task can be accomplished in a few seconds. The invention can be applied to any type of twin-tire, whether round or square in section, with

equal facility, and can be adapted to any size of wheel.

A CHEAP NEW FUEL.

Interest has been excited by the production of a new fuel which can be cheaply produced in extensive quantities, and which complies with the demand for national economy. It has been evolved by the engineer to a British borough, and is made from household refuse, such as scraps of vegetables and other articles of the domestic dust-bin. These are crushed, treated with pitch or tar, and made into briquettes. The fuel thus formed resembles coal in general appearance, and when broken up burns in the open grate with the glow characteristic of the familiar product of the mine. The engineer identified with its production emphasises the fact that a mechanical plant is necessary to produce the fuel, but there is no reason why the capital outlay in this connection should be heavy, while the cost of manufacture ought to be kept down to such a low figure as to enable the fuel to be sold retail at approximately ten shillings per ton. The raw materials are immediately to hand in adequate quantities, the chief expense being the cost of collection, which has to be incurred in any case. The only additional outlay is for the pitch or tar necessary to make the mass combustible.

CHEAPENING THE COST OF MILK.

No feature in connection with the increased cost of living to-day has aroused such hostility as the rise in the price of milk. The interests responsible for this development maintain that it has been forced upon them as a result of the enhanced cost of feeding-stuffs and the increase of wages which they have had to meet. But the British farmer is the most conservative member of his class in the world. As a rule, time-saving, labour-saving, money-saving devices make no appeal to him. This is clearly seen in connection with the suggested adoption of mechanical milking methods. In peace-times, when labour was cheap and plentiful, his hostility to mechanical methods triumphed; but under the present conditions this antagonism is meeting with public denunciation. That the farmer is in error has been plainly proved, and it is not improbable that the absence of skilled hand-milkers will in the end compel him to introduce mechanical devices. It has been clearly shown, in the case of farms worked upon up-to-date lines, that cows may be milked in far less time, more efficiently, and at less cost by machine than by hand. In one case a mechanical milker is now doing the work which formerly required the services of five hand-milkers. The installation is capable of milking eighty-five cows simultaneously, and the cost of operation is but a mere fraction of that formerly incurred. In this instance electricity being available from the

public supply system, it is employed to drive a one and a half horse-power motor actuating the vacuum-pump, the pipes from which extend to the machines disposed in the stalls. Apart from the saving of time and money, there is no risk of the milk being contaminated by coming in contact with the hands. During the past few years the mechanical milker has undergone considerable improvement and development. Several excellent machines are now on the market, and there is every reason to hope, under the pressure of labour shortage, that this modern method of milking cows will come into general vogue, which will certainly conduce to the greater purity and cheapness of our milk-supply.

REMOVING GUN-DEAFNESS.

One of the evils of the terrific cannonade with giant guns which is being waged upon the battle-fronts is the deafness produced. Many expedients have been adopted to prevent this, but their effectiveness is not complete, while it is not always possible for the soldier to protect his ears with any of these devices. A well-known French aural specialist, Dr Marage, has elaborated a system of treatment which is now being used with conspicuous success. This is a mechanical apparatus which is capable of emitting the sounds of the French vowels as continuously as may be desired. The intensity, duration, and quality of the sounds may be varied, the source of energy employed—namely, compressed air—being controlled by gauges to suit various requirements. The apparatus was devised by Dr Marage for this special purpose, and may be described as a device for applying massage to the affected organ by means of sound vibrations. The ear of the sufferer is first submitted to a searching examination to ascertain the extent of the injuries which he has received. He is then taken to the machine, and each ear is treated separately. From the vowel-sounder a tube, similar to a speaking-tube, is led to the ear, and applied to it in such a way as to enable the sound vibrations to play fully upon the inner ear. The course of treatment lasts about two weeks, by the end of which time it is possible to determine whether the man's hearing is capable of restoration or not. It is stated that, as a result of this novel massage, approximately 70 per cent. of the soldiers stricken by this malady are so far cured as to be able to rejoin their regiments.

A NEW GOLFING-DEVICE.

The impactor golf-machine is a new invention, scientifically designed to analyse the properties of a stroke made with any golf-club upon a suitably attached captive ball. It is claimed by the inventors that the correct length, elevation, and alic or pull of the complete flight are recorded simultaneously on the dial of the

machine, which readily lends itself to the exhaustive study of all the conditions ensuring a correctly timed stroke. Guided by what he learns from the machine, a player adjusts his stance, grip, and swing until a satisfactory and consistent record is secured; and a handbook is in preparation which will assist him in his search for the proper conditions. The value of this invention for ready tuition in golf is obvious, and the pupil is encouraged in a fascinating manner to practise and to study the development of that 'form' which will give confidence and efficiency on the links. By the use of the machine the amateur golfer will be relieved of the tedium and expense generally incurred in the earlier stages of his career, while the professional golfer and the golfing enthusiast will also find it equally interesting and instructive. The charts of well-known courses have been adapted for use in conjunction with the machine, and a simple device is introduced to enable the player accurately to trace on the chart the course of the flights the ball would take between the tee and the green. By this means a new competitive game is introduced, which, while retaining many features of a game on the links, may be played in any confined space. It is expected that ship-owners will enthusiastically adopt this invention as a new deck-game for passengers, and that it will find favour in hotels, hydropathics, &c., as well as amongst the general golfing public.

PETROL FROM SHALE.

The increasing scarcity of petrol, combined with the rising cost of extracting this volatile fuel from heavy oils, is drawing greater attention to shale as a source of oil as well as of other valuable commercial products. This interest is not peculiar to any one country, but is being developed in all parts of the world where the raw material exists in large quantities. So far the only country where the utilisation of this source of supply has been successfully carried on is Scotland, where, by the evolution and installation of ingenious machinery, the prime cost of extracting the oil from shale has been reduced to a figure which enables the resultant commercial products to be vended at prices competitive with those drawn from petroleum. But in the United States, where enormous deposits of shale are to be found, notably in Oklahoma and California, the situation is being minutely investigated by scientists and Government experts. Even in these islands it is possible to develop this industry still further, since there are extensive stretches of rich shale which, as Dr William Forbes-Leslie recently told the Society of Arts, it would at the moment pay to exploit. He drew attention to the discovery of an important oil-shale basin in Norfolk, with whose yield highly interesting and valuable experiments have been made. Under the proper treatment, one ton of shale yielded forty gallons of oil,

sixty-six pounds of sulphate of ammonia (an excellent fertiliser), and twenty-five thousand cubic feet of dry gas possessing high illuminating properties. As the cost of winning petroleum from the earth is increasing very rapidly, owing to the necessity of sinking the wells to greater depths, the day does not seem far distant when the dormant resources of the British Islands in this direction will be requisitioned. As is well known, the Kimmeridge shale outcrop in Dorsetshire is particularly rich in oil, and the recent discovery of deposits in Norfolk should render feasible the establishment of an English petrol-producing industry on a proper scientific and commercial basis.

A NOVEL HYGIENIC SUGAR-BOWL.

An ingenious sugar-bowl which, as it preserves the contents from dust and flies, complies with hygienic requirements, has recently been placed upon the market. The crux of the invention is a special dome-shaped cover or lid fitting tightly into the rim of the vessel. This cover is provided with a special handle, consisting of two levers connected to a novel pair of tongs working upon the cross-lever system. Normally, when the cover is in position these tongs are folded up and occupy the space within the dome. When, however, the outer lever handles are pressed together, the lever system within is brought into play, and a lump of sugar is picked up between the jaws of the tongs. At the same time a grip is offered wherewith the cover may be removed. When the cover is replaced and the handles are released the tongs automatically rise and close into the dome away from the sugar. Not only is the sugar-basin designed upon these lines being sold in many different styles to suit various tastes, but the special cover with the tongs can be adapted to existing bowls at a small cost. To effect this it is only necessary to furnish the inside width of the rim of the bowl.

TAR FUEL.

As is well known, the distillation of coal produces an appreciable quantity of tar, which in turn furnishes, as a by-product, hard pitch. Owing to the scarcity of coal and the accumulation of quantities of this residue, German engineering chemists have endeavoured to turn the latter into a substitute for the former for industrial purposes, and in this connection they have proved highly successful. The pitch is reduced to powder, and is then blown into the furnaces in steady streams of the desired volume by the aid of compressed air. Owing to the lightness of the granulated material, very little pressure is necessary to effect this. The system is closely allied to that followed with crude oil. The powdered pitch, being highly combustible, burns readily, leaving neither slag nor ashes, so that its use is distinctly labour-saving; while, owing

to its heating value being in excess of that of coal, it constitutes an economical fuel. The huge Belgian blast-furnaces at Seraing are being stoked in this manner; and, according to reports, two thousand tons of steel, in two hundred and fifteen heats, were handled within three months in a furnace adapted to this system of firing, at an average expenditure of two hundred and ninety-two and a half pounds of pitch per ton of molten steel. Owing to the success of the fuel in industrial circles a further effort was made to adapt it to domestic requirements, and here again success is stated to have been achieved in combination with another 'fuel waste.' Coke-dust has hitherto been regarded as useless for fuel purposes, and its only value has been as a substitute for sand in mixing concrete and pavement-making. But now the powdered pitch and coke-dust are mixed in certain proportions, and then pressed into briquettes for burning. So long as the stove has a good draught this pitch-coke briquette fuel is stated to give complete satisfaction; it is declared to be clean, and to be of high heating value. This ingenious utilisation of two waste products of the coal distillation process has proved of national importance in another direction. It has contributed to the conservation of the coal-supplies, and has enabled the coal won to be more profitably exploited, either in the gas-plants or the coking-ovens. As we in Britain are being urged to be more sparing in our consumption of coal, especially for domestic purposes, our emulation of the Teuton practice in the manufacture and use of these briquettes might prove of far-reaching

importance, particularly in connection with the heating of the wasteful kitchen-range.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

HARVEST.

'Tis said that Eastern tillers weep
When scanty produce crowns their toil,
And they must snatch from children's mouths
The seed they sow in thankless soil.

But harvest comes, and golden sheaves
Their sorrows change into delight;
Forgot are bitterness and tears,
And joyous plenty ends their night.

So do I hear a harvest song
Ringing o'er all the clash of war,
That tells of reapers gathering in
The fruits of battle from afar;

The better Europe of our dreams,
When sword and rapine rule no more!
The age of gentle chivalry!
The reign of Christ! The death of Thor!
N. MACLEOD CAIE.

POLLOKSHIELDS.

. TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL.*
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Volume VI. of the Seventh Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.

A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.

A cloth case for binding the whole of the numbers for 1916 is also ready.

Back numbers to complete sets may be had at all times.

Annual subscription, including postage to any address, either at home or abroad, 9s. 6d.

The January Part of CHAMBERS'S JOURNAL (published about 22nd December) will contain the opening chapters of a modern novel of powerful interest

ENTITLED

THE DEFINITE OBJECT,

By JEFFERY FARNOL,

Author of 'The Broad Highway,' 'The Amateur Gentleman,' 'Beltane the Smith,' &c.

For full announcement see Advertising Sheet.

Also a Novelette, LA SIERPES, by Andrew W. Arnold, and other Stories, with the usual popular and instructive articles.

END OF THE SIXTH VOLUME.

CHAPTER I.

*C'est trop . . .
J'ai donné mon secret, Delila va le vendre.*

IT was said by his comrades that Lieutenant Bryan Bloxham, for all that after ten years of service he still remained a subaltern, was one of fortune's favourites. But, then, promotion—though the soldier's life was no mere promenade in uniform in the opening years of the last century—was as slow in the British army as it was rapid in the French; and the big man with the brilliantly blue eyes, with hair that rippled beneath his helmet, with a smile that few women saw and forgot, knew that. He knew too that his colonel, Andrew Vennie—Old Andrew, as the commanding officer was affectionately called by every trooper in the regiment—looked on him with a very favourable eye; and that that same grizzled, explosive warrior, as kind of heart as he was short of temper, was generally listened to, and his advice sometimes taken, by the Commander-in-Chief of the British and Allied Spanish and Portuguese forces, my Lord Wellington.

For the rest, often as Bryan heard about his good luck—and he was told of it frequently—he would laugh and say, with a movement half-deprecatory, half-pleased, of his big shoulders, that he supposed his turn for a bad time would come later. But that 'later' showed no signs of hurrying.

The British troops had been sent into Portugal to stem the tide of Napoleon's invading army; and, after a hard fight at Busaco, after their march through middle Portugal, they were entrenched behind the lines of Torres Vedras, that gigantic defence designed by the far-seeing Irishman, whose tenacity was to change the whole course of history; and, so far, Bryan Bloxham, always reckless, always eager to expose himself, had come through the campaign without a wound, without a day's illness.

Now every man in Wellington's army was in winter quarters, and so silently had these twenty odd miles of entrenchments been thrown up that Marshal Massena, the French commander, heard the first whisper of them only four days before he reached them; while, to the majority of his men, the seeing of this chain of brown mounds with their own eyes was the first intimation that they were cut off from Lisbon, which they had looked on as their city of plenty; from the sea, by which they hoped to receive both provisions and reinforcements; and from any effective stroke against the armies from the 'Island of Shopkeepers,' which was breaking in on their victorious record.

Wellington's men waited, far from pleased with their inactivity, though the officers kept hounds and went a-hunting, and the rank and file participated in any sport that might be

going on. But day by day the plight of the French grew worse. It was only the pride of the proudest fighting force in Europe that kept these veterans before entrenchments that they knew they could not storm. Hunger, starvation, stared them in the face. They could neither beg, borrow, nor steal. By order of the man who was later to blossom into the Iron Duke, the whole country had been swept as bare as if a cloud of locusts had passed over it. Each peasant had driven his flock within the British lines; each farmer had carried off or destroyed all that belonged to him. And yet to retreat was almost as difficult as to remain. There was hardly a blade of grass, much less an ear of corn, all the way back to Coimbra; and to go north by Coimbra through the level middle provinces was the only way the French knew.

True, one alternative remained to them. They could strike west and try to cross the frontier over into Spain, where comparative plenty awaited them. But to do that they must pass over a wild, mountainous region, about which they knew nothing but the one alarming fact that every inhabitant left in it was hostile to them. At first they sent out surveying parties; but they learned so little, while the cost of them—not in money, but in men's lives—was fearful. Each party, before it mapped out a road, or ascertained how a pass cut between two wooded heights, was attacked by peasants invisible among the rocks and trees, who used their muskets with deadly effect. When prisoners fell into their hands the case was even worse. If one of Massena's men was taken, he held himself fortunate to be shot at sight, not done to death by inches.

Therefore, from the early days of October—and the New Year of 1811 had come now, and was well on its way—Bryan Bloxham found life quite a pleasant holiday. He did his share of outpost work, to be sure; whenever there was volunteering to be done he volunteered; but equally he got leave whenever he could, and spent more than one gay time in Lisbon, dancing with the prettiest women by the light of the moon shimmering over the Tagus, or taking his turn at any sport that might be going on. He rode to hounds, too, with a zest that Lord Wellington promised himself he would not forget when an additional galloper was required; and, with that abundant geniality of his, he made friends, quite good friends, with more than one French officer, for the two nations on this occasion fought in a strictly well-bred manner, and the men who were all agog to kill each other when the guns boomed were equally ready to share a bottle of wine together when the flag of truce floated between the two camps.

Bryan Bloxham had even time for other and very different employments. His nature was curiously many-sided for his time and his

generation. He had the gift of taking interest in many things, of doing many things. He would shyly sketch in the white line of the Atlantic rollers as they tumbled in among the great rocks almost at the foot of the last of the British entrenchments, as modestly he would dabble in a sunset, or he would rein up his horse to survey the luxuriance of the cork-woods, the waving gray-green of an olive-grove.

He did yet more. While few of his brother-officers spoke any language but their own, Bryan contrived not only to come by a very fair knowledge of Portuguese, but to hear from the refugees within the lines tales of the long-past days when Portugal was one of the great Powers of the world—stories of adventure, of love, of the Moorish occupation; and, concerning himself with things nearer at hand, a hint was dropped to him that within the Quinta Marina were concealed quite unexpected relics of bygone Portugal.

This *quinta*, as Bryan speedily learned, belonged to a certain Don Miguel de Calvalhos; and, as it stood on the brow of the hill looking down on to the Atlantic hardly more than a few hundred yards from the outposts, he had passed it by dozens of times.

In this miscellaneous cluster of buildings, mostly huddled behind a high wall of rough blocks of stone daubed all over with white plaster, the old Portuguese grandee lived with a couple of servants who went abroad as rarely as their master. Don Miguel had neither wife nor child, and so unsociable was he that though he probably owed his life, and certainly the security of his property, to the British occupation, he kept his door obstinately closed.

But one day Don Miguel found that the provision for his small household had not been allowed to pass through the British lines. The old man walked out from the *quinta*, strolled into the open country, and addressed himself to the first soldier he met. As chance would have it, this soldier happened to be Bryan Bloxham, the one Englishman in all Portugal, perhaps, who was longing to make Don Miguel's acquaintance.

The old man, with his face half-hidden beneath his wide felt hat, with his heavy *capa* wrapped about his gaunt frame, imperiously stopped the horseman, and as imperiously, not to say insolently, stated his grievance. Nine men out of ten would have resented the manner; quite as large a proportion would have made light of Don Miguel's anxiety about three bags of onions, a couple of cheeses, and a few sacks of maize; but Bryan Bloxham wished to see the interior of the *quinta*. Besides, to his mind, life was too short to spoil with resentment unless a quarrel were absolutely thrust on one; while it was one of his accepted maxims that one might as well do a good turn by the way if one could.

He smiled with those blue eyes of his into

[Christmas Number.

the forbidding face. 'I am going to headquarters now,' he said. 'I will see to the matter at once.'

The old Portuguese, without so much as a syllable of thanks, turned about; but Bryan was as good as his word. That very evening he was able to promise the arrival of the provisions for the next day.

The young man rode leisurely up to the *quinta*, while the sun was still comparatively high in the blue sky, to give this news himself; and as he looked ahead, over the line of the olive-grove to where the horizon melted into a haze tinged with gold, he did not notice that a woman, a peasant woman apparently, with a country basket poised on her head, and the inevitable flower behind her ear, was watching him, stealing along behind him, and that when he stopped at the door of the *quinta* she sat down among the grass as if to wait and see what might follow.

José, Don Miguel's servant, answered Bryan's sharp knock at the wooden door set in the middle of the high wall, and the dark-faced man was as taciturn as his master. He said curtly that no strangers were admitted within the *quinta*; but when Bryan told him that he came with good news for the dinner of the morrow, José so far unbent as to offer to give a message.

A message would, after all, have done quite as well; but that was not quite what Bryan proposed. 'Your master will see me, my friend,' he said as he jumped from his horse, and threw the reins to his orderly. 'I will come in,' he went on in his careful Portuguese; and as confidently as if he had been cordially invited, he pushed José gently back, and when he stood on the other side of the iron-bound gate he went on to say that he was in no hurry. If Don Miguel were resting or engaged, he had time to await his pleasure.

He sauntered farther into the courtyard as he said that; and while José, seeing that he was worsted, hurried toward the house, muttering a curse as he went, Bryan began a leisurely survey of the scene before him.

The *quinta* was not built altogether on the accepted plan of country houses in Portugal, as Bryan had hitherto seen them. It was true that the inevitable paved courtyard possessed in its centre the equally indispensable well with a great stone head, and that facing the door by which Bryan had forced his way in was a double flight of steps leading up to the house itself. But instead of both remaining sides being taken up with a collection of low, untidy buildings, on the west, where the sun might linger, there appeared to be a little garden. Now Bryan had heard a whisper of this garden—how long ago a certain king had planted it for love of a pair of bright eyes. Bryan walked rapidly across the stone flags, his spurs clinking behind him, his sword rattling against its attachment; and
1916.]

as he stepped between a series of low pillars—which showed that, however much King João might have builded, the Moor had been there before him—the soldier saw a square finished off at the farther end in a way which was quite new to him.

A line of arches rose up before the background of the great outer wall; and even against the white of the plaster, visible between every two openings, they showed whiter still, for their outer surface was composed of white glazed tiles carefully fitted one against another. The arches were low and flat, and on the broad shafts, on the delicate spans, the tiles, painted with a peculiar vivid blue, first made encircling frames, and then showed within those frames a series of scenes from bygone Court life, still in blue on white. Bryan knew enough to understand that he saw before him one of the most perfect survivals of an art peculiar to Portugal in its prime. He stood a moment, with the greenness of the new grass at his feet, with the trickle of water making music in his ears, with the promise of blossom in the budding camellia-bushes, in the clumps of iris. Then, as he looked up and down, a new expression overspread his face. It lost its pure enjoyment; it became alert, excited even.

Bryan strode close up to the row of arches. He looked quickly at the first one; he passed on to the next. He went down all the line to make sure that he was not mistaken. Then he turned about, and came back more slowly, until at the third from the end he suddenly pulled up. The picture within the medallion was by no means the least interesting of the series. It showed King João bestowing the great order of Portugal, the Order of Christ, on a kneeling grandee, who, in fact—though Bryan did not know this until later—was an ancestor of the very Don Miguel to whom the *quinta* belonged now. Bryan merely glanced at this scene; all his attention was fixed on an oblong insertion which filled up the space below, and which was repeated in each shaft. As he bent down to examine it, the artist was banished by the soldier.

It was apparent that he had before him in these oblongs a series of maps of the Portuguese provinces; and if they were correct, for this was before the days of an Ordnance Survey, they might prove of the greatest service to Lord Wellington, who was almost as badly off for accurate knowledge of the country as were the French.

Bryan had purposely pulled up before the oblong which took in Lisbon and the surrounding country. He could check that by experience. He fixed one position after another, and then through his ardour was just beginning to filter the remembrance of having heard that the *quinta* was originally a Moorish palace, and that the Moors were especially learned in such arts as geometry and map-making, when he felt a sharp touch on his arm.

'Don Miguel!' Bryan exclaimed as he looked round.

The old Portuguese stepped a pace or two away, then bowed without speaking.

Bryan came towards him, too eager to be pulled up for a shade of manner. 'These maps'—he began.

The old man put up a lean hand, with thin claw-like fingers discoloured with incessant cigarette-smoking, and with a gesture stopped the eager words. 'You seem to take a great interest in my poor garden, Senhor Englishman,' he began icily. 'I am glad it has afforded you pleasure. I live here by myself,' he went on dryly. 'I enjoy it myself.'

But Bryan was past taking a snub. 'Don't you understand,' he returned as eagerly as ever, 'that these maps are invaluable just now? You did well to conceal their existence; the French would have given anything to know of them; but now Lord Wellington will be sure to come and look at them himself.'

The old Portuguese heard the rush of words. His face grew even darker than its wont. But while he kept silence, twisting his cigarette between his fingers, Bryan came to him again.

'Have you got paper and a pencil?' he began confidently. 'I should like to draw out a little bit, or Old Andrew will never believe what a find I have got for him.'

The dark eyes raised themselves to the blue ones. There was a moment when Don Miguel was very near to bidding this audacious young Englishman to leave his presence at once; then something else prevailed with the old man. Some memory awoke in him, some feeling perhaps for youth, and for the confidence of youth. The old man dropped his eyes; he began to walk down the path; he drew Bryan along with him.

At the other side of the garden, where only the line of twin pillars divided it from the courtyard, Don Miguel pulled up. 'I have kept my door closed for years,' he explained. 'I do not see why I should open it now; but you are like sunshine after a storm, Senhor Englishman. You please my old eyes, I hardly know why.'

The old man went on again. Bryan walked silently by him. He was very much interested, perhaps a little elated, but he was not so surprised as he might have been. Strange developments had a way of coming to Bryan Bloxham.

Neither of the two men said a word until they reached the old well-head. Then Don Miguel waved his hand toward the house.

'You may come in,' he said. 'My steps will hardly know themselves when they find a stranger's feet on them. And, Senhor Soldier,' he went on, looking up searchingly, 'you say that you could copy my pictures on to paper?'

Bryan assured the old man that he could do so much.

Don Miguel nodded, and began to go to the house. With his hand on the stone baluster, he paused yet once more. 'Your name, *senhor*?' he asked.

Bryan gave it, together with his regiment and his rank.

The old man looked the big figure up and down from head to foot, and then he announced his decision. 'Senhor English Soldier,' he said, 'you may copy my pictures in the garden if you like; but I will have neither your Commander-in-Chief nor any other man within my walls.'

CHAPTER II.

'If you please, sir!'

A sentry came forward from the earth-work that was known as the Atlantic outpost, and, putting up his hand to the salute, stopped Bryan Bloxham, who was cantering back from the Quinta Marina to make his report to his colonel.

Things were done in a less precise manner in the army then than they are now. Don Miguel's stipulation had been accepted. No one in authority saw anything particularly incongruous in a cavalry officer making maps for a fighting force. If the old Portuguese made a point of Bryan Bloxham's doing it, the British were in Portugal to conciliate, not to antagonise; and Bryan was about as good as any one to copy the tiled atlas in the *quinta's* garden.

But to Bryan personally the matter had quite unexpected results. Don Miguel, shyly, grudgingly even, at first, showed signs of wishing to make friends with the young man, who, in every possible way, was his exact opposite. From timid advances which Bryan received in his matter-of-course, every-one-likes-me manner, the old Portuguese came to open friendship, until before many weeks were past Bryan might stable as many hunters as he pleased in the tumble-down range of disused buildings, his pet hound might bring up her family in another corner, he might knock on the grim door in the high wall every day in the week; and, lastly, Don Miguel set aside for him one of the rooms within the *quinta* itself, and there Bryan worked at his maps, transferring his tracings to parchment, colouring in the rivers and the woods and the mountains.

After one particular afternoon of work, Bryan had smoked cigarette after cigarette with Don Miguel, had listened to the old man's tales of the time when he brought his Spanish wife home to the *quinta*, and, finally, when midnight was well past, he had thrown himself on a broad divan, and had slept as soundly as only one with such strength and health as his could sleep.

In the early morning, with a square of parchment that Andrew Vennie especially desired to
[Christmas Number.]

see carefully folded within the breast of his tunic, Bryan set off from the *quinta*. The day was but just breaking. It had been a wild night. Bryan recollected how the great gusts of wind, the lashing rain, had punctuated Don Miguel's talk about bygone times. The ocean rollers were still grumbling moodily as they dashed against the boulder-strewn coast; the mist was still low down, almost clinging to the dripping grass; and the sun, determined to shine, was struggling through a bank of piled-up clouds.

Bryan Bloxham reined in his horse and inquired of the sentry who had stopped him what might be the matter.

'A woman, sir,' blurted out the man.

'A woman!' repeated Bryan. 'Where?'

'Here, sir!'

Bryan bit his lip impatiently. Ever since men went to war, women in the camp have been an additional complication. It chanced, too, to be one that, in this connection, Bryan especially disliked.

'I suppose I had better see what she has to say for herself,' he answered dubiously. He recollected the poor creatures who sometimes appeared in the orderly-room: women maddened by hunger into thieving, women caught at worse purposes, and he never saw such a scene without feeling that it blurred and spoiled his picture of life as he liked to look on it.

The sentry limited himself to 'Very good, sir; but Bryan asked yet another question: 'Are you sure that you are right to detain this woman? What has she to say for herself?'

'She does not speak a word that we can understand,' answered the soldier; 'that is why we made so bold as to stop you, sir.'

Bryan began to walk his horse along. 'How did the woman get within our lines?' he asked next.

The sentry thrust out his lip. 'Black night,' he muttered. 'Couldn't see your hand before your eyes. Rain splashing like water out of a spout on to your face.'

Bloxham nodded. The woman had evidently come into view unexpectedly, probably as the mist lifted suddenly.

He sent the soldier to tell the guard to turn out the prisoner; and then Bryan Bloxham, sitting on his charger, waited, and as he waited his eyes strayed over the landscape before him. The tempest had worn itself out. It was being followed by that peculiar calm that so often does come after one of Nature's fits of passion. The mist from the sea was mingling with the mist from the wet earth, and together, one gray, one golden, they were driving along before the new-born day. Bryan marked the beauty, the peace, indifferently enough at the time; but he remembered the scene all his days; and he remembered too—for trivial incidents as well as great ones serve to mark the cross-roads at 1916.]

the turning-point of a life—the tramping footsteps of the guard, the tired faces of the men eager to be relieved, the outline of a cloaked figure, so small and so slender, surrounded by stalwart frames in military greatcoats.

The guard opened out, drew back. Bloxham straightened himself on his horse. The woman remained standing where she had been left, the great cloak about her face, its large hood covering her head.

Bryan looked down. At the first glance he was conscious of something unexpected. He had looked for the dishevelled, the repulsive, the bold.

'Why are you here?' he began sternly; but he got no farther than that one question. He was answered, not in broken English, not in Portuguese, but in French. It was no country-woman's voice either, no camp follower's, and neither did it excuse, much less plead.

'Pardon, monsieur,' interrupted this voice, 'I think you are making the same mistake that your men have done before you. I am from the French camp; and, monsieur, I claim your help and protection.'

Bryan had looked down, and the next instant he jumped from his horse.

The woman had dropped her cloak, and, as he stood before her, she pushed aside the heavy cloth hood. She showed him her face, her eyes, the oval of her cheek.

Bryan drew in a deep breath. 'Madame!' he began hurriedly; and then, as his eyes sought hers, he pulled up, and he substituted 'made-moiselle.'

The girl, for she seemed quite young, ignored the change of address. 'I claim your protection, monsieur,' she repeated.

Bryan answered at once. 'I will do what I can,' he began eagerly; 'but'—

The pretty head was lifted sharply; a frown drew down the white brow. 'But?' questioned the girl.

Bryan tried to laugh lightly; nevertheless he, who hitherto had been so sure that there was no life like a soldier's, all at once discovered that the calling had its disagreeable aspects. 'I must ask you a question or two, madame,' he went on apologetically. 'You will tell me, for instance, how you came here?'

'Oh,' returned the girl, and she laughed as if she were amused, 'is that all? I can answer that easily enough.' She began immediately.

Luckily, as Bryan thought at this moment, he understood French almost as well as he did English. When the Convention and the murderous guillotine drove so many of her finest sons from France, they found no more certain hospitality than in England. One such refugee had been sheltered in the old manor house where Bryan was born, and Bryan had learned French from the courtly old man who acted as nurse, as schoolmaster—and as a friend.

It seemed that this pretty girl had actually ridden out from the French rear-guard without an escort. On the way, her muleteer, the one man with her, had threatened to cut her throat if she did not dismount and let him drive off with the mule and its belongings, and the few valuables with which it was laden. She was only too willing to escape on such terms. Through the darkness, through the rain, she had wandered on foot. She had lost all sense of direction. A gleam from a camp-fire had at last given her hope just when she was about to fall exhausted. She had made for the light only to find herself within the British lines, not the French. 'Your men, monsieur,' she wound up, 'must bear out my story if you need confirmation. They will tell you how wet I was, how mud-stained.'

Bryan bowed. It was quite a couple of minutes before he could bring himself to ask the guard if what so pretty a woman said was true. He coloured right up to the roots of his fair hair, and the girl, watching him, perhaps understood, for a smile that had in it a hint of amusement, and of something deeper, touched her lips, while there flashed into her great dark eyes, as a lantern flashes out into the night, one quick glance of what could but be called triumph. The next instant the oval face was very still.

Bryan Bloxham turned from the group of soldiers. 'Madame,' he began, 'I had to ask for form's sake. My men assure me that you were wet and dripping.'

But the girl seemed hardly to concern herself with the corroboration. 'I am not madame,' she corrected. 'I am Clementine de Gillamont—Mademoiselle de Gillamont. I am on my way to nurse my father, Colonel de Gillamont, of the Twentieth Chasseurs. He is reported, at headquarters, to be badly wounded.' Clementine looked up at him again. 'You will not keep me here, monsieur?' she said. 'Think, my father may die from want of care!'

Bryan drew himself up. 'Mademoiselle,' he assured her—and he dwelt on the title—'we English do not make war on wounded men or on devoted daughters.'

The girl came a step closer. 'I knew, monsieur,' she murmured, and she dropped her eyes so that the long lashes fell on the pink cheeks, 'that I could trust myself to you.'

Bryan flushed with pleasure; but underlying the pleasure was a certain embarrassment. He was not sure what to do. Mademoiselle de Gillamont evidently expected to be sent back then and there to the French lines. But he, a subaltern, had no right to decide whether a Frenchwoman was to be detained or liberated. Besides, one so young, so pretty—though the distance between the outposts of one force and those of the other in the days before long-range shooting was hardly two miles—could not go

alone. Bryan had no authority to furnish an escort. The proper proceeding, of course, was to refer the girl to superior authority.

Old Andrew Vennie was very grim where a woman was concerned, but he was a just man. Bryan turned. He was just about to propose to escort Mademoiselle de Gillamont to his colonel himself, when Clementine, as if she knew what was coming, raised her great dark eyes to his; and Bryan all at once felt that this girl, with a face that had no match, so far as he knew, for beauty, looked to him, Bryan Bloxham, and to no other man, to help her.

The two, the slight woman and the broad-shouldered man, stood facing each other. Neither of them spoke, and as they waited, with the morning growing brighter and the breeze from the sea just fluttering the strands of Clementine's hair against her little ear, Bryan knew that something had leaped into his life that had not been there before, and that that something had no likeness in the past, had no precedent in any other experience.

It was the swift rise and fall of a horse's hoofs thudding over the turf that broke in on Bryan Bloxham's exaltation. A second soldier was riding up; and Bryan, as he muttered an impatient word between his lips, saw at the first glance that the new-comer was a Spaniard belonging to the force under General Romano quartered about Mafra.

The Englishman expected the Spaniard to ride past him, for the two forces rarely interfered with each other; but as the small, dark-faced man came nearer he jerked in his steed.

For one instant the wiry Andalusian horse, breathing hard, stood with its heaving flanks almost touching Mademoiselle de Gillamont, and the girl flashed one quick, expressive glance into the face that waited for just this look. Then, as Bloxham unwillingly brought up his hand to the regulation salute—apart from his annoyance at being interrupted, his insularity caused him to have no great opinion of the Spaniards within the lines of Torres Vedras—the new-comer in his turn sprang to the ground.

'I am Ramon di Gracias, captain. On the staff,' he announced.

Bryan coloured with vexation. 'I am Lieutenant Bloxham, Ninth Horse,' he answered grudgingly.

The Spaniard smiled significantly, and took a step forward. 'I am senior to you, then, sir,' he said.

Bryan was silent. It seemed to him intolerable that any one, above all a foreigner, should supersede him while Mademoiselle de Gillamont's fate hung in the balance.

The Spaniard saw the annoyance, and it appeared to gratify him. 'A lady within the lines—at this hour,' he began.

Bryan turned on him. 'The lady lost her way,' he thundered.

[Christmas Number.]

The Spaniard, so wiry and so slim, looked the heavier Englishman up and down. 'A pleasant interlude doubtless,' Captain di Gracias went on. 'A charming variation on dull duty.'

Bryan's face went purple this time. He raised his great arm, and the next moment the Spaniard would assuredly have suffered for his impertinence had not Clementine interposed.

She put her hand on Bryan's sleeve; she pulled him aside. 'Monsieur,' she began breathlessly, 'you will not forget. I have put myself in your hands. Take me back yourself to the French lines. We are wasting time, and every minute may be of consequence to my father.'

Bryan heard the eager words. The suggestion exactly chimed with his own inclination. Old Andrew expected him, to be sure; but an hour later would do as well as an hour earlier. Bryan knew that there was a tumult within him. His being, his manhood, urged him to set out at once; but some remnant of prudence still remained to him, some thought of his duty as a soldier still admonished him.

It was the Spaniard who broke the silence. 'Mademoiselle,' he said as he stepped up to the girl's side, and this time he made no attempt to veil his insolence, 'why trust yourself to a dull Englishman when a Spaniard is by? Is not England the land of fogs and bargainings; is not Spain the country of romance and myrtle-flowers?'

Clementine de Gillamont slowly lifted her beautiful face. The impertinence appeared to have made no impression at all upon her. 'Senhor,' she was beginning, but the sound of that voice addressing such a man was more than Bryan could stand. He flung himself round, setting his great back to Captain di Gracias.

'Mademoiselle,' he began slowly, decidedly, 'I am at your disposal. You honoured me by confiding yourself to me. You wish to reach the French outposts. I will escort you there. Shall we set out at once?'

CHAPTER III.

IT was hardly noonday when Bryan Bloxham found himself back at his own quarters. He had escorted Mademoiselle de Gillamont to the French lines; he had waved his white handkerchief on his sword to announce that he came in peace.

The officer in command of the outpost and Bryan happened to have met before, and Captain de Pratz-Clos received the big man, whose hospitality he had partaken of when he had brought a letter from Marshal Massena to Lord Wellington, with a friendly smile. It was when the Englishman explained the purpose of his visit, when he stepped back and brought up Clementine, that there came a sudden change
1916.]

over the Frenchman's face. There seemed to be dismay written there, a great repugnance; and then, with the thought that had banished the smile from his blue Breton eyes, that had closed the lips tightly under his big moustache, still unexpressed, Captain de Pratz-Clos turned to his countrywoman. 'Mademoiselle'—he began.

'De Gillamont,' put in Clementine hastily but very clearly.

The man she spoke to looked hard back at her. 'Mademoiselle de Gillamont,' he returned, and it seemed as if he grudged to give her the name—'I suppose I must send you, mademoiselle, to'—

'To the Convent of Ste Marie di Prega,' put in the girl.

'Just so,' retorted the Frenchman, with an odd emphasis on his words; 'to the Convent of Ste Marie di Prega, where'—and he dwelt even more emphatically on the next words—'the severely wounded are lodged.'

Captain de Pratz-Clos seemed to ponder for a moment. When he looked up he addressed himself to Bryan, not to Clementine. 'It is clearly my duty,' he muttered, and he spoke with a curious detachment, as though in this instance he separated his duty as a soldier from his inclination as a man.

Bryan was struck by the icy manner.

The fine Frenchman, for all that his blue eyes were so alive, for all that there was energy, decision, in every movement of his well-knit body, must have singularly little of the fire of his nation if he could be so frigid before one of his own countrywomen, who was not only unusually beautiful, but who had risked so much to reach her father.

Bryan looked quickly from the man's face to Clementine's. If he was dismayed, she seemed to have remarked nothing.

'Thank you, *mon capitaine*,' she answered tranquilly. She turned and looked at Bryan. For quite an appreciable space her eyes fixed themselves on his. She seemed to be measuring the man who had brought her back; she seemed to be estimating the possibilities of his mind as well as those of his body. Then, with a half-sigh, with a shrug of her shoulders, she looked down.

Bryan understood that a struggle of some sort was taking place in her thoughts. He wondered what could be troubling her, perplexing her. 'Mademoiselle,' he cried, and he made an impetuous step nearer, 'what more can I do for you?'

The girl heard the ring in the voice.

De Pratz-Clos heard it too. The Frenchman turned angrily about. '*Mais c'est trop fort!*' he exclaimed; and again, just as he had done before, the Frenchman pulled himself up. He turned to Clementine. 'Mademoiselle,' he said, and his tone was a command, not a

suggestion, 'you say that you are anxious to reach your—the convent.' He went to the door and set it open. The action of dismissal was unmistakable.

Clementine de Gillamont turned to Bryan. '*Adieu, monsieur!*' she murmured. 'I thank you.'

There was pathos, there was dignity, there was resentment in the emphasis on the pronoun.

Bryan understood all that had gone unexpressed; at least he thought so. He bent forward, his face aglow, his eyes alight. '*Mademoiselle,*' he returned, and he did not care whether Captain de Pratz-Clos heard him or not, 'you honoured me when you accepted my escort. You will honour me still more if you call to me whenever you have need of me. I will not say *adieu*. We shall meet again—we must meet again.'

It was of this girl with the alluring face that Bryan was thinking as he came back to his own quarters. He felt strangely elated. The very air seemed to be filled with champagne. There might have been a new blueness about the sky, so sensible was he of the glow of its colour; the very defences—earthworks, ditches, fences—unprepossessing as they were, had some charm of shadow or of tint as he looked at them. He went straight to his hut, to the one place where he had some small chance of being alone. He sat down on the bench which served him alike for a bed and a chair; and there, with one leg thrust out, with an elbow on one knee and his chin in his palm, he sat still, as if mentally as well as physically he needed to take breath.

So far it had been a whirl of emotion without clear thought. Bryan Bloxham knew that he had been stirred by a new experience; that he, habitually the most active of men, wished to sit still, and actually, that he might enjoy again that which had gone before, to dream awhile.

This time of reflection might have brought knowledge in its train; but Bryan Bloxham had hardly surrendered to the unaccustomed tranquillity when he heard his name being called.

Instantly he sprang up, the soldier in him alert. He hurried out of the hut. The sunlight flooded on to his face, and before he could recover from the confusion of the glare he heard that Old Andrew wanted to see him at once.

'What for?' asked Bryan.

'Something in a hurry. You are to go at once,' came the reply.

Then, and not till then, Bryan Bloxham thought of the map which still remained tucked within his tunic. In a very few moments he stood face to face with his colonel.

It was quite a while before Andrew Vennie spoke. The gray-headed veteran was seated before a poor table in a bare room. He was evidently looking over a pile of papers, for the quill by his side was still wet, and his sword served as a letter-weight to one of Bryan's own

tracings. His faithful hound was at Colonel Vennie's feet, and the old man's eyes, with the colour faded out of them by exposure to tropical suns and to blinding blasts, were stern, angry even. Then, as the fine figure of the man before him seemed to fill up the room, to bring down still lower the stained, rough ceiling, something twitched in the sharp face, and the clean-shaven lips drew together as if they feared, not to scowl, but to tremble.

Bryan saluted and waited. He knew the signs of the times. Every man in the Ninth knew exactly when Old Andrew was put out; and though there was something about his colonel which did not wholly agree with anything that he recollected to have observed before, Bryan concluded that the wind of authority was very much in the east.

Colonel Vennie looked up, threw down his pen, pushed a map, on which he had been drawing lines and making crosses in red ink, from him with so violent a movement that the square of parchment slid off the table on to the earthen floor; and Carey Roy, evidently thinking that it was time to move on, tucked his brown body well under his master's chair.

As Bryan's arm fell his commanding officer turned on him. '*Mr Bloxham!*' he snapped out.

The ceremonious title made Bryan start. Often enough Old Andrew called him '*my lad*'; sometimes the grizzled-headed man went so far as to use the name that Mary Bloxham had just had time to give to her boy before all things earthly faded from her; but never since he joined did Bryan remember to have heard his formal title. He threw up his head, and the blue eyes looked a straight question into the stern gray ones.

'I have to ask you, sir,' went on Old Andrew, in his harshest barrack-yard voice, 'what you have to say for yourself. I have sent for you to give you every chance; but, by gad, sir! unless you can clear yourself, I tell you at once that you will leave this room under arrest.'

Bryan stepped back, dismayed. There was evidently something much more grave at stake than a couple of hours' delay with a tracing which might or might not be required that week or the next either. '*Clear myself!*' he ejaculated; 'of what?'

Old Andrew half-raised himself in his chair. '*Answer me,*' he spluttered incoherently.

'I will answer any question you put to me, sir,' retorted Bryan. 'But I do not know what all this means.'

It is possible that while old Andrew Vennie was waiting for Bryan he had made up his mind to put a restraint on himself, to proceed gradually, to get at the beginning of things, and take them along gradually; but the old man had never been diplomatic for ten minutes at a time in all his life, and now Bryan's outcry effectually banished any nice calculations.

[Christmas Number.]

The tall soldier, as straight as when he joined, for all his seventy odd years, swung his chair backward until every one of its rickety wooden spokes creaked. 'Not understand!' he echoed, while he brought that same chair down again on to its two long-suffering front legs; and Carey Roy, finding his position perilous, rose, stretched himself, and, selecting a stand between the table and the unglazed square which served for a window, grumbled in his deep bass. 'By Gad, sir,' went on Old Andrew, and now he rose, 'tell me, did you or did you not march as bold as brass across from our lines to the French outposts this morning?'

'Oh, that!' exclaimed Bryan, as if there were a great deal of fuss about very little.

'You did!' cried out his colonel, pouncing on the half-admission. The old man paused. He dropped both hands on to the unsteady table, and it rocked from right to left under the pressure. Then, while a beam of insistent sunlight flooded into the room, Colonel Vennie asked his next question. 'How came you,' he went on, 'an English officer, to take it upon yourself to go to the French lines without a pass from headquarters, or without a flag of truce?'

'I could see no other way, sir,' answered Bryan sturdily.

Old Andrew looked hard at the young man. 'Gad, sir,' he fumed, 'are you telling me that something forced you?'

'Just so,' answered Bryan promptly.

Andrew Vennie looked scrutinisingly into the fair, open face. The old man was torn between two considerations. On the one hand was his liking for Bryan, was his experience of him all through the campaign, was that still more potent thing of which Bryan knew nothing, that made the veteran of more than fifty years' service watch over this boy as he had watched over no other being since he donned his tunic and shouldered his musket; on the other hand was the fact that every word Bryan Bloxham said seemed to confirm a piece of information that Colonel Vennie had received that very morning, coupled with the knowledge that even the best man, and the staunchest, finds it hard to stand up against one temptation.

'Why did you go?' finally demanded Old Andrew, and he mumbled, because he felt that indeed he was giving Mary's boy a last chance.

Bryan paused a moment before he replied. It was not that he was afraid or that he repented. He had been aware when he set out that he was doing an unprecedented, a perilous thing. But with a certain type of men a woman's name never comes easily to their lips.

'I went to restore a French lady to her friends, sir,' he said at length.

At the words 'French lady' Andrew Vennie's two hands rocked the table again. That was exactly what his information told him, though the matter had by no means been put in the 1916.]

same light. 'What had you to do with a French lady?' he went on sharply.

'She demanded my protection, sir,' went on Bryan sturdily.

Andrew Vennie heard the unabashed ring in the voice. He looked hard into Bryan's face. It began to dawn on him that it was possible that his information might be true to fact and false as to motive. He breathed hard, and again Old Andrew tried to put a curb on himself. 'What can you tell me about this French lady?' he asked.

'Everything that I know myself,' returned Bryan fearlessly.

'Then, by Heaven,' cried out Old Andrew, 'be quick, and say what you do know!'

At once, confidently, but still with perplexity, feeling that something lay behind that he did not yet understand, Bryan told how he had first seen Clementine de Gillamont, what she had told him, what she had required of him.

The old man heard the enthusiastic story to the end. Then he slowly took up his pen and began to make lines on the table before him. Andrew Vennie remained thinking, meditating for quite a while; and Carey Roy, seeing that the times had changed, dragged his sleek coat over the floor, and laid his smooth head on his master's knee.

At last, when Bryan was almost beside himself with wonder, his commanding officer looked up. 'Did nothing strike you as strange in this tale?' he asked.

'Nothing!' Bryan cried out. 'Why should it?'

Old Andrew nodded grimly. His old lips twitched again. 'Even if what you say be true'—he began.

'If!' interrupted Bryan indignantly.

Old Andrew smiled as if he liked the interruption, but he deliberately repeated the phrase. 'Even if what you say be true,' he reiterated, 'your conduct was most blameable. What warrant had you, a subaltern, to restore a French subject? What right had you to present yourself at a French outpost? A less honourable foe would have detained you as a deserter; a more vindictive one would have shot you at sight.'

The commanding officer had evidently only begun his admonition; there was as evidently considerably more to be said, for even in those informal days, when Wellington's men sometimes went to a theatre as the guests of the French with passes signed by the two Commanders-in-Chief, an impromptu visit to the enemy's outposts was hardly a thing to pass over in silence. Then, all at once, Andrew Vennie's judicial tone gave way, and the old man flung out his hands. 'Thank God, my lad!' he cried, 'I do believe what you say. I can believe that you have been a dupe, not an accomplice.'

'A dupe, sir?' echoed Bryan.

The lined, weather-beaten face with the

mastiff jaw relaxed, and with the eyes that had a gleam in them which contradicted Old Andrew's reputation for severity, he looked into Bryan's with a half-understanding, half-reproachful expression. 'I do not doubt you, lad,' the old man went on slowly. 'But, Lord, boy, what a fool you have made of yourself!'

'A fool! How?' ejaculated Bryan.

The old man bent forward. 'Think again,' he said. 'Did it never occur to you'—

Bryan interrupted him. 'If you are asking me to doubt a word that Mademoiselle de Gillamont told me, then'—

He never got to the end of his hot protestation. Andrew Vennie lifted his hand. 'By gad, sir!' burst out the old man, his temper carrying him away again, 'it is not what I ask you to do, but what you will see for yourself you must do unless you are a bigger fool than your mother's son has any right to be.'

There followed a moment's pause. Bryan could not but know that it was a time of strange happenings. He could not but know—every man in the camp did—the part women generally took when they mingled actively in the affairs of the two nations. The mere suggestion of this possibility sent the blood flaming into his face. 'I do not know what you mean, sir,' he answered, because he guessed all too well.

The old warrior shook his head. 'My lad,' he began anew, 'did you believe just what this Mademoiselle de Gillamont chose to tell you?'

'Every word of it,' flung back Bryan.

'You had no misgivings?'

'None!'

Old Andrew heard the vehement cry. He would once have spoken up so for a woman, but only once. He recognised the ring in the voice; he knew what it meant.

The old man muttered a hard word under his moustache, something about jades and deceivers. 'My lad,' he repeated, and then he stammered, cast about for what he should say next, and, as usual when Andrew Vennie was perturbed, he lost his temper. 'You!' he spluttered. 'Lord, you young fool, don't you understand what I mean? I'm trying to tell you that this Mademoiselle de Gillamont is no more Mademoiselle de Gillamont than I am. She is a spy, sir; and when she was caught she made up to you to get her out of the hole. If you had brought her to me, as was your duty, you would have seen where she would be now.'

Bryan heard this terrible accusation, and his hand sprang to his sword.

But his colonel was before him again. The old man was not making his assertion at random. A certain notorious woman spy was known to be about. The woman was exceedingly clever at disguisements. It was more than suspected that she had visited the British lines once or twice before. There was a certain leakage of information, and she was supposed to be the

cause of it. Moreover, clothed in her proper person, she was known to be young, to be attractive. Andrew Vennie was even provided with a description of this woman. He read it aloud, and, as the old man dropped out his words one by one, Bryan's hand fell to his side, and the clear blue eyes looked appealingly ahead.

For the first time, as Bryan Bloxham stood in this poor room, he was afraid. His heart began to thump against his side; a gray shadow came over his face. Andrew Vennie's catalogue like list of brown eyes and white teeth was bad enough, but there was yet other confirmation. Bryan recollected—he could not but recollect—that something in the manner of Captain de Pratz-Clos. The dryness, the contempt even, the pointed withholding from this lovely woman of that which was hers in virtue of her sex, not to speak of her beauty, were explicable enough now, if—if what that damning recital pointed to was true. Bryan turned his head; he looked out to the strip of trampled grass visible through the opening; he put up his hand—it trembled as he lifted it—and wiped the beads of moisture off his brow. He wanted in every fibre of his being to contradict Old Andrew, he wanted to protest that even his respect for his commanding officer would not permit him to listen to such an accusation, but he could not say a word.

Bryan Bloxham had been honest with himself all his life; so now his own heart was honest with him. He was not sure! He could not be sure! Do what he would, there was misgiving, not confidence, in his heart. He looked dumbly across the stained deal table. Andrew looked as hard at the distressed face. The old man had usually scant mercy on those who loved not wisely but too well. He had little toleration for the tender passion in any form. He held that a soldier in love was a soldier lost, but now he would have given anything to palliate, if he could not reassure.

But Colonel Vennie was not the man to shirk. He knew, too, that the surgeon who makes a patient yell with agony (this was before the days of anæsthetics, remember) was often doing him the greatest service. 'Was this the first time'—he went on slowly.

'That I had seen—her? Yes,' replied Bryan.

'You give me your word?'

'Yes,' answered Bryan.

'And that you have repeated every word that passed between you?'

'Yes,' said Bryan, 'all but'—

'All but what, sir?' shot out Andrew Vennie.

Bryan looked up, and his pathetic face told what was the gist of that which had been omitted.

The old man dropped his eyes; he considered for quite a long while.

'There must be no second time,' he announced.

[Christmas Number.]

Bryan nodded dumbly.

Andrew Vennie rose; he came round; he stood close to his subaltern; he touched the young man's sleeve.

'You understand,' he said, and he carefully looked away. 'There must be no second time. I appeal to you for your own sake—because your mother would have said the same to you, and she was the finest woman I have ever met—to take care that there be no second time of your making. But,' went on the old man, 'if you are taken unawares—and I think this woman may try to get at you again—then I rely on your honour as a British soldier not to take this Mademoiselle de Gillamont, as she calls herself, back again, but to bring her straight to me.'

Bryan heard the weighty words. He understood that he was being dealt with considerably, mercifully even. Men had been court-martialled for less glaring errors of judgment. Yet Bryan stood with his eyes on the floor. He thought of what he was being called upon to renounce, or what, maybe, he might find himself called on to perform.

'Thank you, sir,' he answered. 'I understand.'

Andrew Vennie heard the reluctance. He brought his hand down on the young man's arm again. 'Bryan Bloxham,' he admonished, 'you will not forget. I rely on you. I rely on your honesty, on your honour. You will do your duty, sir.' The old man turned away, and sat down by the table.

Bryan remained where he was, and for the moment his mind refused to think of his own position, it began to occupy itself with what might be called an irrelevant train of reflection. Bryan found himself wondering how well Old Andrew had known his mother; why the colonel, who had never mentioned her until to-day, had alluded to her as if she held so large a place in his estimation. Then the young man's thoughts went on, and there reproduced itself in his mind's eye the miniature which always stood on the carved Tudor shelf above the fireplace in the oak room at Bloxham Manor. Such thoughts faded as fast as they had risen, and next the sense of what was required of him, of what his honour bound him to do, flooded down on him. Mechanically he raised his hand to the salute; mechanically he turned to go. He got through the rough door somehow; he stood in the open. Outside in the fresh air he began to sway uncertainly, to breathe as if he were tired with a long course.

Bryan Bloxham began to walk heavily along. He wanted to see no one; he wanted to speak to no one. He tried to face the blow as a man should. He himself had told this girl with the soft pink cheeks and the appealing eyes that they must meet again. Now he had to tell

1916.]

himself that to look anew into that fair face would be a calamity, not a joy. If only he could have disbelieved; if only he could have flung back Old Andrew's description, and maintained that there was a mistake somewhere! But that was just what he could not do. There was the insistent inner conviction, the perception, that the charge was true. Other men, he told himself, had believed against the world, and they had been justified of their faith. But Bryan Bloxham had no real faith, and he knew it.

The big man groaned aloud. And as he walked on, with the sun, that only an hour ago had seemed so glorious, now nothing to him but a burning ball; with the blue that had seemed to him to be the shade of love, of hope, but an expanse of metallic colour, Bryan Bloxham realised exactly what had come to him. Some men, he knew, love because they will; some men because they cannot help it. He belonged to those who walk in bondage to their own hearts. He was a Samson chained, and even in this the first hour of his clear perception he saw that he would remain a prisoner.

It should have been his purpose, his joy, to seek out Clementine de Gillamont; and now all that was left him was to put the doings of this morning as far from him as might be, to endeavour to live out his days with as little thought of her as might be.

CHAPTER IV.

BRYAN BLOXHAM came slowly out of the heat and bustle, out of the sound of lilting, haunting music, out of the glow of countless wax candles in round chandeliers suspended from the embossed and gilded roof; away from the babble of tongues speaking English, Spanish, Portuguese; away from the glance of bright eyes and the friendly greeting of his comrades.

It was but three weeks since Bryan Bloxham's unauthorised visit to the French lines, and February, with its warmer breath, with its flowering shrubs, and its camellias all blossoming with their wax-like, rosette-shaped blooms, was well on its way.

The notables of Lisbon had organised a ball. It was a means with one section of the community—mostly the light-hearted and the gay—of showing their appreciation of the British efforts on their behalf. A general invitation had been extended to the British officers, and among those selected to accept it was Bryan Bloxham. Perhaps old Andrew Vennie had bethought himself that youth is young, and that if one woman had magic in her smile, so might also a second. At any rate, the old man had been cordial about leave.

Bryan had made his bow to more than one

signorina ; but the merry-making found no echo in his heart, and he had just slipped away from the great throne-room of that Palace of Belem which stands not far from the banks of the Tagus. He was almost at the wide entrance ; he could see the indigo-blue of the night through the open door ; and his mind, tuned by its very perturbation to his love of beauty, was thinking of the river with the glittering constellations glowing above it, of the great church of Belem across the square, with the silver light from the moon sparkling on the elaborate carving of the great west door, on the statue of the famous Don Henrique above the portal, when—all but into the night, all but out into the freshness—he pulled up short.

Bryan Bloxham's whole being was invaded by a rush of heat. Something seemed to glow scarlet before his eyes. The big man began to take gasping breaths, and immediately there began a war within him. He was torn by opposing impulses. On the one hand was an urgent desire to look once more where he had looked but an instant before ; on the other was the certainty that though it might be inglorious, it would be a thousand times better for him, more prudent—nay, more honourable—to go resolutely out of this palace of the old kings of Portugal.

But the force pulling him back was a much more powerful one than the force urging him along toward the square. He threw up his head. He pressed his lips together ; a glint came into his eyes. He straightened his shoulders. Bryan Bloxham turned about. He moved back to the throne-room. He avoided the throng pouring out from the door with its heavily carved frame. More than one woman glanced up at the big Englishman in his magnificent uniform ; but Bryan had not so much as a thought for any one of them. He knew what he was seeking, whom he was seeking. He was persuaded that only one pair of eyes could look at him with that precise glance. It was true this was the last place in which it would seem likely he should meet their gaze. That reflection almost made him pause for the instant ; and then a sudden hope shot across his being, as a ray of light darts into a closed room. What if during these last dreary weeks, with their interminable length of days, with their nights when he only slept to dream uneasily, he had been making a mistake ? What if Andrew Vennie, never over-prone to give the benefit of the doubt, had been perpetuating a monstrous calumny ? What if he, Bryan, should be able to return to duty on the morrow, humbled and abased, it is true, but with the hideous nightmare that had pursued him waking or sleeping gone for ever ? The mere notion made his whole being expand. It was even strong enough to resist the memory of his own conviction, of that confirmation of Andrew

Vennie's assertion that had come out of his own mind.

A moment later he was back within the long throne-room itself. He stood craning his neck over the multitude of moving forms. He looked searchingly at each woman's figure, at each dark mantilla-covered head.

Then, as suddenly as he had pulled up in the cool marble vestibule, he began to move toward the great dais where, when there was peace in Lisbon and a lawful reigning house, the two great chairs of state stood under a high, gold-fringed canopy.

A woman's figure had glided from between the crimson curtains covering the third of the long row of windows. Bryan saw the figure reflected in the mirror which filled the space between one window and the next. He started off in pursuit ; but a friend spoke to him, and detained him. Bryan shook the man off as soon as he could ; he hurried past another pair of curtains, but for the moment the woman he sought was lost to him.

Regardless of the dancers assembling for a good English country-dance, in which Bryan but so little a time ago would have participated with as keen a zest as any man, he stepped into the open space of polished floor. In a minute more, reflected lower down the room in the last of the series of mirrors, he was sure that he caught a glimpse of her he sought.

Bryan Bloxham started off anew in pursuit. This time the mantilla-covered head turned, as though conscious of being observed ; then with almost a furtive movement the black lace was drawn farther over the face.

The young man bit his lip. This evasion, this fearfulness, was not what he had hoped for. It did not look likely to lead up to what he had dared to think of. He muttered a despairing word between his teeth, a word dragged from him by the fear coming down over his brief elation, as a damp cloud comes down and shuts out a spring day.

He was stopped next by a bunch of Portuguese grandees and British generals. He got round them at last, and found himself at the far end of the room. There before him was the square of crimson carpet, reached by three wide, low steps ; there was the canopy covering the empty space ; and at either side of this dais, stretching from it to either wall, was a double row of pillars painted white and decorated with gold.

Bryan stood still. The music was giving a curious Southern turn to the old English melodies ; the dancers were forming and parting. But Bryan kept his back to them. He had eyes, he had a mind, only for the one woman he was pursuing. What had been a possibility at first had become a certainty now. He knew that, and he knew more. The woman in the mantilla was as well aware of his purpose

[*Christmas Number.*]

as he was, and she seemed to be drawing him along rather than to be evading him.

He saw this same form glide behind the pillars at the left of the dais.

Bryan searched the dimness behind them, for the great circles of candles, while they illuminated the open space for dancing, left the corners in shadow, and behind the screening pillars there was such darkness that it might almost have been another room.

Bryan waited with his blood swirling, with prudence trying to assure him that even yet he had time to retreat; with the mere human longing to see one face, to hear one voice, sweeping all other thoughts aside; and then that slender form, with the white dress showing below the lace of the long mantilla, peeped out between two columns. She looked straight at Bryan Bloxham, and remained standing there. Impetuously he stepped across the square of crimson; with one stride he was down the three steps. He made into that dim space, with the wall hung with silk, of crimson also, on one side of him, and the double row of columns on the other. Even as he came closer, Bryan felt that the situation had been well chosen. The woman heard the rattle of his sword, the click of his spurs. She turned, and swept one swift glance about her. She put up her hand and pushed the lace away from her face.

There had been no mistake. It was Clementine de Gillamont. It was the devoted daughter who had prayed to be taken to the French lines that she might hasten to nurse a wounded father; it was the woman whom old Andrew Vennie had not hesitated to describe as a notorious spy.

Bryan placed his hand on her arm; he held on firmly, as if to prevent her leaving him again. All he had meant to say went from him. He forgot the questions, the reproaches, he had prepared, and instead there came out one sharp, hard question. 'How did you think you could escape me?' Bryan Bloxham ejaculated.

The dark eyes looked up. There was neither fear nor remorse in them. There was a certain insistency in the glance, it is true; but that seemed to come from the desire to fix an exact position.

'How should I know that you would want to see me again?' Clementine answered at length, and she spoke lightly.

Bryan fell back. The unconcerned answer staggered him. It killed his hope. It pointed to even more than that. He looked hard at the lovely face before him. The woman who had robbed him of his peace had been beautiful in her peasant's cloak, with the rough felt hood on her head. Now, dressed with a certain exquisiteness, with a rose under her ear to show how pink was her skin, how dark was her hair; with a string of cameos (a favourite ornament of the moment) joined round her white neck with

1916.]

pearls as big as peas, and her skirt veiled in gold-embroidered muslin, Clementine de Gillamont was almost bewilderingly beautiful.

Bryan saw that, and he tried to keep a hand on himself. He repeated to himself that it behoved him to act as a man of sense, of honour. But he knew how little these prudential considerations really weighed. The urgent thing, the driving thing, was not to know how Clementine came to Lisbon, what she was doing at the Ball of the Notables in the Palace of Belem, but to learn if their hour together had been but acting, if her appeal to him had come out of her heart or had been but a political manœuvre.

'Tell me,' he began urgently, 'who you are.'

The pretty woman looked up as if amused.

'If you have forgotten my name,' she retorted evasively, 'why should you be surprised if I was not sure that you would care to see me again?'

Bryan almost shook the arm on which he hastily put back his hand. 'How did you get here?' he went on hardly.

'Why should I not be here?' she retorted.

Bryan looked over the pretty head. He was fighting with himself; he was fighting against himself.

'Tell me,' he asked, through his clenched teeth, 'are you Mademoiselle de Gillamont, or who are you?'

It was a challenge, and the woman who heard it recognised it as such. She paused, determining maybe how much she might dare. Then the smile that Bryan remembered all too well touched her lips. 'Monsieur,' she said, 'I do not see why you should question me.'

The bright eyes looked at the man's working face. They saw their owner had the advantage.

'No, monsieur,' went on Clementine, 'it seems to me that it ought to be enough for you that you are the man who once put me under an obligation. It is hardly chivalrous to demand payment with such an uncivil question.'

The reply, as it was meant to do, stung Bryan. 'I regret, mademoiselle,' he cried hotly, 'if I am giving you occasion to think me unmannerly.'

Clementine dropped her eyes to the ground, but her lips smiled. Perhaps if a spider ever feels genial with a fly it wears some such expression. 'In that case, monsieur,' she went on tantalisingly, 'it will be easy for you to amend your ways.'

'How?' asked Bryan.

The girl slipped back from his shaking hand; she wrapped the mantilla about her again; she drew herself up. 'Perhaps you will pass out before me, monsieur,' she returned.

Bryan went pale, his lips twitched, the veins showed on his temples, but he looked at her, forced her to look at him. He might be as wax in her hands, but even while imprinting himself with her mould he was making a struggle for his own being.

'And if I pass out before you?' he asked, and each word was pressed from him as water is wrung out of a sponge.

'In that case, monsieur,' answered Clementine significantly, 'it is possible that you may find that you are rewarded for your confidence.'

Bryan heard the half-admission. He understood, he was meant to understand, all it implied. 'Tell me what you wish me to do,' he cried.

It was a moment before Clementine spoke again. The country-dance was coming to an end; the fiddles were hastening the tune; the ringing laughter floated into this dark space which had all the advantages of isolation, and, to Clementine's mind, none of the disadvantages of being alone.

'Sir English Soldier,' she said, 'all I ask is very easy. Walk down the room to the door. Wait there. After that, after you have proved that you trust me, I will explain anything you please.'

The suggestion seemed so simple! It had in it that touch of whimsicality that just such a pretty woman might be expected to think of. It was so much in keeping with this bewitching face—not with another Mary Bloxham, who sat at home and merely waited as women did in those times when each letter took more weeks than it had pages to reach its destination—that Bryan was all but turning about, when he recollected the word that he had given to old Andrew Vennie, the thing that the colonel expected of his subaltern. He pulled up, and if his face had been white before, it was gray now.

The music wound up with one sharp, high note; the circles of dancers broke up. The hurrying feet began to patter over the hard floor; the majority of the throng was making for the great door to seek the coolness of the *patio*, the dropping of the fountain in that open space in the middle of the building without which no house of any pretensions at all is constructed in the Peninsula.

'Mademoiselle,' said Bryan, 'I regret I cannot do that. Mademoiselle, do you not understand? I would give ten years of my life to be convinced that you do not understand. Tell me, who are you? Who brought you here? Make it clear to me how the Mademoiselle de Gillamont that I took back to the French lines can be here at a ball in Lisbon.'

The woman heard the entreaty. She understood that Bryan was struggling between his feeling for her, between his admiration for her, and his loyalty as a soldier. She was more beautiful than most women, and she knew it. She was an alluring woman, and never once had she hesitated to make use of her charm. 'Monsieur,' she said in quite a new tone now, softly, shyly almost, 'I should prefer you to trust me.'

This time Bryan's lips twitched; this time he

rocked as if a bullet had struck him. 'Mademoiselle,' he said, the words coming from between clenched teeth, 'I cannot.'

'You cannot?' echoed Clementine.

'Mademoiselle,' went on the driven man, 'you must see that I cannot.'

Clementine looked up again. She let her eyes linger on his working, twitching face. 'Why not?' she whispered.

'Clementine,' cried Bryan, 'don't you see what you are doing? Don't you see how you are maddening me? Explain, for Heaven's sake, if you can!'

The cry was wrung from the big man. It spoke to his pain, to his honesty, but it only moved Clementine in so far that it gave her a better chance of getting her own way.

'Don't you understand?' she breathed. 'I am asking for your confidence in me. You are telling me that seeing is believing. That is not enough, for I'—she fixed her eyes on him again—'I should value your confidence in me.'

Bryan hesitated. If this woman's soul matched her face, then what was she not artlessly revealing to him? His breath began to come in sharp gasps. He still remembered the word he had given; he still hung on to his promise; but he felt as if, after all, he might be playing fast and loose with Paradise. His very extremity drove him to clear speech. 'Clementine,' he blurted out, 'don't you see that it is you who must help me?'

The girl threw back her head. Her eyes gleamed. The man's stand angered her. 'And if I will not explain?' she flung back.

Bryan put down his trembling hand against his sword. It was his duty or—this woman. Hastily he began to speak; quickly he said what he had to say. 'Then, mademoiselle,' he returned, and he felt as if he were signing his own death-warrant, 'I am a British soldier, and I must do my duty. That duty would be to call up the guard standing by the door of this room, and give you over to them on suspicion of being—a spy.'

Clementine heard the hurried words. There had always been the chance that this big Englishman might not be so malleable as she would like. She stood for a moment with her head down. It was now maybe that for the first time a little esteem came into her mind; it was now maybe that a spark touched her heart and reminded it that it belonged to a woman. For a moment she hesitated. Then her training, the knowledge that she needed Bryan for her tool—that was why she had dared so much to come to this ball—got the better of her. She put up her hand. 'Monsieur,' she began slowly, watching the effect of each word, determined to confess as little as might be, 'I cannot explain.'

'You cannot!' echoed Bryan.

'I am in your hands,' she went on, and she

[Christmas Number.]

threw back the lace covering from her. 'You may denounce me as a spy, if you can bring yourself to do such a thing.'

Bryan looked away from the pleading eyes. 'I have my duty to do,' he said, and he was harsh because the words hurt him so.

'Monsieur,' almost whispered Clementine, 'is it any man's duty to condemn a woman to a fate worse than death?'

Bryan muttered the words after her as if they conveyed no meaning to him.

She came up and put her hand on his arm. 'Think,' she went on, 'to what you will condemn me if you denounce me. Think,' she continued, as he neither spoke nor stirred; 'will you deliberately, in cold blood, give me up to a fate worse than death itself?'

Still not a motion, not a syllable answered her. She stepped back. She waited. Her nerve was magnificent, for she did not add a single word, she did not permit herself so much as a rustle of her gown.

The throne-room was almost deserted; the music was stilled. The group of Portuguese notables had moved into the centre of the floor. Clementine looked into the light. The minutes went by. No word came to her, but gradually the tension of her features relaxed; she almost smiled.

Bryan Bloxham stood as motionless as she did. He understood now to what she was referring, and it caused him to shiver as though the ague were upon him. He had heard of the prisons in the Peninsula; he had heard of the dungeons reserved for political suspects. He had even been shown one, a hole ending in water that sometimes rose and flooded the place knee-deep; a hole never light, but damp, pestilential, where a man had prayed for death as a boon, and he was but suspected of selling information to the French.

At length Clementine turned to Bryan Bloxham. 'Monsieur,' she said very softly, 'the dance is over. We may be observed now. Give me your arm. Take me out of the room yourself. Take me out of the palace yourself. Take me into the street, into the night, Monsieur'—and her voice rose just a tone—'you cannot refuse to give me my chance.'

Suddenly Bryan wheeled about upon her. He came close to her, so close that he crushed her soft dress.

'Do you know that I have given my word?' he hissed.

'To whom?' whispered back Clementine.

He told her.

The girl looked over her shoulder into the light, into the space. She had still time, but not too much. She touched his hand. 'Take me out into the night,' she said for the second time.

He felt the warmth of her fingers, the softness of them.

1916.]

Clementine moved yet nearer to him. 'Monsieur,' she breathed, 'I cannot die that death.'

He shivered.

'Monsieur,' she went on, 'have you forgotten? I am young; I am beautiful.'

He understood what that meant too, and he groaned through his clenched teeth.

'Monsieur,' she added, 'has any man the right deliberately to deliver up a woman to that?'

He put up his other hand. He covered hers. He pressed it down. Yet still he did not speak.

Clementine understood. She was tearing the very soul out of him; but he had given his word. She played the last card in her hand. 'Tell me,' she whispered, and she let her head slip down until it touched his shoulder, 'did you never hear of a woman who was bidden to go free and sin no more? How will you feel,' she went on, and the words came softly one by one, 'each day when you awake, and look out to the sunshine, and recollect that you turned a deaf ear to the woman who asked you that question? How will you feel each night when the day goes down, and you remember that there is no morning and no evening in the place to which you have condemned me, and that I asked you the question you will never forget; only night, always night, and smells and dropping damp, and here and there a man worse than a beast of prey?'

Bryan heard. Each separate word was as a sharp-pointed needle piercing his heart. He began to sway; his chest began to heave as if it would burst his tunic. He pulled Clementine nearer to him; he threw his arm about her; he crushed her to him. Then roughly he flung her from him. 'Come,' he said hoarsely.

And as they turned together, the big Englishman with his sword catching, so unsteady was his gait, and the beautiful woman with the lace carefully pulled over her face, Captain Ramon di Gracias came abruptly round the pillars. He might have been hiding, or he might have appeared by chance. At any rate he looked after the two figures. He knew that big English form again. He did not need to be told who the woman was that was with him. He stood, one foot lifted on to the first of the steps of the dais, the brilliant uniform throwing his lean, olive-skinned face into greater contrast. He watched until the man who walked so unsteadily, until the slight figure which might almost have been supporting him, were lost to view, and then the Spaniard drew in his thin black moustache, and he drew down his eyebrows, while his eyes narrowed as a cat's do when it sees a mouse. A strange compound of emotions seemed to imprint themselves on his face. It was as if in some sense he was a gratified spectator of a scene that he himself had engineered; and yet there was that in his look, above all in the way in which his right hand opened and shut, as if

it itched to feel a knife in its palm, which pointed to a very different state of mind.

The slim, lithe man stood motionless until the music began; then he muttered an oath, a threat of vengeance on some foe, and, with his row of white teeth snarling as if they belonged to a wolf's fangs, he mingled in the crowd again.

CHAPTER V.

BRYAN BLOXHAM rose from his stooping posture before the tiled oblong in the garden of the *Quinta Marina* which represented the province of *Entre Minho e Douro*, the most northerly part of the kingdom of Portugal. He had but one more map to make, and he regretted that his task was so nearly finished. He could see Don Miguel, of course, as long as the British army remained within the lines of *Torres Vedras*, but that would not be the same as having an official reason for regular visits. He wondered, as one's mind does turn to trifles rather than dwell on a main issue, if the old man would ask him now to give back the key of a certain little gate concealed behind a clump of bushes, and opening behind one of the shafts of the tiled work within, which enabled him, without any one being aware of his presence, to enter the Garden of Arcades, as that square of greenness by the courtyard was called to distinguish it from another garden at the front of the house, which had received the name of the Moor's *Repose*.

The key had been handed to him with a great air of mystery, and he had been strictly enjoined not to speak of it to any one, not even to his colonel. Bryan had promised secrecy, not because he thought the matter of prime importance, but because he wanted to gratify Don Miguel's whim. He had grown very intimate with the old man. He had heard many things about his friend's private affairs. Among other things, he had learned that grief, which is the parent of so many human eccentricities, was the cause of Don Miguel's isolation.

It was a story with more than one parallel in the Peninsula. Don Miguel had married a relative, though she happened to be a Spaniard. The girl possessed the thing that is supremely valued in that land of olive skins and dark eyes: she had golden hair and blue eyes. She had been fondly loved. But Don Miguel's happiness did not last as much as a year. The girl-wife faded out of life, and her husband was firmly persuaded—whether there was any solid foundation for this or not Bryan never could be sure—that her death was not due to natural causes. Certain it was then, certain it is said to be even now, that poisoning is by no means a lost art in Spain and its sister-kingdom. It was also to be taken into account that the girl's family bene-

fited from a pecuniary point of view by her decease.

At any rate, the suspicion had soured Don Miguel. He declined to hold any communication with his wife's family. He had shut himself up in the *quinta*; he was said to be very rich, and to have no mind to leave his wealth to religion; and now, in this utterly unexpected way, this big, blue-eyed Englishman was the one being to whom the old man's heart seemed to open out.

Bryan, as he walked away from the arcades, went on to think of one of the many tales that Don Miguel had told him. The Portuguese grandee was proud to admit that English blood ran in his veins. He maintained that the fair colouring of his girl-wife was an inheritance from that great-grandmother who, a hundred and more years ago, had been English herself, and had married one of the Portuguese noblemen who went to England in attendance on that unhappy queen whom the Merrie Monarch, in his more feeling moments, alluded to as 'Poor Kate.'

But before Bryan had strolled as far as the fountain in the centre of the green square his mind had left behind it such bygone things as great-grandmothers, and he folded the tracing-paper that he carried in his hand; he knew again how ill at ease he was, how dejected. The afternoon sun beat fiercely down on him, but he took no heed of its glow. The garden, the courtyard, were as still as if no human being lived in the *quinta*. Old José and Mariquita, his wife—she had come to the house years ago as an attendant on the Spanish bride—were probably both enjoying a prolonged siesta; while Don Miguel had departed from his usual routine, and for the first time for years had announced that he meant to pay a visit to Lisbon, to see his notary, the old man added significantly.

Bryan hoped his host would be back before nightfall. He made up his mind to wait for him. His appearance would be a surprise, for, expecting to be on duty, he had expressly stated that he would not visit the *quinta* that day.

He found something consoling in the hours spent with Don Miguel, in those confidences which showed how other men had loved and had had to make the best of a broken heart. But at this moment Bryan was very glad of a short space of time to himself. It was only by an effort of will that he, hitherto the most sociable of beings, did not shun his comrades. He felt as if each one of them must guess something of what he had done. He felt as if every time Andrew Vennie looked at him the old man was probing his heart. Again and again he went over the circumstances to himself. He had given his word, and he had broken it; he had refrained from giving up an enemy of his king and his country. Against such considerations were ranged not only his love but his

[Christmas Number.]

humanity. Could he, could any man, deliver up a woman on the charge of being a spy when the war had so inflamed the minds of the Portuguese that the mere fact of being French condemned a man to a hideous death, though he were innocent of any other charge than that of obeying his emperor in Paris?

More than once Bryan had been on the point of risking all, of making a clean breast of the whole matter to Andrew Vennie. It was not the fear of consequences that restrained Bryan. It was that something within him again. Clementine had put forward the most moving of all pleas; she had begged for a chance to go and sin no more; but Bryan was not, he could not be, certain that the vow she had vowed to him would be fulfilled.

He stood still with the scent of the violets, opening their purple flowers in the grass at his feet, coming up to him, with the teasing flies buzzing about him; and then, with a hopeless gesture, he went along through the double row of pillars into the courtyard. It was so quiet that the ringing of his footsteps on the flags was the only sound. He mounted the steps—José, by the way, had garlanded them with strings of great maize-coloured onions to dry in the sunlight; he pushed open the door into the house beyond. Within the stone-walled, stone-paved corridors it was dim already; it was chill, as if no sun shone without. Bryan stood a moment with half a mind to call for José and ask him to beg Mariquita to make him a cup of coffee; but he hesitated. Mariquita was the one person in the *quinta* who had no smile for him, never a gracious word. The old woman always looked at the big Englishman with a glint in her sunken eyes, with a tightening of her thin lips. Bryan was so sensible of her hostility that he had once mentioned it to Don Miguel. 'I am afraid Mariquita finds me a great trouble,' he said.

The old man had dismissed the notion lightly. Mariquita was full of prejudices and hopelessly ignorant. She hated heretics, even though they were the saviours of her country. It was perhaps Mariquita's sourness that stopped Bryan; it was perhaps the finger of that fate which makes puppets of even the most resolute of us. At any rate, the big man went down the corridor until he came to the door of the room set apart for him. He was about to open it, when a breath of air came to him. The whiff of freshness was so unusual in that dim, heavy old house, where Mariquita hated draughts as she hated the French—or heretics—that Bryan involuntarily went along a few more steps. He was hardly less surprised to find that the door into the Moor's Repose stood open. Don Miguel had occasionally pushed the cobwebs aside or disturbed a happy family of ants to open it and let himself and Bryan into the garden; but that it should be unbarred when the old man was

from home struck Bryan at once as extraordinary.

The explanation his English training at first suggested to him—that Mariquita was taking advantage of her master's absence to indulge in what was known in home circles as 'cleaning'—he dismissed at once. The old woman would consider such a thing waste of energy. Her household arrangements seemed to be conducted on the supposition that flies and spiders, that dust itself, came from *le bon Dieu*, and were not lightly to be disturbed.

Bryan came up to the open door. He looked into this second garden. A heavy outer wall, a continuation of that which ringed round the courtyard, and which was almost in the nature of a fortification, bounded this space also. But the garden slanted down a hill, and the ground was cut into terrace after terrace. The stream, indispensable to all Moorish horticulture, still trickled musically as it fell from one level to the next; but the surprise jets, that favourite practical joke of the most solemn of nations, the sprays hidden under the footpath which sprouted up water when any unwary stroller in the garden set his foot on it, were all choked up or broken altogether.

The room Don Miguel had placed at Bryan's disposal looked on to this old garden. It was screened from the garden by a low veranda, which at the time when the garden was built had doubtless been finished off with pierced stone-work between its pillars, so that the women of the household might take what had to serve them for air without the danger of any strange eyes falling on them. But the spaces between the pillars were open now; jasmine and myrtle, growing as they pleased, twined themselves about the arches. The wing had been rebuilt, and windows such as Christians use had been fitted into the room, and had been provided with heavy wooden shutters. These shutters, which had not turned on their hinges for years, had been pushed back when Bryan Bloxham took possession of the room; and the window itself, to Mariquita's further annoyance, had been made to open so that Bryan, while he drew or coloured his maps, could smell the scent of the flowers or smoke a pipe with the night air blowing on to his face.

He walked along the veranda listlessly for the first few steps, then quickly. He came hastily up to the window. He saw—and the circumstance seemed to him to announce something unpleasant, momentous even—that its sashes were ajar. He knew he had fastened them when last he left; and, as he thought that, with a sudden leap of consternation, as if this might concern him nearly, vitally, he recollected that recent information declared the French troops to be in desperate straits. It was nearly March now, and the British had been within the lines of Torres Vedras, the French without them,

since October. Each day one army or the other was expected to make a move. It was the common topic of gossip round the camp-fires, at the messes. Bets were passing freely as to whether Lord Wellington would let the enemy slip away, trusting to the barrenness of the land, to the hostility of the population, to finish them off; or whether he would fall on them and endeavour to set the seal on his masterly manœuvres with a brilliant victory. Then, as he thought of that, and while apprehension made his mind race, Bryan Bloxham recollected a word that Andrew Vennie had let fall. Bryan had been dining with his colonel. The old man invited the officers of his regiment to what fare there might be by twos and threes at a time. There Old Andrew always had a genial welcome for them, and generally a glass of the best wine of Xeres. But as Bryan sat at his table two evenings ago his colonel had called him to his side, had filled their two glasses, and then, looking into the tawny liquid, had asked a question or two about the maps.

Bryan had answered these questions easily enough. It was when Andrew Vennie went on that a certain uneasiness invaded his mind.

'It is a good thing that the Quinta Marina is well within our lines,' dropped out the colonel. He waited a moment, looking hard at Bryan.

The young man coloured. He knew he did. He was caught again in the mesh that entangled him. If—if he had but been sure of Clementine!

'Since a spy was captured close by we have strengthened the guard at that outpost,' Andrew Vennie went on. 'You,' weightily, 'will not forget that, my lad?'

The commanding officer rose as he said so much, and with a gesture dismissed his subaltern. Bryan had stepped back, feeling as if he had been struck. The next day came the order revoking his turn for duty, and bidding him spend the afternoon at his map-making.

Andrew Vennie might have spoken at random. A prudent soldier would strengthen an outpost near to things of such value as the maps of the arcades; but Bryan felt then as if he were being admonished—warned even. The idea had troubled him; it came back to him in the brief space that he stood by the unlatched window looking into the room that was in one sense his own. He pushed open the sash. He entered quickly. He looked hastily around him. There was the wide divan against the wall, piled with the cushions on which he slept when he passed the night here; there was the one piece of furniture out of setting with the character of the room, a high bureau with its writing-table and its pigeon-holes above, and a big cupboard below; there was the table standing on the tiled floor. But when he got so far as that he made a hasty step forward. He bent; he straightened himself as abruptly. If things were as he already guessed

they might be, he must face the room, not lower his head. He looked down at a crumpled ball round by the leg of the table. The blood began to ebb and flow in his veins. He was sure that the crumpled ball was not only paper, but that it was tracing-paper such as he used for his maps. He had never cast any aside in that careless way. Any sheet he spoiled he burned at once.

Bryan Bloxham stood a moment, tall, upright, the pistol already out in his hand. He knew that the door out of the room into the corridor was locked. He knew that he and his strong arm commanded the window, and he looked searchingly around into the shadows. It was the first moment of elation that Bryan had known since the ball. The fighting-man was in the ascendant.

The next moment even that glow was dulled. That ball of paper just out of range of his feet did not point to a common thief. He drew himself up. He edged himself down the room until he stood with his back against one wall, with the window on his right and the high bureau facing him. Then he levelled his pistol. He pointed it at the beautiful piece of furniture, but he did not aim at the upper part, where, in the range of little spaces, were stored his pencils, his colours, his compass, and all the other necessities of his work. He let his arm fall lower, and his pistol pointed to the cupboard below. He stood so, alert, steady, content to take time.

With his sharp eyes he examined every detail of the bureau that Don Miguel had fetched down from one of the upper rooms for his express use. It was more modern than most of the things in the *quinta*—that is to say, it was getting on for two hundred years old. It had nothing Portuguese about it. Indeed, Don Miguel maintained that it had been made in London, and that it was part of the dowry of his English ancestress.

At last, when Bryan Bloxham had looked for other traces of a thief's presence, and had found none other than that roll of paper, he began to speak in his best, most carefully pronounced Portuguese. 'Listen,' he announced with the full force of his good lungs; 'I know that some one must be hidden within that press. I am armed. If no one comes out I shall fire through the doors.'

The big man stood back; he waited. Not a motion, not the smallest rattle of the closed doors, greeted this announcement. Bryan smiled grimly. He squared his big shoulders.

He repeated his decision, but this time he said it in French. He waited again.

The room faced directly south; the sun was already slanting in, and one long wedge of light struck on the floor, showing up the quaintly patterned tiles, ornamented with red and black and green; but it showed too that ball of paper, that ball which, since such commodities as parch-

[Christmas Number.

ment and tracing-tissues were by no means in common use at that epoch—and, above all, in this particular country—assumed a graver importance each time he looked at it.

A new quick fear—a thought to which his mind would not give place—shot through him. His heart cried out that the idea was impossible, but it hastened him; it made his eyes measure the cupboard, reminding him that there was hardly room for a man to crouch within it.

'Listen,' he cried—and it may be Bryan Bloxham himself did not realise all he was assuming, for now he used the French language only—'I shall count ten, and then fire.'

As before, not even the merest scratch of a sound rewarded him.

'One!' began the big Englishman in his ringing voice. 'Two!' he continued. He waited; he looked at the shut doors. He thought that all his life he would remember the ringed marking of the wood. 'Three!' he went on, and always with his pistol ready pointed in his hand. 'Four!' he shouted out. 'Five!' he called forth. He paused then. He bit his lip. The dew came out on his brow; that same gray shadow that had overspread his sunburnt face on the night of the ball of the notables in Lisbon came out over his temples now, stole lower, and drew down the corners of his lips. He fixed his eyes on the elaborate brass mounting about the keyhole. He looked so hard, so searchingly, that it seemed as if the case were so urgent that he must see through, that he must discover with his own vision precisely who crouched within.

Then he went on, not to count, but to warn. His voice was a cry, a driven cry, but it was firm. 'Do you realise,' he uttered, 'that I am half-way through the count, and that as there is a heaven above I intend to shoot—I will shoot?'

The admonition had its effect. Desperate men do desperate deeds. And Bryan's voice showed that, let the consequences be what they might, he would not falter. He caught the click of the inner bolt; he heard the rattle of the lock. He began to smile as a man does smile, with drawn lips, with a tight mouth, when he does not know if victory will not cost him more than defeat. He waited another instant, but it seemed the space of years. He watched the doors start open; he saw the stirring of a drab, huddled mass. Bryan Bloxham set his teeth. His eyes were dilated; they bulged in their suspense, in their uncertainty. In another moment that curled-up form must unroll; in another moment he must see with his own eyes whether his heart had been torturing him, or whether what he feared was true. The dew came out round his brow. These were not seconds of time that were passing; these were some fractions of the infinite wringing, squeezing a man's very nature out of him.

1916.]

The dark mass stirred. Bryan kept his hand steady by one mighty effort; then a form struggled on to the floor of the room; then that form raised itself, showed a woman's figure, a woman's face.

Bryan, as he saw, groaned as if the pain within were intolerable. His arm fell at last nerveless. For a moment he stood propped up against the wall, his head lolling forward, his eyes on the ground, afraid of what he might see if he lifted them. Then, staggering still, reeling, he lurched forward. He laid his hand on the shoulder of the woman who, stretching one cramped limb after another, waited for him with more amusement on her face than dismay, with more confidence than embarrassment.

It was Clementine de Gillamont again. It was the woman he loved madly to his own undoing; it was the woman who had looked with her great eyes into his eyes and pleaded with him to give her another chance.

Bryan Bloxham held on to this woman; then, with his hand grasping into her flesh, he flung out a single reproach. 'You promised me—never again!' he ground out.

Clementine answered never a word. She had to be sure how much more this man's love could suffer and still survive. She had to be sure that her empire over him was as strong a thing as when she had trampled on the first instinct of the British gentleman—the imperative necessity to keep his word.

Bryan lifted his hand at last. He stumbled from her, stood propped up against the table. He did not speak. He had nothing to say. Everything had been summed up in that one incoherent cry.

Clementine came toward him; she came close up to him. '*Mon ami*,' she began softly; '*mon ami*.'

She put up her hand; she touched his.

But she had reckoned wrongly. The caress stung Bryan Bloxham. He jerked himself upright. It was an offence, not a palliation, that the woman who had given a new proof of her treachery should endeavour to cajole him. He removed himself a pace or two away. He folded his arms across his chest. He had been weak once; he had been weak twice; the third time he would be strong.

Clementine looked at him, quite a world of surprised, hurt sweetness in her great dark eyes. 'You are angry with me,' she began softly. She stopped, cast down her glance. 'Why,' she asked, as if Bryan's whole attitude were unreasonable, a cruel thing she had no right to expect, 'have you changed so?'

Bryan looked at the beautiful bowed head. He felt as many an upright man before him has felt when entangled in the perfidy of an unscrupulous woman, that it was so hopeless to try to make her understand; and then, while he waited, while he tried to gather courage to tell

her that this time he meant to do his duty, he saw a little curl slip down her neck and entwine itself round her pretty ear. Dumbly, as one does protest when the very forces of nature seem to take sides against us, Bryan protested in his heart that this was not fair, that this was trying a man beyond his strength.

Clementine saw her advantage. She came closer again. '*Mon ami*,' she whispered reproachfully, 'you are condemning me unheard.'

Bryan swung round. He lifted his head eagerly. Hope leaped into his heart anew. He was so ready to be convinced; he was so eager, so pitifully eager, to be convinced. He made an impetuous movement toward her; his mouth was even opening to speak, when his foot touched the ball of rolled-up parchment. It crinkled as he crushed it down on the tiled floor. The noise came as a reminder to him; he pulled himself up. He would not be duped anew. He might be torn with love, but he was a man, and he would stand firm.

'Look at this,' he said; and as he kicked the ball with his toe, it slid right under the divan.

Mademoiselle de Gillamont followed the ball with her eyes. She bit her lip. She was probably thinking that she ought to have known better than to leave so tell-tale a piece of evidence, when Bryan began to speak again.

'Mademoiselle'—— he cried.

Clementine looked up at him.

'Mademoiselle,' she repeated, and this big man knew that she was reminding him that the last time they met he had called her by her name, he had called her so much more besides.

Bryan's face went gray. The veins came out in his neck. He began again.

'Mademoiselle,' he said, his tone harder than before, 'you came here to spy. You came here to steal my papers.'

The bald accusation was out at last. The very words hurt him as he heard himself saying them. He stepped back; he put his hand down on the table.

Clementine followed him. She was not worsted yet. She tried another woman's wile. 'You are unjust,' she murmured, and her lip began to quiver.

'Unjust!' Bryan flung back at her. 'I have trusted you once; I have trusted you twice. Each time you have deceived me. I have broken my word to save your life'—— He stopped abruptly.

Hitherto his voice and Clementine's, both so charged with feeling, but both of them tense and low, had been the only sounds to break the stillness of the old house. Now a new one intervened. It came from afar, but it came in insistently, imperatively. Bryan knew what it meant as soon as he heard it. Clementine de Gillamont guessed what it meant.

Instinctively she turned to him; instinctively

she pressed up to him. 'What is it?' she whispered, and as she spoke the knocking was renewed. 'What is it?' she repeated as there was silence for a moment again.

In another moment, if Bryan had ever had any doubt, he knew. There were footfalls; there was the sound of voices. 'It is a British guard!' he muttered.

'A British guard!' repeated Clementine.

'They are coming to search the house,' the young man went on.

'For what?' asked the woman, and her wits seemed to have deserted her.

'For you,' cried the man by her.

Clementine looked up into the face bending down to her.

'Who knew you were coming here?' went on Bryan eagerly, hurriedly.

The voices were still talking and arguing. Old José was evidently expostulating, and Mariquita provided a diversion, for she set up a series of shrill screams. The interruption gave the two alone in the room looking on to the Moor's Repose a moment to think. Bryan's mind winged backward with the swift thought that just as his visit to the French lines had been announced to Old Andrew, so now some one must have told his colonel that Clementine was at the *quinta*. There was treachery within treachery.

Clementine, for her part, looked round eagerly, wildly. Her one idea was evidently to hide, to escape. She took a step toward the garden, but impetuously Bryan pulled her back.

'The house will be surrounded,' he ejaculated.

She looked at the press, and Bryan caught her intention from her glance, and for very pain he twisted his lips into a smile. 'That would be no good,' he said harshly.

She began to look up and down the room, but she had only a moment more.

The parleying without was settled. If a British guard were here, it was within the house now.

Bryan heard them coming. He went toward the door. But again he looked back, again his eyes sought Clementine's. She was not crying; she was making no appeal. She was just watching him. Bryan understood. Even at this, the eleventh hour, she did not believe he could desert her.

Neither would he.

He was round again; he was back by her side before he understood that he had taken a resolution. He put his hand on to the slender shoulder before he knew that he had a plan at all. He bent down; he spoke into her ear. 'Give me your papers,' he whispered urgently.

She understood. Her right hand went up quickly, and then she hesitated. What if it were a game of guile against guile? What if Bryan was beating her at her own game? And what if this visit of the guard had been arranged? It must either be that, or one other man must have played her false.

[Christmas Number.]

Bryan bent yet lower. 'Do you hear?' he commanded hoarsely. 'Give me your papers!'

This time Clementine judged that her best way was to obey. She thrust a packet toward Bryan. It was small; it was neatly folded; but as he felt the slips of paper within his fingers he made no doubt that they were tracings of his own maps.

He looked once at Clementine; his face was drawn; his eyes were haggard. He thrust the incriminating packet within his tunic.

There came another knock, and this time it was on the door of the room where they were.

'Open in the king's name!' cried a voice in English.

The emergency gave Bryan back his coolness. He had formed no plan, he did not know what he would do next, but one great purpose came to him, one great motive sprang into life within him. He would save Clementine once more if he could. He must save her.

He walked quickly down the room. He turned the key in the quaint old lock, and flung open the door. But there, standing in the wide aperture, he started. He was face to face with old Andrew Vennie.

For one instant, just as when he had summoned Bryan before him previously, the veteran's eyes looked into the eyes of the young man. For one instant the old campaigner's face twitched and his lip seemed to tremble; then, if there had ever been any softness with Andrew Vennie, he put it behind him; he put behind him too the thought that this big man was Mary's boy; and, drawing himself up, motioning the guard to follow him, he walked into the room.

It was still in high light. It was still flooded with sunshine, and one glinting pool of brightness struck against the walnut press, and, as it were, bent itself up against the grained wood.

The guard pressed back to the wall; their crimson coats showed up against its cool tone. The men stood at attention, dropping the butts of their muskets with a precision that seemed to Bryan oddly familiar and yet oddly remote.

Andrew Vennie went up to the table. He faced about there. 'Lieutenant Bloxham,' he called out as he would have summoned a man on parade.

Bryan stepped forward. His back was to the window; it was turned to Clementine too, and as he marked that he gravely, deliberately, as if she, and not his colonel, demanded his first consideration, changed his position, and with a movement of his hand seemed to associate himself with her.

'Sir!' thundered Old Andrew.

Bryan looked back into his colonel's eyes. He was strangely calm, strangely unconcerned. He could not, at this moment, bring himself to believe that this was real, that this was the gravest moment of life, that on the issue of it hung not only his future, but his honour as well.

1916.]

The gray-haired man who was watching him drew himself up. Old Andrew meant to be judicial; he meant to be impartial. And he had never had a harder task.

'Lieutenant Bloxham,' he began anew, 'I will hear you in your own defence. What have you to say for yourself?'

The question seemed to fall into the room. It seemed to strike against the hard floor.

Bryan answered it promptly. 'That you are making a mistake, sir,' he said at once.

Old Andrew started. 'A mistake!' he reiterated. He looked up quickly, and then his honest old eyes went on past the man's fine figure to the woman who stood but a pace or two away. 'I can see for myself that you are not alone,' he observed grimly.

Bryan looked at Clementine. He turned sideways that he might look her full in the face. He wished Old Andrew to see where his gaze was fixed. He wished every single man in the room to see. 'This lady claimed my protection once before,' he began proudly.

Andrew Vennie stretched over the table; he flung out his right arm. 'Then,' cried the old man, pouncing on the admission, 'you do not deny who she is! You do not deny that she is the woman I warned you against! Have you forgotten that you gave me your word to report to me her next visit?'

'I am about to do that now, sir,' returned Bryan.

Andrew Vennie put his two hands down on the table. He leaned far forward on them. 'Eh?' he ejaculated, and the one poor syllable meant so much more than a mere question. He had heard the desperate ring in Bryan's voice; he saw the tight mouth, the drawn-down lines of a face that ought to be so gay and confident. He had had more than a little experience. He knew that while some men volunteer for a forlorn hope gaily, as if they were going to a ball, other men appeal desperately as the one way out of a situation that has grown intolerable. Bryan's face had no exultation about it now. It had that other look. Old Andrew had been watching the lad he loved for weeks past. He had been fearful that the course was growing too stiff for the boy. Now he knew that Mary's son had come to his last ditch, and that he was prepared to die in it.

The stress of the situation communicated itself even to the guard. There was no man in the regiment more popular with the troopers than Bryan, because no one is a better judge of a gentleman than the simple soldier. The men against the walls neither moved nor spoke, and yet there was not one who was not regretting that he must look on and see this fine young fellow 'broke,' as broke they supposed he must be.

Andrew Vennie turned; he looked round over his shoulder. He was about to take a hard step, a decisive step. He hoped to rescue Bryan

in that way from himself. 'Corporal of the guard,' commanded Old Andrew, 'advance!'

The man, a burly campaigner, with scars in the most miscellaneous corners of his body, approached.

'Arrest that woman!' went on the colonel.

Bryan heard the command. He stood stock-still. It was not that he faltered in his purpose, but it was because his mind refused to supply him with an immediate suggestion. He watched the corporal advance. He knew that Clementine was looking at him, that she was appealing to him. He saw the big man lift his strong arm; he saw the great hand at the end of it come down on Mademoiselle de Gillamont's slender shoulder. Then Bryan's whole person seemed to heave. A new emotion surged over him. It came rushing along, as the mighty breakers leap up at high tide. No man, he told himself, must touch this woman while he had an arm to fight for her. The call of possession settled everything. It showed him the way. It plumbed the depth of his love, measured the lengths he would go to save her. Bryan's ingenuity, that a moment ago had refused to help him, was in full motion in an instant. His mind began to gallop. It told him all that he had to circumvent, all that he had to prevent. He had not a moment to think, to plan. If he waited half-a-minute longer Clementine would be dragged aside; she would be hustled; she might even be searched. For the present it was the indignity of such an imprisonment that hurt him the most.

He flung round on Andrew Vennie. 'Colonel Vennie,' he cried out with that note in his voice that rings in a man's tones when he is defending his own, 'tell your men to unhand that lady.'

For sheer amazement Old Andrew stared speechless; in an equal amazement Corporal Barton dropped his hand; and Clementine, alert now, watchful, waiting as an actress for her cue, fixed her eyes on Bryan's face.

But Bryan did not so much as glance her way. He knew that the fight had but begun. He knew that he must have something more definite than mere protestations to urge. He saw that unless he could account for Clementine's presence in this room by some motive that every man must acknowledge and admit the force of, he might delay her arrest for a moment, but would do nothing to make it impossible. He asked himself what motive he could advance, what unanswerable argument he could put forward.

Then, with the sunlight still streaming in, with every man's eye on him, and the quaint setting of the room emphasising the strangeness of what was passing, an idea came to him.

It seemed to Bryan Bloxham that there was one way—and one way only—by which he could save Clementine de Gillamont. He had no time to think of the tremendous consequences the

idea involved. He had no time to think of how it would affect his future, of how the fine old man at home whose only son he was would look on it. It was literally one step at a time with Bryan Bloxham. He walked nearer to the table. 'Colonel Vennie,' he began anew, 'I claim your protection for this lady.'

'Mine!' almost screamed Old Andrew, if so gruff a voice could scream.

'Colonel Vennie,' went on Bryan, 'I am sure when you understand you will tell this lady that you regret your mistake!'

The old man opened his mouth. It remained a moment a great round 'O' of unbounded dismay; then, without articulating a syllable, the lips snapped to.

Bryan saw the perplexity. He was playing a desperate game, and he knew it. At last he trusted himself to glance at Clementine. Her eyes were on him, and he saw them. They were shining; her colour was fluctuating, and there was yet more on her face—there was something that had hitherto been wanting. There was a womanliness; or was it admiration for the man she had calculated on making her dupe, and who now, with his eyes open, when he could have no illusion as to who she was, as to what she was, was fighting for her with no thought of self?

Bryan turned away from that softened look, from the quiver of the red lips. He had read the mute message on Clementine's face, and he was not even glad. He had been tricked before. He might be tricked again. With no hope of that recompense which makes a man dare all, with no hope that anything that this beautiful woman intimated to him could be more than acting for her own ends, he yet knew that he loved her, that he could not help loving her, and that he must give all he possessed to save her.

'I am sure, sir,' he resumed, as if he were the colonel and the other man the subaltern, 'that you will be sorry for your mistake.'

'Sorry!' blurted out Old Andrew. He looked hard at Bryan, as if to make sure that he had heard aright. 'In the name of thunder, why should I be sorry?' he went on.

'Because'—answered Bryan. He had come to the supreme moment. He had come to playing his last card. He looked again at Clementine. She must help him now. She must back him up. The young man drew back a pace. He squared his shoulders, threw back his head. 'Sir,' he began slowly, weightily, 'this lady is my wife! A wife's place is at her husband's side.'

Andrew heard, and he let fly a great oath. Clementine heard, and she answered with a gasping sob. The old man started up; he pushed the table aside with such energy that its legs scraped over the tiled floor. His spurs rattled as he moved; his sword in its scabbard clinked

[Christmas Number.]

with each step. He went right up to this beautiful woman. He looked her up and down. He saw how alluring she was, and in his heart he cursed her for ruining a fine man. 'Madame,' he said hardly, 'you heard what Lieutenant Bloxham said. Is it true?'

'Yes,' answered Clementine.

'You are his wife?' pursued Old Andrew.

'Yes,' answered Clementine again.

'Then,' went on the colonel, and now he flung his question at her, 'when were you married?'

Clementine did not look at Bryan; she dared not. She saw the trap; but, even as she perceived it, those nimble wits that had served her so often showed her a way of escape. 'In Lisbon, monsieur,' she answered.

'When?' demanded Colonel Vennie.

Again it was hardly an instant before Clementine answered, 'The morning after the notables' ball,' she said.

The old soldier fell back. His jaw dropped. Bryan had been to the ball; Bryan might have been married before he returned to the lines.

Suddenly, shooting across the old man's bitter regret that Bryan Bloxham should be tied for life to a woman of such doubtful antecedents, or rather to a woman about whose antecedents there was no doubt at all, a gleam of hope shot through the colonel's mind. 'By whom were you married?' he asked sharply.

It was again Clementine who answered. 'By a priest of my faith,' she said.

'Then,' cried old Andrew Vennie, 'that, according to the English law, is no marriage. Bryan Bloxham is an English subject, and can only be married as one.'

He threw back his head. Andrew Vennie had lost sight of his original purpose of tracking down the notorious spy. His mind was filled with its anxiety to save Bryan Bloxham from an adventuress. But again he had reckoned without the young man's devotion. Bryan walked up to his colonel. He knew that, as the law stood in the year of grace 1811, old Andrew Vennie spoke the truth. The marriage of an Englishman and a foreigner by the priest of another faith was no marriage in the eye of the British law.

'Sir,' Bryan Bloxham said quietly but imperatively, as a man who is within his right, and will not be gainsaid, 'there is a chaplain in the regiment. If we have omitted anything, that omission is easy to repair.'

CHAPTER VI.

OLD Andrew Vennie was alone in the room of the Quinta Marina that had been given up to Bryan Bloxham and his work. It was hardly an hour since Bryan had asserted that 1916.]

Clementine de Gillamont was his wife, and had demanded to be remarried by the chaplain of his own regiment.

Colonel Vennie had given his consent because he could not refuse, but in his heart of hearts the old man was neither satisfied nor convinced. He did not believe in that ceremony in Lisbon. He came very near to the truth, for he told himself that the marriage was the fabrication of a desperate moment—which was right; and that Bryan had never set eyes on this woman in Lisbon—which was wrong.

And while Old Andrew impatiently moved about the room, stamping to the window and back, sometimes going into one corner and then to the next, even pushing aside the chairs as though the mere disarrangement of the furniture might bring light to his troubled brain, Bryan was in the courtyard, pacing to and fro; while to Clementine had been assigned another of the rooms in the *quinta*. Ostensibly she had been confided to old Mariquita's care; but Andrew Vennie had seen to it that a sentry was posted at her door, another before her window. He did not trust that old Spanish woman with an ugly gleam in her deep-sunken eyes; still less did he trust Clementine.

As for Don Miguel, he was still away; and the old man's wrath, when he returned and found his house invaded by soldiers, a woman, and a parson, was easier to imagine than to describe. The notion had struck Bryan, and even amid his anxiety and his perplexity it made him smile.

The orderly that Andrew Vennie had sent back to the headquarters of the regiment had returned a few moments before. Bryan knew what his errand had been. He expected to be summoned into his colonel's presence, and to hear what hour was fixed for this marriage that was to have neither joy nor gladness about it. He thought—what man would not?—of things as they might have been. As for the future—he would not go into that. If he saved Clementine from arrest, from trial, from a long imprisonment certainly, if not from death, that was as much as he could think of now.

But even as he told himself that, another thought came into his mind. It occurred to him, for the first time, to wonder how Clementine had found her way into the *quinta*. Not by the great barred gate, unless with old José's permission. No one could scale the walls. Don Miguel had been positive that no second key to the secret gate into the Garden of the Arcades existed.

Bryan Bloxham passed his hand over his brow. More than once he had fancied that yet other entanglements existed, that he and Clementine were but two actors in the drama, and that there must be others helping forward the development as well. But his brain could bear no more. He turned back, his head droop-

ing, all the spring gone from his fine shoulders; and, as he faced the house, Corporal Barton came down the steps and informed him that the colonel wished to see him. He hurried into the old house. He had come to the point when men go straight ahead, because what is to come cannot be more intolerable than what has gone before. He pushed back the low, broad entrance-door; he even marked the fine metal-work with which it was ornamented. He had looked at it often. It was a woman's cipher surmounted by a royal crown. Bryan smiled with drawn lips. There was love everywhere, and wherever there was love there was pain, bitterness, some one's undoing. He went down the cold, dim corridor. He had been perplexed when he last came along. He was desperate now. He pulled up, caught by the remembrance of his old father; the picture of his cousin, the girl he had carelessly supposed he might marry one day, came back to him. The very lightness of such an attitude, the ease with which he took or left fate then, mocked at him now. He went on again. A sudden gust of wind blew to the door into the Moor's Repose. He listened to it as if he had never heard a hurricane get up suddenly before, and then he entered the room that had been set apart for his own use.

His colonel was there, and there alone.

The glory of the day seemed suddenly to have been quenched; there was a gray, grim air, where but so little a time before there had been high light; but there remained enough illumination to show up Old Andrew, and Bryan thought that he had never realised before that the old man's face was so rugged and so lined.

It was some time before a single word was spoken. The young man stood and waited. The colonel remained motionless, with his head down, with his eyes lowered. It seemed as if Andrew Vennie, who ordinarily did not know what hesitation was, was fearful this time of what might happen if he spoke.

At length the old man jerked up his big frame. He made two steps to the table. He stretched out his right arm; he held forth his hand, with his fingers clasped right over the dim wooden surface; then slowly he opened those fingers, and Bryan saw something drop out of them. The object fell on to the table. The thud of its impact, insignificant as it was, seemed to echo through the room. Bryan watched that little ball half turn over, and roll back again. He knew what it was. It was a piece of crushed-up tissue-paper. It was the tracing that Clementine had left on the floor.

Andrew Vennie, with his arm still outstretched, looked up. 'I have just picked this up,' he said. 'It was under that divan there. Can you account for it?'

Bryan looked at the old man. He had been conscious all along that Andrew Vennie wanted

to be convinced, not to convict. The certainty added to his trouble, doubled his sense of treachery. He hated all this entanglement, but he was growing used to involved issues. Nay, his pliable mind was even becoming nimble at evasion. He looked at the ball. His new-found dexterity prompted him. 'I think, sir,' he said, 'that that is a sheet of my discarded tracing-paper.'

He put out his hand, but Andrew Vennie was before him. 'I will unfold it myself,' said the old man.

The hot colour flooded over Bryan's face. The words stung him. He had sunk so low that his own colonel would not trust him. For a moment he forgot everything but that his honour had been impugned. A rush of hot words was on his lips; then his teeth went to. He hung his head.

Andrew Vennie unfolded the square of paper. It crinkled as it was flattened out. To the end of his days Bryan never heard the rustle of paper without the pain of this hour coming back to him.

The square was not very large; it was smaller than the sheets that were generally taken back to headquarters. Bryan saw that at once. He wondered if his colonel would remark it.

The old man laid the square on the table. He put his hand over it. He carefully covered up the writing. 'Tell me,' he commanded, 'which map is this?'

Bryan hardly thought for an instant. 'I cannot,' he evaded. 'It is a spoilt sheet. I have spoilt several. I cannot say which of them it may be.'

Andrew Vennie's eyes blazed. The old man hated a lie, but he hated an excuse almost more. 'I thought you assured me that you destroyed all waste maps,' he said.

Bryan looked straight back at his commanding officer. He was loath to follow fabrication with fabrication, but he had come to the point of doing it glibly. 'I must have missed this one,' he answered.

The old man heard. He looked hard at the face before him. He saw the strained lines about the mouth, the tightly-pinched-in lips. He knew—he felt sure that he knew—that every word Bryan was saying was untrue, and that this, an essentially honest, man was showing himself to be a liar for the sake of a woman who, when the peril was past, if past it should be, would employ her time by making him who had saved her tenfold more miserable than before.

Andrew Vennie muttered a string of hard words between his teeth. He waited a minute, controlling his impatient temper as maybe he had never controlled it before; and then, as he recognised that there was nothing he could say, no argument he could use, he lifted his hand. He looked down at the sheet before him. He stood with his legs a little apart, with his head pushed forward. He examined the map. It

[Christmas Number.]

was a representation of that part of the province of Estremadura where Lisbon and the surrounding country was to be found. One by one Andrew Vennie read the names printed on it. Those carefully penned letters showed no individuality. They might be Bryan's work; equally they might have been formed by another hand. He put down his own broad first finger; he traced the thin blue line of the Tagus and the streams flowing into it. He looked at the two heavy strokes that marked the fortifications of Torres Vedras. His faded keen old eyes ranged up a little. One town caught his attention. It was Santarem. He stopped; he looked at it fixedly. Santarem! The map ended there. The rest of the paper was left blank. It was to that town that the French had fallen back. Bryan Bloxham brought his work in sections; but Andrew Vennie did not recollect one that matched this sheet. The old man knit his brows. If he had believed Bryan's story little enough at the time of hearing, he believed it even less now. He looked up sharply. Bryan was watching him. The commanding officer opened his mouth, but with an impatient movement he turned away. What was the good of inviting this driven man to lie anew? The lad—and Andrew Vennie never forgot this—was fighting not for himself, but for a woman. And, since he knew his world, he knew too that the man who would scorn an evasion to his own profit can be trusted to throw truth to the winds when he deems that a woman depends on him.

Suddenly Andrew Vennie gave a jerk. A thought had struck him. He took up the sheet of paper; he held it stretched out between his two hands. He raised it, turned it to the window. Bryan saw, and he guessed what the movement meant. The thin, tough tissue he used himself was without a watermark. He prayed that this sheet might be without one also. His eyes grew round, staring, as they waited, as they watched. He had but a moment's suspense, but it seemed to him as long as ten ordinary minutes.

Then Colonel Vennie quietly lowered his arms. He laid the sheet back on the table. Then he put his right hand on it, and he looked Bryan full in the face.

There was yet another moment, while the colonel and the subaltern faced each other.

'Lieutenant Bloxham,' began Andrew Vennie, 'you assure me that this is your map?'

Bryan would not trust himself to speak. He bent his head.

'Lieutenant Bloxham,' continued Old Andrew, 'do you still maintain that this sheet belongs to you?'

Bryan tried to think; he tried to determine not only what he should say, but the consequences of his speech. Involuntarily the blue eyes raised themselves to the lined, anxious face; involuntarily a supplication came into the glance.

1916.]

Andrew saw that look. Mary had once lifted her eyes mutely, and there had been just that expression in them. If he had heeded it, how different a whole long lifetime might have been! It hurried the old man; it even deprived him of his advantage. 'By heaven, sir!' he rasped out, his judicial calm all broken up, 'if this is your sheet, then you have used tracing-paper with the French imperial watermark on it.'

The words rang through the room. Bryan stepped hastily back. It was as though some one had struck him; but he made no answer. Tremendous, terrible as the charge was, he had nothing to say in reply to it.

Andrew Vennie lifted the paper again. Again he held it up, and again there was light enough coming through the window to show him the outline of the eagle's wings. He slowly lowered his arm as he deliberately laid the sheet back on the table. Another gust of wind shook the window, rattled the old casement. The long arms of the jasmine without began to sway as if they were agitated, and one suddenly whipped against the dim blue panels.

Colonel Vennie waited until the wind fell; then he marched past the table and stood before Bryan. He looked up into the young, distorted face. 'Bryan Bloxham,' he began, 'I'm not going to speak to you as your commanding officer, but as man to man. You have got yourself into a scrape, lad. I have been in scrapes in my time when I was young. You must tell me the truth.'

The gruff voice with the yearning note in it ceased.

Bryan stood still, with his eyes fixed before him. He had nothing to say.

The silence seemed to last so long that the shadows had time to come still farther into the room.

'Bryan Bloxham,' began Old Andrew anew, 'I have asked you as man to man to tell me the truth. Have you nothing to say to that?'

'Nothing, sir,' cried the young man.

Colonel Vennie looked up sharply. He had never been defied as he was being defied now. 'Bryan Bloxham,' he went on, a touch of temper coming into his voice, 'you must tell me the truth—or'—

'Or?' put in the young man dully.

'Or,' repeated Old Andrew, 'by gad, sir'—For a moment no threat likely to avail occurred to the old man. Then all at once the old face twitched grimly. 'Or, sir,' hastened on Colonel Vennie, 'I will have Mademoiselle de Gillamont sent for. I will ask her what she knows about this map. And—do you hear, sir?—I will have her searched to see if she has another on her.'

Bryan started. The indignity was intolerable to him. 'You would find nothing,' he cried impetuously.

'Why should I find nothing?' demanded Old Andrew as sharply. The old man suddenly

marched up to Bryan. He took hold of the broad shoulder; he shook it. 'As the Lord lives, sir,' he demanded, 'what shall I find on you if I tell my men to search you?'

Bryan heard; he felt Andrew's grasp. It seemed to him that a penalty had to be paid, that some one had to pay it. He had gone so far. He might as well go on to the end. Suddenly he ran his right hand into his tunic, and brought out a packet of tightly folded papers. He stepped forward, pushing Old Andrew aside as he advanced. He flung these papers on to the table. He thrust out his hand anew, and pointed to them as they fell.

Old Andrew saw; he heard. He watched the packet spin across the table; he saw the layers of paper separate themselves. For a moment the old man hesitated again. But he had his duty to do, and he meant to do it. 'Mr Bloxham'—— he began.

Bryan interrupted him. 'I will save you the trouble of questioning me, sir,' the young man cried. 'I will save you the trouble of examining those maps. They were made for the French *État Majeur*. They are on French paper.'

He pulled up and folded his arms. 'Now,' he went on, 'if any one is to be sent to Lord Wellington as a spy it must be myself, not Mademoiselle de Gillamont. There is not a particle of evidence against her. You yourself have seen that those maps were in my possession. You yourself have heard me confess that the other sheet belonged to me.'

Old Andrew heard the ringing words. 'Mr Bloxham,' he said, 'I must ask you to hand me your sword.'

But Andrew Vennie got no further. The old man all at once felt something swell up within him. He put up his hand as if his stiff stock choked him. He pulled at it, muttering as he fumbled. Then he bent, and, as he always did when he was agitated, he struck the table with his fist. He raised his fine old head, and there were tears in the faded eyes, the slow, painful tears of one who had not cried for close on thirty years.

It was not the commanding officer who looked up dumbly at the culprit. Bryan started as he saw the look. He was not before his colonel any longer; he was looking at one who, with his more than threescore years and ten on him, was asking that his old shoulders might be spared the weight of a grief, and of shame that is so much worse than grief. The completeness of the revelation kept Bryan Bloxham dumb.

Andrew Vennie watched the frozen face, with the drawn-down mouth and that dull gray shadow over its warm tinting.

'Lad,' muttered the old man, 'I don't believe yet that your mother's son would forget himself and turn traitor. I don't believe that he would sell information to the French. You have shown

me the maps. I saw you take them out, but as there is a heaven above me, I believe that you took them out to shield that woman. Lad,' went on the old man, edging nearer and nearer, 'you are a fine man, if ever there was one. Speak up now. Tell the truth, lad. I'm not your colonel. I'm the man that never loved but one woman, and that your mother. Tell me how you got drawn into it. Let us talk it over. Lad,' continued Old Andrew, as Bryan only rocked and said no word, 'don't you hear? I'm asking you to trust me. Don't you understand, if you disgrace yourself, you disgrace me, and the regiment too?'

The words, ground out, halting, jerking, stumbling, echoed through the room. Bryan heard them, and as each one reached him it seemed to pierce right through him. He had borne so much. There comes a point when even the strongest will can endure no more. Impetuously he put out his hand; impetuously he sought Old Andrew's grasp. 'Sir,' he cried, as he hung on to the fingers closed over his, 'I must marry Mademoiselle de Gillamont, or'——

'Or?' thrust in Old Andrew.

'Or,' hastened on Bryan, 'there is an attack on the French lines to-night.'

'No,' corrected his colonel, 'not on the French lines, but on the Convent of Ste Marie di Prega.'

'On the convent?' echoed Bryan.

'The French fortified it. It is a strong place now. It is the key to Santarem,' returned Colonel Vennie.

Bryan was still a moment. This was a fresh proof, if he needed more than he had already, of Clementine's double dealing. The certainty hurt him almost as much as if it were the first time that he had found her wanting. His mind went back to that early morning when he took her back to the French lines. He could hear her insisting that she must set out at once for the convent. Bryan remembered every detail of the scene, but perhaps the thing that stood out in sharpest outline was the recollection of Captain de Pratz-Clos and his obvious reluctance, the fine Frenchman's hardly concealed contempt.

'The attack is to-night, sir?' he asked a moment later.

'Just before daybreak.'

'It is a forlorn hope?' went on Bryan.

The old colonel gulped. He guessed to what they were coming.

'Many a man will not come back!' Bryan pursued.

The gray-headed old soldier only jerked his head downwards.

'Most of them will not come back?'

The old man raised his eyes this time. 'Lad!' he besought.

'Most of them will not come back!' Bryan reiterated.

[Christmas Number.]

'Yes,' said Andrew Vennie this time; 'yes.'

Bryan put out his other hand. Old Andrew clasped that too. With death so near to one, with trouble right on one, even the most undemonstrative is driven to some outward expression.

'I volunteer for service to-night,' resumed Bryan, and he spoke eagerly, but very deliberately. 'If no one has spoken before me, I beg to lead the attack, to plant the fuse, to apply the match.'

Old Andrew heard. Bryan had jumped to the conclusion that the attack would involve an attempt to blow up some wall or some door. He was right. Such a measure was almost an invariable feature of a storming-party when artillery was but in its infancy. But Andrew did not think of that. He was occupied with the personal element.

'Lad,' he asked, 'is it as bad as that?'

Bryan nodded.

The two men stood motionless. Their hands dropped apart. The wind rose again, and it shook the window anew.

Presently Bryan began to speak again. 'Sir,' he confessed, 'I lied. I did not marry Mademoiselle de Gillamont in Lisbon.'

'I thought as much,' muttered the man who heard him.

'But, sir,' went on Bryan, 'I saw her in Lisbon.'

'Lad!' blurted out Old Andrew.

'I let her go,' the big blue-eyed man went on. 'I broke my word.'

Old Andrew lowered his eyes.

'I knew she was a spy. She confessed as much to me.'

The old man's white head dropped still lower. 'Go on,' he said hardly, and between his shut teeth.

'She promised to give it up,' Bryan continued. 'I let her go. I—I didn't believe her, but I let her go. I loved her then. I love her now.'

'The jade!' ejaculated Colonel Vennie this time.

'I found her here,' continued Bryan, each word coming forth as if it were wrung from him. 'And'—

'And?' took up Colonel Vennie.

Suddenly Bryan threw up his arms. 'Sir,' he appealed, 'I can't explain any more. I can't make you understand. I don't understand myself. Nothing she can do will kill my love. If I live I will marry her. I must marry her. To-night is the only way out for me.'

'To-night!' echoed Old Andrew, as though he had suddenly grown stupid.

Bryan looked down into the old, sad face. 'You see yourself, sir,' he said dully but very evenly, 'there are only two things left for me: to get killed to-night, or to marry Mademoiselle de Gillamont if I return.'

1916.]

Colonel Vennie heard. 'Only two things!' he muttered to himself.

Bryan drew himself up. It was all but dark now. He might never see the sun rise again. He was glad, not sorry. 'As there is a heaven above,' he protested, 'it will not be my fault if I come back.'

CHAPTER VII.

'COME in,' grunted Andrew Vennie.

The door opened; Corporal Barton stepped within; he saluted, and stumped up to the table. 'I was to give you this, sir,' he said.

Andrew Vennie blinked; he suppressed a yawn; he glanced once at the wedge of folded paper that the burly veteran held in his hand. 'Put it down,' he retorted laconically.

The corporal obeyed. He waited yet another moment, as though to give his commanding officer time to read, and to send back an answer.

'What are you waiting for?' growled Old Andrew.

The corporal turned about; he closed the wide door sharply after him.

But even when he was alone again Colonel Vennie made no effort to take up his letter. He was still at the Quinta Marina; he was still in the room where Bryan Bloxham had traced out the maps. It was very cold, all dim but for the feeble glow from a lamp on the table. The casements fitted badly, and the icy draught of the Portuguese night trickled in between them. No one had thought of closing the wooden shutters, and the wind, that had at first blown only in puffs and gusts, as though its humour was wayward, and it would first sulk and then clamour, had now settled down to a driving gale. The old man heard the rattle against the rickety panes. The tempest, so long as there was no rain, was all to the advantage of the surprise attack. Not the most vigilant sentry, with a black night and a raging gale to contend against, could detect the approach of the hostile force.

The old soldier thought of that band of devoted men. They had started as midnight tolled. It was long past that hour now. Old José had remarked that a new day was beginning as he brought in a fresh supply of oil for the lamp, and that seemed a very long time ago.

Andrew Vennie rose uneasily. He went to the window, and stood looking at the wall of darkness. He knew enough about the Convent of Ste Marie di Prega to estimate what the cost of storming it would be. In his mind he pictured the building itself, rising up white on a mound with a surrounding wall even stouter and higher than that round the *quinta*. The land about was low; it was marshy, all mud and slimy water, overgrown with tall reeds, but running under the

very walls of the convent; and—this was what made it of such importance—it was crossed by the best road to Santarem. The way, like so many other things in the Peninsula, owed its existence to ecclesiastical enterprise. It was a flagged path down which three or four men might walk abreast, worn in the centre with the passing of countless mules, raised on a causeway which continued over the marshes, and was terminated by a high gatehouse, constructed partly to take tolls and partly as a fortification, at the point where the causeway reached the solid land.

The expedition must first storm this gatehouse, and then march down the causeway. Andrew Vennie knew all the odds against success, the lives that the enterprise must cost.

The old man shook his head. He turned about mournfully. He walked back to the chair in which he had been nodding. Physically even his stout frame was weary, but he would not stretch himself on the divan. If he had been driven to explain, he would have urged that it was an un-British piece of furniture; but the real reason was distaste. From under it he had taken that rolled-up piece of paper, and the discovery of that ball of tracing-tissue was the reason why Bryan Bloxham was even now marching forward to seek—not honour, not glory, but death.

As Old Andrew remembered this, and groaned; as he fell heavily into the straight chair, with the high arms of twisted walnut and its upholstery of gilded Cordova leather, his glance caught the note still lying where the corporal had left it. Andrew Vennie looked at it dubiously. He had been persuaded all along that it must be from Clementine de Gillamont. At length the old man brought himself to reach out his arm for it. He took it up as though there might be poison in the touch; he brought out his spectacles, balanced them on his nose. He read what was written on the sheet:

'Mademoiselle de Gillamont wishes for a personal interview with Colonel Vennie. Colonel Vennie will regret it if he refuses Mademoiselle de Gillamont's request.'

The assurance of the message, the threat with which it concluded, made the old man's blood boil. He blinked his spectacles off his nose, he muttered hard below his breath, he raised his two hands to tear the paper across, and then he stopped. What did this woman mean? What did she know? Or, rather, what did she not know?

For an instant Old Andrew thought of buying this French spy at her own price so long as he rid Bryan Bloxham of her. Then he remembered. Mary's son had joined the forlorn hope; he had demanded the service of supreme danger for the express purpose of getting himself killed.

For the second time Clementine's note was all but torn in two.

At last, after the old face had worked, and

the old lips had muttered, Andrew Vennie rose. His orderly was in the passage, and he gave a curt command to the man. Then Colonel Vennie went back to his chair and waited.

It was only a very few moments later that Clementine de Gillamont stood before him. She had had no means of making a toilet, but it was evident that she had arranged her hair carefully. For the rest, her plain dark dress, expressly fashioned that its wearer might glide away unperceived, could not deprive the girl of her air of distinction, and the fatigue and emotion that she must have undergone had merely added a softening shadow here and there, heightening her beauty rather than diminishing it.

The door closed. Clementine looked over her shoulder as if to make sure that it was shut; then she walked up the dim room. The old man, watching her, was sure that everything—her pace, her poise—was a matter of calculation, that she was purposely bringing herself within the circle of light.

When she was all but touching the wide walnut table she pulled up. She bent across it; she looked long and steadily at the face watching her narrowly, suspiciously. At last, as a queen who had not received all the homage due to her, she threw up her head. 'Colonel Vennie,' she began, 'you are my enemy.'

'I trust so,' ejaculated the old man.

'You may hate me,' went on Clementine judicially, 'which is stupid of you; but you are honest, which is wise of you. Honest people come into their own at last.'

She stopped; and Andrew Vennie, still staring at her, still frowning, still pursing up his tight lips, made no answer.

'You are thinking,' went on Clementine, 'that I am going to try to make terms with you.'

This time Andrew opened his mouth. 'You are right there,' he retorted grimly.

The beautiful woman nodded. She smiled provokingly. 'You see,' she remarked deliberately, 'I guessed right. It looks as though I knew something about you. Now, you know nothing about me.'

Andrew Vennie kicked the table with an impatient foot. 'Mademoiselle,' he said, 'I'll thank you to come to business. That is,' he amended, 'if you have any to come to.'

The challenge rang out in the still room. The wind, suddenly howling even more fiercely than before, seemed to answer it.

'Colonel Vennie,' cried Clementine, as the windows rattled anew, 'will you tell me how long you intend to detain me here?'

'Until to-morrow afternoon,' answered the old man.

'I understood that the English chaplain was to have been here before midnight,' the girl went on.

'He has been put off until noon to-morrow,' retorted Old Andrew.

[Christmas Number.]

'Indeed!' commented Clementine de Gillamont. 'And the delay was never mentioned to the bride! That is truly courteous.'

The veins in Old Andrew's neck swelled. 'Mademoiselle,' he retorted, 'such a woman as you can well afford to wait for an honest man to marry her.'

Clementine looked up sharply. For a moment there seemed to be amazement on her face. It was as if she were hearing an unwarrantable thing. Then suddenly she gave a gasp. The colour surged into her cheeks, down her neck. Her calm, her nice calculations, were all broken up. '*Mon Dieu, monsieur,*' she cried, and she flung up her two hands, 'must I stand here and listen to your insults!'

Andrew Vennie looked straight into the flashing eyes. But he held his ground. The truth might be insulting, but to his mind it was the truth, and he would abide by it.

'Monsieur,' went on Clementine, her tone ringing, 'I am not a bale of goods to be put back into a warehouse or taken out again as convenience demands.'

The old soldier heard that too, and still his unwavering glance told the woman watching him that he withdrew nothing.

Clementine looked at him, and the glance began with anger; then suddenly something more, something that went down deeper, that affected her profoundly, took its place. There comes a moment in even the most calculating woman's life when her femininity rises up and insists upon being reckoned with. Clementine de Gillamont had come to this point now. She knew that there was that to which she could not, she would not, submit, because she was a woman; she knew that, for the same compelling reason, security, immunity—nay, life itself—could be bought too dear. She had sought Colonel Vennie prepared to return something for value received. She had thought to lay the foundations of new obligations, to prove that she was a tool worth using. Now, in a flash that seemed to come from nowhere, without an argument, but just because she must, she recognised that nothing so easy would suffice. She must go down into the very depths of her own personality, and must fling away both prudence and expediency, to re-establish herself as a woman in her own eyes.

It was a bewildering piece of self-revelation, but Clementine de Gillamont no sooner understood it than she acted on it. '*Monsieur le Colonel,*' she cried out, 'what will you say of me if I tell you that I will not consent to be married at noon to-morrow?'

'You will not do that, I'll wager,' retorted Andrew Vennie.

The beautiful girl drew herself up. Her throat throbbed; her chest heaved. 'Monsieur,' she began once more, 'I insisted on seeing you for a very different end. I had something I could

1916.]

tell you that you might care to hear, but now I understand. You have judged me, and nothing I could do would alter your opinion. To you I am a French spy, and Bryan Bloxham is my dupe.'

Andrew Vennie answered the last clause of the sentence, and that only. The hint of a possible revelation of things that might be told, that it would serve him well to hear, he passed by. It was an old device of the intriguer in a tight place, and not worth the breath the words were said with.

'What do you call yourself?' demanded the stern old man.

'Monsieur,' answered Clementine quickly, 'I can only remember that I am a woman.'

'A woman?' questioned the hard voice.

The flame within the lovely eyes leaped up anew. Clementine had paid some instalment for wrong-doing before, but she had never before been shown so plainly as this how contemptible she was. The reprobation hastened the impulse that had sprung up in her heart. She leaned forward with her two hands on the table. 'Monsieur,' she said, 'I am a woman, and for that reason there are some insults that I will not permit. Therefore, for fear that you should add to those you have allowed yourself already, I announce to you now, *Monsieur le Colonel*, that there will be no marriage between myself and Lieutenant Bryan Bloxham.'

Andrew Vennie looked up sharply. 'Eh?' he muttered incredulously.

Clementine de Gillamont repeated her decision.

Old Andrew brought his fist down on the table. 'Then what is to become of you?' he asked as bluntly as before.

'I leave my future to you, monsieur,' retorted Clementine.

'To me!' ejaculated Old Andrew.

The girl smiled. 'You may arrest me if you think fit,' she went on tranquilly. 'You may subject me to a dozen indignities; but I myself have saved myself from the greatest of them all. For the rest, what evidence have you against me? I ask you, monsieur,' she wound up, as Old Andrew sat there and said nothing, 'what evidence have you against me?'

'Your description,' said Andrew sullenly.

'Pink cheeks, red lips, brown eyes. It will apply to twenty women.'

Andrew Vennie got heavily on to his feet. The woman before him was bewildering. She turned, she twisted, until he did not know where he was. 'And Bryan Bloxham?' he ground out.

'What of him?' Clementine flung back promptly.

Andrew beat the table anew. 'He knows you are a spy,' the old man answered.

Clementine looked hard into the lined, weather-beaten face. 'I do not believe he told you that,' she cried out confidently.

Andrew Vennie heard a ring in the voice.

It told him something; it insisted on his acknowledging something to himself; but if possible, as he heard, he hated this beautiful woman more than before. 'Bryan Bloxham confessed to me that he saw you in Lisbon,' he went on.

Again Clementine answered with a derisive laugh. 'I heard what he said about Lisbon,' she retorted significantly.

Andrew Vennie leaned forward. 'Bryan Bloxham told me,' continued the old man, 'that he had not married you in Lisbon, but that it was there that you confessed your trade to him. He knew that it was his duty to arrest you, but you begged him to let you go.'

Suddenly the girl bent over the table. With that extraordinary faculty of hers for plumbing a nature, she realised, even as Old Andrew spoke, that Bryan Bloxham's confession was not a betrayal, not a repudiation, nor yet an abandonment, but that it implied some tragic, some desperate outcome.

'What have you done with Bryan Bloxham?' she cried.

'Nothing,' answered the soldier grimly.

Clementine leaned yet farther over the table. 'Then,' she demanded, 'what has he made up his mind to do to himself?'

Andrew Vennie looked at the wide eyes. He saw the drawn-down mouth. All the anxiety written on the lovely face was clear to him. For the first time his horror of the spy was tempered by something akin to pity for the woman. The next instant he thrust aside his softer feelings. They were but a testimony to the dangerous allurements of this intriguer. 'Bryan Bloxham has made up his mind to get himself killed,' he flung back.

'How?' gasped Clementine.

Andrew Vennie began at once. As Clementine listened her breath came quicker.

'Not the causeway of Ste Marie di Prega?' she cried, anticipating him.

Old Andrew looked at her sharply. 'What do you know about the causeway?' he demanded.

'Tell me!' reiterated the girl urgently.

Old Andrew answered fully this time. 'The attack will begin on the gate at the end of the causeway.'

Mademoiselle de Gillamont put up her hand to her side. She swayed; the colour left her face. 'This must be stopped!' she cried.

For very fear of what might be to come, Andrew Vennie laughed hardly.

'This must be stopped!' reiterated Clementine.

The old man leaned over to her. 'The attacking force set out at midnight. They were to be there before dawn. The wind will favour them. No one can hear them coming.'

Clementine threw out her hands. 'Don't you understand?' she bewailed. 'It does not matter whether it blows a hurricane or is as still as a summer day!'

'Why not?' demanded Andrew Vennie.

'The French have been warned,' cried Clementine. 'It was this that I thought to tell you. I did not know that the attack was for to-night. I thought it was for to-morrow.'

'The day was changed,' thrust in the colonel.

'I demanded to see you to tell you that your plans had been betrayed,' the girl went on. 'I thought it was the one thing I could do—the amends to you and Bryan Bloxham.'

Andrew Vennie interrupted her. For a moment he cared nothing about this woman as a woman, or her motives. He wanted to know about the French and the attack. He put a short question.

Clementine answered clearly. It was not the first time she had made a report. 'The guard in the gatehouse has been doubled,' she said. 'Cannon have been mounted to command the causeway. The French will await the lighting of the tinder. The man who makes the light will be shot down as he tries to ignite the fuse.'

'Then, mademoiselle,' cried Andrew Vennie, 'Bryan Bloxham will not return. He has volunteered to ignite that fuse.'

Clementine felt a cold horror coming down over her. 'Is that true?' she gasped.

'It is true,' the old man answered.

The girl put up her hands. She pressed one to each temple. 'He must not die!' she moaned.

'Woman,' retorted Andrew Vennie, for still he had no mercy, 'you have sent Bryan Bloxham to his end yourself.'

Clementine looked at the hard face. She saw that veiling the grim light in the faded eyes were tears. She saw the massive chin thrust out squarer and squarer because the stern lips would quiver. And then she looked past the heavy figure in the brilliant uniform to the darkened window. Her eyes remained fixed there, but they saw nothing of the blackness of the night. They were filled with another vision—with a picture that her mind, that her heart, put before her. She saw Bryan Bloxham as if he were present in the flesh. She saw the love struggling with reproach in his eyes. She estimated now what he must have felt, what he must have endured. A cold shudder ran through her as she told herself that it was she who had brought him to the pass of choosing death rather than life.

Then her head dropped quickly, her eyes fell right down to the ground, and for the second time since she entered this room Clementine de Gillamont was shown herself. But a short time before she had realised that the woman within her was more powerful than the adventuress; now she learned another thing. She knew that she loved Bryan Bloxham. The fact presented itself to her just in that form. It stayed thus, fixed in her mind. It had neither adjunct nor qualification.

[Christmas Number.]

She paused still, before so tremendous a discovery; then she determinedly turned again to Andrew Vennie. 'Bryan Bloxham shall not die,' she began.

Andrew Vennie put up his large hand. He hated this beautiful creature as only an honest man can hate a dishonest woman. 'That,' he said, and it seemed to him that the confident assertion was little short of blasphemy, 'is out of your hands—or mine.'

Clementine looked as hard as before into the rugged face. 'The expedition to the convent must be stopped,' she insisted.

'It has started,' retorted Old Andrew.

The girl made a step past the table. 'The expedition must be stopped,' she reiterated.

The old man looked at her. It seemed to him useless to explain, to argue. He bent his head.

Clementine saw the movement. The mute hopelessness convinced her as not a thousand words could have done. She hastened closer to the old man. She stood before him, almost touching him. 'If you cannot save Bryan Bloxham, can no one?' she questioned.

Old Andrew looked over the dark head. 'The French shoot straight,' he answered.

Clementine lifted her eyes. 'The gate is packed with picked men!' she gasped.

Andrew Vennie pushed the slim form away from him. 'Poor lad!' he groaned.

The girl heard. She knew that the pity might be for Bryan Bloxham, but that the judgment was for her. For a moment she lowered her head before it; her slim shoulders sank down, hunching forward; then the very strength of her feeling, her lifelong habit of persisting to the end, spurred her anew. 'But before he gets to the gatehouse?' she demanded.

'Who is to stop his getting there?' questioned Old Andrew savagely, and he threw the question over his shoulder.

'A messenger!' the girl breathed.

The old soldier snorted. 'Brave men do not turn tail for a messenger,' he retorted.

Clementine paused before that. It was true. Soldiers did not set out on such errands and then face about because a woman sent to say that she wished to see one of them. She put up her hands, wrung them together, and the very movement seemed to help her to realise that one thing, and one thing only, might stop the expedition. She stepped before Andrew Vennie again. 'The expedition would halt if it were assured of treachery?' she asked.

Andrew Vennie looked hard down at her. He knit his brows together. 'Yes,' he conceded.

'Then,' cried Clementine—and she put a hand on his arm, and she shook it as if to hasten his perceptions, his initiative—'send. Say the French have been warned; say the gatehouse is strongly fortified; say that to go
1916.]

forward is but a useless throwing away of life.'

Andrew Vennie moved up his arm. He drew back. But, though he might repudiate the touch, the hot words stayed in his ears. This bewildering woman was right. The certainty of treachery would justify his recalling the attacking force on his own responsibility. But when it came to an investigation, when the Commander-in-Chief asked how Colonel Vennie had come to take so great a thing on himself—a thing that would disarrange, perhaps nullify, a whole plan of campaign—what could he answer? He had not a scrap of proof but a woman's word, and that word was notoriously of little worth.

The old man shook his head. 'I believe you are speaking the truth at last,' he decided; 'but I have no proof.'

'The proof for whom—of what?' flung out Clementine.

Andrew Vennie heard, and explained.

'Then,' gasped out Clementine as soon as the old man had finished, 'Bryan Bloxham is to die because I can't produce a written proof that your instructions have been copied and sold to the French?'

Old Andrew looked hard into the flashing eyes. 'The Lord help us! Yes,' he answered.

But Clementine was on him in another instant. 'Man,' she cried, 'you can't let Bryan Bloxham die because I am a French spy; you can't send a brave man to certain destruction because it has been my trade to cajole, to lie. Send me to Lord Wellington.' The girl came nearer again. Again she put her two hands on the old man's arm. 'Let me explain to the Commander-in-Chief myself,' she hurried on. 'I can convince him. I will tell him things that he must believe. I can show him how I gained information; that I sent it back to the French.'

Old Andrew heard. He almost laughed. 'And yourself?' he asked.

'Myself!' echoed Clementine.

'By your own confession you would be a spy,' the old man went on.

'What of that?' cried the girl.

Andrew Vennie put out both his arms. He shook off the girl's grasp for the second time; but now it was only to place his big hands on her two shoulders, to hold her before him, to look right down into her face. 'Spies are shot,' he flung at her.

Clementine heard; she understood. This old man still doubted her, still believed her to be incapable of putting love before self, of holding the life of another dearer than her own. As Clementine de Gillamont realised this she laughed back in Andrew Vennie's face. 'I can but die once,' she told him. 'What does it matter if I die so long as Bryan Bloxham lives?'

The ring in the voice was not lost on the old soldier. It conveyed more to him, did more to convince him, than even the vibrating words. No woman could offer more.

Colonel Vennie acknowledged the sacrifice. He dropped his eyes. Women were inscrutable. He had known that long enough. They were either so good or so bad, but he had not thought they could be transformed as the woman before him was.

He let go his hold; and while Clementine swayed at the release he went past her. He went along, with his head down, toward the table and that uncertain light from the lamp. He had tried this woman cruelly, and she had not been found wanting. He sat down heavily. His sword scraped on the tiles; the table creaked under the weight of his two elbows. Now, in his turn, he had something to confess.

Clementine was after him in a moment. 'Colonel Vennie,' she began.

Old Andrew looked up at her.

'There is no time to lose,' she went on vehemently.

'What o'clock is it now?' Andrew Vennie muttered.

Clementine looked hard back at him. She could catch an idea; she was quick at taking in a suggestion. She came up to the broad form; she bent over the wide shoulders. 'You mean?' she demanded.

Andrew Vennie asked her a question. 'From the British headquarters, over the hills to the gatehouse of the convent, how many roads are there?'

Clementine de Gillamont flung back her head. Her eyes became round with horror. 'Was not the force to take the low road?' she asked.

Andrew Vennie shook his head. 'It was to split up into detachments. Each detachment was to make its own way. The troops were to rendezvous under the cover of the broken rocks overlooking the gatehouse.'

'Then,' cried the girl, 'you do not know which route Bryan Bloxham has taken, which detachment he is marching with?'

The old man raised his faded eyes to the girl's glowing ones. He, she—for there is nothing so exclusive, so selfish, as a great affection—had forgotten that there were other men, each with but a life apiece to lose or to preserve. For this beautiful woman and for the scarred old soldier the only thing to be thought of was Bryan Bloxham; the only being they even remembered was Bryan Bloxham.

Old Andrew groaned aloud now. 'God help me!' he confessed, 'I do not know with which detachment he marched. I cannot tell by what path he will make to the gatehouse.'

Clementine de Gillamont bowed her head. This was conclusive. This was final. This made it impossible to recall the expedition.

Besides, was there not that question of time which neither Andrew Vennie nor Clementine had gone into? It was nearing daybreak. The force was to attack before dawn. There was not time to send a message.

Old Andrew put out a shaking hand, and, groping, he sought again for the girl. 'Maybe,' muttered the old man hoarsely, for he had no hope, 'the lad will somehow know what you would have done for him if you could. He'll die easier for that.'

Clementine stepped back. Andrew Vennie let his head sink toward his chest. The girl stood still.

Andrew Vennie began to mutter. He spoke to himself. 'They were to start at midnight,' said the old man. 'They were to lie down behind the boulders, each company as they came up, until all was ready.'

He was silent again, and the wind buffeting against the windows shook the casement. 'Maybe,' went on Andrew Vennie, and now he turned about as though to point these things out to Clementine de Gillamont, 'they will shoot him down as he puts his foot on to the causeway. Maybe they'll let him get close on to them.'

The girl answered with a gasping moan.

'They'll shoot him in the head most likely,' continued Old Andrew. 'He'll roll backwards if they do. His eyes'—the old man dropped his lids over his own here, and he nodded—'maybe they'll be open.'

The wind had fallen again. The room was very cold and very still. Clementine shuddered. She trembled in every limb; her teeth began to chatter.

A moment later there came a new blast. A door banged somewhere within the *quinta*; and, as if in answer to it, the tempest flung itself under the veranda, caught up the long jasmine trailers, whipped them against the windows, and the next instant there followed a fierce gust of rain.

Clementine heard the lashing sound. Andrew Vennie heard it. The old man flung up his white head. He listened—listened painfully, intently. The storm went on spattering, flinging great drops against the panes.

Then, with an inarticulate cry that was neither a shout nor a groan, the old soldier jumped to his feet. He put out his arm. He grasped on to Clementine. 'Don't you understand,' he ground out between his clenched teeth—and he held the girl at arm's length and swayed her to and fro in his vehemence—'don't you know if they get this rain down by the causeway there will be no attack?'

'None!' ejaculated Clementine.

'They can't attack,' went on Andrew Vennie. 'The rain will damp the powder; it will put out the fuse.'

Clementine listened to the rapid words. She
[Christmas Number.

knew enough of military matters to be sure that Andrew Vennie was right. Fuses were primitive things in those days. It took little to put one out. Gunpowder was soon damped, and then not even the most determined could fire off a gun with it when it was wet. She looked up at Andrew Vennie. 'You mean,' she said, for she must have this thing in plain words, 'that if this rain goes on the attack must be abandoned?'

The old man folded his arms. 'I mean that,' he said slowly.

The girl turned from him. The storm went on; it howled; the rain washed against the window; then came the wind anew.

Clementine de Gillamont stood telling herself that the tempest was fierce, repeating to herself that here was the way of deliverance. Then she suddenly began to stumble forward. She hastened across the tiled floor up to the casement. Already the water was trickling in where the draught had previously entered. Already a little pool had collected where the pressing of many feet had worn away the glazed surface of the tiles. Clementine cared nothing for the cold, as little for that round of water. She welcomed every drop as it flowed in to increase her discomfort. She pressed up to the double series of little panes, as near to them as she could get. She dropped on to her knees. One of the wooden shutters, caught by the blast, wrenched away its rusted catch. It began to swing to and fro. It creaked as it turned. Clementine heard it as it banged against the wall, then clattered in to the window and half opened again. The wind caught it as if it were straw. Clementine cared nothing for it; as little for the wind. What did matter was the rain, and the rain came dropping, it came dripping, it came persistently, noisily, heavily.*

The unhappy woman, who was still hardly more than a girl in years, and who in the beginning had been so much more sinned against than sinning, pressed her cheek against the cold glass. She had done wrong and to spare. She had but one thing to recommend her, and that was that at last she loved, and that for the sake of that love she would lay down her life or begin it anew.

Clementine thought of these things, of so many others. She made her resolution. On the morrow, if fate spared Bryan Bloxham, she would remove herself from his vicinity; she would retire to a convent. She put up her two arms. Her hands, with their fingers outstretched, she pressed against the glass. She remained so, motionless, wet, cold, until, at length, from her lips was wrung a cry, a bitter cry. 'Until day-break, dear Lord! Until daybreak, *Madre di Dios!*' she reiterated, she clamoured.

* The rain is spoken of in Colonel Anderson's book, *The Diary of a Peninsular Veteran*, as responsible for putting off such an attack.

CHAPTER VIII.

'SENHOR ENGLISH SOLDIER!' began Don Miguel in high displeasure. The old man paused. He was half-way up the flight of steps which led from his own courtyard to the entrance into the house. He threw back his head, and as the flap of his long felt cloak fell from his left shoulder he impatiently flung it back again.

The day was still very young. The sky, though it was clear now, had a cold blue look about it, as though the sun had hardly yet forgiven Dame Nature for her unmannerly paroxysms of a few hours before. The water was still lying in pools in the depressions of the courtyard; and the great cork-tree which grew just without the wooden door, and, incidentally, afforded shade to the numerous beggars who sought alms at the *quinta*, creaked its great branches mournfully.

But Don Miguel did not give so much as a thought to the tempest. He was accustomed to such violence; for the storms, when they did blow in from the Atlantic, came with fury. What the old man did remark—and resent—was the invasion of the *quinta* by British soldiers. He had begun to tell José what he thought, when the figure of Andrew Vennie appeared between the carved stone jambs of the entrance.

It was then that Don Miguel turned on the British officer.

Old Andrew answered temperately. He was a sensible man, if he was short-tempered. He understood something of what Don Miguel must be feeling.

Briefly the Englishman sketched the events of the last twelve hours. He told Don Miguel that information had reached him of the presence of a notorious French secret agent within the *quinta*; but he was careful not to particularise whence the information came. He went on to say that at the hour indicated he arrived at the house, and what he had learned there.

Don Miguel, however, fastened on a point that, if it had not escaped him altogether, had seemed of small importance to Andrew Vennie.

'How did the Frenchwoman get within the walls?' he immediately asked. He came up the remaining steps, and stood on the wide slab before the door; and Andrew Vennie stepped out to him. The two old men, a complete contrast in every way, yet already drawn nearer together by their mutual interest in Bryan Bloxham than would seem possible otherwise to two such totally opposite natures, paused for a moment, debating.

'Is there no way in but that?' asked Colonel Vennie, and he nodded to the stout oak door.

Reluctantly, for the old Portuguese detested to give up even one of the secrets of his dwelling, Don Miguel mentioned the secret door to the Garden of the Arcades.

Andrew Vennie thrust out his lower lip. Had Bryan Bloxham broken another promise? Had he, for the sake of that love which entangled him as a net enmeshes a victim, been guilty of another dishonour?

It was Don Miguel who finally put the thought into words. 'The strength of the strongest is but as a thread of silk in a woman's hands,' he remarked.

Though Old Andrew had not been very far from this conclusion himself, he refused to doubt one of his officers before a foreigner. 'Look among your own household before you say that, Don Miguel,' he retorted.

The dark eyes watching him flashed. 'My people are but two,' returned Don Miguel—'José, who has been with me all his life, and Mariquita, who came with my wife.'

'I don't think much of the woman,' answered Andrew Vennie bluntly. 'I should begin with her.'

The old Portuguese turned sharply upon him. 'Senhor,' he answered hotly, for he had been so long without any one to make a suggestion, much less to animadvert on what he tolerated, 'I prefer to judge my household myself.' He turned on his heel, all his dislike of intrusion mounting within him. He entered the house; he even went so far as to shut the door in his anxiety to put a barrier between himself and that troublesome soldier; but he was hardly within the dim, cold corridor, with its note of perpetual musty gloom, when another thought struck him.

This blunt Englishman, who was Bryan Bloxham's commanding officer, and who, therefore, Don Miguel supposed, had authority over his subordinates, had referred to the marriage that had been arranged for the morning as though it would assuredly take place.

'*Madre di Dios!*' muttered the old Portuguese, 'this Englishman must be mad.' He stopped, reflecting on that. There was a moment when the old man's strange, new-found affection for Bryan Bloxham pulled one way, and his indifference to other people and other people's interests fought with it.

The struggle was brief. Don Miguel turned on his heel. He flung open the beautifully ornamented door again.

'Your force could not attack Ste Marie di Prega,' he began.

Andrew Vennie just nodded.

'Then Bryan Bloxham will return,' went on the Portuguese.

'Please Heaven!' muttered the old man.

Don Miguel came a step nearer. 'You intend to let the marriage go on?' he inquired hotly.

Andrew Vennie contented himself with another nod.

'But the woman is a secret agent!' cried Don Miguel.

Andrew Vennie evaded that consideration. It was the very one that he had been putting

from him ever since the dawn broke through a cloud of driving rain. 'The woman said she wouldn't marry him,' he muttered, as the dark, glittering eyes remained fixed on his face.

'Said she wouldn't!' repeated Don Miguel contemptuously. He waved that aside. 'When the Devil was sick the Devil a saint would be' represented his estimate of Clementine's declaration.

Andrew Vennie was possessed of something uncomfortably near to the same misgiving himself. It was one thing, as he knew, to rise to a great renunciation in the hour of tension and stress; it was quite another matter to persist in it when everything had settled back into an ordinary routine. The old soldier did not know much about women; but he did know that all humanity, be it of what sex it may, can find a convenient excuse for a complete change of face if it be but sufficiently vital that an adequate reason should be forthcoming. Added to that was the principle of Andrew Vennie's whole life, was his notion of honour, of obligation. 'I don't like the match any more than you do, senhor,' he conceded; 'but, if the lad is alive, a man's word is his bond.'

Don Miguel threw up his head. 'A spy!' he expostulated again. 'A woman who worms out secrets and sells them!'

Andrew Vennie had no answer to that. He had settled the case as he saw it; and because it bore hardly, possibly fatally, on the one being he loved, that seemed to him no argument for departing from what he considered an obligation.

Don Miguel perhaps gathered something of this; at any rate he saw that he and his point of view had not prevailed. For a moment an angry expression overspread his olive-tinted face; for a moment hot words seemed to be trembling on his thin lips; then a slow smile overspread his features. Don Miguel paused as if a new notion had come to him, and as if that notion would exercise his craft and that talent for intrigue which he possessed in common with so many of his countrymen. Ceremoniously, and in complete contrast to his last abrupt departure, he begged to be excused.

Andrew Vennie replied negligently. He would as soon be alone as have to try to restrain himself with this unreasonable—as it seemed to him—excitable old Portuguese. But had Andrew Vennie been as keen an observer of other men as he was of the lads of his regiment, Don Miguel's sudden smoothness would have afforded him food for reflection. Instead, Colonel Vennie merely walked to the edge of the pavement and stood looking over the low balustrade. He was anxiously awaiting definite news of the force sent out to the causeway; and, while he watched the wooden door, in spite of his innately kind heart, in spite of that wish to believe in a woman which Englishmen almost always possess and a Spaniard almost never, he sighed heavily.

[Christmas Number.

Meantime Don Miguel went along to the point where the corridor forked. There one turning went down to the part of the building in which the room that had been set apart for Bryan was situated; the other led to the portion of the *quinta* he himself inhabited. The two wings were quite distinct. They belonged not only to different epochs, but to different races of builders. By some quaint turn of fancy, Don Miguel had assigned to Bryan Bloxham a room in the lighter, the newer, part of the building. He himself lived in the old block. It was Moorish, not European, in style, and, instead of being approached by the *patio*, it was entered through a large octagonal antechamber.

Here, as usual, the floor was tiled. The light was supplied from a lantern in the roof, and under that lantern was a low, wide basin with a jet of water playing into it, and a family of goldfish swimming about. Close by the walls were raised slabs of tiled work, suggesting the benches where, in the days of the long-gone Emirs, suppliants had waited. The doors—there were three of them, the one by which Don Miguel had entered, and the two opposite, leading to the rooms he used himself—were set in horse-shoe arches; while a few feet farther within ran all round the octagon a row of pillars, and the ceiling from the pillars to the wall was moulded with countless little pendants of Moorish stucco-work.

Don Miguel walked up to the dropping jet of water. He took out a cigarette, and began to roll it. In common with so many people who live solitary existences, he had his unexpected softness, the thing that faintly ministered to the human necessity for affection. Some people take to dogs; women, they say, to cats. Don Miguel secretly cherished quite a feeling for this fleet of little yellow fish. He was persuaded that they knew his voice. He liked to see them bob up their glittering heads and catch the morsels of bread which he dropped in to them. These fish maybe—or more probably his determination that no one but himself and old José should enter the two rooms that he occupied—were the reason for the few European items of furniture which broke the Eastern air of the antechamber. At any rate, the great chair in which Don Miguel habitually sat, and the table by the side of it on which were arranged his smoking necessities, were placed close by the rim of the fountain.

Don Miguel went straight to that seat now; and, because he knew so well what he meant to do, because it seemed to him that his plan must be effective, he allowed himself a few moments in which to rest his limbs and elaborate the purpose in his mind. Meditatively he rolled a cigarette between his finger and his thumb. He quite perceived that the old house, which for so long had only sheltered a man who asked nothing but to be forgotten, now roofed over most of the driving forces of nature. He waited yet a little
1916.]

longer. It pleased him to reflect that, since his life had been broken in upon, he was to emerge from the welter not as a participator, or as a spectator, but as the personage who brought the drama to its dénouement. He smiled, and there was nothing genial in the movement of his lips. Whatever Don Miguel meant to do or to leave undone, he assuredly intended to be ruthless.

The first disturbance to these reflections came from old José. The old servant was full of excuses, of solicitude. Don Miguel cut him short. He did not want the reasons why José had to admit the British guard; what he did wish for was his morning meal.

The simple fare must have been waiting for him, for in another minute Mariquita brought it in herself. There was a coffee-pot, a wide cup and its saucer, and a hunch of bread on a small brass tray.

The old woman's eyes never left the dark form in the great chair from the moment she entered until she came close up by the fountain. There she paused. The sharp light falling on her made her own features seem even thinner, more severe, than customary. Her eyeballs seemed to be sunk deeper within wide black circles, and the eyes themselves smouldered with a curious dull fire.

Don Miguel did not so much as glance her way. Mariquita was a part of the *quinta*. He thought of José as another man like himself, never of Mariquita as a woman. She stayed on because she had once entered. There had been, it is true, one moment when her personality had emerged. Don Miguel had come very near to sending her away then.

Mariquita had abandoned her habitual taciturnity to speak to her master of his heir. She had even permitted herself to press the claims of the young son of his wife's brother. The mere mention of such a thing drove Don Miguel to fury. He firmly believed that his wife had been done to death at the instigation of her own people, and he swore anew that not one of them should possess a stick or a stone that had once been his. Since then many years had passed by. The reversion of the old place, of the jewels that had been lavished on the golden-haired bride, of the wealth that Don Miguel was supposed to have hoarded, had never been touched on. Then Bryan Bloxham penetrated into the *quinta*, where he became a welcome guest. Finally, Don Miguel had made his hurried visit to Lisbon.

As Mariquita stood with the tray poised on the upturned fingers of her bony hand, she asked one of her rare questions. 'The journey of the *senhor*—has it prospered?' she inquired.

Don Miguel looked up. Perhaps he was surprised at being addressed; perhaps some thought of the past came back to him, for his lips parted slowly, and again that sinister smile

touched his features. 'What was to do is not finished in a day,' he returned; 'but it is well begun.'

Mariquita stood still again after that. Once more she looked searchingly at her master. Then she set down the tray, and, though the action was trivial in itself, something in her manner invested it with an air of finality. She stepped back. 'May the Holy Mother have you in her keeping, senhor!' she said.

She was almost at the door before Don Miguel replied, and then it was to give an order. 'Send the Frenchwoman to me,' he commanded.

Mariquita put up her hand. She swept the wisps of iron-gray hair off her face. 'What do you want with this Frenchwoman?' she demanded. 'Let these English, who are heretics and will burn in the next world if they escape in this, attend to her.'

Don Miguel threw down his cigarette. He was accustomed to obedience, not to argument. 'Send the Frenchwoman to me,' he repeated sharply.

This time Mariquita went out without another word.

Don Miguel, as soon as he was alone again, sat back into the wide chair, reached out his arm, and poured some of the coffee into the wide cup. Then he took up the wedge of close native bread, broke off a corner, and, in the accepted fashion of his country, dipped it into the coffee. He stirred it up and down, until the hard, dry interior was moist. He was about to bite off a piece, when he looked into the basin of the fountain. A little head appeared above the water; a black bead of an eye looked out into the air. Don Miguel broke off a crumb. He dropped it down; he did this every morning, but secretly, that neither José nor Mariquita might guess that he found companionship in a goldfish. Another little creature darted at the second morsel, and the old man, instead of eating his own meal, waited for the shining yellow heads to come up again.

The next moment he put out his arm. He lifted his coffee-cup, but the liquid was already colder than he liked; so, doing as he had often done before, he emptied the coffee into the fountain. He saw the brown trickle mingle with the water; it seemed to cover over a fish lying low down by the bottom of the basin. He turned back to the table again to pour out a fresh cup, and then the noise of the door opening diverted Don Miguel's attention. He looked round quickly. He was not without curiosity to see the woman who had enslaved one so open-minded as Bryan Bloxham, who had evidently made an impression on such a hardened old campaigner as Colonel Vennie.

But even as Clementine de Gillamont stepped out from the shadow of the arches, and while he gave her credit for all her beauty, Don Miguel saw what neither Bryan Bloxham nor Andrew

Vennie had remarked. He knew that Bryan Bloxham's Delilah was not wholly French. From the first glance he was persuaded that she had Spanish blood in her.

The old Portuguese rose. He bowed. This woman was no common adventuress. She was worth the velvet glove. 'Mademoiselle,' he began; but he did not ask her to be seated.

The girl bowed in her turn.

'Mademoiselle?' the old man went on, and the word was a question this time.

Clementine gave her name.

'Ah,' observed Don Miguel, and he looked straight at her, 'that is French, is it not?'

'Just so, monsieur,' answered Clementine tranquilly.

Don Miguel shot a sharp look at her under his brows. He was not to have it all his own way. The prospect of a tussle amused him, for he thought he knew how it must end. 'Mademoiselle,' he went on, 'I have been told that you honoured my house with a visit during my absence.'

Clementine looked at the olive face. She permitted herself to smile.

'Mademoiselle,' continued the old Portuguese, and already his tone was touched with irritation, 'I have heard everything. I know everything.'

The girl heard the challenge. She did not yet see the point at which Don Miguel was driving, but she did see that he was actuated by no benevolence to her. She looked up genially, gaily even. 'Then, monsieur,' she observed, 'you have doubtless been told also that I am under the protection of the English Colonel Vennie.'

Don Miguel half-raised himself. 'Mademoiselle,' he retorted, and his voice was very smooth, 'if you rely on that, I must remind you that you have made a mistake.'

'What mistake?' cried the girl quickly. 'I have the colonel's word.'

The old man in the wide chair placed his elbows on the arms, he joined his fingers lightly over his knees, and he smiled slowly. 'You forget,' he said, speaking to these finger-tips rather than to the woman who was waiting for his next words with the dawning of a new anxiety in her eyes, 'this is my house. I am a Portuguese.'

'What of that?' thrust in Clementine.

This time Don Miguel turned on her. 'You were found in my house,' he remarked. 'I can claim the right to deal with you. I have the right to say that I prefer to hand you over to the arm of my country.'

Clementine missed no word, no point. She saw the threat. Nothing could have been better calculated to daunt her. If there was one thing that made her quail, it was the possibility of a Portuguese prison. Her piteous appeal to Bryan, though it might have suited other motives as well, had not been overcoloured. She viewed capture by the English with comparative

[Christmas Number.]

equanimity. At the worst it meant the swift bullet. As she said amid the glitter of the ball at Belem, in a Portuguese political prison there were worse things than death.

Clementine de Gillamont gave but a moment to apprehension. She rallied her nimble mind; she brought her wits into play. She understood that it was useless to appeal to clemency, as fruitless to speak of chivalry. Only her own perception of what would influence him could save her. 'Monsieur,' she returned, and very carefully she emptied her voice of all emotion, 'has it occurred to you that Bryan Bloxham would hardly thank you for delivering me up to the Portuguese authorities?' •

'He would never know,' retorted Don Miguel grimly.

'He expects to find me here when he returns.' 'Ah!' said the old man; 'when!'

The girl heard the cruel inflection. 'Our marriage is fixed for noon to-day,' she cried.

'That is what I intend to prevent,' flashed back Don Miguel.

Clementine nodded. Now she understood exactly what she had to deal with.

'You have forgotten something in your turn, monsieur,' she said.

'What?' shot out the old man.

'Has it never occurred to you, monsieur,' questioned Clementine, 'that when a lover finds that his bride has disappeared he does not go on smoking the cigarette he has just lighted?'

Don Miguel bit his lips. It was an inconvenient suggestion. A man in love, a man balked of his love, even if he were a steady-pulsed Englishman, might not be an easy person to put off. Don Miguel had but to cast his own mind back to see the dangers a man would run for the sake of a woman. He himself had been warned that malice, that enmity, would follow if he married the golden-haired cousin. Those next in succession to her considered it more convenient that she should be a nun. He had disregarded everything but his heart. His bride had paid the penalty.

The next moment the old man sat upright again. 'Mademoiselle,' he observed, 'you do not know that Lieutenant Bloxham will come back again.'

Clementine still kept her glance steady, but her chest heaved. It was true. The man she loved had gone out to get himself killed. She would have given everything that she possessed to know that he had failed.

'It rained until past the dawn,' she made herself answer.

Don Miguel paused again. He was in no hurry. The Portuguese, who is habitually hasty, can be very deliberate when he is vindictive. He put out his hand. For the second time his coffee would be cold. He took up the hard round of bread again, and, following his habit, began to work off a crumb. As he did that

1916.]

he looked into the marble basin. For quite a perceptible space of time he gazed at the pool of water, which was clear and colourless again. As he waited Don Miguel's face went curiously gray; he stared so fixedly that it was as though his eyes refused to believe what their own vision told them. His glance was glued on to one particular goldfish. The little creature was lying on the very floor of the basin; its scales seemed to lack their habitual glitter; it was quite motionless.

Don Miguel put down his cup. He set it exactly in the centre of its saucer. He arranged the pieces of broken bread on the plate by it. 'Mademoiselle,' he began, and his voice cut, it was so cold, 'I will trouble you to come nearer.'

'Why, monsieur?' asked Clementine.

'I wish you,' went on the old man in the same deliberate manner, 'to tell me what you see in the fountain.'

'Wherefore, monsieur?' asked Clementine warily.

Don Miguel lifted his eyes from the clear water with the ripples forming and circling out on its surface. He took up one of the two pieces of bread on the tray. 'It may interest you to watch a goldfish eat a crumb of this bread,' he said.

He broke off a crumb. He held it out between his thumb and his forefinger. Clementine looked at him attentively. Her air was an inquiry. She saw that something of moment had intervened, and unless she were acting with consummate skill, that was all she felt about the matter.

'Why should your goldfish interest me, monsieur?' she asked.

The cold, glittering eyes scrutinised the beautiful face. Don Miguel fully admitted the perfection of the lines, of the colouring. What he did not observe was that new thing that had come into it the previous evening. He was looking for the smallest symptoms of fear, of apprehension. 'Mademoiselle,' he said, 'if I forced you to eat this bread, what would you do?'

The girl waited a moment. It was astonishing how unerringly she knew when to be frank and when to evade. 'I do not follow you, Don Miguel,' she said quietly now. 'You have some motive in your speech that I have not perceived; but I see no reason why, if it pleases you that I should share your breakfast, I should decline the offer.'

The old man dropped his arm abruptly. He muttered a hard word between his teeth, drew his brows low down over his eyes. For one moment, two, he remained thus, evidently thinking hard. 'Mademoiselle,' he said when he raised his head, 'I will ask you a question instead of forcing you to eat when you are not hungry. It is not easy to get into my house. The ingenuity of women is wonderful, I know; but still you would favour me by telling me precisely how you entered.'

Clementine answered promptly this time, and as firmly. 'That I must decline to do,' she said.

Don Miguel threw back his head. 'Very well, mademoiselle,' he hissed, and he laughed again; 'if you will not answer me of your own free-will, I can wait—until more effective persuasion than mine is brought to bear.'

Clementine shrank. It was the same threat, but this time it was accompanied by a bribe. She saw—she had been intended to see—that though Don Miguel would not give mercy, he might sell it. 'Monsieur,' she said—and she reminded herself that if one party to a bargain can propose terms, so can another—'I take it that above all you object to my marriage with Bryan Bloxham?'

'Just so,' answered Don Miguel.

'You give yourself too much trouble,' went on the beautiful girl. 'Your solicitude for him is unnecessary. No man can marry a woman against her will, and I have something to say in this matter.'

'What?' asked the old man as eagerly as a fish catches at a bait.

Clementine de Gillamont drew herself up. 'I have already assured Colonel Vennie that I will not be married to-day,' she said.

'You said that last night,' Don Miguel flung back at her.

The girl looked straight at the olive face. She smiled as a woman does smile when she realises that there are heights in her, and depths, that have escaped her adversary. 'What I said last night I say again to-day,' she averred.

Don Miguel rose. He stepped away from the little table, away from that splashing, dripping fountain and the pool of water with the little fish lying motionless on the marble. He drew himself upright, uplifted his moustache with a swift turn of his fingers. 'Who has bought you?' he cried.

The lovely woman coloured at the insult. 'Don Miguel,' she replied, 'I do not intend to answer such a question. If I denied the charge a thousand times you would not understand. But what does matter to you, what it will meet your ends to know, is that, as I said last night, I purpose to retire to a convent.'

'When?' thrust in Don Miguel, neither moved nor abashed.

'Monsieur,' said Clementine, 'I am willing to go at once. Assure me of honourable treatment, and I will set out as soon as you can saddle a mule to send me there.'

The old man looked at her incredulously. He might have understood; once he had loved supremely himself. But it was what this woman had been that stood in the way of his seeing.

Clementine de Gillamont realised this. She knew there were many stone walls in life, higher ones in a woman's than in a man's; but that not one blocked up insight, cut off compassion, impeded a clear view of the possibilities of a

woman's heart, so effectually as her past. With a little sigh she let that go. 'Surely,' she went on, 'it would serve your own ends better to have me in a convent than to deliver me up as a prisoner.'

Don Miguel walked back to his chair. He sat down in it, leaned forward to look at that same still goldfish. This woman, who seemed to be as clever as she was beautiful, spoke the truth. To a man trained to his belief—however little he might conform to his creed—there was finality about the cloi'er. Bryan Bloxham would surely respect a penitent sinner's vow of expiation; he would as surely strain every nerve to rescue that same sinner were she consigned to a political dungeon.

Don Miguel raised his eyes. He was more than half-inclined to accept the terms. He knew the cynical proverb of old Spain, 'Compromise with your enemy if you can. It will save your powder, and his back is always there for your knife.' 'Mademoiselle'—he began.

But the door which led from the other wing of the *quinta* was suddenly, noisily, flung open. Andrew Vennie stood within. His big frame, in its scarlet uniform, was set within the bulging arch with its arabesques picked out in crimson and ultramarine and gold. The soldier flung a look at Clementine, another at Don Miguel. He was evidently surprised to see them together, but equally he had no time for that astonishment. 'The expedition has returned.'

Don Miguel rose. He took a step forward. '*Monsieur, mon Colonel*'—he put in, as though to be first.

Andrew Vennie cut him short. 'But'—he cried.

'But'—repeated the old Portuguese.

It was Clementine who hurried over the smooth tiles, with their involved pattern of brown rings on a green ground. She passed swiftly between the pillars; she laid hold on Andrew Vennie's tunic; she shook him in her vehemence. 'But?' she cried shrilly.

'A man is missing,' blurted out Andrew Vennie.

Clementine gave a great sob. 'What man?' she demanded.

She heard the name she had feared, had expected to hear. Bryan Bloxham was the one man who had failed to return.

Andrew Vennie thought he understood. Don Miguel leaped to the same conclusion.

Involuntarily the two men lowered their heads, as one does at the passing of the dead.

But Clementine lifted hers; she threw up her two hands. 'I know who has done this!' she cried. She turned away from Andrew Vennie; she faced Don Miguel. She ran back to him, and a shaft of sunlight streaming through the lantern caught her dark hair and seemed to set it alight. 'I know who has done this!' she repeated.

[Christmas Number.]

CHAPTER IX.

AS Clementine's words rang through the room Andrew Vennie banged to the door. He shut it in the disturbed face of Corporal Barton, who, with a kind of idea that his beloved colonel was marching into a lion's den, was following close behind. He strode forward, his spurs clicking, his sword scraping over the tiles; he walked up to Clementine, and laid his hand heavily on her arm. He understood at last that this was no isolated action of a French spy, working on her own account, and being paid so much an item for information, but a part of one and the same long coil of deception which maybe had its root in political intrigue, maybe in purely personal matters. 'You must tell me all you know,' he announced sternly.

Clementine looked at him. Every crisis where the feminine is intermingled—and not much goes forward without the element—results in a woman's looking to the strangest quarters for her friends and allies. The girl glanced up at the stern, grizzled-headed man now as if she knew that she would get justice—and something more—from him. 'Send for Captain Ramon di Gracias,' was her most unexpected reply.

Andrew Vennie repeated the name, he was so astonished. 'A.D.C. to Général le Marquis de la Romano?' he amplified, lest there might be two.

The girl nodded.

'He has been especially lent for the expedition to Ste Marie di Prega,' the Englishman exclaimed; and he was about to give the reason for the selection, and to add that Captain di Gracias and no other had reported that Bryan Bloxham was missing; but before he could explain Don Miguel interrupted him.

The old Portuguese stood before them with a strange passion on his face. 'That man shall not enter my door!' he cried out vehemently.

'He is within the *quinta* already,' Andrew Vennie answered.

Don Miguel jerked back his head. He was so angry that the brown hue of his skin had turned to a kind of livid gray. 'Does he dare to show his face here?' he hissed. 'If I am still master here José shall throw him out.' He made a stride to the door.

But Andrew Vennie shot out his long arm and clasped the thin shoulder. For once the Englishman saw farther than the Portuguese. 'Stop!' he said. 'Don't you see that this Captain di Gracias may be the very man we want?'

Don Miguel half-shook off his hand.

'Think, senhor!' resumed Andrew Vennie. 'Let us find out where we are. There seems to be more here than either you or I understand. When we have straightened things out a bit, 1916.]

then, if you want to, you can tell your unwelcome guest to be gone.'

Don Miguel pushed an impatient foot to and fro over the tiles. He could not acquiesce all at once. For a moment his craft warred with his urgent desire to avenge himself; then he smiled. 'I must bow to your superior wisdom, Senhor Englishman,' he returned coldly.

Andrew Vennie, having received so much of a permission, did not quarrel with it because it was conceded grudgingly. He walked to the door in his turn. He gave a few short, explicit commands to the invaluable Corporal Barton, the most emphatic of which was that, though he would rather the Spanish officer did not suspect he was being watched, he was not to be let out of sight, much less permitted to leave the *quinta*; and then, closing the door with another resounding bang as some relief to his feelings, Andrew Vennie came back and directed a sharp, business-like gaze full on Don Miguel. 'Senhor,' he said, 'let us begin at the beginning. What do you know of this Captain di Gracias?'

'He is my nephew,' flung back Don Miguel.

The soldier looked along to Clementine de Gillamont. 'Mademoiselle?' he said.

'And,' she answered, taking up the question, but answering it as she was not expected to, 'he is the man who has made away with Bryan Bloxham.'

'Made away?' repeated Old Andrew.

'Yes,' said the girl. 'I see it all now. Bryan Bloxham was in his way. He would have his chance last night. He would take it.'

The Englishman swung round on her. 'By gad!' he cried, 'you seem to know all about this Captain di Gracias. How much did you tell him, or he tell you? Did you know he was to accompany the expedition to Ste Marie di Prega?'

'I did not,' she answered.

'But you say that Captain di Gracias is responsible for Bryan Bloxham's disappearance?' Old Andrew hurried on.

'I do,' affirmed Clementine.

'Why should Bryan matter to a Spaniard?' continued Old Andrew.

This time it was Don Miguel who answered, not Clementine. 'He has heard of my journey to Lisbon,' the old man exclaimed.

Andrew Vennie looked more incredulous than ever, but the old Portuguese laughed shortly. 'Don't you understand?' he said. 'Some one must have talked to him of me and my affairs—some one who guessed my intention.'

'What intention?' demanded the soldier crossly.

Don Miguel enlightened him with a proverb. 'Never visit a notary when you are in health,' he remarked, 'lest the signing of the parchment brings on a fever.'

Andrew Vennie understood in part. He made a gesture half-hopeless, half-wrathful. There

were things taken for granted both by Clementine and Don Miguel that amazed him.

The next moment Don Miguel himself turned round on Clementine. 'Did you know why I went to Lisbon?' he asked.

The girl raised her eyes. 'No,' she said briefly; and this very astute old man believed her.

Don Miguel dropped back. There were so many strands making up this involved pattern that he had to think a moment before he knew which he should pull out next. Then he beckoned to Andrew Vennie. 'Come here, monsieur,' he said.

Old Andrew obeyed. He joined Don Miguel by the fountain.

'Do you see that goldfish?' the old man asked.

'It is dead,' returned Old Andrew, impatient at such a trifle.

Don Miguel pointed to a second.

'It is dead as well.'

This time Andrew Vennie spoke more slowly. He looked up, for he began to wonder if there might not be something in this too.

'Just so,' returned Don Miguel, answering the suspicion in the glance. 'Both these fishes were alive this morning. They must be the two which ate the bread. There must have been poison in that bread. It was intended for me.'

'For you!' returned Andrew Vennie.

Don Miguel smiled as if he were amused. 'Yes,' he said; 'and whoever put it there must not only have wished to prevent my paying a second visit to Lisbon, but must be in league with my nephew.'

He paused again. Clementine de Gillamont looked up expectantly. She had not forgotten Bryan Bloxham, but her experience had taught her that there are occasions when a good deal is to be gained by waiting. She was sure this was one of them. Either Bryan was dead—which she refused to believe—and nothing could help him, or he was being held a prisoner; and a more perfect understanding between these two old men would do the most to rescue him.

It was Don Miguel who first addressed her. 'Don't you see,' he said, 'that it may help Bryan Bloxham now to tell me who let you into the *quinta*?'

The girl answered unhesitatingly this time. 'Mariquita,' she said.

'Then,' flashed back Don Miguel, 'who are you?'

'I am your niece,' returned Clementine as readily. 'Ramon di Gracias is my half-brother.'

The old man threw back his head; his eyes glowed. 'You belong to my family!' he said reproachfully.

'My father was your wife's brother and your cousin,' answered Clementine. 'He married twice. My mother's name was De Gillamont.'

'And,' cried Don Miguel passionately, 'you lower yourself to ply the trade of a spy!'

Clementine flushed. But such a little time ago she could have heard the taunt with composure. She had persuaded herself that the world had been hard to her, and that she had the right to be hard to it. But recently, within the last few hours, all the old landmarks seemed to have been removed. The excuses that had seemed good enough appeared to be no excuses at all. The conduct that at the worst seemed to be not so much less good than many other people's appeared to be monstrous now. Love had done for Clementine what it does for every real woman. It had awakened within her the urgent longing to be worthy of it. She had something to say in her own defence, it was true. Haltingly, timidly, omitting to tell how in the beginning she had been lured by Ramon, cajoled by him, and when she turned restive threatened, she went back to what was at the root of it all. She had been driven by poverty. 'We were penniless, Ramon and I,' she said in a low voice. 'My father gambled away his last *peseta*. One must eat to live. Besides, after all, my mother was French. She loved me. While she lived I knew nothing about evil. She died because her life was so hard. I could not endure slow starvation. I did this instead.'

Don Miguel heard the pitiful tale, but he made no comment. It was Old Andrew who muttered, 'Poor lass!' under his breath.

After that there was a moment's silence.

Don Miguel broke the silence. 'Just now,' he asked suspiciously, 'when you begged to be allowed to go to a convent, why did you not tell me who you were?'

Clementine smiled bitterly. 'I might have been made to eat all your breakfast then,' she retorted, 'not merely invited to share it.'

Andrew Vennie dropped his head. He stood still, thinking hard. He wanted to get on with the essentials of this extraordinary story. He selected what he looked on as the cardinal points. They were two. First, it would appear that unless Ramon di Gracias could say something convincing in his own defence he was a traitor, and must be dealt with as such; and, secondly, that if Clementine's story were true it was this Spaniard who had contrived Bryan Bloxham's disappearance.

The old soldier smiled grimly. He walked deliberately down the room and flung open the door. 'Corporal!' he called, and of course Barton appeared in a moment. 'Tell Captain di Gracias I wish to see him here, and at once,' he commanded.

After the curt order was given silence again fell within the octagonal room, with its suggestion of another land, another civilisation. Clementine, wearied physically at last perhaps, shrinking maybe from facing an accomplice of her own flesh and blood whom she had been driven to denounce, slipped behind one of the pillars and shrank on to the low platform by

[Christmas Number.]

the side of the wall. Don Miguel let her go without so much as turning his head. She was nothing to him. On the other hand, his feeling about Ramon di Gracias was very active. He hated him.

The old man moved his chair. He brought it away from the table, set it so that it looked straight down the room, and when he had made sure that he could see who came in by the door from the very moment of entry, he sat down, and with his head thrown back and his lips pressed together, he waited.

Andrew Vennie, of course, made no secret of his impatience. One minute went by, and he jerked out an impatient word; another, and he turned restlessly. It had just come into his mind to wonder if the Spaniard had not been too astute for them all, and got out of the *quinta*, when Corporal Barton appeared within the door.

'Captain di Gracias,' he announced.

The young man—he was still on the sunny side of forty, with the spare, well-knit figure of his nationality—walked confidently into a fully lighted room. He was evidently surprised to see Don Miguel there as well as Colonel Vennie, and was perhaps not quite at his ease, for his hand went quickly to the hilt of his sword and back again. Then he drew up about midway between the fountain and the pillars. He brought his brown hand to the salute, and permitted himself a survey of the scene before him.

But if the young man's glance was appraising, Don Miguel's was even more so. He remarked a thing that might have escaped Andrew Vennie. He saw that while his nephew's glance touched the British soldier, then went on to himself, next took in the general details of the room, it came back to the coffee-table, to the broken morsels of bread, and lingered there.

Once more there was a pause. Don Miguel, though he had pertinent things to say on his own account, was willing to let the Englishman begin. He wanted to see what Andrew Vennie would do. He had always understood that though it took a good deal to move these phlegmatic islanders, when they were aroused they were given to wiping the slate very clean.

Andrew Vennie, after all, disappointed Don Miguel's anticipation. He started where the old Portuguese expected he would end.

'The French were ready for us at Ste Marie di Prega?' he observed.

The young man lifted his eyes; but before there was time for any one to see the question, the astonishment, in them, he controlled himself and dropped them carefully to the floor. 'The rain prevented the attack,' he evaded.

'Did you know that the French were prepared?' Andrew Vennie went on.

'I!' ejaculated the Spaniard.

'Yes,' repeated Andrew Vennie, 'you!'

The dark eyes looked right up this time. 1916.]

'*Mon Colonel*,' expostulated Ramon di Gracias, 'how could I?'

Old Andrew folded his arms across his chest. He thrust out his lower lip.

'It was you who sent word to them that we were coming,' he accused.

The Spaniard sprang back. His hand went to his sword with a movement that had a theatrical wave with it. He half drew out the blade; then he rattled it back again with a gesture which seemed to say that even before such injustice he would endeavour to be patient. '*Mon Colonel*,' he expostulated, 'no man has the right to bring such a charge against me.'

'Not unless he can prove it,' interposed Old Andrew dryly. He drew himself up, and looked at the still figure in the great chair. 'Captain di Gracias,' he went on weightily, 'the man who will sell one side will sell the other. You know what you have been doing.'

The young man thought he saw his chance. 'I put patriotism before everything,' he cried. 'Am I to be insulted because I cared so much for my country that I did not mind what I did to serve her?'

Andrew Vennie put up his hand, he waved it slightly, as one moves on the light smoke from a cigar. 'You sent very precise information to me,' he returned grimly. 'You made great haste to inform me of Bryan Bloxham's visit to the French lines, and you put a construction of your own on that folly. You let me know that if I sent Bryan Bloxham to the *quinta* yesterday I should not find him alone. You assured me that the woman I had especially warned him against would be there with him.'

Ramon di Gracias threw up his head. 'You are proving my zeal,' he exclaimed. 'You, by your own showing, are setting forth what valuable services I have rendered to the Allies.'

Andrew Vennie looked hard back. 'Is that how you put it?' he said slowly.

'Yes,' cried the young man. 'And I will appeal to the Commander-in-Chief to hear me, to judge for himself how grossly I have been maligned, insulted.'

Andrew Vennie turned about. 'Mademoiselle!' he said.

Clementine, crouching at the wall, had been hidden from view by the back of Don Miguel's chair. She had heard every word, and what she learned set her blood aflame. Up till now, though she had denounced Ramon di Gracias to save the dearest thing in the world to her, she had done it reluctantly. Blood is proverbially thicker than water. Besides, there is honour, though it be of a poor sort, between thieves. Now she had learned that she had been betrayed from the moment she knew Bryan Bloxham. She raised herself quickly, as quickly came up to the British soldier and stood beside him.

Don Miguel looked after her as she hastened;

he caught a glimpse of her face, and he smiled as though he had seen what gratified him.

Clementine looked at her half-brother.

'You!' he said slowly; for he knew that now he had not only another foe to contend with, but the one who would do him the most harm of all.

Clementine faced the dark face looking down malignantly into hers. 'It seems,' she said, 'that you betrayed me to the English, and now you would do away with Bryan Bloxham because I love him.'

Ramon di Gracias looked coldly back. He laughed as Don Miguel himself might have done. Up till this moment he had not despaired of hoodwinking the British officer, of circumventing his uncle; but with Clementine against him he had no chance, at any rate, of clearing himself from the charge of having sold both sides; and, because he recognised this, his first notion was to strike vindictively at the woman who had turned against him. 'Do you think I wanted Bryan Bloxham out of the way because of you?' he asked.

Clementine faced him still. 'Yes,' she said.

Ramon laughed again. 'I could have put an end to your philandering whenever it suited me,' he said.

'Then why did you hate him?' she cried.

The young man waved his hand round the room. 'I wanted this,' he confessed, unabashed.

'This!' echoed Andrew Vennie.

Don Miguel understood. 'Ah!' he observed, speaking for the first time, 'so the parchment was to bring fever not only to him who set his name at the foot of it, but as well to him who might have profited by the funeral.'

Still Andrew Vennie hardly followed, and he was about to ask for a further explanation, when Clementine swept the question of the inheritance aside.

'What have you done with Bryan Bloxham?' she thrust in.

'Has he left you?' asked Ramon, and the question was a taunt.

'It is you who have made away with him,' she flung back.

The young man folded his arms; he smiled evilly again.

She came a step nearer. 'It is you who have made away with him,' she repeated.

Her half-brother but looked at her. Her perturbation amused and gratified him.

'Do you hear?' said Clementine. 'I have told Colonel Vennie, I have told Don Miguel, that it is you who have made away with Bryan Bloxham.'

'And do they believe you?' the young man sneered.

Then Clementine did an unexpected thing. She drew herself up, passed over the insult as if she had never heard it. She stepped aside. 'Colonel Vennie,' she said confidently.

The old soldier understood. 'Captain di

Gracias,' he began weightily, 'I think you have forgotten one thing. Lieutenant Bloxham is a British subject. The officers of the British army do not disappear. In war-time they fall in action; but if they are done to death in cold blood it is murder, and the man who is responsible for their death pays the penalty. He is hanged—not shot.'

The young man heard these ominous words. Just as there was one thing intolerable to Clementine, there was one thing intolerable to Ramon. He had debased himself, he had taken bribes, he had not scrupled to do many things that no honest man would, and yet the notion of hanging like a common convict was insupportable to his Spanish pride. He saw that he was trapped. He understood that he would never go out of the door behind him but as a prisoner. He swung round on Colonel Vennie, determined to fight to the last. 'I have not admitted that I did away with Bryan Bloxham,' he said.

The old soldier looked hard back at him. 'We sentence no man at random,' he said sturdily.

'Then'—put in the young man quickly, and involuntarily he took a step sideways.

Colonel Vennie stepped behind him, and impeded his passage to the door. 'No,' he said, as Ramon was compelled to face him, 'you are not at liberty to leave this room. When you go out, it will be under an escort. You will be charged with the murder of Bryan Bloxham. And if the charge is established you will be hanged by the neck. If you escape that, you will be arraigned for selling information to the French. The penalty for both is the same. I give you this chance. If you have anything to say, will you speak now, or will you let the inquiry go to the trial?'

Andrew Vennie folded his arms. Clementine stood waiting eagerly. Don Miguel bent forward, and he looked like an animal about to spring.

Of the whole group, Ramon di Gracias seemed the most unmoved. He was thinking feverishly. There was a chance of his getting off—on the charge of murder, that is—because there was a chance that no trace of Bryan Bloxham might ever be found. He looked up at the lantern. The sun was high above it, and the flight of time had a great deal to say to his chance. He dropped his hand down, threw back his head. 'Colonel Vennie,' he said, 'I surrender myself to you. I rely on you to see that I have a fair chance to prove that I am not guilty.'

The fateful words rang out into the room.

Andrew Vennie bowed. 'Captain di Gracias, you have appealed for justice. Be sure that as far as it is in my power I will see that you get it.'

The words were hardly uttered, the old soldier still standing erect, his head raised, when once again the door leading into the corridor began to turn on its hinges. It swung back slowly this time, as though whoever was pushing it had half stepped aside to answer a question. There was

[Christmas Number.]

a brief space while no one showed in the widening aperture. Andrew Vennie looked down frowning. He wondered who could be coming to interrupt them now. Don Miguel, mindful of what had gone on in past times in this very *quinta*, looked up with apprehension.

It was Clementine alone who seemed to understand. There was but a moment of indifference with her; then she leaned forward with the light springing up in her eyes, with the colour glowing on her cheeks, and her lips parted and trembling. Before she could step forward she saw that she was right. A big form in a British uniform filled up the space. 'Bryan!' cried the girl. 'Bryan!'

The blue eyes met hers. It was indeed Bryan Bloxham, but Bryan spent and weary, with that worn look on his face which showed that he had gone through hard things. His uniform, too, was torn; it was stained; it was bedraggled; it was wet with thick mud and much water.

Clementine hastened to him. Andrew Vennie followed her almost as quickly.

'Lad,' cried the old soldier, 'what has happened to you?'

It took but that one quick question to get at the story. A treacherous blow had struck him down, and the man who had dealt it bound him on the ground, and carried him down to the marshes. There he had been tied to a tree-stump, and left to sink by his own weight in the slime and the mud. He was up to his knees before he succeeded in working aside the bandage about his mouth. He had exerted all his strength to cry out for help. It was the French within the gatehouse who heard him, and they rescued him just in time. The chivalrous foes refused to make war on a man in his plight; they sent him in to the British lines under a flag of truce. He stopped when he got so far.

Clementine hurried close up to him; Andrew Vennie threw his arm about him. The three of them, standing in a group, had forgotten both Don Miguel and Ramon di Gracias.

The old Portuguese saw that. He looked at his nephew. The young pair of eyes met the old pair. The two kinsmen had never seen each other before, but they had been enemies ever since Ramon was born. They both knew that; and they both knew that now, in this critical moment, there was a certain understanding between them. To both of them, when it came to the point, pride of race outweighed personal animosity.

Don Miguel as little as Ramon di Gracias could think of that death by the rope. The old man considered a moment. Ramon di Gracias waited, and gazed into the lined olive face.

The old man put out his hand. He leaned sideways, and took up the wedge of bread. He held it a moment, looking at it. Then he rose, and bowing ceremoniously, as a host might to a specially honoured guest, he handed it over to his nephew. The young man put out his hand.

1916.]

It was steady. The brown fingers closed on the bread. Silently, lest they should be observed and frustrated, he bowed in his turn. Don Miguel smiled slowly. He went back to his seat. Clementine was bending over Bryan. Andrew Vennie had never a thought to spare for the pair by the fountain. Ramon di Gracias lifted the wedge to his lips and looked upwards.

The afternoon siesta was hardly over when a mule was led out from the long row of tumble-down buildings on the opposite side of the courtyard to the Garden of the Arcades, and brought up to the flight of steps before the entrance-door. The animal was saddled for a lady; on each side of its neck were slung leathern bags, as though it was going on a long journey; and a Portuguese driver was at its head; but down by the main door was Corporal Barton, while drawn up without the wall under the shade of the cork-tree were three troopers. The mule stood patiently, but the horses chafed under the heat and the flies. They threw up their heads, and set the accoutrements jingling. Bryan heard the sound as he lay between sleeping and waking. Its very familiarity soothed him at first. But then, as the remembrance that he was still within the *quinta* and not by the cavalry lines came back to him, he sat up and listened. He had slept off the most of his fatigue; there but remained that feeling of having come back from very far which sometimes does linger with a man after he has seen death face to face. Suddenly some thought made Bryan Bloxham spring up. He hastened to the great entrance-door. He saw the mule; and he understood. It was saddled for Clementine, to take Clementine away. He set his lips in a firm line, and with a smile as grim as that which Andrew Vennie could assume on occasion, he walked down the steps and pushed the muleteer aside. 'Wait,' he said in the man's own tongue, 'until I send for you.'

Keeping his hand on the bridle, Bryan Bloxham looked up the steps. He knew all about himself now. He had learnt that what yesterday had been in part an obligation of honour had to-day become his dearest wish. He had always known that he loved Clementine, but he had never been quite certain that he had not better go away and leave her. Brief as had been the glimpse of her on his return, love is very quick, and he had seen a change in her. He had marked Andrew Vennie's attitude too. His colonel, from open hostility to Clementine, had certainly got so far as some kind of understanding with her. Bryan remembered these items, and thought very little of them. There was a thing so much greater than they. There was the question of love as love.

A little time went by. The sun still shone, and a green lizard or two slipped out from the joints between the stones and basked in the

warmth. At last Clementine came out, and both Old Andrew and Don Miguel were with her. She was veiled; she was cloaked. Bryan saw her start when her eyes fell on him; he noticed that the two old men exchanged glances. Bryan let the party come down the steps until they stood beside the mule, and it was only when Clementine put up her hand to mount that he let go the bridle.

'What are you doing that for?' he inquired, as he hastened up to her.

The girl pushed back the dark hood that more than half-covered her face. She did it unthinkingly. It was the same gesture that Bryan had seen on the first morning they met. He remembered that. 'I am going away,' she said.

The young man smiled as though the notion amused him. 'Where are you going?' he demanded.

This time the girl passed over the question to Don Miguel.

'My niece would enter Religion,' said the old Portuguese slowly.

Bryan Bloxham came a step closer. 'You forget,' he said, and he looked hard into the dark eyes. 'I have something to say to that.'

Clementine seemed to shrink farther into her heavy felt cloak. 'You have nothing to say,' she murmured hastily.

Bryan Bloxham moved until he stood squarely before her. He waited a moment, and a little lizard ran farther up the balustrade, then stopped and turned round its tapering head as if even it were interested in this.

'Our marriage,' resumed Bryan Bloxham, 'was fixed for to-day. It has been postponed, but there is to-morrow.'

Clementine drew herself up. She stepped back and back until she mounted on to the last of the stone steps. She flung her cloak aside, and put one hand on the coil of the balustrade. 'I will not marry you, Bryan Bloxham,' she said slowly, deliberately.

The young man looked back at her. 'Eh?' he repeated stupidly. He raised his head. His eyes were on a level with hers. He could look into her face from his own, and he examined it slowly, searchingly.

Clementine tried to keep her gaze steady. She summoned all her pride lest she should fail before the ordeal.

'Say that again,' demanded Bryan Bloxham after a long pause.

'I will not marry you,' replied Clementine.

'Why?' shot out Bryan.

'Why!' echoed the girl.

Bryan laughed shortly. 'Yes,' he said, 'I demand to know the reason why.'

Again Clementine's eyes flashed. 'You persecute me,' she cried. 'You drive me into a corner. I asked nothing better than to go quietly away, to disappear out of your life. Both Colonel Vennie and Don Miguel knew

that it was better so. Now you have prevented that.'

'And,' wound up Bryan Bloxham, who apparently was quite unmoved by this passionate protest, 'you have not answered my question.'

The two old men in the background exchanged glances. This masterful young man gratified their old hearts, as a particularly lusty child gratifies a doting mother.

But Bryan meant to be answered. Clementine saw that.

'Since you will be told,' she said, 'understand no man shall marry me for pity. No man shall marry me to satisfy the obligations of his honour. No man who would hesitate to marry Clementine de Gillamont shall marry Mercedes Clementine di Gracias.'

Bryan put up his two hands. He laid them one over the other on the knob of the balustrade. 'That is no answer,' he remarked.

Clementine looked once back at him. 'It is all I have to give,' she said obstinately.

The young man sighed again. He moved the uppermost hand; he transferred it to the other baluster. If Clementine came down she must walk into his arms.

'No,' he said, 'there is something else to say yet. I will ask you a question, and you must answer it.'

He paused an instant. He looked up. The sky was so blue, and it was good to be alive and young.

'Clementine,' he said distinctly, loudly—and he did not care a straw if Old Andrew heard him, or Don Miguel, or Corporal Barton or each of the three troopers waiting without—'there is only one thing I want to hear. Do you love me, or do you not?'

The girl went back another step. She half shut her eyes. She loved Bryan Bloxham better than herself, and still her only thought was to do what was best for him. Love had come to her late, it had come to her after that which might throw a shadow across it as long as she lived, but it had come to her in perfection. She tried to speak; she put up a hand uncertainly.

Bryan saw the movement, the helplessness of it. He waited for nothing more, not for a look, not for a syllable. He made one bound upwards; he shot out his arms and clasped them round Clementine. He stood there thus with any one who looked on to see. Clementine's head was on his shoulder, and he looked over it, down at Andrew Vennie and the old Portuguese.

'I should take the mule back to the stable if I were you,' he said to them.

He did not wait to see if they acted on this excellent advice. What they did or left undone was nothing to him at the moment. He turned to Clementine again. 'To-morrow!' he said triumphantly to her; and this time she looked straight back at him, and she did not say no.

[Christmas Number.]

THE REFUGE.

BY WILLIAM FREEMAN.

IT was past nine, and Sir John Royston had almost given up expecting him, when the maid announced Embury.

'Ask him into the library,' said Royston.

It was more than a year since he had met Embury, a year in which he had been extraordinarily hard-worked. The little leisure he had been able to snatch had been spent at the sea, and Embury himself had married and moved to a distant and rather inaccessible suburb. His letter of that morning had been the first since that which had announced his wedding.

As Embury came, the light of the electrolier showed him older, grayer, thinner. He looked like a man who worried too much and felt things too keenly. Royston caught himself wondering whether he had been badly hit by the war. Embury wrote—chiefly essays and verse—but he had also a considerable private income.

Royston shook hands, and turned to exchange the diffused brilliance of the central light for that of the small electric lamp on the table. He argued that a man so obviously harassed as Embury would not want to discuss his troubles in the glare of a couple of forty-candle-power lamps.

'Sit down,' he said, 'and tell me the news. How's Mrs Embury?'

'She's pretty fit,' said Embury mechanically. He dropped into the chair opposite Royston's. 'But it's grossly unfair of me to monopolise your time like this, Jack. Which reminds me that I haven't congratulated you yet on the new serum, and the title.'

'That's all right,' said Royston. 'One can't do less than one's best in these times, and the serum was just a lucky discovery. Experimental work has an everlasting fascination of its own, especially to the dabbler in psychology.'

'Exactly. And it's your knack with that sort of thing which brings me here. Have you time—and patience—to listen to a rather commonplace and long-winded story?'

Royston nodded, and pushed forward a cigarette. 'I can give you until seven o'clock to-morrow morning, my son. Go ahead.'

Embury faced him, fingers interlaced; the same Embury he had known since the pair of them were at Oriel together, yet with a difference that had nothing to do with the fact that twenty-odd years had passed since then.

'Then I'll make a start. About a year ago I met a girl who seemed to possess all the qualities I'd stipulated a wife of mine should possess. It's the sort of bargain that I suppose every bachelor tries to drive with the Fates, and the 1916.]

Fates are generally sport enough to compromise. Her name was Daphne Frewen, and she was acting as amanuensis and companion to old Lady Harrow. She was nineteen when I first met her, and without a relative in the world. We became engaged, and at the end of three months were married.

'For a time we were absolutely and completely happy, and then—well, less happy. I'm inclined to think now that the fault was almost entirely mine, and that our case, so far from being unique, was more or less typical of what happens in most marriages where one partner makes demands in the way of sympathy and understanding which the other isn't equal to meeting.'

'In this case, was it you who made the demands, or Mrs Embury?'

'I. I'd assumed that Daphne's mind was receptive and adaptable. It was; but there were limitations, and I discovered them, not gradually, but suddenly. I was like a child who expects a piece of elastic to stretch indefinitely, and who finds that beyond a certain point it won't. I got irritated, and then exasperated. I tried not to show it; but Daphne isn't a fool, and she has a high spirit of her own, and once or twice there were—scenes. Things were drifting to a crisis when the Dreams came.'

'The Dreams?'

Embury nodded. 'Or, rather, the same Dream repeated, for the variations were very trivial. The thing began one raw night in late October. I'd been working overtime to finish some work for Foulsham of *The Universal*. It was my first commission from him, and I was anxious to make good. It was past eleven when I knocked off, and my eyes were aching and my nerves jumpy and jangled. I went from the study into the dining-room, and found Daphne crouching over the fire. The light hadn't been switched on, and there were no signs of the coffee and biscuits I'd asked her to have ready.

"What on earth have you been doing?" I asked.

'She looked up with a start, and I'd an impression that she'd been crying. "Dreaming, I think."

"Where's Collins?" Collins was the maid.

"She's spending the night with her people. Her brother's home on short leave, and I let her go."

"Then," I said, "I"— Well, exactly what I said isn't worth recording; but I remember at the time being conscious that it was brutal, even while I excused myself on the score of fatigue and general exhaustion. It's

queer how one's brain can work in separate sections, so to speak. Daphne hardly spoke at all, but her face went pale. She was wearing a white dress, and in the half-light she looked almost ghost-like.

"I'm sorry," she said. And then, after a little pause, "Do you mind if I go up to bed now? The biscuits are on the sideboard, and the kettle won't take five minutes to boil. I'll put it on the gas-stove, and fetch the coffee."

"She brought the canister, and her fingers touched mine as she gave it to me. They were like ice. She looked so frail and fagged that I came near to taking her in my arms, and telling her that in future I'd ask nothing better than to have her as she was, and that my ideas concerning perfect mental affinity and so forth could go hang. But I didn't. She slipped quietly away, and when I went up to the room about an hour later she was sleeping.

"I went to bed myself soon afterwards, but I couldn't rest. For hours my brain worked in the foolish, frantic, exhausting fashion for which I knew I'd have to pay later on. Finally I dropped asleep as suddenly as if I'd taken a drug, and out of that oblivion the Dream emerged.

"It seemed that I was walking down a wide, straight road lined with poplars, to a village. In the middle distance, on the left, was a cluster of cottages with red roofs, and walls of white and pink and yellow plaster. On the right was a bigger building, half-hidden by trees. In front of this, on a patch of turf, was a swinging sign, "Le Refuge Heureux." I could distinctly hear the creaking of the board as it swung in the wind. I walked on until I came opposite the house. It was surrounded by green-painted railings, on which blotches of rust were beginning to show; while a gravel drive led to the entrance—a glazed door at the top of three wide steps, with a stone flower-pot filled with geraniums and lobelias on either side. As I stood peering in through the gate the door opened, and a slim figure in a gray dress came to meet me.

"It was Daphne, but younger than when I'd known her—not more than sixteen or seventeen, dear and beautiful beyond words. Her soft hand pulled back the fastening of the gate, and we paced slowly up and down the drive. (It's queer that I couldn't remember afterwards a word of what we said, though every inflection of her voice remained.) Presently an elderly woman wearing a white coif came to the top of the steps and called, and Daphne waved her hand and left me. I waited until I heard the slam of the door, and then went out through the gate into the road. I turned to look up at the creaking sign again, and suddenly the sky grew intolerably bright, and I awoke.

"That, Jack, is the dream; and I've had it, with trivial alterations, many times. It's come to play a fundamental part in my life. The Dream-Daphne fills a gap that the real Daphne

failed to fill. We talk of things—vague, intimate, delightful things—that the real Daphne wouldn't understand. Indeed, I've never even mentioned the Dream-Daphne to her. I've been happy—absurdly happy—living, as it were, in two planes. My work reflected it. The critics who mattered spoke of "fresh depth and brilliance." That was until a month ago."

"And then?"

Embury leant forward. Royston could see the harshly carved lines at the corners of his eyes and mouth. "The visits grew shorter and shorter, until one day she told me sorrowfully that they must cease altogether, and that she was leaving the Refuge. I remember the overwhelming wretchedness that came upon me then—the utter, unreasoning depression that belongs to dreams. I tried to discover where she was going, to make plans by which we could meet somewhere else; but she was called away by the woman with the coif before she could answer. I'd only one other dream after that, and then it was the woman who appeared. She stood at the top of the steps and silently shook her head, and then went in again and closed the door behind her. I haven't seen the house or the Dream-Daphne since; I've lost the only avenue of escape from a life which, if it wasn't intolerable before, has become intolerable now."

Royston eyed him thoughtfully. "At the present time we've most of us access to three worlds—the world of dreams, the world of normal realities, the world of abnormal realities. The door of the first has been slammed in your face; the second's intolerable."

"And the third?"

"It's an irregularly shaped territory comprising most of Europe, and the passport consists of a khaki suit, a certain elementary knowledge of drill, and the modern rifle. You're forty-three, Steve; but you don't look it. If you're reasonably sound in wind and limb I can guarantee to see you through. Hasn't the idea occurred to you before?"

"If I hadn't been a self-absorbed fool it would have done so, months ago," said Embury roughly. He stood up. "Can you overhaul me now?"

A week later Daphne Embury called. Royston found her waiting in the library when he came back from the hospitals. The afternoon sunlight showed a delicately featured woman with deep-set eyes of luminous gray.

"I came," she said quietly, "to tell you about Stephen."

"He joined up?"

"Yes, the day after he saw you. He showed your letter to the right people, and they're sending him to the front almost at once. I wanted to thank you on his behalf."

"I've done nothing—less than nothing. But I'm glad to have met you."

She smiled faintly. "Because of what he told you. Because of the Dream?"

[Christmas Number.

'For that and other reasons.'

'Am I the sort of person you expected to meet, Sir John?'

He met the challenge of the wonderful eyes squarely and without smiling. 'I knew that you must belong to one of two types—one fairly common, the other rare. Now I know that you come under the second category. Will you give me your own version of "Le Refuge Heureux"? For of course you know.'

'Of course.' She paused a little, as if to collect her thoughts, and continued: 'Steve has gone, and, whatever happens, I shall feel that he did the best—the only—thing. What I am going to tell you now is the part of the story he doesn't know. I always meant that he should, but he's been intensely occupied with his own work, and I've a sort of terror of boring him. When we first met I was earning my living as companion to Lady Harrow. Before then, and until my father died, we'd been living abroad on a small annuity he had. I was educated at a Belgian convent in a little village called Suisnes.'

'"Le Refuge Heureux"?''

She nodded. 'In the seventeenth century the place had been an inn, and the sign was so appropriate that it was allowed to remain. The Sisters were very good to me, and trained me to face the world as adequately as their own unworldliness would let them. I left when I was seventeen, always hoping to see them again. But the chance never came.'

'And then?'

'When I was nineteen I met Steve, and we were married. I knew from the first—though he didn't—that there would come a time when he would discover my limitations. For Steve is nearly a genius, while I—I'm just ordinary. I can't say the things I feel, or tell him of the things I'd like to tell him. Our happiness lasted unspoiled for nearly a year; then he began to realise that I couldn't keep pace with him mentally, and the gulf between us grew. There were times when I'd have given my very soul for him to look at me with the old kindly blindness, and other times when nothing seemed worth while. One night, after things had been worse than usual, I woke to find the moonlight streaming into the room, and Steve sleeping restlessly. I suppose a sort of madness must have come over me, for I slipped on the old gray gown I used to wear at the convent, and bent over him, trying to thrust myself into his consciousness, to make him think of me as I was then. And I saw his face change, and knew that I'd succeeded. After that, I was able to send him the Dream almost every night, though I'd rather have died than that he guessed it.'

'That marked the second part of our lives together, and it lasted for more than a month. Then the power began to fail me. I couldn't make my own personality reach him. I was afraid—desperately afraid; and I knew that he

1916.]

was afraid too. I knew that his waking eyes would look on me more and more coldly, and that perhaps in the end he—he'd hate me. Only now I know that it won't be so. He'll see me in the Dream once again, and then'—

'Well?' said Royston.

Mrs Embury rose from her chair. 'God's good, and I'm content to wait. But I wanted to meet you, and to explain. Good-bye.' She held out her hand with the same faint, enigmatical smile, and a moment later Royston was seeing her into the taxi which was to take her to the station.

He went back to the library, pondering; and then, since there were heavy arrears of work to be overtaken, he thrust the interview into the hinterlands of his brain, and settled down again at his desk. And the next day and the next, and for many days afterwards, he heard nothing of Stephen Embury, or of his wife.

But one morning Royston found on his plate an envelope franked with the familiar triangular post-mark, and ripped it open with quickened interest.

'DEAR JACK'—he read—'I'm sending you this on the eve of a big attack, and quite possibly it may never reach you. But since it forms, so to speak, a sequel to our last conversation, I'd like you to know.'

'Two nights ago I had the Dream again, keener and more vivid than ever. I saw the swinging sign, and the white-coifed woman, and the Dream-Daphne came to meet me. We said "Good-bye," and I awoke with the echo of her voice in my ears. An hour later our regiment was told to move forward. We marched all day, rested an hour or so, and then pushed on again. The second morning found us in a straight white road that seemed familiar—do you know the extraordinary sensation of coming face to face with what one has only seen before in a dream?—and finally halted on the outskirts of a village—*my* village. I was sent ahead with a patrol to make inquiries, but the whole place seemed lifeless. A peasant-woman, coming to meet us, assured us that the Huns, in falling back, had done their best to wipe it off the map. She hadn't exaggerated. The cottages had been levelled to their foundations, and behind a wooden sign that still swung drunkenly was a mass of rubble and broken beams and splintered glass that I recognised as "Le Refuge Heureux."

"The good Sisters who used to teach there," the woman told us, "are, praise be to Saint Michael! in safety. They have money with them, and when the war is over they will teach afresh. If m'sieu' knows of any little one in whom he would see gentleness and tender charity implanted, he could not do better than put her in their charge."

'And so, Jack, my dream's materialised—and

ended. The whole business is clean beyond my comprehension. I only know that the Refuge has gone, and with it my last chance of meeting my Dream-Daphne again. If I come out of this inferno alive it'll mean making a fresh start; but the crude hideousness of war teaches a man a good deal.

'I've just heard that we push on again at dawn, so I must finish.—Yours, S. E.'

'I'll run down to Sunningham and see her,' Royston told himself.

But he did not go—then, at any rate. At first he was a little dubious of the wisdom of going, and for nearly a month afterwards circumstances conspired to make it impossible. When finally he did go, it was in response to a note from Mrs Embury.

'Stephen has been sent home,' she wrote. 'His fighting days are over. He was wounded badly in the last advance; but he is almost well now. Will you come and see us?'

Royston wired an affirmative, and caught the first afternoon train.

The day was fine, the walk from the station

to the house pleasant. But he was in no mood to linger. He was wondering acutely on what basis the *ménage* at The Pomegranates had re-established itself.

The maid who opened the door was evidently expecting him. 'You will find them in the summer-house, Sir John,' she explained.

Royston turned obediently down the path she indicated. The summer-house was at the far end of the garden, and he crossed the lawn to reach it. His footsteps made no sound on the turf, and he saw Embury and his wife for quite a minute before they were aware of his presence.

Mrs Embury was seated, a child in her arms. Its outflung hands were clutching at Embury's coat, and Embury was bending over it with an expression on his face that left no room for doubt or fear. Royston, hardened bachelor though he was, allowed himself the luxury of a sigh.

'The Refuge and the Dream-Daphne have gone,' he told himself. 'But he won't need them now. In a year or so he'll probably forget that they even existed. Gray-eyes was right, after all. But women so frequently are.'

'POLLY' (REFUGEE).

At the luncheon hour, down a famous street,
The Pressmen hurry—a jovial troop,
Cheery slaves of the printed sheet,
Chuckling over the latest 'scoop';
And some of 'em turn, at a greeting shrill,
To wave at a window on Ludgate Hill.

Preening herself as she gaily swings,
Polly watches the world go by;
Watches her master (making 'rings')
With kind, but not uncritical, eye;
Laughs and whistles, and calls with a will
'*Bon jour!*' to her lovers on Ludgate Hill.

But shame! oh shame! when Polly addressed
A passing dame (in her own Walloon),
Whose hands to her outraged ears were pressed
As she fled in horror, and none too soon.
(Oh Poll! 'tis as well we have no great skill
In the gift of tongues upon Ludgate Hill.)

For Polly dwelt in a Flemish town—
A gay little burg in the yester year;
But the devil broke loose, and his friends came down
To harry its people, mad with fear;

Poor little town that is hushed and still,
Far from the racket of Ludgate Hill!

And Polly has known the roar of the shell,
The tramp of the foe in a Land of Tears—
Sounds, if Polly could only tell,
That linger yet in her master's ears.
(Faith! it would make our blood run chill
If we heard them nearer to Ludgate Hill.)

So Polly was found in a burned-out shack,
Starved, forsaken, and like to die,
With never a quill to her bare little back;
But we do not mention it, Polly and I.
For now (though I pay no milliner's bill)
She's the best-dressed parrot on Ludgate Hill.

And if you are passing some shining day
That gilds the gray old City I love,
And a grass-green feather should blow your
way
While a lady is making her toilet above,
Look up, if you please, at the topmost sill,
And wave to Polly on Ludgate Hill.

M. GLYN-STEWART.
